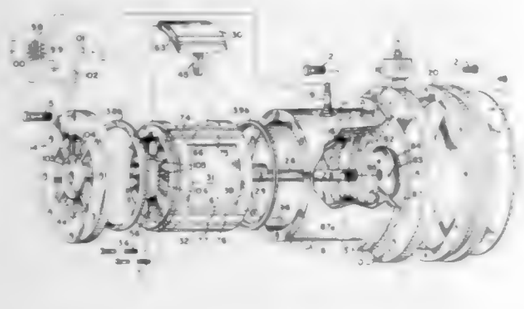
1. A rotary internal combustion engine comprising spaced-apart side walls and a peripheral wall interconnecting the side walls to form a hollow outer body, a rotatable shaft journaled in the side walls and having an eccentric portion disposed within said outer body, and a rotor disposed within the outer body and having a plurality of portions sweeping the inner surface of the peripheral wall in sealing relation therewith, the rotor being mounted on the eccentric for rotation relative to the outer body and to the eccentric, said rotor having an internal cavity for the flow of a working fluid through the rotor, the cavity being open toward each of the side walls, one side wall having a passage for supplying the working fluid therethrough to the rotor cavity, such passage being located in that portion of said one side wall which is at all rotor positions radially inward of the outer periphery of the rotor, said one side wall also including a flow-over passage for connecting the working fluid supply passage with working chambers of the engine formed between the rotor and inner surface of the outer body, the other side wall also including a flow-

over passage for connecting the rotor cavity with said working chambers, the opening and closing of both flow-over passages being controlled by the outer contour of the rotor and said flow-over passages being so situated and formed that motion of the rotor during operation of the mechanism results in the flow-over passage in said other side wall being opened to each working chamber before the flow-over passage in the side wall containing the working fluid supply passage is opened to said chamber such that working fluid first enters each working chamber by way of the rotor cavity and flow-over passage in the said other side wall, and thereafter enters the chamber by way of the flow-over passage in the side wall containing the working fluid supply passage without flowing through the rotor cavity.

3,373,723
INTERNAL COMBUSTION ENGINE

Donald N. Blosser, 1328 Petal Way, San Jose, Calif. 95129

Filed Aug. 1, 1966, Ser. No. 569,203
6 Claims. (Cl. 123—17)



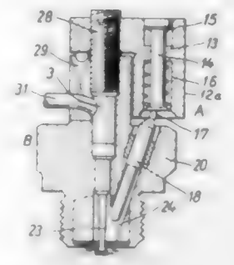
An internal combustion engine provided with a plurality of swinging pistons mounted on pivots in a rotatable piston carrier which has a hollow air passage therethrough for receiving air at one end and means to compress it at the other end. A fixed shaft attached to the end plates of the engine housing provided with an eccentric fixedly attached thereto. A hollow member is mounted on the eccentric, said hollow member being attached to the piston rods. A hollow power takeoff shaft rotatably supported on the fixed shaft and fixedly connected to the piston. Fuel is fed to the aforesaid other end of the hollow air passage to be mixed with the compressed air. The compressed air and fuel are supplied to a fuel feeding passage connected to the inner end of the aforesaid hollow air passage to feed fuel to the cylinders in predetermined sequence as the piston carrier is rotated.

3,373,724
FUEL INJECTION AND IGNITION DEVICE FOR INTERNAL COMBUSTION ENGINES

Hermann Papst, St. Georgen, Black Forest, Germany

Filed Feb. 8, 1965, Ser. No. 430,844
Claims priority, application Germany, Feb. 10, 1964, P 33,560
23 Claims. (Cl. 123—32)

1. A unitary fuel injection and ignition device for an internal combustion engine comprising, in combination, a body of thermally insulating material and formed with a first bore of uniform diameter therethrough forming a chamber of small volume and communicating at one end of said first bore with the combustion chamber of the engine; a pin-shaped electrically heatable igniter element located with small clearance in a second bore formed in said body inclined to and intersecting said first bore in such a manner that the tip of said element is located at the intersection of said second and said first bore substantially aligned with the surface of the latter; nozzle means communicating with the other end of said first bore for intermittently injecting fuel thereinto; elongated guide means coaxially arranged with said nozzle means projecting therefrom past said tip to said igniter element at least to said one end of said bore for guiding a jet of fuel injected by the nozzle means closely spaced from

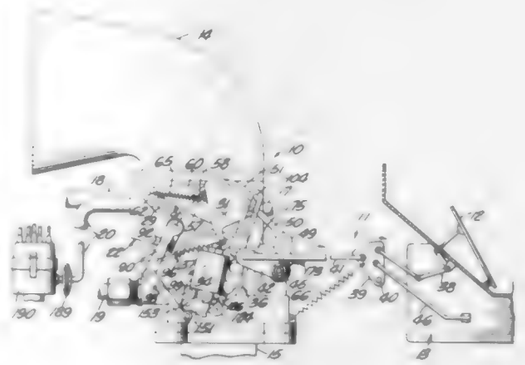


the inner surface of said first bore through the latter into the combustion chamber of the engine so that only scattered droplets of said fuel will reach a hot layer of air surrounding said tip of said igniter element to be instantaneously ignited thereby; and means for supplying electric current to said igniter element for heating the latter.

3,373,725
FUEL SUPPLY SYSTEM, CARBURETOR AND METHOD

Michael A. Arpaia, 16530 Chatsworth, Granada Hills, Calif. 91344

Filed Sept. 3, 1965, Ser. No. 484,959
32 Claims. (Cl. 123—119)

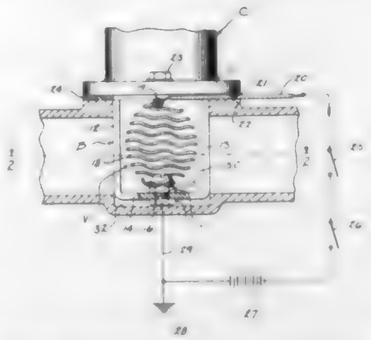


This carburetor for internal combustion engines is operable to supply regulated quantities of fuel into regulated quantities of combustion air in accordance with combustion requirements. Hot exhaust gas preheats the combustion and is mixed therewith to modify the fuel-air ratio and mixture to enhance the combustion characteristics. The fuel-air ratio varies over a considerable range and is regulated automatically by intake manifold pressure and engine temperature conditions. Advancement and retardation of ignition occurs automatically in accordance with different engine operating conditions. A single fuel valve is adjustable to control fuel flow over the full operating range of the engine and cuts off all flow when the engine is not operating and opens immediately on engine turnover during a starting operation.

3,373,726
FUEL VAPORIZER FOR INTERNAL COMBUSTION ENGINES

Walter A. Albrecht, 141 W. Chestnut St., Burlington, Wis. 53105

Filed Feb. 17, 1966, Ser. No. 528,112
1 Claim. (Cl. 123—122)

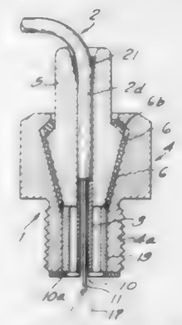


A device for preheating and prevaporizing liquid fuel emanating from an automotive carburetor system having a U-shaped bracket formed from a single length of strip metal insertable in the intake manifold of an engine below the carburetor. The U-shaped bracket having vertically extending substantially parallel legs between which is mounted a heating coil also extending in a vertical position. The heating coil being in a position directly in the path of the fuel sprayed from the carburetor. The vertical legs also being positioned in such a manner as to not obstruct or be in the path of the fuel and the heating element being in an electric circuit in connection with the batteries of the vehicle and vehicle's ignition switch.

3,373,727
SPRAY NOZZLE

Hermann Papst, St. Georgen, Black Forest, Germany

Original application Feb. 18, 1964, Ser. No. 345,125. Divided and this application Aug. 23, 1966, Ser. No. 574,421
Claims priority, application Germany, Feb. 18, 1963, P 31,167
12 Claims. (Cl. 123—139)



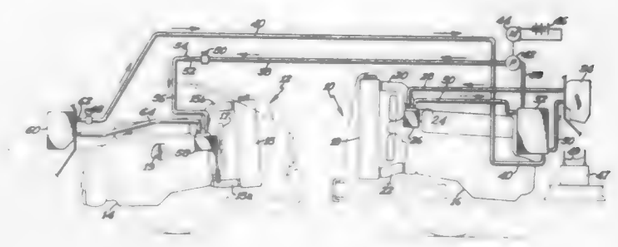
A fuel injection system for an internal combustion engine has an injection pump of the type having a constant rate of discharge in timed relation with the engine, delivers fuel to an open type nozzle forming a tubular discharge pattern within a glow tube.

3,373,728
METHOD AND APPARATUS FOR HEATING STALLED ENGINES

Dennis I. Collins, 5016 Morgan Ave. S., Minneapolis, Minn. 55419

Filed May 5, 1966, Ser. No. 547,823
6 Claims. (Cl. 123—142.5)

An apparatus for heating cold stalled engines which consists of a heat exchanger coupled to the cooling system of a heated engine such as the engine of a tow truck. Heat supplied by the engine of the tow truck elevates the temperature of the heat exchanger sufficiently to heat the coolant of the stalled engine connected to the heat

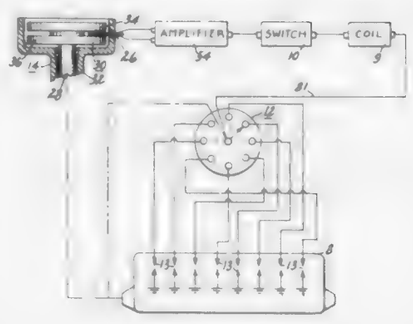


exchanger. A pump is connected in the circuit between the heat exchanger and the stalled engine for circulating the relatively cool liquid contained in the stalled engine between the heat exchanger and the stalled engine.

3,373,729
ELECTRONIC IGNITION SYSTEM

William T. Lemen, Frankfort, Ind., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Filed Dec. 10, 1965, Ser. No. 513,055
7 Claims. (Cl. 123—148)



A potential signal pulse generator having a rotor member comprised of two axially spaced flange portions, each having a plurality of permanent magnets mounted around the axis thereof in such a manner that each permanent magnet of one flange portion is in axial alignment with a corresponding permanent magnet of the other flange portion. A Hall Effect device is located between the flange portions and positioned in such a manner that the magnetic field produced by each permanent magnet pair is at right angles to the plane in which the input electrodes of the Hall Effect device lie.

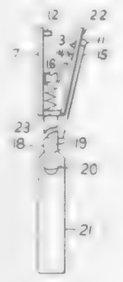
3,373,730
CENTRIFUGALLY OPERATED HAND-CARRIED TOY PROJECTOR AND PROJECTILE

Robert E. Jenison, Rte. 1, Box 74, Lopez, Wash. 98261

Continuation of application Ser. No. 308,790, Sept. 13, 1963. This application June 9, 1966, Ser. No. 562,994
6 Claims. (Cl. 124—5)

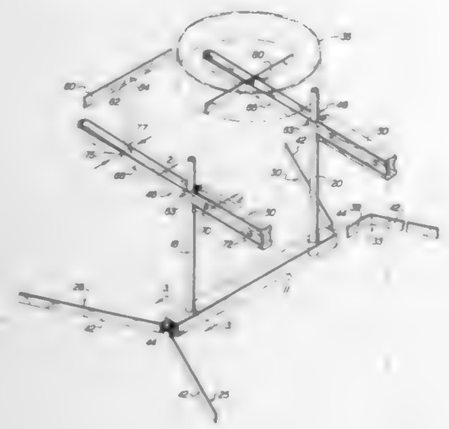
A toy projectile kit is disclosed wherein the projectile is a spinner device which has a center body and thin wing-like arms that extend from the body in opposite lateral directions and are interconnected through the body for conjoint rotation about a lengthwise axis of the arms. The spinner device is launched from a staff or baton which has an upright handle portion and a pair of gripping jaws on the top of the handle portion, one

of which is rigid in construction and rigidly connected with the handle portion and the other of which is capable of flexing in relation to it. The jaws are mutually opposed to one another in a position relatively crosswise of the "throwing" arc of the baton, and are spaced apart to define a slot which opens to the top and sides of the baton and is adapted to receive the body of the spinner device when its arms are disposed in a position lengthwise of the slot and edgewise of its walls. In addition, there are



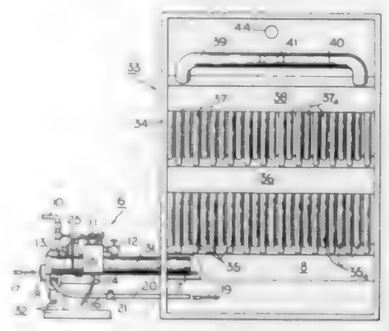
inwardly directed lug means on the walls of the slot which engage the edges of the arms when the device is so inserted into the slot, and retain the device in the foregoing position in the slot until the flexible jaw flexes or is flexed in use, in the direction of spreading the top opening of the slot. Thereupon, the body of the spinner device is released through the opening and rotation is imparted to the arms by the momentary delay imposed at the edge of the arms adjacent the lug means on the rigid jaw.

3,373,731
WILDERNESS CHEF
Alvin Lee Shook, 301 S. Pearl St., Salem, Ill. 62881
Filed Apr. 4, 1966, Ser. No. 539,695
9 Claims. (Cl. 126—30)



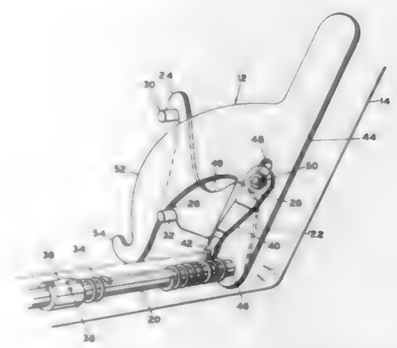
1. An apparatus of the type described comprising an elongated horizontal base support member having a flat bottom and providing a vertical channel having a vertically extending standard passing therethrough and open ends from which horizontal stabilizing legs extend radially, and a horizontal stove member supported by said standard and vertically displaced from said base support, said stove member comprising a handle portion on one side of the standard and a cooking support portion on the opposite side of said standard, one of said portions meeting said standard at an angle when the stove member is in horizontal position, the other of said portions providing a stop member, and spring biasing means holding said stop member against said standard but yieldable to allow displacement of said stop from contact with said standard, said cooking support providing an essentially horizontal surface.

3,373,732
GASEOUS-FUEL JET-FIRED HEATER
Wincenty Tarnas, 371 Portland St., Cambridge, Mass. 02138
Filed Oct. 10, 1966, Ser. No. 585,586
3 Claims. (Cl. 126—116)



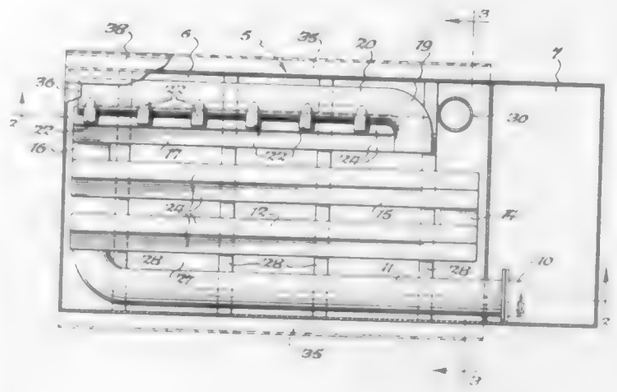
In gaseous-fuel burning apparatus, a constant-speed electric motor drives an air blower to force a high-velocity stream of air from the outlet of a straight hollow air barrel while gaseous fuel is being discharged from the outlet of a surrounding concentric hollow barrel slightly upstream of the air-barrel outlet at a position where the gaseous fuel is caused to be entrained with the stream of air, and a pilot igniter near the outlet of the gas barrel but removed from the air stream serves to ignite the fuel when the fuel supply and motor are turned on independently of pre-established settings for the flows of gaseous fuel and air.

3,373,733
OVEN DOOR HINGE
Robert W. Harrington, William C. Covey, and George McArthur, Jr., Delaware, Ohio, assignors to Sunray Stove Company, Delaware, Ohio
Filed Sept. 23, 1966, Ser. No. 581,478
13 Claims. (Cl. 126—191)



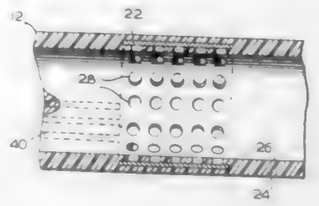
The invention disclosed in this application relates to an oven door hinge and, more particularly, to a hinge for a lift-off door wherein the structure of the hinge permits of the obtaining of all spring forces from a single spring which reaches a valley point of tension at the lift-off point and wherein the spring tension and the spatial relationship among the hinge elements remain substantially constant during removal and replacement of the door. The spring closing force acting on the door at the "broil" position is opposed not only by gravity but also by a cam surface.

3,373,734
SNOW-MELTING APPARATUS
Raymond B. Roemer, 1091 Cleveland Drive, Cheektowaga, N.Y. 14225
Filed Mar. 8, 1966, Ser. No. 532,620
2 Claims. (Cl. 126—343.5)



This apparatus includes a container for the snow and ice to be melted in which a coil having at least one turn is normally submerged in water resulting from the melting and in which combustion of fuel takes place in a part of this coil and in which hot products of combustion pass through the remainder of the coil while submerged, resulting in high efficiency in the use of heat.

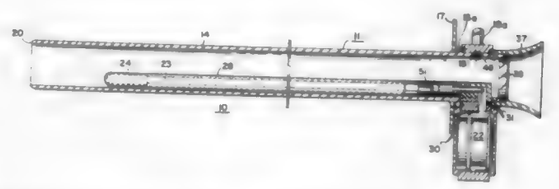
3,373,735
MEDICAL-SURGICAL TUBE
John P. Gallagher, 2415 Foxhall Road NW., Washington, D.C. 20007
Filed Oct. 21, 1965, Ser. No. 500,118
7 Claims. (Cl. 128—2)



1. A medical-surgical tube having an internal end portion adapted to be inserted within a body cavity and an external end portion adapted to remain outside the body, a color-change acid-base indicator carrier means on the tube and located adjacent the outlet end portion of the tube, and means providing liquid communication between the inner wall of the tube and said indicator carrier means.

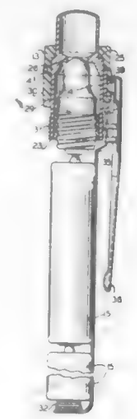
3,373,736
SIGMOIDOSCOPE AND ILLUMINATING MEANS THEREFOR
John Michael Fiore and William Frank Ferro, Troy, N.Y., assignors to Smith Kline & French Laboratories, Philadelphia, Pa., a corporation of Pennsylvania
Continuation-in-part of application Ser. No. 339,479, Jan. 22, 1964. This application Mar. 22, 1965, Ser. No. 441,813
5 Claims. (Cl. 128—6)

An illumination unit for use with a speculum device consisting of a housing means, releasably secured to the proximable end of the speculum, elongated support means releasably secured to the housing means, illuminable means secured to the free end of the support means, and



disposable contamination means surrounding both the support and illuminable means.

3,373,737
LIGHT CONTROL FOR DIAGNOSTIC INSTRUMENTS
William C. Moore, Skaneateles, and John D. Connors, Auburn, N.Y., assignors to Welch Allyn, Inc., Skaneateles Falls, N.Y., a corporation of New York
Filed Sept. 28, 1965, Ser. No. 490,875
2 Claims. (Cl. 128—9)

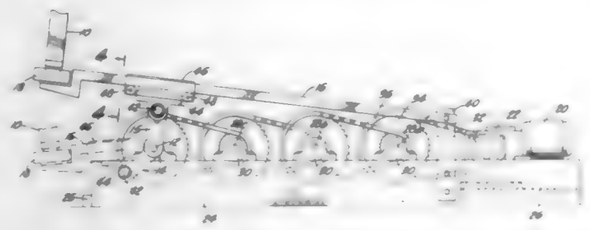


A diagnostic instrument has a tubular light socket in a hollow housing connected as one terminal of a lamp-battery series and a metal spring contact member mounted on the housing is connected as the other terminal. A switch ring of insulating material is rotatably mounted on the socket and a brush element in contact with the socket is carried in a slot in the ring. A hole in the ring communicating with the slot is registerable in "on" position with one end of the spring member which is biased toward the brush element. A depression in the ring is also registerable with the spring end for locking the ring in "off" position.

3,373,738
THERAPEUTIC OSCILLATING APPARATUS
Kurt W. Wittke, 7055 Corbin Ave., Canoga Park, Calif. 91306
Filed Jan. 27, 1965, Ser. No. 428,468
10 Claims. (Cl. 128—28)

1. Apparatus for oscillating a bed about a horizontal plane, comprising in combination:
(a) a stationary support frame,
(b) a crankshaft rotatably supported on said frame,
(c) drive means for rotating said shaft,
(d) a crank driven by said shaft, said crank being arranged to rotate about said shaft,
(e) a lifting arm having one end pivoted to said frame and means on the other end of said lifting arm adapted to support said bed,
(f) a carriage member slidably disposed on said lifting arm,

(g) means connecting said crank to said carriage member,

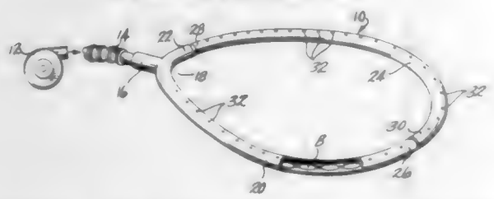


(h) said carriage being so constructed and arranged with respect to said crank and said lifting arm as to support and oscillate the bed supporting end of said lifting arm as said carriage is oscillated by said crank.

3,373,739
APPARATUS FOR MASSAGING THE SCALP WITH ROTATING BRUSHES
John Cameron Rankin, P.O. Box 902, Montgomery, Ala. 36102
Filed May 10, 1965, Ser. No. 454,448
6 Claims. (Cl. 128—56)

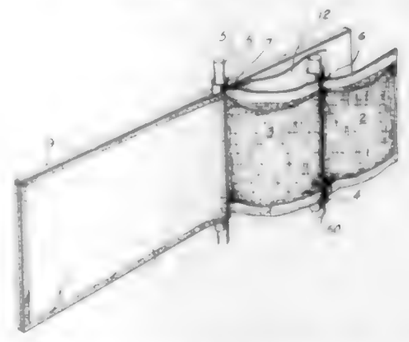
Apparatus for massaging and exercising the scalp of the head embodying a pair of downwardly and inwardly curved arms, on the lower ends of which are mounted either hand operated or motor driven brushes, the brushes being mounted for universal movement relative to the head, and handles immediately associated with the brushes by means of which the brushes may be moved inwardly and upwardly while rotating the same, thus to exercise the scalp.

3,373,740
HYDROKINETIC BATH APPARATUS
Anna Riepl, 2102 Lake Washington Blvd. SE., Bellevue, Wash. 98004
Filed Apr. 8, 1965, Ser. No. 446,569
8 Claims. (Cl. 128—66)



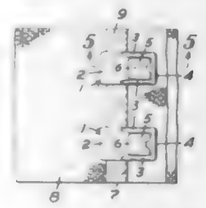
Hydrokinetic bath apparatus comprising a submersible aerator of branched conduit form, the conduits being made from a soft elastomeric material rendering them soft and flexible. Ballast means in said conduit. A closed loop form of such aerator including a removable section rendering it changeable in size from a large loop including such section to a small loop minus such section.

3,373,741
PLASTIC SPLINT
James T. Hill, Bowie, Md., Donald R. Ingenito, Washington, D.C., and Fred Leonard, Bethesda, and Peter M. Margetis, Silver Spring, Md., assignors to the United States of America as represented by the Secretary of the Army
Filed Mar. 19, 1965, Ser. No. 441,389
8 Claims. (Cl. 128—90)



This disclosure relates to a new splint and more particularly to a novel, light-weight, load bearing splint. The splint comprises a padded envelope containing at least two separate and distinct materials maintained separately, the materials when mixed being capable of forming a cured plastic resin composition.

3,373,742
BANDAGE FASTENER AND ASSEMBLY
Stuart T. Shears, Belmont, and Warren C. Anderson, Jr., Marblehead, Mass., assignors to United-Carr Incorporated, Boston, Mass., a corporation of Delaware
Filed Sept. 2, 1965, Ser. No. 484,607
2 Claims. (Cl. 128—171)

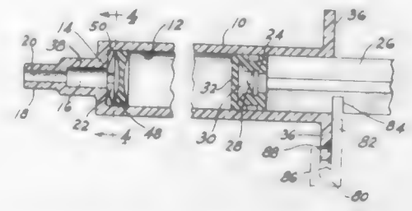


The combination of a stretch fabric, rolled bandage which is adapted to be tightly wound about part of one's body and a fastening device for securing the end of the bandage to the underlying windings. The fastening device is of a molded, synthetic plastic construction and is permanently attached to one end of the bandage, preferably by heat sealing. In addition, the fastener is self-orienting in that the flexible projection(s) which piercingly engages underlying windings may be readily deflected below its normal plane to effect such engagement regardless of the attitude of the other parts of the fastening device as it emerges from the end of the bandage roll.

3,373,743
DISPOSABLE HYPODERMIC SYRINGE
Jacob A. Saffir, Los Angeles, Calif., assignor to The Dentists' Supply Company of New York, York, Pa., a corporation of New York
Filed Nov. 29, 1963, Ser. No. 326,988
2 Claims. (Cl. 128—218)

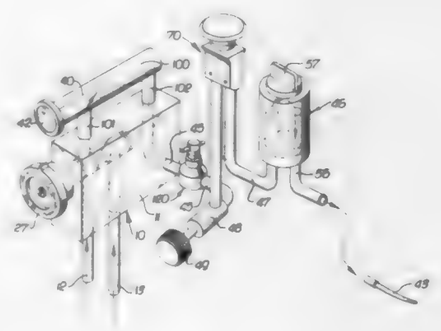
1. A disposable hypodermic syringe comprising an elongated tubular body of substantially uniform cross-

sectional shape, defined by an uninterrupted cylindrical surface between the opposite ends thereof, one end of said body having an end wall fixed thereto and provided with passage means through which contents of said body may be discharged and aspirated and to which a hypodermic needle is attachable, said end wall having radial projections which slope upwards from the passage means extend to the inside wall of the tubular body the opposite end of said body being open and receiving a piston which is slidably mounted within said body, and a rod connected to said piston and extending through said open end of said body to effect reciprocation of said piston in opposite directions within said body, in combination with an imperforate closure



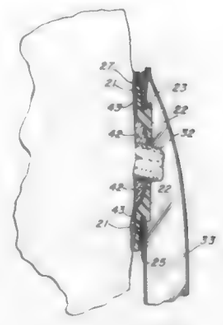
means mounted within said body adjacent said one end thereof and at the periphery thereof being substantially cylindrical and of uniform width throughout its circumference and sealingly engaging the interior walls of said body to prevent contact of contents of said body with the passage means on one end of said body until discharge of said contents is desired, said closure means being of such thickness and flexibility that positive pressure upon the piston will cause the closure means to engage the said projections so as to effect separative movement of at least part of the periphery of said imperforate closure means laterally away from the interior walls of said body and thereby permit either discharge or aspiration of material through said passage means in said one end of said body and past said closure means.

3,373,744
BODY CAVITY IRRIGATING APPARATUS HAVING A MEDICAMENT ADDITIVE CHAMBER WITH MEANS TO INDUCE A MIXING BUBBLE
William Denis Kendall, Los Angeles, Calif., assignor to Dynapower Systems Corporation of California, Santa Monica, Calif., a corporation of California
Continuation-in-part of application Ser. No. 403,803, Oct. 14, 1964. This application Apr. 2, 1965, Ser. No. 445,045
4 Claims. (Cl. 128—229)



The disclosed apparatus concerns enema or douche application wherein discharge water temperature and treatment additive entrainment are beneficially controlled.

3,373,745
MEDICAL DEVICE SUCH AS FOR ILEOSTOMY AND COLOSTOMY
John R. Benfield, 4801 Sheboygan Ave., Madison, Wis. 53705, and George W. Barnhart, P.O. Box 1151, Ogden Dunes, Ind.
Filed Nov. 16, 1964, Ser. No. 411,524
6 Claims. (Cl. 128—283)



Disclosed is a device to hold a bag to receive bodily discharge from a stoma such as formed by a colostomy operation. The device comprises a flexible disk, such as of silicon rubber, with a flange to hold the bag and a rear surface molded in contact with the body to the body contour in and about the stoma.

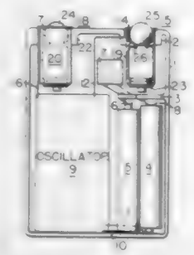
3,373,746
INTERNAL PROPHYLACTIC
Courtney W. White, 4890 Hart Drive, San Diego, Calif. 92116, and Lawrence J. Crow, 9451 El Granito, La Mesa, Calif. 92041
Filed Sept. 8, 1965, Ser. No. 485,698
3 Claims. (Cl. 128—294)

1. An internal prophylactic appliance comprising:
an open ended tubular member constructed of a porous expandable material;
an inner absorption member constructed of a porous expandable material, said inner absorption member being press fitted within said open ended tubular member; and
a capsule adapted to dissolve at body temperature wherein said open ended tubular member is encapsulated in said capsule, the outer said open ended tubular member having an outside dimension suitable for the insertion thereof within a user's urethrae.

3,373,747
ELECTRICAL MUSCLE STIMULATOR DEVICE AND RAZOR ATTACHMENT THEREFOR
Robert Tapper, Los Angeles, Calif. 90016 (% General Medical Co., 5701 W. Adams Blvd.)
Filed Apr. 28, 1967, Ser. No. 634,695
10 Claims. (Cl. 128—422)

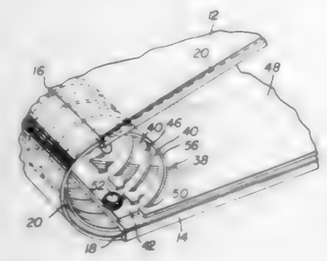
An electrical muscle stimulator employs an electrically conductive substance to make contact superficially of a muscle to be stimulated. The conductive substance is dis-

pensed from a pair of spaced dispensers having revolvable spheres. A semiconductor oscillator device provides a unidirectional peaked voltage waveform having relatively long dwell periods between the peaks. For a self-contained structure an amplifier and a step-up transformer in addition to the oscillator device provide a desired amplitude of electrical output, with a variable impedance element included for adjusting it. To accomplish



shaving while accomplishing muscle stimulation and/or hair erection, one or more shaving heads are positioned adjacent to the pair of dispensers. Resilient mechanical contact and the electrical contact are provided by a spring within each dispenser. Gating, to periodically interrupt the series of peaked pulses to allow the muscles to relax, is achieved by motion of the device over the skin or by electrical interrupting means.

3,373,748
EXPANDABLE RING BINDER
Ronald J. MacCormack, Rancho Cordova, Calif.
(P.O. Box 74, Medway, Ohio 45341)
Filed Aug. 1, 1966, Ser. No. 569,318
2 Claims. (Cl. 129—1)



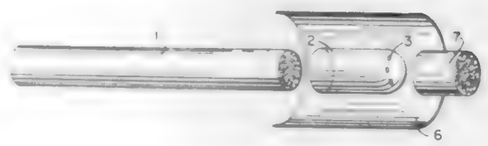
A looseleaf binder utilizing an adjustable binder ring sheet between a pair of covers. One end of the sheet is slidably received within and selectively extensible from a pocket defined in one of the covers with the second end of the sheet, subsequent to the defining of a loop with the sheet, being secured to the inner face of the cover having the pocket therein. The second cover includes a bracket which is engaged over the loop portion of the sheet so as to allow for a movement of the second cover toward and away from the first cover.

3,373,749
BINDERS OR HOLDERS FOR BOOKS
Frank Wance, Linden, and Rudolph A. Kraft, Westfield, N.J., assignors to S. E. & M. Vernon, Inc., New York, N.Y., a corporation of New York
Filed Sept. 13, 1966, Ser. No. 579,141
1 Claim. (Cl. 129—38)

A binder for relatively large books such as telephone directories, reference books and the like, the binder having a back and covers pivoted thereto. A hollow rectangular housing is attached to the inside face of the back at each of its opposite ends. A U-shaped wire retainer has legs fitted between the pages of the book and has its opposite ends protruding beyond the pages of the book. One of the housings has two holes into which the legs of the retainer, at one end, enter. At their opposite ends the legs are connected by an integral offset cross piece. Near the cross piece, portions of the legs enter the

second housing and a spring-biased latch contained within the second housing extends over these portions of the legs. The latch is retractible to free its engagement with the retainer by a key that is entrant through a slot located between the second housing and the back of the book.

3,373,750
CIGARETTE FILTER
Jon W. Beam, 1310 E. 2nd St., Cushing, Okla. 74023
Filed Oct. 1, 1964, Ser. No. 400,782
10 Claims. (Cl. 131—10.5)

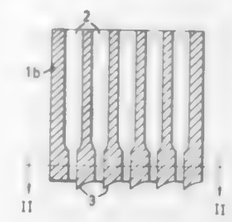


A filter cigarette having a capsule-shaped section containing a number of spaced pinholes in the hemispherically shaped end which increase the velocity of the smoke and direct the smoke against a side wall.

3,373,751
METHOD IN UTILIZING AND REFINING TOBACCO DUST AND WASTE
Arne Wallberg, Jonkoping, Sweden, assignor to Industrilaboratoriet Aktiebolag, Jonkoping, Sweden, a joint-stock company of Sweden
Filed Oct. 13, 1964, Ser. No. 403,577
Claims priority, application Sweden, Oct. 18, 1963, 11,449/63
3 Claims. (Cl. 131—140)

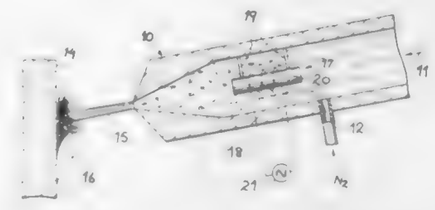
Method for producing shaped masses of tobacco from waste tobacco including milling the waste tobacco in the presence of water for a time sufficient to destroy the cell walls of the tobacco without materially reducing the fiber length, and to hydrate and fibrillate cellulose content thereof, and thereby produce a paste-like mass. An inert gas is passed through the mass during the milling and is removed prior to shaping. Thereafter the paste-like mass is

shaped into helical strings or thin filamentous web by extrusion through a nozzle having a plurality of passages, the wall of each passage at its mouth having (1) a projecting point which defines only part of the circumference of



the mouth of the passage or (2) an insert which defines only part of the circumference of the mouth of the passage and has a friction coefficient which differs materially from that of the remainder of the mouth of the passage.

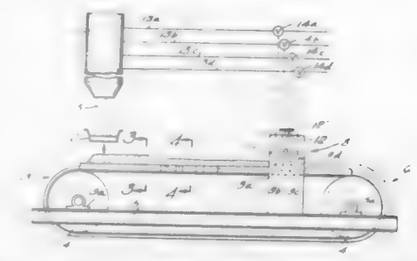
3,373,752
METHOD FOR THE ULTRASONIC CLEANING OF SURFACES
Kiyoshi Inoue, Kanagawa, Japan (182 3-chome, Tamagawayoga-machi, Setagaya-ku, Tokyo, Japan)
Filed Nov. 12, 1963, Ser. No. 322,932
Claims priority, application Japan, Nov. 13, 1962, 37/49,783
1 Claim. (Cl. 134—1)



Method for cleaning a surface by directing a high-pressure stream of liquid/gas mixture from a nozzle thereagainst, ultrasonic vibrations being imparted to the mixture in the nozzle by an electromechanical transducer cooperating with a resonant body downstream thereof and having a natural frequency of vibration of the order of that generated by the transducer, while serrated areas on the internal tapered wall of the nozzle and on the resonant body augment the turbulence in the nozzle.

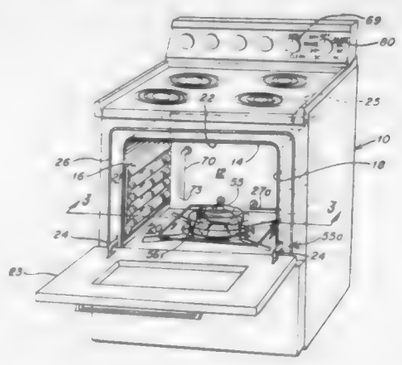
3,373,753
METHOD AND APPARATUS FOR MEASURING AND ADJUSTING THE MOISTURE CONTENT AND THEREWITH THE FORMABILITY OF GRANULAR MATERIAL SUCH AS FOUNDRY SAND AND THE LIKE
Hermann Jacob, Fachenfelderweg 115, Horst, Kreis Maschen, Germany
Filed July 29, 1966, Ser. No. 568,864
Claims priority, application Germany, July 31, 1965, J 28,692
14 Claims. (Cl. 134—18)

1. A method for measuring and adjusting the moisture content and therewith the formability of granular material such as foundry sand and the like comprising the steps of dropping the granular material in moistened condition and in a thin stream onto a surface extending substantially normal to said stream; continuously moving said surface in a direction substantially normal to said stream so that the material will form on said surface a continuous pile of triangular cross section in which the angles of the triangular cross section will depend on the angle of repose of the material, which angle of repose will in turn be proportional to the moisture content of the material; maintaining the base of said pile at a constant preselected width so that the height of the pile will depend on the



angle of repose; measuring the height of said pile thus formed; and regulating the moisture content of the material before dropping it onto the surface in dependence on the measured height of said pile of preselected width.

3,373,754
SELF-CLEANING OVEN
Herbert D. Squire, Galesburg, Ill., assignor to Admiral Corporation, Chicago, Ill., a corporation of Delaware
Filed Dec. 30, 1965, Ser. No. 517,686
2 Claims. (Cl. 134—58)



A self-cleaning oven employing a water impeller blade for violently dispersing cleaning fluid throughout the oven enclosure and for simultaneously comminuting dislodged food soil. A fan blade is coaxially mounted with the impeller blade for circulating warm air throughout the chamber to dry the oven after cleaning and for maintaining more uniform cooking temperatures.

3,373,755
SHEET MATERIAL HANDLING AND TREATING APPARATUS
Mataichi Tajima and Kiichiro Sakamoto, Kanagawa, Japan, assignors to Fuji Shashin Film Kabushiki Kaisha, Kanagawa, Japan
Filed June 24, 1966, Ser. No. 560,176
Claims priority, application Japan, June 24, 1965 40/37,298
4 Claims. (Cl. 134—134)

1. An apparatus for handling sheet material comprising:

a tank,

a gate through which a piece of sheet material may be introduced into said tank,

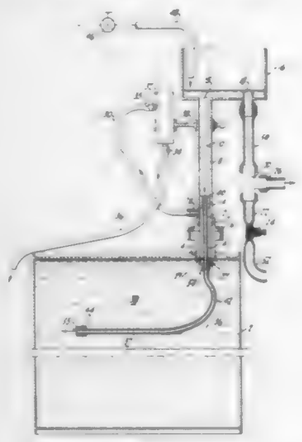
a pair of feed rolls which, upon rotation in a forward direction (1) engage the leading edge of said piece of sheet material, as said sheet material is introduced through said gate, (2) advance said sheet material into said tank, and (3) disengage said sheet material in said tank,

a butting member in said tank adjacent to the leading edge of said sheet material when said sheet material is in said tank and is disengaged from said feed rolls,

means for moving said butting member against the leading edge of said sheet material to move the trailing edge of said sheet material into contact with said feed rolls, and

means for rotating said feed rolls in a reverse direction to engage said trailing edge and withdraw said sheet material from said tank.

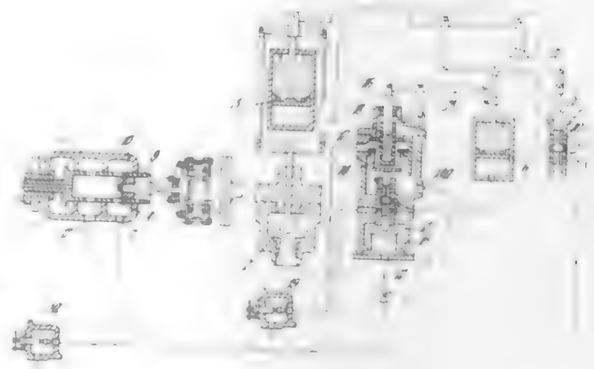
3,373,756
APPARATUS AND METHOD FOR FEEDING CHEMICALS INTO LIQUID SYSTEMS
Herman J. Franz, Richmond, Calif., assignor to Garratt-Callahan Company, Millbrae, Calif., a corporation of California
Filed June 28, 1966, Ser. No. 561,227
6 Claims. (Cl. 137—1)



An apparatus and method in which a water-tight container of soluble chemicals has an influent conduit with a flexible tube extending into the container, an effluent conduit, and chemicals in the container which are dissolved at a controlled rate by adjusting the liquid head level of liquid passing into the container to control the rate of flow of the solvent through the container.

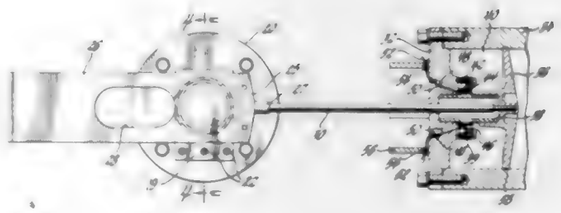
3,373,757
SPEED GOVERNING SYSTEM WITH HYDRAULICALLY OPERATED COMPENSATING DEVICE
William George Watson, Newcastle-upon-Tyne, England, assignor to C. A. Parsons & Company Limited, Newcastle-upon-Tyne, England, a company of Great Britain
Filed June 7, 1965, Ser. No. 461,674
Claims priority, application Great Britain, June 15, 1964, 24,780/64
2 Claims. (Cl. 137—34)

A speed governing system for a steam turbine incorporating a governor operable responsive to a change in the turbine speed for varying the pressure in a hydraulic system operated by the governor and provided with a valve for controlling the flow of steam to the turbine in which a compensating device sensitive to changes in the pressure in the hydraulic circuit and the pressure in a separate feedback circuit operable for varying the opening of the valve is provided. The compensating device includes a control movable responsive to a change in the pressure of the hydraulic system for altering the valve opening and



at the same time for altering the opening of ports in the compensating device for changing the pressure of fluid in the feedback circuit in a non-linear relationship to the movement of the control member. Hence, the relationship between change of pressure in the hydraulic system and the movement of the control member is made non-linear for compensating for the non-linear relationship between the valve opening and the flow of steam.

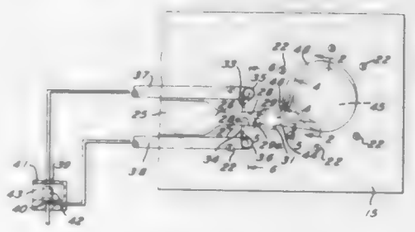
3,373,758
HIGH SPEED GATE VALVE
Frederick K. Boutwell, Alexander B. Wenzel, and Alexander C. Charters, Santa Barbara, Calif., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Sept. 27, 1965, Ser. No. 490,543
8 Claims. (Cl. 137—68)



1. A high speed explosively actuated gate valve comprising, in combination:
a flat member having a passage therethrough, a thin flat gate overlying said flat member and covering said passage, said flat gate being transversely movable in a plane parallel to the surface of said flat member,
an aperture in said gate, said aperture overlying said passage in at least one position of said gate as it translates from a starting position to a terminating position, said gate having end portions of sufficient size to cover said passage when said gate is in its starting and terminating positions,
a fixed cylinder with a piston slidable therein having a line of action in said plane, said cylinder adapted to be pressurized on one side of said piston,

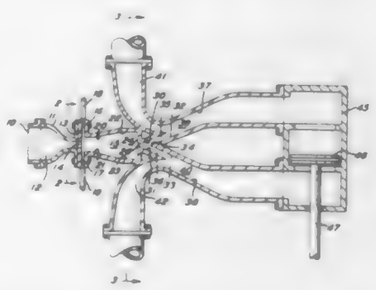
means to operatively connect said piston to said gate, a frangible link connecting said one side of said piston to said cylinder to hold said piston in its starting position when it is subjected to a differential pressure,
an explosive charge adjacent said frangible link, and
triggering means operatively connected to said charge whereby actuation of said triggering means explodes said charge breaking said link and releasing said piston to allow it to move under differential pressure and translate said gate to uncover said passage for a very short time.

3,373,759
FLOW CONTROL APPARATUS
Robert B. Adams, Bethayres, Pa., assignor to Moore Products Co., Spring House, Pa., a corporation of Pennsylvania
Filed Jan. 21, 1965, Ser. No. 426,994
11 Claims. (Cl. 137—81.5)



Flow control apparatus having oppositely arranged superposed vortex chambers with fluid selectively delivered to said vortex chambers from a pure fluid proportional diverting valve, the vortex chambers extending to a common outlet.

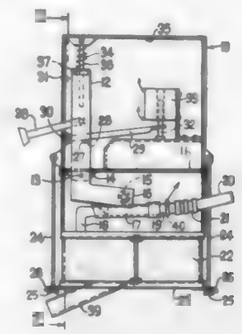
3,373,760
FLUID CONTROL APPARATUS
Robert B. Adams, Bethayres, and Theodore J. Huslin, Philadelphia, Pa., assignors to Moore Products Co., Spring House, Pa., a corporation of Pennsylvania
Filed Feb. 24, 1965, Ser. No. 434,941
11 Claims. (Cl. 137—81.5)



Fluid flow control apparatus having a fluid interaction chamber with a single outlet smaller than the inlet and with a blunt end at the outlet of the chamber, diverging collecting passageways being provided beyond the chamber with backward vents.

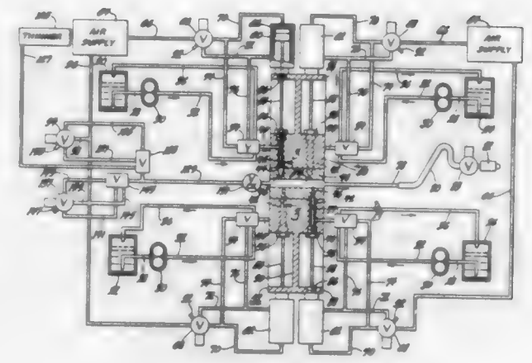
3,373,761
AUTOMATIC CONTROL MECHANISM FOR MILKING MACHINES
Andrew J. Flocchini, 7078 Lakeville Highway, Petaluma, Calif. 94952
Filed Oct. 24, 1965, Ser. No. 504,871
3 Claims. (Cl. 137—205)

Apparatus for controlling the milking of a dairy animal in which a time-delay relay, energized by a milk-responsive probe, releases a spring-loaded arm to cut off



the vacuum to the animal when the milk flow ceases for more than a preselected interval.

3,373,762
MULTIPLE FLUID DELIVERY SYSTEM WITH LIQUID AND GAS PURGING MEANS
William J. Korchak, Arlington, Tex., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Oct. 15, 1965, Ser. No. 496,602
5 Claims. (Cl. 137—240)

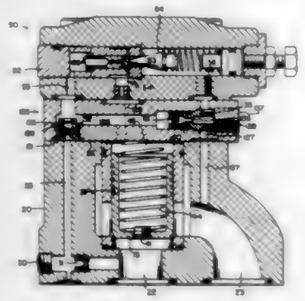


1. A multiple fluid delivery system including tubular means having an axially extending passage and a plurality of transversely positioned passages extending to said axial passage, each provided with a valve seat, each of said transverse passages being provided with a valve positioned transversely relative to said tubular means cooperating with the valve seat therein, means for delivering different fluids to said transverse passages for delivery under the control of the valves provided therein to said axially extending passage, a fluid discharge means connected to one end of said axially extending passage and purging means connected to the opposite end of said axially extending passage for delivering a purging fluid to said axially extending passage for conduction therethrough.

3,373,763
HIGH SPEED VALVES
Robert Smilges and Joseph H. Caslow, Columbus, Ohio, assignors to American Brake Shoe Company, New York, N.Y., a corporation of Delaware
Continuation-in-part of application Ser. No. 102,824, Apr. 13, 1961. This application Jan. 4, 1963, Ser. No. 253,779
20 Claims. (Cl. 137—169)

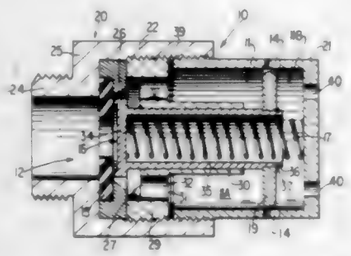
1. A valve comprising, a valve body, said body presenting a cylindrical chamber therewithin, an inlet port entering said chamber at one end thereof, an outlet port ex-

tending laterally from said chamber, a cylindrical valve member slidably received in said chamber, said valve member having a diameter larger than that of said inlet port and having an endwise portion seating in edge contact against said inlet port, elastic means biasing said valve member toward said inlet port, a restricted fluid passage communicating between said inlet port and said chamber at the end of said valve member is opposite to said endwise portion, the area of said valve member



which is subjected to pressure in said chamber at the end of said valve member opposite to said endwise portion being greater by about 0.5 to about 6 percent than the area of the endwise portion of said valve member which is subjected to pressure at said inlet port when said valve is closed, and a pilot valve adapted to release pressure in said chamber at the end of said valve member which is opposite to said endwise portion when pressure in said chamber equals a predetermined value.

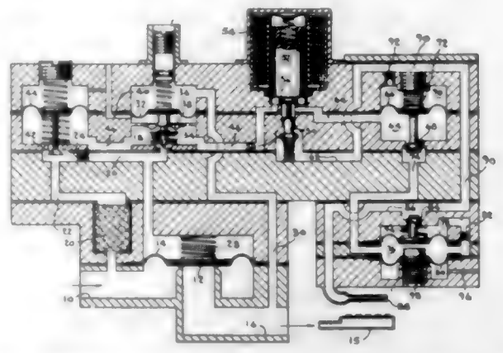
3,373,764
HIGH FLOW RELIEF VALVES
Alfred J. Munn, Wayne, N.J., assignor to Specialties Development Corporation, Belleville, N.J., a corporation of New Jersey
Filed Feb. 17, 1966, Ser. No. 528,301
1 Claim. (Cl. 137—469)



A high flow relief valve including a tubular body provided with an inlet and a tubular casing attached to the body and provided with an outlet in its side wall, a valve seat at the inlet, a valve member within the body, a piston in the casing carried by the valve member to regulate the flow through the outlet as the valve member moves and to be acted upon by the fluid flowing through the valve. The casing is adjustable to vary the position of the outlet with respect to the piston to adjust the operating characteristics of the valve.

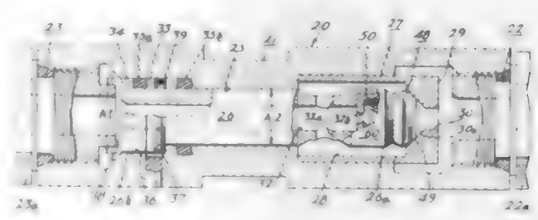
3,373,765
ELECTRIC RESET FOR PNEUMATIC SENSOR CONTROL
Lourdes V. McCarty, Milwaukee, Wis., assignor, by mesne assignments, to Controls Company of America, Melrose Park, Ill., a corporation of Delaware organized in 1966
Filed Oct. 23, 1965, Ser. No. 502,842
7 Claims. (Cl. 137—489)

1. A control system for regulating gaseous flow comprising:
first and second conduits;
a first restriction between the conduits;
a second restriction on the outlet of the second conduit;
a pressure regulated gas supply to the first conduit;
a first valve in the first conduit operative when closed to interrupt flow through the first conduit;



pressure responsive means regulating said valve to close the valve when the pressure in the second conduit is below a given value relative to the pressure in the first conduit and to open the valve when the pressure in the second conduit is above a given value relative to the pressure in the first conduit;
a control valve located between the gas supply and the first conduit and operative in one position to connect the supply to the first conduit and in another position to vent the first conduit.

3,373,766
BRAKE PROPORTIONING VALVES
Roger E. Doerfler, Baltimore, Md., assignor to Hydrasearch Co., Inc., Annapolis, Md., a corporation of Maryland
Continuation-in-part of application Ser. No. 469,271, July 2, 1965. This application Oct. 22, 1965, Ser. No. 502,264
8 Claims. (Cl. 137—494)

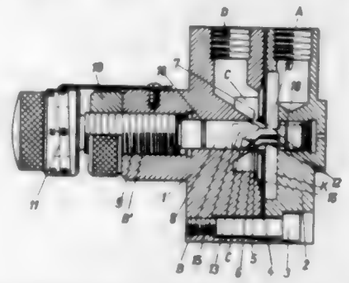


Apparatus for proportioning hydraulic brake pressure to a wheel pair of a motor vehicle, the apparatus including a spool mounted in the bore of a body having an inlet and outlet end. The spool, responsive to an increase in pressure at the inlet end, moves towards the inlet until it seals off the inlet pressure and prevents further communication between the inlet and outlet until an increased pressure is placed on the inlet end of the spool. Thereafter pressure increases to the wheel pair at a fixed percentage of the inlet pressure increase rate. The improvement includes a novel check valve for inhibiting flow or pressure communication between the inlet and outlet when the spool is sealing the inlet, and to permit flow upon release of pedal pressure from the master cylinder.

3,373,767
FLOW CONTROL VALVE FOR REGULATING FLUID FLOW RATES
Jürgen Watermann, Baustrasse 17, Solingen-Ohligs, Germany
Filed June 24, 1965, Ser. No. 466,707
Claims priority, application Germany, June 27, 1964, W 37,060
8 Claims. (Cl. 137—503)

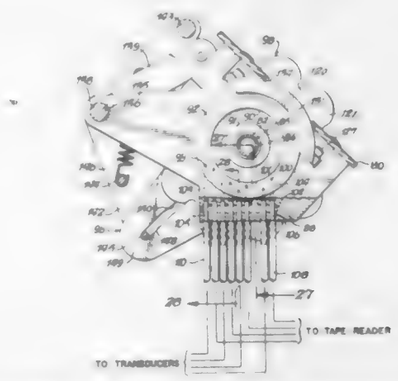
The flow-rate regulator provides a restrictor between a stationary wall portion and a throttling member moved

by the flowing medium, the restrictor reducing its cross section of flow in response to an increase in the pressure differential between the inlet and the outlet of the flowing medium, so as to maintain a constant rate of flow. The regulator is characterized by a stationary outer cylindrical rim and a flexible diaphragm mounted by the rim; one side of the diaphragm is exposed to the inlet pressure, and the other side is exposed to the outlet pressure, the stationary wall portion being on the outlet side opposite the diaphragm. The diaphragm has a round central aperture with its edge facing the stationary wall portion to



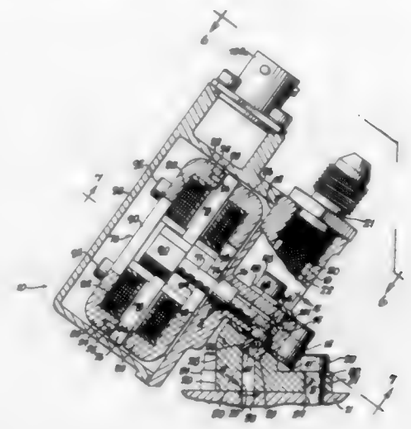
provide a circumferential gap in communication with the outlet, and a spindle mounted movably in the central aperture is provided with means for adjusting its location from outside, in order to vary the circumference of the gap. The portion of the spindle penetrating through the diaphragm forms a hollow cylinder whose sheath is cut out to provide shaped openings for passage of the fluid medium into the gap, and the hollow spindle is closed off by transverse walls at both ends. The delineations of the cutouts are such that a change in the circumferential length of the gap occurs in linear proportion to the longitudinal movement of the spindle.

3,373,768
POSITIONER
Robert Z. Hague, Oradell, Howard H. Laucks, Oakland, and Conrad C. Treff, New Milford, N.J., assignors to Moog Inc., a corporation of New York
Original application Jan. 7, 1963, Ser. No. 249,842, now Patent No. 3,198,084, dated Aug. 3, 1965. Divided and this application Sept. 23, 1964, Ser. No. 405,637
4 Claims. (Cl. 137—556)



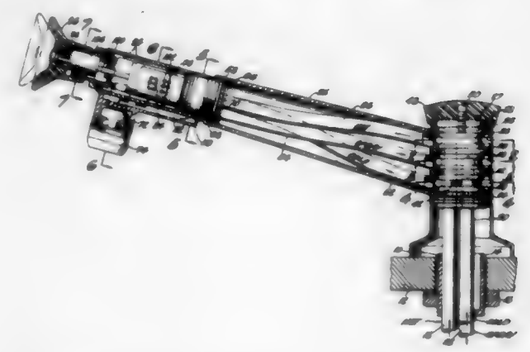
1. In positioning apparatus, the combination comprising means constituting transducer chambers, and manual control means for controlling the presence or absence of pressure fluid in said chambers, said manual control means including a pivotal dial member the periphery of which has numbered stations and a recess adjacent each of said stations and detent means cooperating with said recesses to yieldingly hold said dial member at any station selected, said dial member having port means therein arranged to vent said chambers according to predetermined pivotal positions of said dial member corresponding to said stations.

3,373,769
VALVE FOR CONTROLLING SIMULTANEOUSLY THE FLOW OF TWO SEPARATE FLUIDS
Aurelius Chaves, Jr., Lancaster, William J. Thayer, East Aurora, and Roderick F. Bailey, Alden, N.Y., assignors to Moog Inc., a corporation of New York
Continuation of application Ser. No. 387,637, Aug. 5, 1964. This application Nov. 2, 1966, Ser. No. 591,646
10 Claims. (Cl. 137—595)



A control valve for handling isolated fluids, comprising a body having separate chambers each with an inlet and an outlet, separate valve closure elements arranged severally in said chambers and connected together for movement in unison to open and close said outlets simultaneously in response to a command signal, and flexure means mounting each of said closure elements for such movement and also sealing said chambers one from another.

3,373,770
SWING SPOUT CONTROL MECHANISM
Irving A. Ward, Los Angeles, and Jack K. Rauh, Hacienda Heights, Calif., assignors to Modern Faucet Mfg. Co., Los Angeles, Calif., a corporation of California
Filed June 24, 1965, Ser. No. 466,658
1 Claim. (Cl. 137—615)

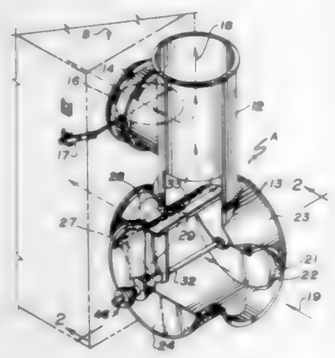


A swing spout for supplying hot and cold water having a mixing valve positioned adjacent the spout outlet for controlling the volume of mixture of water discharged therefrom.

3,373,771
GAS FLOW MODULATOR VALVE
John L. Boyen, Oakland, Calif., assignor to Besler Corporation, Emeryville, Calif., a corporation of California
Filed Apr. 29, 1965, Ser. No. 451,914
6 Claims. (Cl. 137—625.46)

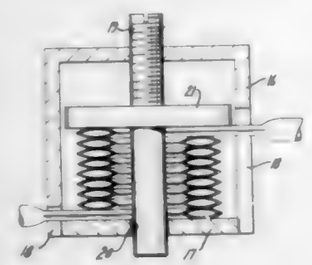
A fluid flow modulator valve having a plurality of outlet ports and including a variable positionable baffle plate

having a curved surface corresponding to the inner surface of the valve to enable the plate to be aligned in close proximity for closing at least one of the ports. The



valve also includes at least one rib for alignment with the plate to provide a fluid-tight seal around at least a portion of the closed port.

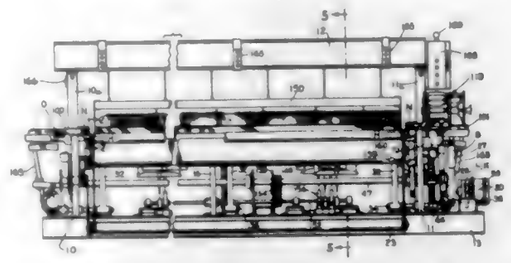
3,373,772
FLUID SYSTEM AND A RESTRICTOR THEREFOR
Adolph J. Hilgert, Mequon, Wis., assignor to Johnson Service Company, Milwaukee, Wis., a corporation of Wisconsin
Filed Nov. 17, 1964, Ser. No. 411,768
5 Claims. (Cl. 138—43)



A pure fluid control system includes a fluid source connected to an impact modulator or other fluid modulating device through a special restrictor. The restrictor is a tubular metallic member having a generally oval cross section terminating in very sharply defined side edges. A collar encircles the restrictor section and includes a generally flat surface parallel to the plane through the side edges of the restrictor. A movable plate rests on the opposite surface of the restrictor within the collar and a screw threads and acts on the plate to selectively compress the restrictor to establish a selected pressure drop. The restrictor in a particularly useful and novel arrangement is coiled in a spiral manner to provide adjacent convolutions disposed between a base plate and a movable plate. To provide a potentiometer type control, the coiled restrictor is disposed within a chamber with a centrally located movable plate.

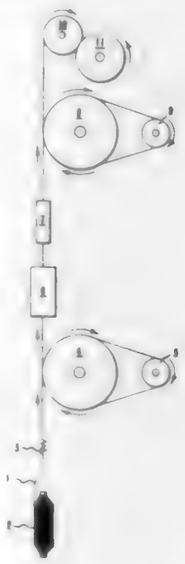
3,373,773
LOOM
George H. Balentine, Jr., Rte. 5, Star Park Road 29609; Richard W. Johnson, 20 Lisa Drive 29607; and Thomas L. Cox, Apt. D, Windsor Apts., 3701 Buncombe Road 29609, all of Greenville, S.C.
Filed July 12, 1965, Ser. No. 471,025
43 Claims. (Cl. 139—1)

An improved protection system is provided for looms wherein sensors are positioned on the lay and a cyclical element is driven by cyclically driven means on the loom. The element produces a signal which would stop loom operation if the shuttle has not reached a required position in relation to a sensor. In conjunction with the



protection system an improved lay drive is provided. Other improvements include a loom drive, fault detectors, shuttle position detectors, a thread cutter, transfer mechanism, lay structure, control circuitry and associated parts.

3,373,774
CREPE FABRIC OF POLYESTER YARNS
Calvin J. Cruz, Greenville, N.C., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Filed Feb. 21, 1966, Ser. No. 528,730
2 Claims. (Cl. 139—420)

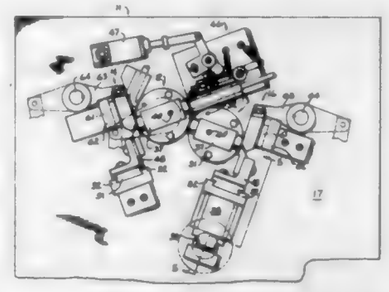


A plain-weave crepe fabric the filling of which comprises a "torsionally crimped" polyethylene terephthalate textile yarn and the warp of which comprises continuous filament polyethylene terephthalate textile yarns having a shrinkage-modulus in the range from about 0.1 to about 4.0 grams per denier which is less than 0.027 of the percent crimp development of the filling yarn, the warp filaments having a residual shrinkage from about 2% to about 12% with the residual shrinkage of each filament in the darp differing from the residual shrinkage of the other warp filaments by no more than 2%.

3,373,775
APPARATUS FOR PRODUCING LOOPS ON COIL SPRINGS
George A. Reddington, San Leandro, Calif., assignor to HRC Development, Inc., Lodi, Calif., a corporation of California
Filed July 19, 1965, Ser. No. 472,921
6 Claims. (Cl. 140—103)

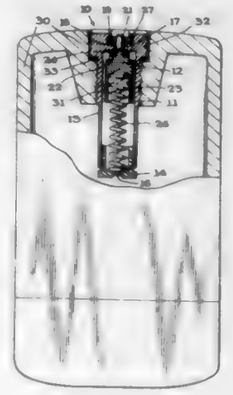
An automatic spring looping apparatus is described which is simple and has a minimum number of moving parts. The apparatus comprises two spring supporting

members mounted adjacent one another on a mounting plate and each of which has an open ended spring receiving and locating bore. The first of the spring supporting members is mounted for rotation between a spring receiving and loop forming position and a spring transfer position in which its bore is coaxially aligned with the bore of the second supporting member, and the second member is rigidly mounted on the plate. Loop forming



mechanism associated with each of the spring supporting members at an open end thereof includes an anvil for engaging a spring within the bore and maintaining it in position at the end of the bore during formation of a loop on its end. The anvil of the loop forming mechanism associated with the second spring supporting member is retractable from in front of the open end of the bore to permit a spring to be ejected through such end after a loop is formed on it.

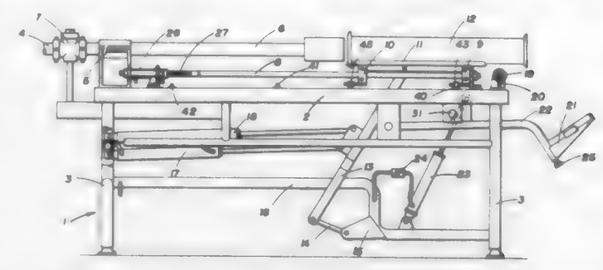
3,373,776
FILLER VALVE FOR LIQUID GAS LIGHTERS
Kyujiro Kajita, 108 Kobinata Suido-cho, Bunkyo-ku, Tokyo, Japan
Filed July 6, 1965, Ser. No. 469,694
Claims priority, application Japan, Oct. 12, 1964, 39/57,770
6 Claims. (Cl. 141—4)



A filler valve used with liquid gas lighters having an outer tubular section and a spring mounted inner tubular section. A porous member is mounted adjacent the opening through which fuel is fed from a fuel supply so as to absorb some of the escaping liquid and thereby cool the area and casing by means of the process of evaporation of the liquid from the porous material.

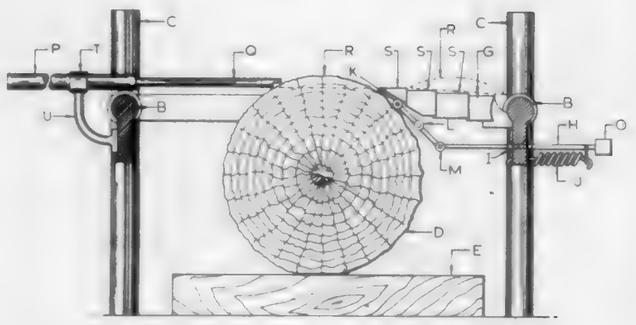
3,373,777
FOOD MOLD LOADER
Richard A. Hawley, Oakland, Calif., assignor to Meat Packers Equipment Co., Oakland, Calif., a corporation of California
Filed Nov. 12, 1965, Ser. No. 507,509
8 Claims. (Cl. 141—263)

An apparatus—for filling a meat loaf mold—which includes a stuffing horn, a mold-supporting carriage, and means mounting the carriage for movement toward and



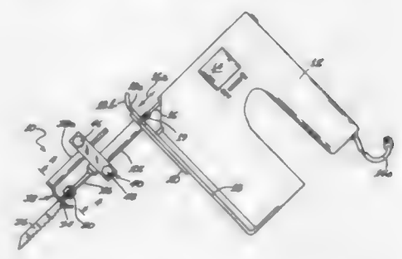
away from the stuffing horn; there being a power unit operative to so move the carriage.

3,373,778
SAWMILL CAPABLE OF HIGH PRODUCTION AND LUMBER QUALITY CONTROL OPERABLE BY ONE MAN
Charles E. McManama, Latah County, Idaho (Rte. 2, Box 81, Potlatch, Idaho 83855)
Filed July 6, 1965 Ser. No. 469,737
5 Claims. (Cl. 143—19)



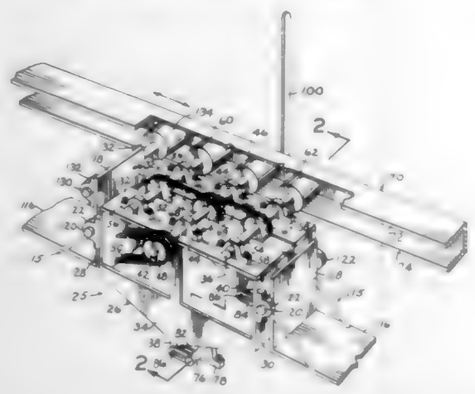
A sawmill combination using a horizontal traversing bandsaw as the head saw traveling on rails over a log to saw boards from the log and a mechanism to eject the board therefrom, with known sawmill components.

3,373,779
SABER SAW EXTENSION
Irvin M. Taft, 928 Euclid, St. Paul, Minn. 55106
Filed Jan. 21, 1966, Ser. No. 522,152
3 Claims. (Cl. 143—68)



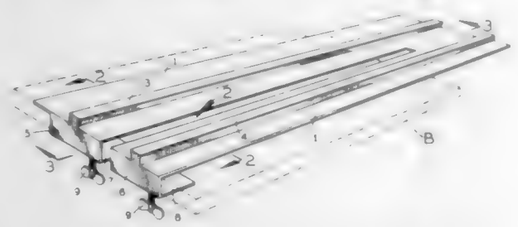
An attachment extension for a saber saw which increases the reach of the saber saw blade without increasing the length of the blade itself. The extension includes a plate attached to the base plate of the saw with an integral tubular member extending away from the saw slidably supporting an extension shaft. The extension shaft is coupled to the saber saw shaft at one end and is provided with saw blade attaching means at the distal end. An additional foot is attached to the end of the tubular member.

3,373,780
SAWMILL FEED DEVICE
Herbert A. Lowther, Box 172, Talihina, Okla. 74571
Filed Jan. 19, 1966, Ser. No. 521,565
6 Claims. (Cl. 143—105)



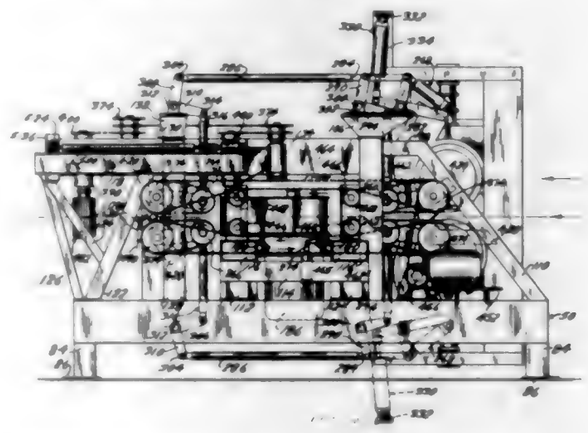
1. A feed mechanism for a sawmill husk having a carriage mounted for horizontal to and fro movement above a support, comprising: friction plate means connected to the depending surface of said carriage; a frame positioned below said carriage; shaft means extending transversely of said frame; friction rollers at one end of said shaft means and releasably contacting said friction plate means; means for rotating said shaft means; and lifting means for raising and lowering said frame.

3,373,781
GUIDE FOR PORTABLE SAWS
Sidney Grosswald, Miami, Fla.
(1740 S. Glades Drive, North Miami Beach, Fla. 33162)
Filed May 13, 1966, Ser. No. 549,850
3 Claims. (Cl. 143—167)



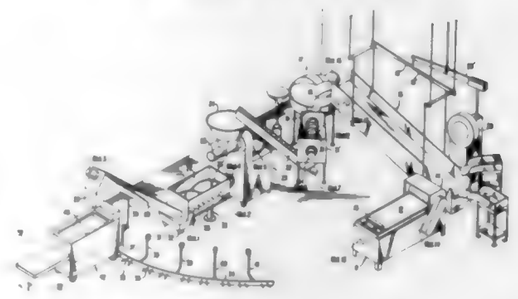
1. A guide for a power saw means for making a straight cut through a board comprising a main base plate having a planar bottom surface,
- a pair of parallel spaced gibs on said plate along the length thereof integral therewith positioned in parallel spaced relation with said bottom surface,
- said plate having an open slot from one side thereof parallel and between said gibs a predetermined distance through said plate from the said one side,
- an integral clamp means on each side of said slot positioned at the said one end of said plate extending downward a predetermined distance from said bottom surface having coplanar inner register surfaces at a right angle to said bottom surface and said slot,
- each of said clamp means having an integral inward extending portion in spaced relation from said bottom surface including a threaded hole therein normal thereto,
- a thumb screw threaded into each of said holes for independently engaging the under side of said board for holding same when one edge thereof is positioned against said register surfaces and the upper side of said board is positioned against said bottom surface,
- a power saw means including a guide shoe slidably engaged with said gibs for reciprocating movement along said gibs with the driven blade of said saw means extending downward through said slot whereby a board clamped against said bottom surface will be straight sawed when said saw means is operated and reciprocated along said gibs.

3,373,782
SIDE, TOP AND BOTTOM CHIPPERS
Lionel Pease, Seattle, Wash., assignor to Mill Equipment, Inc., Seattle, Wash., a corporation of Washington
Filed Oct. 20, 1964, Ser. No. 405,101
40 Claims. (Cl. 144—326)



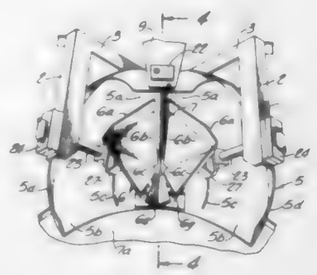
1. A chipping machine, said machine comprising:
(a) a first chipper and a second chipper;
(b) said first chipper chipping in a first plane;
(c) said second chipper chipping in a second plane;
(d) said first and second planes being substantially parallel;
(e) means to vary the distance between the first chipper and the second chipper;
(f) a first feed roll juxtapositioned to the first chipper;
(g) a second feed roll juxtapositioned to the second chipper; and
(h) means to simultaneously vary the distance between the first feed roll and the second feed roll as the distance between the first chipper and the second chipper is varied.

3,373,783
AUTOMATED FOOD PROCESSING LINE
Eugene C. Spangler, Silver Spring, Md., assignor to Marriott Corporation, a corporation of Delaware
Filed Oct. 10, 1966, Ser. No. 585,526
10 Claims. (Cl. 146—1)



1. A food processing and distributing system for supplying a plurality of product stations in turn, comprising
scaling conveyor means for depositing measured quantities of constituents of a batch in a mixer,
mechanical means for cutting and mixing said constituents and ejecting the batch,
means for storing said batch and conveying the same to a grinder at a rate independent of the ejecting rate,
means for grinding said constituents,
storage means for receiving the ground product,
a plurality of product-using stations each having a receiving hopper,
automatic delivery means for delivering said stored product to a said hopper in response to a demand signal therefrom,
means including first and second probes in each said hopper for measuring maximum and minimum quantities of product and for generating said demand signal when the hopper content is below a minimum measured by said first probe,
electrical interlock means for maintaining said demand signal, when generated, only until said content reaches a maximum measured by said second probe,
motor means operative in response to said demand signal from a said hopper for causing said delivery means to approach thereto,
automatic circuit means for causing said delivery means to adjust to said hoppers in turn when more than one generates a demand signal and for limiting the delivery of product to the duration of a demand signal.

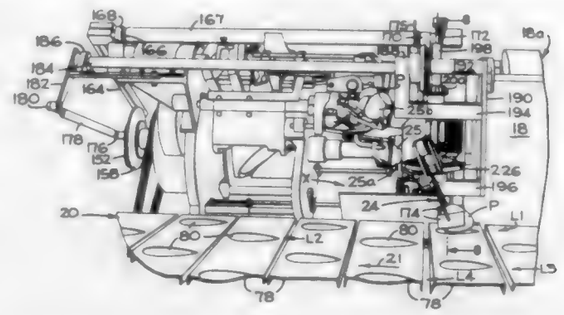
3.373.784
FRUIT CUTTING AND FEEDING APPARATUS
Franklin K. Holbrook, Whittier, Calif., assignor to Brown International Corporation, a corporation of California
Filed Oct. 23, 1965, Ser. No. 503,978
10 Claims. (Cl. 146—3)



Two cup segments cooperate at starting positions thereof to receive and confine a piece of fruit that is to be cut into halves. The two cup segments are mounted respectively on two rotary support structures that are tangential to a common plane and are rotated synchronously to move the cup segments in orbits out of their starting positions and back to their starting positions. A fixed knife blade is positioned in the tangential plane to cut the piece of fruit in half as the cup segments leave their initial positions. Two guide means concentric to the two axes of rotation of the support structures cooperate with the cup segments to captivate and transport the cup segments to a common discharge zone.

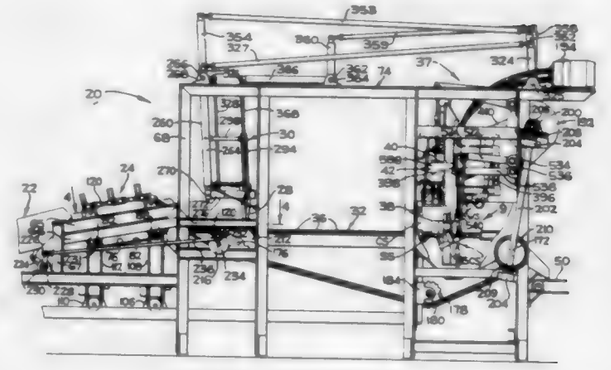
3,373,785
FRUIT PROCESSING BATTERY
Gerald R. Anderson, Campbell, Calif., assignor to FMC Corporation, San Jose, Calif., a corporation of Delaware
Filed June 6, 1966, Ser. No. 555,400
15 Claims. (Cl. 146—43)

14. A fruit processing battery comprising a row of spaced fruit processing machines, a fruit supply conveyor mounted alongside said processing machines, said conveyor being provided with fruit supporting pockets for each of said processing machines, each of said machines having a feed cup intermittently positioned at a feeding station adjacent said conveyor, fruit transfer means individual to each of said processing machines for gripping and conveying fruit from selected fruit pockets between



a pickup position in which a fruit pocket lies upstream of said feed cup to a fruit discharge position in which the fruit lies above said feed cup, and means for continuously driving said conveyor, said transfer means and said processing machines in synchronism.

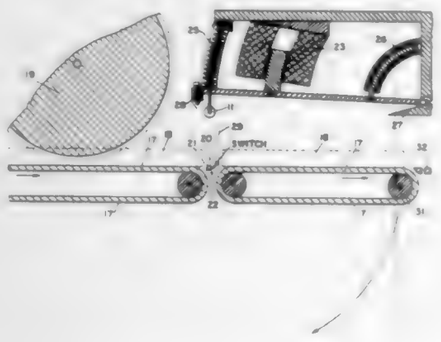
3,373,786
FRUIT SEED-CELLING MACHINE HAVING AUTOMATIC DEPTH CONTROL MEANS FOR CUTTER
Gerald R. Anderson, Campbell, and Sherman H. Creed and John T. Parker, San Jose, Calif., assignor to FMC Corporation, San Jose, Calif, a corporation of Delaware
Original application Mar. 2, 1964, Ser. No. 348,485, now Patent No. 3,310,084, dated Mar. 21, 1967. Divided and this application Nov. 16, 1966, Ser. No. 606,486
6 Claims. (Cl. 146—52)



1. In a machine for processing apples or the like, the combination of means defining a pocket with an aperture therein, and supporting an apple on one of its flat ends, said apple having the stem material removed therefrom and having a cylindrical cavity therein, a vertically movable carrier disposed above said pocket, a coring unit carried by said carrier, a continuously rotating cutter on said coring unit rotating about an axis concentric with the axis of said aperture, said cutter having a cutting edge movable in a cylindrical path, means for swinging said cutter from a retracted position wherein said cutting edge moves in a cylindrical path having a diameter slightly less than that of said cylindrical stem cavity to an extended position wherein said cutting edge moves in a cylindrical path having a diameter in excess of the diameter of the stem cavity to sever the seed cell from the apple, said cutter having a transverse section with a diameter slightly less than that of said cylindrical stem cavity and an area in excess of that of a semi-cylindrical segment of said diameter, and means for lowering said carrier to cause said cutter to locate and enter the stem cavity of the apple

when said cutter is in the retracted position for the purpose of recentering the apple prior to swinging the cutter to its extended position.

3,373,787
ASPARAGUS CUTTER
Nicolaos Basil Tanos, 1731 R St. NW., Washington, D.C. 20009
Filed Mar. 17, 1967, Ser. No. 623,973
6 Claims. (Cl. 146—81)

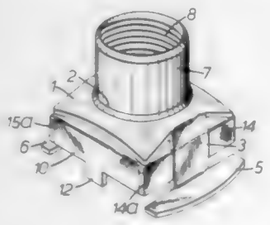


A machine for separating the edible from the fibrous part of an asparagus stalk by pressing along the stalk a probe for finding or locating the point at which the stalk starts yielding considerably under a predetermined amount of pressure and then severing the stalk at said point.

3,373,788
METHOD OF SEPARATING EDIBLE FROM FIBROUS PORTION OF ASPARAGUS
Nicolaos Basil Tanos, 1731 R St. NW., Washington, D.C. 20009
No Drawing. Original application Mar. 17, 1967, Ser. No. 623,973. Divided and this application Sept. 12, 1967, Ser. No. 667,057
4 Claims. (Cl. 146—241)

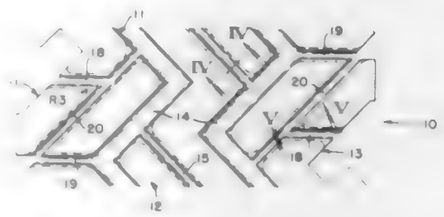
A method for finding the extent of the edible part of an asparagus stalk by pressing a probe against and along the stalk with a predetermined amount of pressure for locating the point of considerable change in yielding of the surface of the stalk, which point is between the edible and the fibrous part of the stalk, and at or near which point the stalk may be severed for separating the edible from the fibrous part thereof.

3,373,789
SHEET METAL NUT WITH RESILIENT CAGE
Leslie Parkin, Bobbers Mill, and Sydney Alan Andrews, Stapleford, England, assignors to United-Carr Incorporated, Boston, Mass., a corporation of Delaware
Filed June 29, 1966, Ser. No. 561,568
Claims priority, application Great Britain, Aug. 24, 1965, 36,303/65
1 Claim. (Cl. 151—41.75)



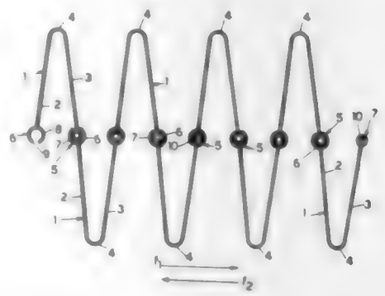
A two-piece cage nut adapted for rapid installation in an apertured support. The cage includes an apertured base, opposed flexible side walls extending normal to the edges of the base and adapted to be snapped through an aperture in the support and an arm extending laterally outwardly from the end of each side wall for engaging the face of a support adjacent an aperture therein. A nut disposed within the cage includes a head underlying the base of the cage, a threaded barrel extending through the aperture in the base of the cage and opposed generally rectangular walls extending from the edges of the head. Certain of the walls of the nut define a pair of opposed gaps in which the side walls of the cage are nested to prevent inward flexing of the latter for passage thereof through an aperture in a support. The nut also includes a pair of opposed lugs extending from other walls thereof, which lugs are adapted to engage the edges of a support aperture to limit rotation of the nut with respect to the support.

3,373,790
PNEUMATIC TIRE TREAD
James F. Newman, St. Clair Shores, and John W. Taylor, Grosse Pointe Farms, Mich., assignors to Uniroyal, Inc., a corporation of New Jersey
Filed Sept. 14, 1965, Ser. No. 487,111
3 Claims. (Cl. 152—209)



Groove cracking and lug tearing where lug elements are divided by narrow grooves may be avoided by undercutting the leading edges of the lug elements adjacent the narrow grooves.

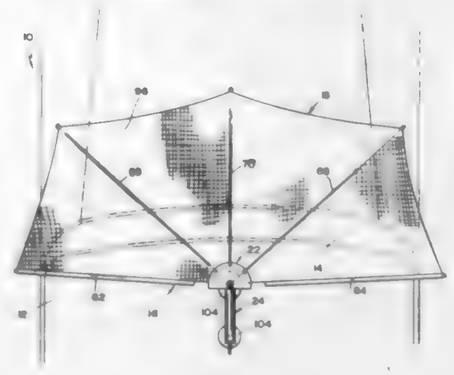
3,373,791
FLEXIBLE CURTAIN FOR MOVABLE PARTITIONS OR WALLS AND PROCESS AND DEVICE RELATIVE THERETO
Franco Milani, Fagnano Olona, Italy, assignor to Milani Resine S.p.A., Fagnano Olona, Varese, Italy, a company of Italy
Filed Nov. 24, 1964, Ser. No. 413,416
Claims priority, application Italy, Dec. 2, 1963, Patent 709,394
3 Claims. (Cl. 160—181)



1. A foldable curtain comprising a plurality of successive contiguous elements, each said element being substantially alike, said element comprising first and second rigid members longitudinally joined by an intermediate flexible third member, complementary engagement means on the terminal ends of said first and second members for mutual substantially permanent engagement of one element with its adjacent element, said terminal ends comprising enlarged extensions of constant cross sections, one of said extensions being substantially channel shaped for slidably receiving therein a complementary substantially tubular extension of the adjacent element, and suspension

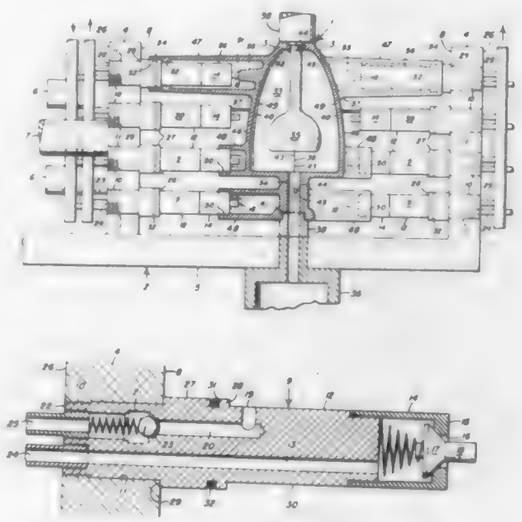
means at one transverse end of each of said elements, said suspension means comprising means for engaging with an inner portion of said tubular extension.

3,373,792
AUTOMOBILE RAIN VISOR
Alcide Lessard, 545 Scituate Ave., Cranston, R.I. 02910
Filed Sept. 13, 1965, Ser. No. 486,761
5 Claims. (Cl. 160—368)



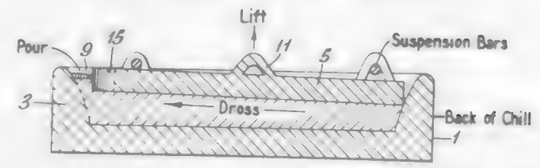
An automobile rain visor for attachment to the roof of an automobile having a flexible waterproof sheet that is moved to and from an extended position by an operating mechanism, the operating mechanism including a handle that is pivotally moved and that cooperates with a spring to effect the movement of the sheet to and from the extended position.

3,373,793
APPARATUS FOR SELECTIVELY COOLING METAL MOLDS
Loren W. Smith, Eggertsville, N.Y., assignor to Symington Wayne Corporation, Salisbury, Md., a corporation of Maryland
Continuation-in-part of application Ser. No. 444,459, Mar. 31, 1965. This application May 2, 1966, Ser. No. 546,992
10 Claims. (Cl. 164—341)



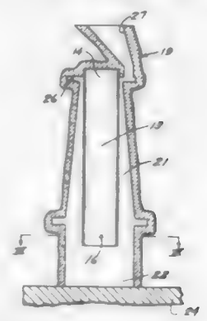
Casting apparatus having relatively movable mold holders and expendable metal molds, a number of laterally spaced nozzles in an arrangement on each holder and sockets on the back of each mold each for releasably seating a nozzle, the socket on each mold being predetermined in number and relation relative to the nozzles on the related holder for selectively seating certain thereof and cooperating with the certain nozzles for holding the mold on the holder and cooling an area of the mold determined by the relation during the casting operation.

3,373,794
FERROALLOY CASTING PROCESS
Richard A. Crago, Grand Island, N.Y., assignor to Union Carbide Corporation, a corporation of New York
Filed Feb. 1, 1966, Ser. No. 524,139
2 Claims. (Cl. 164—127)



1. A process for casting magnesium ferrosilicon which comprises preparing molten magnesium ferrosilicon, pouring the molten magnesium ferrosilicon into a chill, providing a metal member in contact with the upper surface of the molten magnesium ferrosilicon in the chill, said metal member substantially covering the upper surface of the molten magnesium ferrosilicon, causing the molten magnesium ferrosilicon to solidify in the chill in contact with said metal member, removing the metal member after solidification of the magnesium ferrosilicon and removing the solidified magnesium ferrosilicon from the chill.

3,373,795
GATING OF UNSHROUDED AIRFOILS TO PERMIT DIRECTIONAL SOLIDIFICATION
Frank J. Hein, East Rochester, Ohio, assignor to TRW Inc., Cleveland, Ohio, a corporation of Ohio
Filed Aug. 10, 1965, Ser. No. 478,710
2 Claims. (Cl. 164—359)

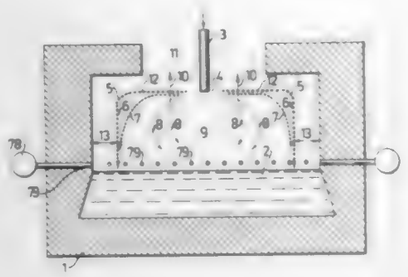


Mold assembly for producing a casting having a directional grain orientation extending from a relatively massive base to a tip of relatively small cross-section, the mold having a reservoir cavity above the tip-forming end of the casting cavity into which molten metal is introduced, the reservoir improving the feeding of molten metal into the casting cavity.

3,373,796
METHOD AND MEANS FOR COOLING A COMBUSTION CHAMBER BY MEANS OF A POWDERLIKE MATERIAL
Enn Vallak, 82 Rte. de Florissant, Geneva, Switzerland, and Sven Eketorp, Bromma, Sweden; said Eketorp assignor to said Vallak
Filed Apr. 25, 1966, Ser. No. 544,868
Claims priority, application Sweden, Apr. 23, 1965, 5,369/65
22 Claims. (Cl. 165—1)

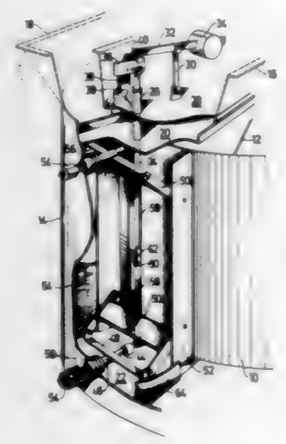
1. A method for cooling of a combustion chamber by means of powdery material with various grain sizes which in the form of at least one curtain is supplied between a wall of the combustion chamber and a high temperature

zone therein, said method being characterized in that the coarse particles of said powder material are mainly sup-



plied outside the fine particles in relation to the central part of the high temperature zone.

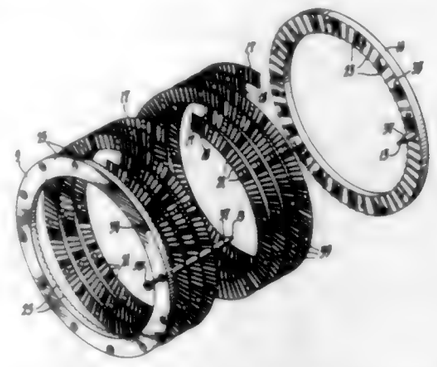
3,373,797
REGENERATIVE HEAT EXCHANGER
Ake Lennart Nyberg, Nacka, Sweden, assignor to Svenska Rotor Maskiner Aktiebolag, Nacka, Sweden, a corporation of Sweden
Filed Nov. 29, 1966, Ser. No. 597,586
Claims priority, application Great Britain, Nov. 29, 1965, 50,526/65
10 Claims. (Cl. 165—9)



Apparatus for use with rotary regenerative heat exchangers having sector plates and axial sealing means which provides for sudden thermal deformations of the rotor which can cause jamming between the adjacent surfaces of the rotor, the sealing means and the sector plates by providing a single yielding connection interconnecting the sector plates and the adjacent sealing means at each end of the rotor which transmits motion between the sector plates and the adjacent sealing means so that the movement of the latter in response to a deformation brings about a corresponding movement of the former, thus avoiding contact between the two.

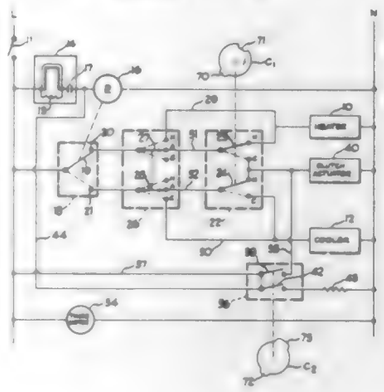
3,373,798
REGENERATOR MATRIX
Earl R. Brummett, Indianapolis, Ind., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Nov. 19, 1965, Ser. No. 508,711
16 Claims. (Cl. 165—10)

A radial-flow rotary regenerator matrix has a core made by coiling edgewise one or more strips having more or less arcuate extent, having a finely corrugated surface to space the sheet to allow fluid flow, and having radial corrugations which taper so as to effectuate the curvature



of the strip and interfit to block fluid flow circumferentially of the matrix.

3,373,799
AIR CONDITIONING AND HEATING CONTROL WITH AUTOMATIC CHANGE-OVER
Alwin B. Newton, Spring Garden Township, York County, Pa., assignor to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Filed Nov. 14, 1966, Ser. No. 593,928
10 Claims. (Cl. 165—12)

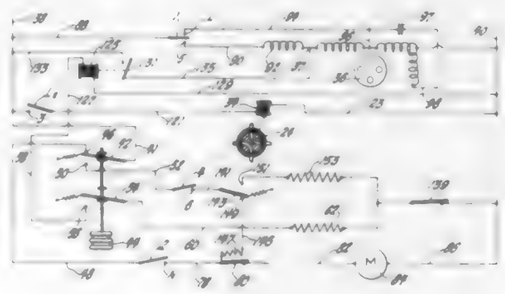


1. A control system for an air conditioning unit of the type including a heater and a cooler for supplying conditioned air to a controlled space, said system comprising a thermostat sensing temperature of air in said controlled space; a first switch actuated by said thermostat; a second switch selectively placing said first switch over the exclusive control of said heater and said cooler; a timer including switch actuating means for said second switch, a continuously driven motor and a clutch interposed between said motor and said switch actuating means, said switch actuating means being adapted to shift said second switch from a first position whereby the heater is under exclusive control of said first switch and a second position wherein said cooler is under the exclusive control of said first switch; and clutch actuating means operated by said second switch for engaging said clutch to effect a driving connection between said motor and said switch actuating means during periods when neither said heater nor said cooler is energized.

3,373,800
CONTROL FOR HEAT PUMP
Donald C. Ferdelman, Dayton, Ohio, assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Sept. 22, 1966, Ser. No. 581,249
5 Claims. (Cl. 165—29)

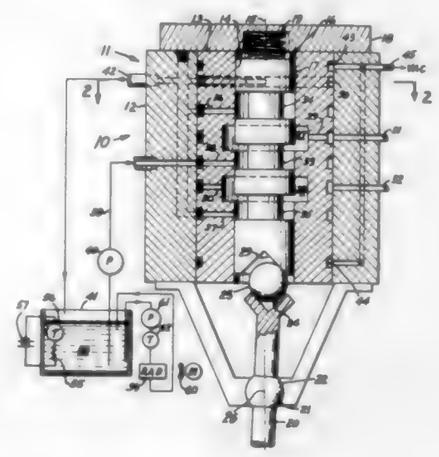
1. A reverse cycle refrigerating and control system including indoor and outdoor heat transfer units, a motor

compressor unit, a reversing valve for changing the refrigerant connection between the motor compressor unit and the indoor and outdoor heat transfer units, flow control means for controlling refrigerant flow between said indoor and outdoor heat transfer units, a double throw thermostatic switch means having a movable contact terminal and two normally stationary contact terminals, a solenoid for operating said reversing valve to reversing position, a supply conductor connected to the movable contact terminal of said thermostatic switch, a second supply conductor connected to said motor compressor unit, a first selector switch connecting one of the station-



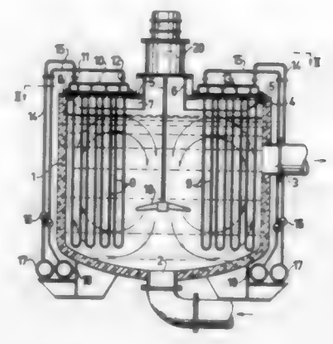
ary contact terminals with said motor compressor unit, a double throw heat changeover switch having a movable contact terminal and two normally stationary contact terminals, a second selector switch connecting another of said stationary terminals of said thermostatic switch means with the movable contact terminal of said changeover switch, conductor means connecting one of the stationary terminals of said changeover switch with said motor compressor unit, a third selector switch and conductor means connecting said solenoid with said first and second supply conductors, and an electric heater connected between a second stationary terminal of said changeover switch and said second supply conductor.

3,373,801
TEMPERATURE REGULATION OF TRACER VALVES
Paul J. Weaver, Pasadena, Calif., assignor to True-Trace Corporation, El Monte, Calif., a corporation of Connecticut
Filed Dec. 10, 1965, Ser. No. 512,879
7 Claims. (Cl. 165—40)



A tracer valve including a spool passage having grooves and ports which control the flow of hydraulic fluid from a power supply to motors and exhaust the fluid to a supply. A reservoir collects the hydraulic fluid and includes temperature modifying means to maintain the temperature of the fluid discharged from the reservoir above ambient.

3,373,802
HEAT EXCHANGER WITH REMOVABLE TUBE GROUPS OF DECREASING FLOW AREA
Johan Elof Wiklund and Magne Lennart Månsson, Halsingborg, Sweden, assignors to Reymersholms Gamla Industri Aktiebolag, Halsingborg, Sweden, a company of Sweden
Filed Dec. 3, 1965, Ser. No. 511,418
Claims priority, application Sweden, Dec. 7, 1964, 14,791/64
10 Claims. (Cl. 165—74)



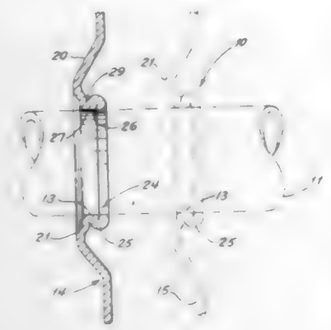
A heat exchanger for passing a heated liquid in indirect heat transfer relationship with a coolant fluid and comprised of a container having an opening at its upper end closed by a closure member. The heated liquid is disposed within the container and has a liquid level spaced below the closure member. Partition means in combination with the closure member form a multiplicity of fluid chambers at the upper end of the container. The fluid chambers are positioned in a number of radially arranged groups and a plurality of U-shaped seamless tubes extend downwardly from the chambers into the body of liquid.

Each tube has its inlet connected to one fluid chamber and its outlet connected to the radially inner adjacent fluid chamber within the same group. The cross sectional area of the tubes interconnecting adjacent fluid chambers within the same group increases radially outwardly from the innermost pair of adjacent fluid chambers. The partition means and the closure member are arranged whereby individual groups of tubes can be removed from the container and replaced by another group with a minimum of effort and loss time.

3,373,803
HEAT TRANSFER ELEMENT
Richard Steinberg, Babylon, Isidore Turinsky, Flushing, and Jose I. Vasquez, Jamaica, N.Y., assignors to Slant/Fin Corporation, Richmond Hill, N.Y., a corporation of New York
Filed June 23, 1965, Ser. No. 466,483
8 Claims. (Cl. 165—182)

The invention provides a novel improved heat exchanger, including a novel heat transfer fin, and the combination of the fin or a plurality of such fins with a fluid conducting conduit upon which they are mounted. A novel method of making the fin is also provided.

The fin incorporates novel tabs struck therefrom to space it from the next adjacent fin mounted on said conduit, and a novel central collar integral with the stock



of the fin which is adapted compressively to engage the outer surface of the fluid conducting conduit upon which the fin is to be mounted.

3,373,804
HEAVY OIL RECOVERY
Eugene D. Glass, Tulsa, and Colonel J. Russell, Jr., Bartlesville, Okla., assignors to Cities Service Oil Company, a corporation of Delaware
No Drawing. Filed Nov. 19, 1964, Ser. No. 412,347
4 Claims. (Cl. 166—2)

1. A method for removing a high-viscosity oil from a subterranean reservoir penetrated by at least two spaced wells comprising:

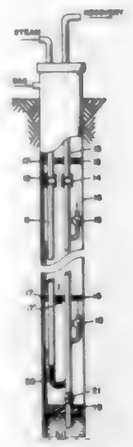
(a) injecting a mixture of normally gaseous oil soluble and oil insoluble components, said mixture comprising from about 10% to about 90% of normally gaseous oil soluble components, into the reservoir through one of said wells until a bank of oil in the vicinity of that well becomes saturated with said normally gaseous, oil soluble component, thus reducing the viscosity of the oil in that bank, the normally gaseous, oil insoluble component travelling through said reservoir in the direction of the offset well, the injection pressure being in excess of the bubble point of the oil in the reservoir so that the soluble component may dissolve in the oil and likewise sufficiently in excess of the reservoir pressure so as to enable a pressure gradient to be maintained between the injection well and the offset well, the temperature of the normally gaseous oil soluble and insoluble components injected being that obtained during compression to injection pressure;

(b) subsequently injecting said mixture of normally gaseous oil soluble and insoluble components into the reservoir through the offset well so as to saturate a bank of oil in the vicinity of said offset well, thereby reducing the viscosity of the oil in that bank, the normally gaseous oil insoluble component travelling through said reservoir and driving the previously formed bank of reduced viscosity oil in the vicinity of the original injection well into that well-bore;

(c) reversing the direction of gas flow through the reservoir whenever the production rate decreases so as to indicate that the bank of reduced viscosity oil in the vicinity of the production well has been depleted,

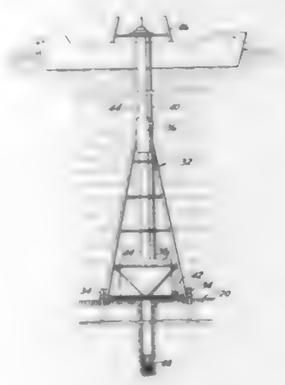
whereby the injection of the mixture of normally gaseous oil soluble and insoluble components serves to reduce the viscosity of the oil in the vicinity of the well then used as an injection well while simultaneously providing the driving force to remove reduced viscosity or oil at an efficient production rate from the offset well then employed as a production well.

3,373,805
STEAM LIFTING OF HEAVY CRUDES
Thomas C. Boberg, Houston, Tex., and Roe Clyde Allen, Jr., Princeton, N.J., assignors to Esso Production Research Company, a corporation of Delaware
Filed Oct. 14, 1965, Ser. No. 495,809
11 Claims. (Cl. 166—2)



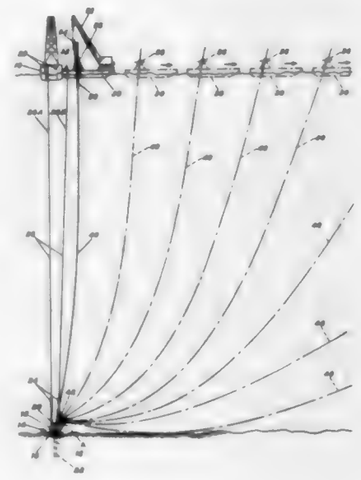
A combined gas lift-steam lift assembly and method for producing petroleum wherein the flow of petroleum is initiated by lifting the petroleum with natural gas and steam is injected into the production tubing to continue and increase the flow of petroleum.

3,373,806
APPARATUS AND METHOD FOR DRILLING WELLS
Virgil D. Stone, Morgan City, La., assignor to Gulf Oil Corporation, Pittsburgh, Pa.
Filed Apr. 21, 1964, Ser. No. 361,447
18 Claims. (Cl. 166—.5)



1. A method of completing a well below a body of water at least about 50 feet deep comprising forcing a heavy-walled snorkel tube permanently encircling and separate from casing of the well downwardly into the ground below the body of water whereby said snorkel tube is supported by the ground and extends upwardly above the surface of the water, said snorkel tube having a diameter of approximately 40 to 72 inches to permit a workman to descend in the tube to install wellhead connections, pumping water out of the tube, cutting off casing of the well adjacent the bottom of the body of water, installing a wellhead assembly on the upper end of the casing, running a flow line from the wellhead assembly upwardly through the tube to above the surface of the water, and supporting the flow line within the tube for delivery of well fluids above the surface of the water.

3,373,807
UNDERWATER PIPELINE CONNECTING METHOD AND APPARATUS
William Fischer, Fullerton, and William R. Postlewaite, Menlo Park, Calif., assignors to Chevron Research Company, San Francisco, Calif., a corporation of Delaware
Filed June 6, 1966, Ser. No. 555,322
7 Claims. (Cl. 166—.5)



1. The method of connecting an underwater pipeline to a submerged wellhead from a floating platform above said wellhead, said wellhead having an opening therein communicating with a well bore penetrating earth strata below a body of water, which comprises

(a) connecting flexible guide means from a location adjacent said wellhead to said floating platform,

(b) lowering one end of a pipeline vertically downwardly from said floating platform along said flexible guide means so that the longitudinal axis of said pipeline adjacent said one end thereof is in a vertically disposed position when said one end lends adjacent said wellhead,

(c) retaining support of the other end of said pipeline on said platform during said lowering operation, said one end of pipeline terminating at substantially a right angle with respect to said longitudinal axis,

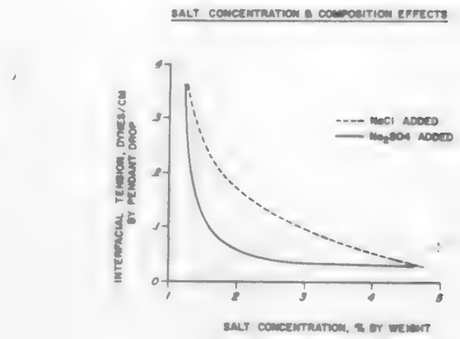
(d) progressively moving said platform on the water surface and continuing the lowering of said pipeline from said platform until said axis of said pipeline is rotated from said vertically disposed position to a generally horizontally disposed position,

(e) securing said pipeline in said horizontally disposed position to place the opening in said pipeline at a known displaced location relative to and substantially parallel with said opening in said wellhead,

(f) then lowering and guiding along flexible guide means a wellhead control assembly adapted to be indexed by said flexible guide means to register with the opening in said wellhead and said one end of said pipeline, and

(g) securing said wellhead control assembly to said wellhead and said one end of said pipeline to permit control of fluid flow between said pipeline and said well bore.

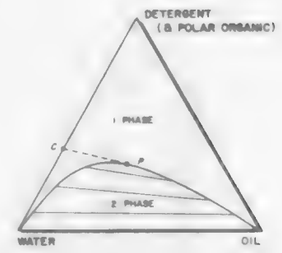
3,373,808
OIL RECOVERY PROCESS
John T. Patton, Houston, Tex., assignor to Esso Production Research Company, a corporation of Delaware
Filed Oct. 15, 1965, Ser. No. 496,362
7 Claims. (Cl. 166—9)



SALT CONCENTRATION & COMPOSITION EFFECTS
INTERFACIAL TENSION, DYNES/CM BY PENDANT DROP
NaCl ADDED
Na2SO4 ADDED
SALT CONCENTRATION, % BY WEIGHT

An improved method for waterflooding a subterranean oil-bearing reservoir wherein the injected flood water contains a sulfonated petroleum surfactant and a quantity of an ionizable sulfate compound sufficient to give an optimum lowering in interfacial tension between the aqueous surfactant solution and the reservoir crude petroleum.

3,373,809
MICROEMULSION OIL RECOVERY PROCESS
Claude E. Cooke, Jr., Houston, Tex., assignor to Esso Production Research Company, a corporation of Delaware
Filed Nov. 15, 1965, Ser. No. 507,836
10 Claims. (Cl. 166—9)

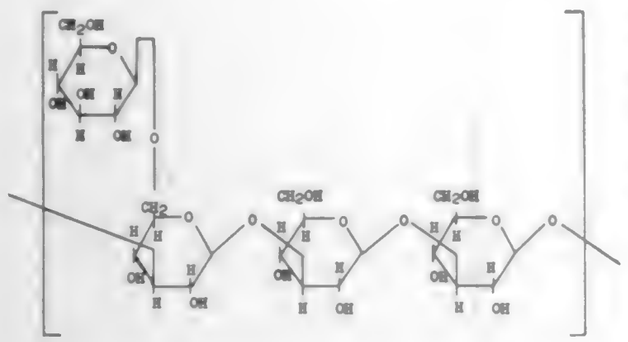


In the recovery of oil from subterranean oil-bearing formations, an aqueous detergent solution is injected for the in situ formation of a water external microemulsion on contacting the reservoir oil. The concentration of surfactant in the injected solution is greater than the minimum miscibility concentration.

3,373,810
WATERFLOOD PROCESS EMPLOYING THICKENED WATER
Sherrod A. Williams, Dallas, Tex., assignor to Mobil Oil Corporation, a corporation of New York
No Drawing. Filed June 17, 1966, Ser. No. 558,254
19 Claims. (Cl. 166—9)

1. A method of recovering oil from an oil-containing subterranean formation penetrated by an injection means and a production means which comprises injecting through said injection means and into said formation flooding water containing as a thickening agent a sulfoalkylated poly(glucosylglucan), a sulfoalkylated polysaccharide B–1459, or a mixture thereof;

said sulfoalkylated poly(glucosylglucan) comprising the reaction product formed by reacting poly(glucosylglucan), the glucosylglucan having the structural formula



with a sulfoalkylating agent, and

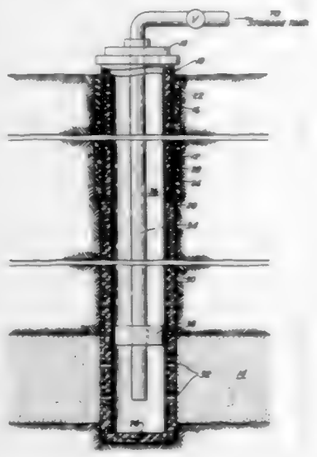
said sulfoalkylated polysaccharide B–1459 comprising the reaction product formed by reacting polysaccharide B–1459, the heteropolysaccharide produced by bacterium *Xanthomonas compestris* NRRL B–1459, United States Department of Agriculture, from glucose with said sulfoalkylating agent.

3,373,811

PROCESS AND APPARATUS FOR HEATING FLUIDS IN A WELL BORE

Fred W. Burtch, Monroeville, Pa., assignor to Gulf Research & Development Company, Pittsburgh, Pa., a corporation of Delaware

Filed Jan. 6, 1964, Ser. No. 335,852
20 Claims. (Cl. 166—25)



1. In a well bore penetrating a subsurface rock formation containing crude oil, a method for maintaining the temperature in the well bore above the cloud point of the crude oil comprising running in the well bore two concentric strings of casing to form an annulus in the well bore between said strings of casing, setting a sheath of matrix material in the annulus, said matrix material having substantially uniformly dispersed therethrough particles of a radioactive fission decay product capable of emitting heat at a rate adequate to maintain the temperature in the well bore above the cloud point of the oil.

11. A well for the production of oil containing paraffin comprising a bore hole extending downwardly to a formation containing said oil, a first casing extending from the surface part of the way downwardly to the formation containing said oil, a second casing extending downwardly within the first casing to a level below the lower end of the first casing, at least a portion of the annulus between the first casing and the second casing being filled with cement containing a radioactive fission decay product dispersed substantially uniformly therethrough, said fission decay product being of sufficient concentration to maintain the temperature of the well bore above the cloud point of the oil.

3,373,812

METHOD OF PERMEABLY CONSOLIDATING INCOMPETENT SANDS WITH A HEAT-CURABLE RESIN

Francis M. Smith, Gibsonia, Pa., assignor to Gulf Research & Development Company, Pittsburgh, Pa., a corporation of Delaware

No Drawing. Filed July 9, 1965, Ser. No. 470,886
3 Claims. (Cl. 166—25)

An incompetent formation is permeably consolidated by heating with steam, thereafter displacing a heat-curable resin-forming furfuryl alcohol composition into the heated zone, and continuing to displace steam or a gas such as nitrogen, carbon dioxide and methane through the impregnated formation to maintain permeability while the resin is cured.

3,373,813

METHOD FOR PERMEABLY CONSOLIDATING AN INCOMPETENT FORMATION WITH HEAT-CURABLE RESIN

James W. Jennings, Verona, and John F. Muirhead, Jr., Oakmont, Pa., assignors to Gulf Research & Development Company, Pittsburgh, Pa., a corporation of Delaware

No Drawing. Filed July 9, 1965, Ser. No. 470,923
4 Claims. (Cl. 166—25)

Combustibles are burned in an incompetent formation surrounding a well bore to heat the formation, and the combustion step is followed by the injection of a liquid resin-forming material which in turn is followed by the injection of gas to displace a portion of a resin-forming material farther outwardly into the formation. Heat remaining in the formation following the combustion step raises the temperature of the resin-forming liquid to cause resinification. Furfuryl alcohol and partial polymers of furfuryl alcohol are preferred resin-forming materials.

3,373,814

STEAM INJECTION USING STEAM-LOSS INHIBITING MATERIALS

Louis H. Ellers and Charles F. Smith, Tulsa, Okla., and Orlin W. Lyons, Houston, Tex., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Filed Apr. 14, 1966, Ser. No. 542,471
14 Claims. (Cl. 166—33)

An improved steam in situ treating process which comprises injecting into a geologic formation, either by slug injection followed by steam injection or by injection directly into a stream of steam as it is being transmitted to or being forced into a geologic formation, the following steam diverting material:

(1) Optionally a thickening agent;

(2) A water-sensitive colloidal swelling agent;

(3) A stabilizing agent which impedes or delays the swelling of the swelling agent until it has impinged upon, and to some extent penetrated, the face of at least a section of the formation being treated; and

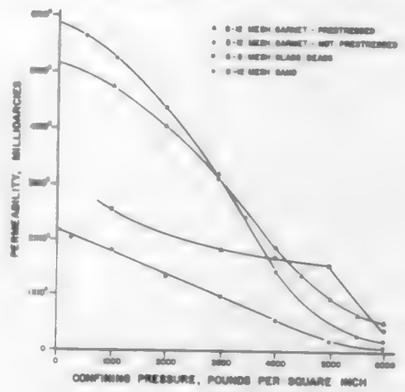
(4) A finely divided particulated substantially water-insoluble, oil-insoluble sealing agent which supplements, or conjointly functions, with the swelling agent of (2) to plug the formation against fluid flow.

3,373,815

FRACTURING OF SUBTERRANEAN FORMATIONS

Othar M. Kiel and Albert L. Kidwell, Houston, Tex., assignors to Esso Production Research Company, a corporation of Delaware

Filed May 6, 1966, Ser. No. 548,250
10 Claims. (Cl. 166—42)



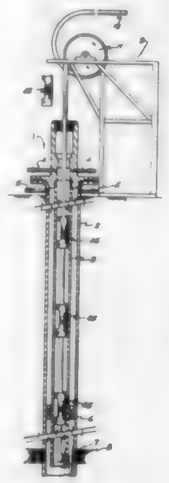
1. In a method for propping open a fracture in a subterranean formation surrounding a wellbore, the improvement which comprises injecting into said fracture a fluid suspension of naturally-occurring individual crystals of a mineral which is essentially inert to the formation fluids and has a Mohs' hardness value of about 6 or greater, said crystals being between about 2½ and about 40 mesh on the U.S. Standard Sieve Series scale in size.

3,373,816

METHOD FOR INJECTOR TUBING GAS LIFT

Chudleigh B. Cochran, Houston, Tex., assignor to Cicero C. Brown, Houston, Tex.

Filed Oct. 11, 1965, Ser. No. 494,686
4 Claims. (Cl. 166—46)



A method of installing gas lift valves and appurtenant tubing in a well. The invention includes a novel method of utilizing injector type tubing unwound from a spool or the like for attachment to and supporting one or more gas lift valves in a well.

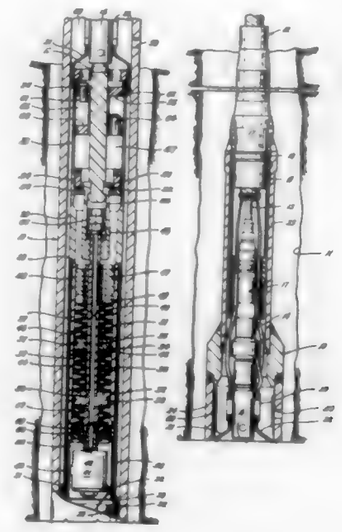
3,373,817

APPARATUS FOR SELECTIVELY RELEASING CABLE-SUSPENDED WELL TOOLS

Walter E. Cubberly, Jr., and Dean F. Saurenman, Houston, Tex., assignors, by mesne assignments, to Schlumberger Technology Corporation, Houston, Tex., a corporation of Texas

Filed Mar. 23, 1966, Ser. No. 536,847
15 Claims. (Cl. 166—65)

1. In sub-surface apparatus adapted for suspension from a cable extending to the surface, means for releasably connecting said apparatus to the cable, comprising: connecting means including a movable member on said apparatus releasably connected to the cable in a first position of said member relative to said apparatus and movable in response to cable tension to a second position relative to said apparatus for disconnection from said cable; and hydraulic means between said movable member and apparatus releasably retaining said movable member in said first position and selectively operable from the surface to release said movable member for movement to said second position.

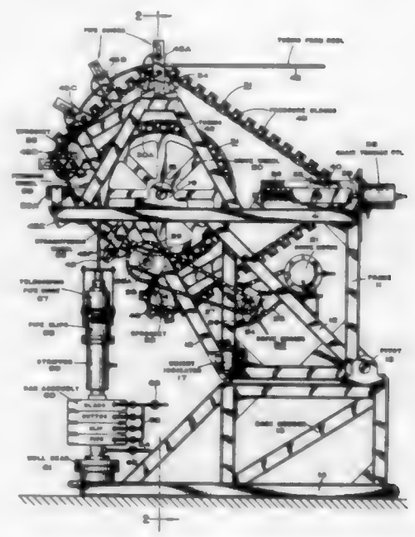


3,373,818

APPARATUS FOR RUNNING PIPE

James L. Rike, New Orleans, La., and Richard C. Babb and Ernest L. Potts, Houston, Tex.; said Potts and said Babb assignors to Brown Oil Tools, Inc., Houston, Tex., a corporation of Texas, and said Rike assignor to Esso Production Research Company

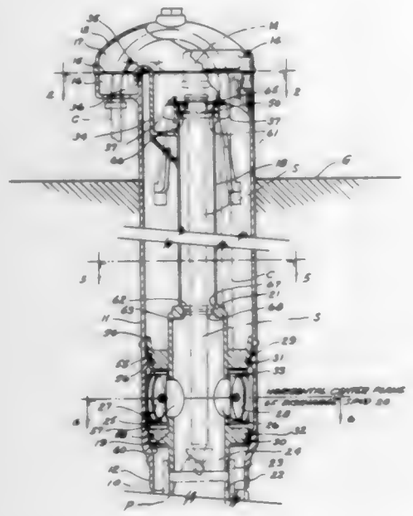
Filed Oct. 20, 1965, Ser. No. 505,305
18 Claims. (Cl. 166—77)



Substantially inflexible pipe is run into a well with apparatus embodying a powered grooved drum and a powered reel for spooling the pipe, a loop of the pipe being held on the grooved drum by a continuous holding means, such as a chain provided with pressure blocks, which is coextensive with and conforms to the pipe loop and allows sufficient force to be exerted on the pipe by the

drum to maintain the pipe on the drum to cause it to part under sufficient tension, the apparatus being provided with guide means for the pipe between the drum and reel and a telescopic guide means for guiding the pipe into the well.

3,373,819
PITLESS WELL UNIT
John Gordon Baker, Evansville, Wis., assignor to Baker Manufacturing Company, Evansville, Wis., a corporation of Wisconsin
Filed May 18, 1965, Ser. No. 456,668
5 Claims. (Cl. 166—88)



A self-contained unit with valved discharge spool. The spool and drop assembly are positioned and held down independently of the cap by means of hook studs and a strap welded to the hold-down pipe which extends from the spool to the top of the case. The case is provided with slots for the stud hooks and a pocket for the orientation strap. A holddown for a meter shaft is provided at the top of the holddown pipe. The spool is designed to provide passage for motor cables, pressure lines, or other auxiliaries into the well outside the valve and discharge chamber of the spool.

3,373,820
APPARATUS FOR DRILLING WITH A GASEOUS DRILLING FLUID
Leon H. Robinson, Jr., Robert H. Friedman, and Max R. Annis, Houston, Tex., assignors to Esso Production Research Company, a corporation of Delaware
Filed May 16, 1966, Ser. No. 550,194
3 Claims. (Cl. 166—187)

1. Apparatus for injecting fluid into the lower portion of a borehole in the earth comprising:

a tubular drill string section;

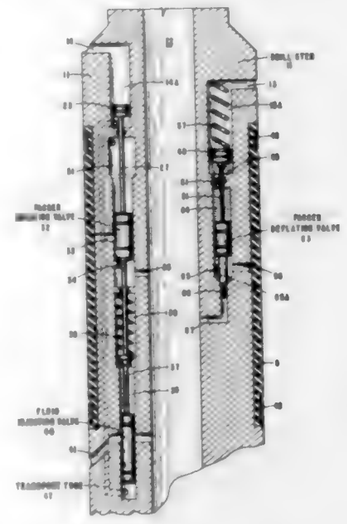
a fluid expansible annular packer affixed to the outer surface of said drill string section, constructed and arranged so that fluid pressure exerted on the inner surface thereof will expand the packer to the walls of the borehole;

first and second fluid passageways in said drill string section connected in parallel between the bore of said drill string section and the exterior of said drill string section under the packer;

a third fluid passageway in the drill string section between the bore and the exterior of the drill string section opening to the exterior of the drill string section beneath the level of said packer;

first valve means positioned in said first passageway and having a portion thereof exposed to borehole pressure around said drill string section in the vicinity of the packer, constructed and arranged to close said first passageway until pressure in said drill string section bore is greater by a first predetermined differential pressure than the borehole pressure above said packer;

second valve means connected to said first valve means and actuated by said first valve means, constructed and arranged to close said third fluid passageway until said first valve means is subjected to pressure in said drill string bore that is greater by a second predetermined differential pressure than the pressure in said borehole above said packer;

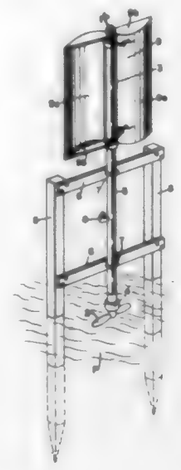


third valve means positioned in said second passageway and having a portion thereof exposed to borehole pressure above said packer, constructed and arranged to close said second passageway until pressure in said drill string section bore is greater by a third predetermined differential pressure than the borehole pressure above said packer, said second predetermined differential pressure being greater than said first predetermined differential pressure, and said third predetermined differential pressure being greater than either of said first and second predetermined differential pressures; and

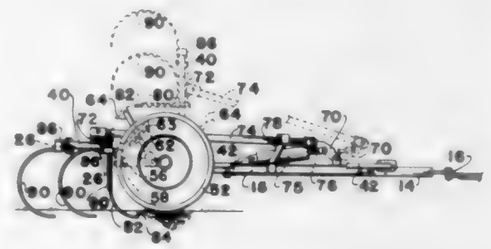
means for holding open said second valve means for at least a predetermined time interval.

3,373,821
POND MILL
Ted O. Sare, Sundance Ranch, Rte. 2, Willard, Mo. 65781
Filed Dec. 17, 1965, Ser. No. 514,645
7 Claims. (Cl. 170—10)

A pond mill for providing an ice-free area in a livestock watering pond disposed in a field exposed to atmospheric weather conditions, comprising a tubular housing; a shaft journaled in said housing and extending above and below the housing; bearings for the shaft at the upper and lower ends of the housing; an impeller on the lower end of the shaft adapted to be submerged below the level of the water in the pond; and a wind-motor secured to the upper portion of the shaft and disposed around the housing for rotating the shaft when wind currents cross the pond, said wind-motor comprising opposed arcuate vanes at opposite sides of the shaft forming an S-shaped rotor exposed to the wind currents over the pond; top and bottom plates connecting the upper and lower ends respectively of the vanes to form a rigid unit, the upper plate being mounted on the upper end of the shaft and the lower plate being journaled on the housing; said rotation of the shaft causing an upward current in the water above the impeller, thereby preventing freezing of the water, and to cause "boiling" up of the water to thaw any ice formation accumulating during windless intervals.

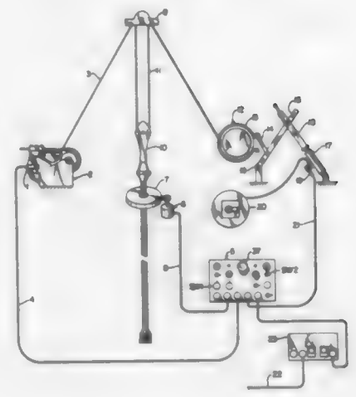


3,373,822
AGRICULTURAL EARTH WORKING IMPLEMENT
Michael C. Hornung, Spearville, Kans. 67876
Filed Feb. 17, 1965, Ser. No. 433,442
2 Claims. (Cl. 172—311)



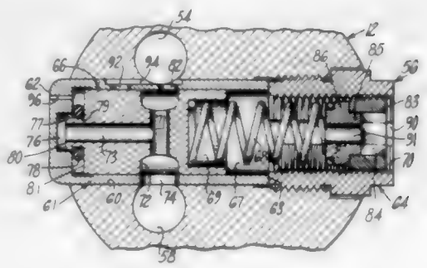
The invention is of a spring tooth farm implement used as a harrow, and having unique means of mounting and supporting the forwardly mounted blades so that they stand up well in use. In utilizing the invention a frame having a beam is employed with the frame being wheel supported for moving same. The beam mounts the working means. These are a row of spring teeth. The spring teeth have a substantially vertically positioned reinforcing member with means for mounting same on the beam. A blade is used which is positioned forward of and in close relationship to the reinforcing member. The blade has means to mount same on the beam in the upper end portion, and the lower portion of the blade in its end portion is pointed and designed for working the soil. The reinforcing member and the blade by its upper end portion are secured on the beam by a clamp. The clamp has a portion positioned on the side of the beam opposite the reinforcing member and blade, and the clamp has mounting means in one end portion which cooperates with that of the reinforcing member and the blade. The clamp has an encircling portion which is disposed about the reinforcing member and the blade. Mounting means such as a bolt and nut are connected to the mounting means of the reinforcing member, blade and clamp to secure the teeth to the beam. As a result the spring teeth are reinforced in use and clamped in position to resist shock and force upon striking objects in the ground.

3,373,823
WELL DRILLING CONTROL SYSTEM
Hal B. Fullerton, Jr., Whittier, Calif., and Richard C. Webb, Broomfield, and Jon E. Benner, Denver, Colo., assignors, by direct and mesne assignments, to Hal B. Fullerton, Jr., and Betty Jane Fullerton, both of Whittier, Calif.
Filed Sept. 20, 1965, Ser. No. 488,530
15 Claims. (Cl. 173—6)



This invention is an automatic control system for controlling the draw works of a rotary well drilling rig. The system comprises means for sensing the rotational speed of the well drilling bit and means for sensing the weight of the bit on the strata being penetrated. The signals relating to speed and pressure are combined to generate a signal related to the product of bit weight times rotational speed. This product is used to control the draw works of the well drilling rig to maintain a constant pressure-rotary speed relation. In addition, means are provided for allowing only a maximum drill pressure regardless of rotary speed. Further, a means is provided for calibrating the system so that it can be utilized with various well drilling rigs.

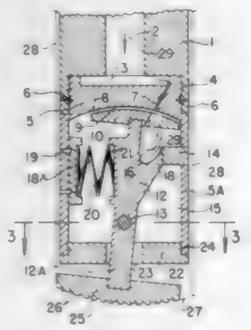
3,373,824
FLUID OPERATED TOOL
Hugh L. Whitehouse, South Euclid, Ohio, assignor to The Stanley Works, New Britain, Conn., a corporation of Connecticut
Filed Nov. 24, 1965, Ser. No. 509,576
27 Claims. (Cl. 173—12)



Device comprising an air motor, a housing having a supply passageway connected to the motor, a bistable on-off pressure sensitive spool valve movable in the passageway for controlling air flow to the motor and biased toward a normally operative position, passage means for

directing back pressure from the motor against the valve urging it into a shut-off position when the motor operating pressure increases beyond a predetermined level, a restriction in the passageway on a supply side of the valve providing an amplified range of air pressures acting on the motor between no load and stall conditions and increasing the sensitivity of the valve, and means responsive to shifting of the valve into a closed position and for maintaining it therein independently of fluid pressure acting on the motor.

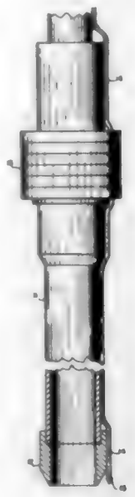
3,373,825
AIR VIBRATION DRILL
Joel B. Guin, 148 E. 48th St., New York, N.Y. 10017
Filed Oct. 14, 1965, Ser. No. 495,848
2 Claims. (Cl. 173—59)



This invention relates to a pneumatic vibration drill designed for light drilling operations on hard material, in which compressed air flows into an equalizing chamber then intermittently through an air channel momentarily aligned once each vibration with an opening through a valve closure into a vibration chamber whose inner walls support a shaft on which is rotatably mounted a vibrating arm rigidly supporting and moving the valve closure, extensions from the arm and from the chamber walls meeting once each vibration and forming an air chamber in which rapidly increasing pressure forces the arm back against an opposing force on the other side, thus simultaneously cutting off the airflow into the chamber and forming an outlet for the air to reduce the pressure and allow the opposing force to return the vibrating arm, close the air chamber again and realign the passages for air into it, the vibrating arm meanwhile moving a drilling means attached rigidly to its lower end. Heavy pneumatic hammers are now used for similar operations, but often large capacity is not needed, or is not available because of the high cost. The present drill can be made of lighter and smaller components, and can be operated with smaller compressors. The total capital outlay is therefore much less. However, very large drills using the same principle can be made, and they can be operated by very high pressure compressors. Due to the much more rapid rate of vibration this drill will cut into rock, concrete, pavement or other hard material more rapidly than regular pneumatic hammers. It has the further advantage that it can be made to drill away the material, while the pneumatic hammer merely splits it or breaks it up.

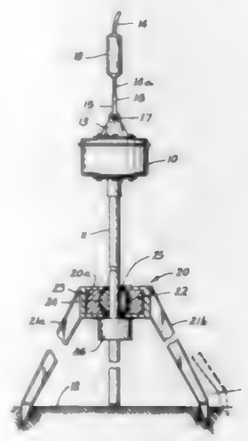
3,373,826
CORING DEVICE
Carey Ingram, 3207 Northampton St. NW., Washington, D.C. 20015
Filed Mar. 31, 1966, Ser. No. 540,152
3 Claims. (Cl. 175—5)

A device for facilitating the recovery of oceanographic bottom sampling instruments. A small tubular means paralleling the instrument has a loose fitting plug in the bottom end that relieves the vacuum effect created when



the instrument is withdrawn from the sediment on the ocean's floor.

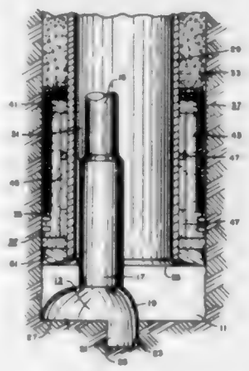
3,373,827
APPARATUS FOR CORING SUBTERRANEAN FORMATIONS UNDER A BODY OF WATER
Jules N. Biron, Durward B. Jones, and Darrell L. Sims, Houston, Tex., assignors, by mesne assignments, to the United States of America as represented by the National Science Foundation
Filed June 14, 1966, Ser. No. 557,531
1 Claim. (Cl. 175—6)



1. Apparatus for coring the subterranean formation lying under the bottom of a body of water, comprising, a coring assembly including an elongated elastic stem at least the lower portion of which is hollow to form a core barrel, a sonic frequency elastic wave generator acoustically coupled to said stem and operable at a longitudinal resonant frequency of the stem to establish a longitudinal elastic standing wave vibration in the stem to cause the lower end thereof to cut through a subterranean formation and collect a core of same in the core barrel, a flexible cable connected to the coring assembly to lower it into position to cut such core and to raise it with the core to the surface, a float attached to the cable immediately above the coring assembly to exert a buoyant force on the coring assembly that is less than the force required to keep the assembly from sinking but sufficient to hold the core barrel substantially

vertical when it moves into engagement with the bottom of a body of water, a stand, means mounting the stand on the stem for longitudinal and limited pivotal movement relative to the stem, and stop means limiting the downward longitudinal movement of the stand relative to the stem, said stand having at least three downwardly extending legs extending below the bottom of the core barrel when the stand is in engagement with the stop means to engage the bottom before the core barrel does and stabilize the core barrel against lateral movement during the coring operation.

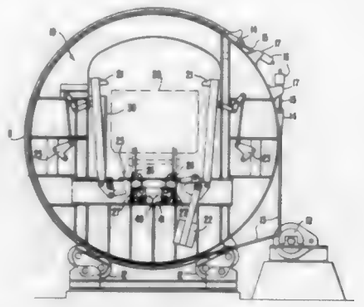
3,373,828
METHOD AND APPARATUS FOR DRILLING
James M. Cleary, Dallas, Tex., assignor to Atlantic Richfield Company, a corporation of Pennsylvania
Continuation-in-part of application Ser. No. 79,740, Dec. 30, 1960. This application Aug. 13, 1964, Ser. No. 389,437
34 Claims. (Cl. 175—65)



8. A method of drilling boreholes in the earth wherein a tubular casing is lowered behind an earth drill while the borehole is being drilled, which method comprises
(a) drilling a borehole larger than the diameter of said casing by progressively advancing said drill downwardly into said earth, said drill being connected to a tubular drill string;
(b) advancing said casing into said borehole being drilled by said drill at a distance above said drill, said casing surrounding said drill string and having an internal diameter larger than said string;
(c) circulating a first drilling fluid adapted to carry drill cuttings to the surface of the earth through the interior of said drill string and the annular space between said drill string; and
(d) maintaining a seal consisting of an unconsolidated, fluid-impermeable mass of particle-form solids between the wall of said borehole and said casing, said seal following the movement of said casing as said casing is advanced into said borehole and preventing the flow of fluids between the annular space between the wall of said borehole and said casing and the interior of said casing.

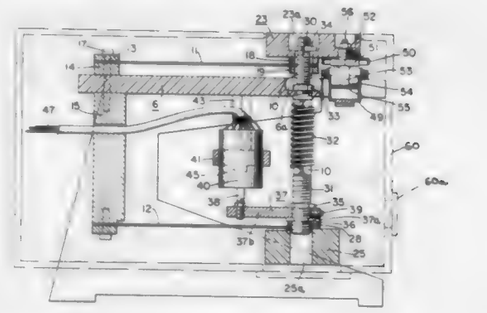
3,373,829
WEIGHING MECHANISM FOR RAILROAD CAR DUMPERS
Robert W. Suman, Hatboro, Pa., and Kenneth E. Thomsen, Northbrook, Ill., assignors to Link-Belt Company, a corporation of Illinois
Filed July 20, 1966, Ser. No. 566,571
16 Claims. (Cl. 177—132)

1. A railroad car dumper comprising
a load receiving table having rails to support and guide a railroad car introduced into and removed from said dumper,
a substantially invertible supporting structure for carrying said table mounted to rotate with the car and table in emptying the contents of the car,



weight transmitting means supporting said load receiving table within said substantially invertible supporting structure to permit limited lateral shifting movement of said table relative to said supporting structure incident inversion of said structure and table to empty a car, said weight transmitting means including a plurality of rotatably mounted rollers each associated with bearing plate means engaged with the periphery of the roller and at least one weighing device disposed in compressive relation with each associated roller and bearing plate means to detect the portion of the weight of said table and the car supported on said table that is transmitted through each associated roller and bearing plate means whereby the total of the detected weights of said weighing devices is indicative of the weight of said table and car supported thereon.

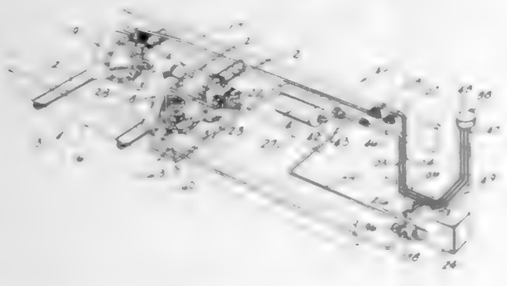
3,373,830
WEIGHING CELL
Edward T. Thomson, Phoenixville, Pa., assignor to Automatic Timing & Controls, Inc., King of Prussia, Pa., a corporation of Pennsylvania
Filed July 27, 1965, Ser. No. 475,151
5 Claims. (Cl. 177—168)



1. A weighing cell comprising:
(a) at least one substantially horizontal flexure plate having one positionally fixed end,
(b) a first horizontal subassembly which receives a load to be weighed connected to the other end of said flexure plate,
(c) a positionally fixed and rigid horizontal member disposed below said flexure plate,
(d) a second horizontal subassembly vertically spaced from said first subassembly, said second subassembly being disposed below said horizontal member and being connected to said first subassembly for movement in unison therewith, said second horizontal subassembly having a vertical portion in which a slot is formed,

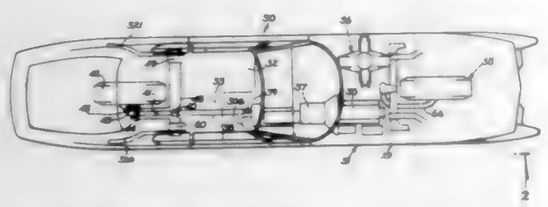
(e) vertical spring means whose upper end is connected to said rigid member,
(f) a vertical spring tensioning member whose upper end is connected to said spring means, said tensioning member being threaded and having a portion thereof which passes through an aperture in said second horizontal subassembly, and
(g) a horizontal nut which engages said (*f*) member and which is disposed in said slot to adjust the vertical position of said (*f*) member when rotated, said nut being accessible for rotation through said slot,
(h) means attached to said (*d*) subassembly for producing relative movement between an inductive member and a core associated therewith.

3,373,831
CONTROL SYSTEM FOR MULTIPLE DRIVE AXLES
Thomas H. Terry, Bay Village, and George L. Moldovan, Willowick, Ohio, assignors to Eaton Yale & Towne Inc., a corporation of Ohio
Filed Dec. 2, 1964, Ser. No. 415,431
12 Claims. (Cl. 180—22)



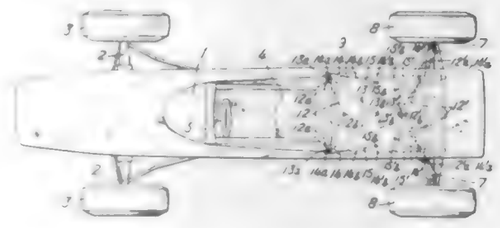
A control system for a multiple axle mechanism comprising a plurality of multispeed drive axles, which are connected by interaxle differential means, the control system having a manually operable selector valve for selectively connecting the shifting means of the drive axles to a source of pressure fluid in order to shift the axles.

3,373,832
GYRO VEHICLE
Thomas O. Summers, Sherman Oaks, Calif. (1536 Fairway Drive, Camarillo, Calif. 93010)
Filed Apr. 19, 1966, Ser. No. 543,708
42 Claims. (Cl. 180—30)



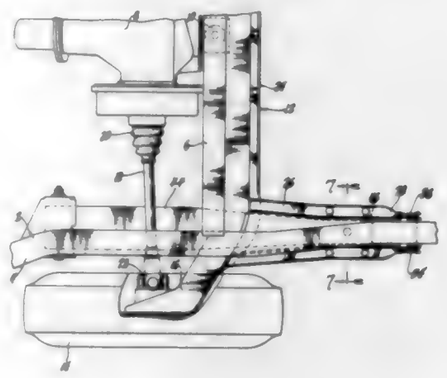
1. A gyro vehicle comprising:
means forward and means rearward of the vehicle center of gravity for supporting the vehicle for translational movement over a support surface;
said vehicle support means including means providing a longitudinal roll axis about which said vehicle has angular freedom;
a gyro gimbal mounted on the vehicle for freedom of angular movement about a gimbal axis;
a gyro rotor rotatably mounted in said gimbal for rotation about a rotor axis, said gimbal axis and said rotor axis being positioned on said vehicle for precession of said gimbal about said gimbal axis in response to torque on said vehicle about said roll axis;
steering means responsive to the position of said gyro gimbal about said gimbal axis for steering one of said vehicle support means; and
means for selectively applying a torque to said gimbal about said gimbal axis to precess said vehicle about said roll axis.

3,373,833
COMPACT MOTOR CAR CONSTRUCTION
Shouichi Sano, Saitama-ken, Japan, assignor to Kabushiki Kaisha Honda Gijutsu Kenkyusho, Saitama-ken, Japan, a corporation of Japan
Filed Feb. 9, 1965, Ser. No. 431,322
Claims priority, application Japan, July 31, 1964, 39/42,971
2 Claims. (Cl. 180—54)



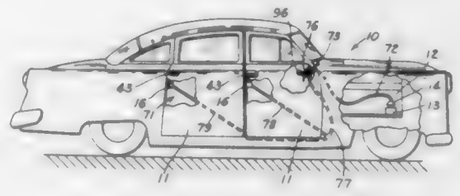
1. In a compact motor car construction, a car body comprising a front car body portion, a rear car body portion spaced longitudinally of the motor car from said front car body portion, a driving engine positioned between said front car body portion and said rear car body portion, a set of V-shaped brackets, extending between said front car body portion and said driving engine and attached at their ends to said front car body portion and at their apex to the top, sides and bottom of said driving engine, and a second set of V-shaped brackets extending between said rear car body portion and said driving engine and attached at their ends to said rear car body portion and at their apex to the top, sides and bottom of said driving engine whereby said front car body portion, rear car body portion, engine and said sets of brackets provide a rigid car body.

3,373,834
DE DION SUSPENSION WITH TORSIONALLY ACTIVE DEAD AXLE AND CANTILEVER SPRING ELASTIC MEDIUM
John W. Rosenkrands, Detroit, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Sept. 15, 1966, Ser. No. 579,619
7 Claims. (Cl. 180—73)



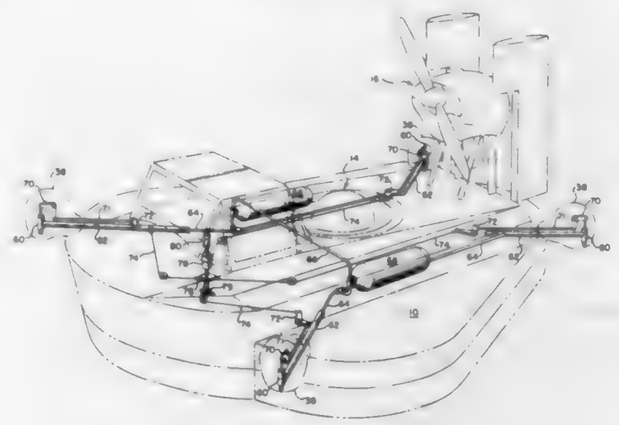
1. In a motor vehicle, a sprung portion, an unsprung portion including driving wheels, a dead axle extending transversely of said vehicle having opposite end portions rotatably supporting said wheels on a common axis of rotation, spaced apart longitudinally extending arm portions formed on said dead axle, shackle means connecting the free ends of said arms on a common axis on said sprung mass, a leaf spring rigidly connected at one end to each arm intermediate its length and extending longitudinally away from said shackles, and pivot means connecting the other end of each spring on a common axis on said sprung mass.

3,373,835
MOTOR VEHICLE DOOR LOCK
Cloyde B. Eatinger, deceased, late of Fort Dodge, Iowa, by Albert Habhab, administrator, Snell Bldg., Fort Dodge, Iowa 50501
Substituted for abandoned application Ser. No. 193,051, Apr. 30, 1962. This application July 29, 1966, Ser. No. 580,556
1 Claim. (Cl. 180—113)



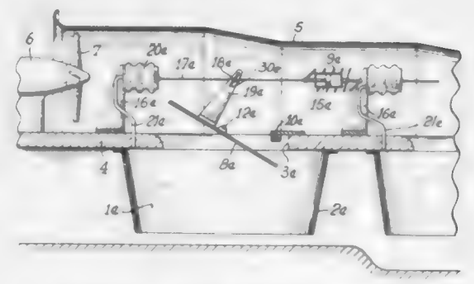
The invention relates to an attachment for a conventional latch for a vehicle door utilizing a source of suction described as the diaphragm assembly of a fuel pump for rendering the usual releasing and locking means of the latch ineffective at all times when the engine is running and, if desired, when the engine is not running. A pivoted locking lug is piston operated by the vacuum line. The vacuum line is controlled by a three way valve having three positions; namely, a first position where atmospheric pressure is applied to the piston, a second position where the atmospheric pressure is sealed off and vacuum is applied to the piston, and a third position where the atmospheric pressure is sealed off and where vacuum is trapped between the piston and valve thus holding the locking lug in locked position.

3,373,836
AIR CUSHION VEHICLE STABILIZING MEANS
John Bradley Chaplin, Williamsville, N.Y., assignor to Bell Aerospace Corporation, Wheatfield, N.Y.
Filed Nov. 15, 1965, Ser. No. 507,755
7 Claims. (Cl. 180—118)



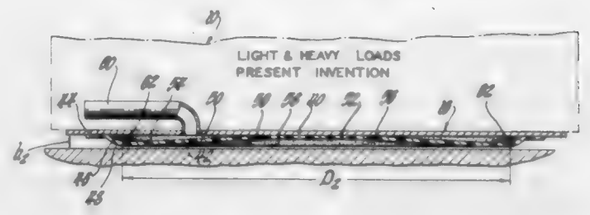
A ground effect machine supported on a cushion of air and provided with steering and propulsion means and additionally with rigidly secured downwardly directed thrust generating engines and control means normally de-activating the engines but effective to actuate same selectively to control movements of the machine about its pitch and roll axes to maintain the machine in a generally level attitude about such axes irrespective of attitude-changing forces due to any abrupt irregularities present in the reaction surface over which the machine is traveling.

3,373,837
FEED SYSTEMS FOR MULTIPLE AIR CUSHION TYPE PLATFORMS
Paul Guienne, Paris, France, assignor to Bertin & Cie, Paris, France, a company of France
Continuation-in-part of application Ser. No. 317,672, Oct. 21, 1963. This application Jan. 28, 1966, Ser. No. 523,748
Claims priority, application France, Feb. 1, 1965, 3,983
10 Claims. (Cl. 180—118)



1. In a ground effect machine of the kind having a platform supported by a plurality of unit air cushions, a system for distributing air to said cushions and including air compressing means; a main conduit supplied with compressed air from said air compressing means; a plurality of unit conduits connected to said main conduit for collecting the compressed air therefrom and connected to the respective cushions for supplying this compressed air thereto; an air flow controlling valve in each unit conduit, each valve having a normally open position and being adapted to be moved toward an operative position wherein the associated unit conduit is at least partly closed; elastic return means for urging each valve into the open position thereof; hollow deformable members associated to each valve which are subjected externally to the pressure in said main conduit and internally to a pressure equal to or lying between the pressures prevailing respectively in said main conduit and in the cushion associated to that particular valve, said members opposing said elastic return means for urging the valve into its open position.

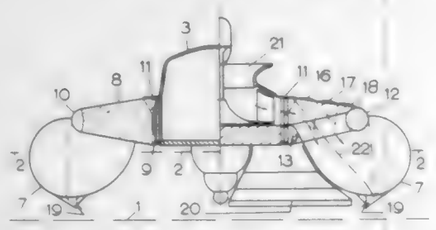
3,373,838
AIR CUSHION DEVICE WITH HEIGHT CONTROLLING BLEED HOLES
Jerry L. Stemple, Decatur, Ill., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed June 19, 1967, Ser. No. 646,991
2 Claims. (Cl. 180—124)



In preferred form, an air cushion device including a platform, a flexible diaphragm underlying the platform and fixed to the platform to define a continuously curving

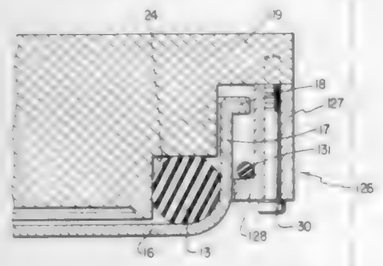
depending convolution spaced from the ground to define a perimetrical throttling gap and further including an inflatable annular cavity between the diahpragm and platform and a plenum cavity between the diaphragm and ground bounded by the perimetrical throttling gap, a plurality of bleed holes in the continuously curved depending convolution directing fluid pressure from the inflatable annular cavity, the plurality of bleed holes being selectively located in communication with said plenum cavity in accordance with load changes on the platform.

3,373,839
GROUND EFFECT VEHICLES WITH EXTENSIBLE BASE AREA
Derek James Hardy, Cowes, and Lavis Albert Henry Riddle, East Cowes, Isle of Wight, England, assignors to Westland Aircraft Limited, Yeovil, England
Filed July 12, 1965, Ser. No. 471,336
Claims priority, application Great Britain, July 28,1964, 30,039/64
12 Claims. (Cl. 180—128)



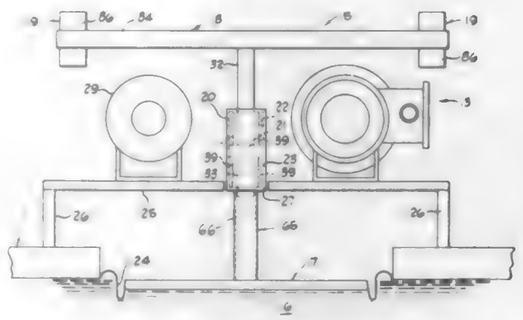
An air cushioned vehicle which utilizes an inflatable flexible skirt for selectively forming a supporting air cushion for the main body of the vehicle of greater lateral area than that of the main body portion. The inflatable flexible skirt is attached to the vehicle by, for example, flexible inflatable supporting members which are separated from the skirt in an air tight manner thereby permitting the supporting members to be maintained at pressures different from that maintained in the skirt.

3,373,840
GAS EXPLODER SEISMIC WAVE GENERATOR
Lauren G. Kilmer, Tulsa, Okla., assignor, by mesne assignments, to Sinclair Research, Inc., New York, N.Y., a corporation of Delaware
Filed Apr. 29, 1966, Ser. No. 546,245
4 Claims. (Cl. 181—.5)



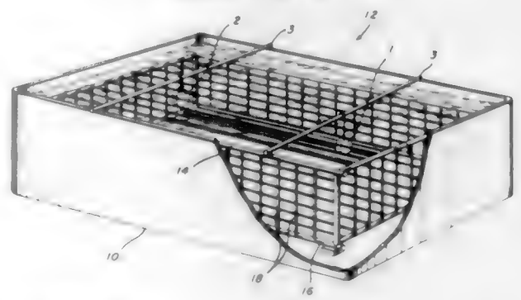
A gas exploder seismic wave generator having a rigid top and a rigid bottom telescoping together to form a chamber in which a gas explosion can take place having a resilient sealing ring inside of the joint formed between the bottom and top. The bottom telescoping member has an outwardly telescoping flange and the top has a portion thereof with a diameter larger than the diameter of the flange. Hook means are provided including flange means extending beneath the outwardly extending flange and a resilient O-ring positioned between the flange and the flange means.

3,373,841
METHOD AND APPARATUS FOR GENERATING SOUND WAVES
Park H. Miller, Jr., Del Mar, Calif., assignor, by mesne assignments, to Gulf General Atomic Incorporated, San Diego, Calif., a corporation of Delaware
Filed Apr. 1, 1966, Ser. No. 539,365
25 Claims. (Cl. 181—.5)



A novel sound source and method of generating sound waves utilizing the source is disclosed which includes a power system, an oscillatory system and a radiating member coupled to the medium in which the waves are generated. The oscillatory system includes a spring member and an inertial member. The power system is coupled between the spring and the radiator and exerts force periodically on both the spring and the radiator to transfer energy to both of them. The resonant frequency of the source as coupled to the medium is adjustable and the power system is preferably operated at the resonant frequency.

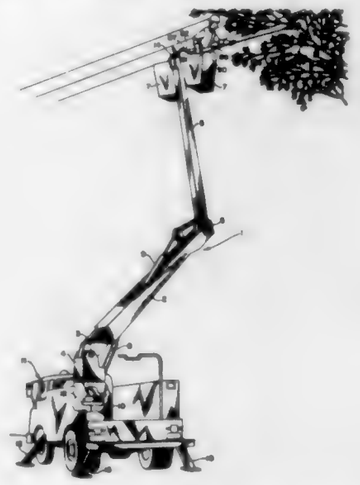
3,373,842
UNDERWATER ANECHOIC CHAMBER WITH SCREEN OF RUBBERLIKE TUBES
Cecil J. Burbank and Frank R. Abbott, San Diego, Calif., assignors to the United States of America as represented by the Secretary of the Navy
Filed Aug. 28, 1967, Ser. No. 664,239
4 Claims. (Cl. 181—33)



Sound transducers cannot generally be tested in a small pool of water because of reverberations caused by echoes from the side walls or boundaries of the pool. Near ideal anechoic conditions are achieved in this invention by mounting a screen of air-filled rubber tubes parallel to the top, bottom and sides of the pool.

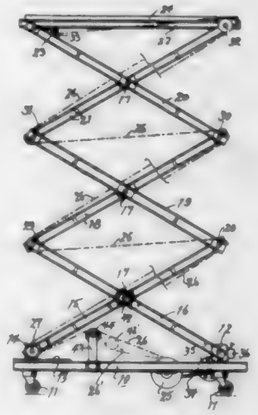
3,373,843
FLOW AND PRESSURE CONTROL VALVE
Herbert H. Schmiel, Cleveland, and Louis G. Hajma, Warrensville Heights, Ohio, assignors to Parker Hannifin Corporation, Cleveland, Ohio, a corporation of Ohio
Filed Apr. 4, 1966, Ser. No. 540,006
24 Claims. (Cl. 182—141)

17. A fluid power control system for an aerial lift device of the type having a base, a boom and bucket assembly movably connected to said base, and a fluid motor operative to raise and lower said boom and bucket assembly; said system comprising first and second valve assemblies operable respectively at said base and at said bucket, and each having a pressure inlet passage and a motor passage for connection with said fluid motor; first and second directional control valve members selectively movable in the respective valve assemblies to control fluid pressure actuation of said fluid motor; first and second selector valve members movable in the respective valve assemblies from one position communicating the



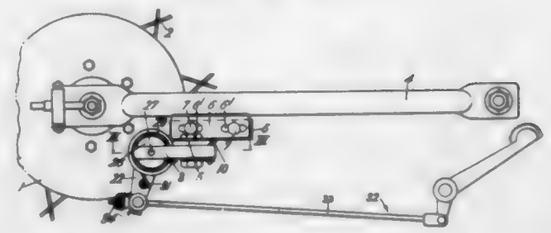
respective inlet passages with the respective directional control valve members to another position in which the inlet passage of said first valve assembly is communicated with the inlet passage of said second valve assembly and in which the inlet passage of said second valve assembly is communicated with another motor passage thereof, said another motor passage of said second valve assembly being connected with the fluid motor of a power tool adapted to be manipulated by a workman in said bucket.

3,373,844
COMPACT MOTORIZED SCAFFOLD ARRANGEMENT
George F. Schafer, El Tahoe, Calif. (P.O. Box AV-Bijou, Lake Tahoe, Calif.)
Filed May 16, 1966, Ser. No. 550,275
1 Claim. (Cl. 182—141)



This invention relates to a lazy tong scaffolding assembly having spaced lazy tong side portions with transversely extending tie rods for stabilizing the assemblies together with an additional lazy tong assembly mounted upon the spacing tie rods and operating in a plane perpendicular to the spaced lazy tong assemblies as a stabilizing means and a cable retracting means in the form of a bobbin over which the lazy tong extending cable is wound with superimposed concentric turns to provide a maximum torque during the initial lazy tong extending operation.

3,373,845
HIGH PERFORMANCE FRICTION DISC BRAKE
Tullio Campagnolo, Corso Padova 160, Vicenza, Italy
Filed Sept. 7, 1965, Ser. No. 485,258
Claims priority, application Italy, Sept. 7, 1964, 50,973/64; July 29, 1965, 7,516/65
6 Claims. (Cl. 188—26)

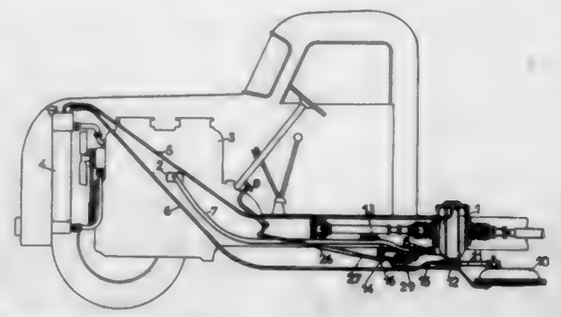


A pair of friction pads, one stationary, the other rotatable, are mounted on opposite sides of a vehicle brake disc for common shifting transverse to the axis of the disc when the rotatable pad is actuated to grip the disc with the stationary pad, the angular movement of the rotatable pad being in the same direction as the disc to provide a servo action.

3,373,846
LOCKING DEVICE FOR ROPES AND SHEAVES
Thomas Gaughan, Jr., 89—51 237th St., Bellerose, N.Y. 11426
Filed Apr. 14, 1966, Ser. No. 542,637
8 Claims. (Cl. 188—64)

A locking device for ropes and the like extending about the sheave of a pulley wherein the device locks the ropes and sheave together from relative movement.

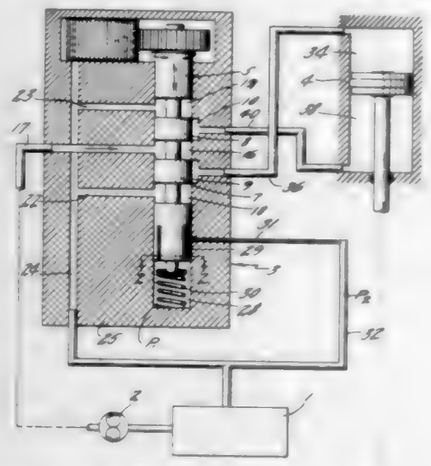
3,373,847
BRAKING ARRANGEMENT COMPRISING AN HYDRAULIC DECELERATOR
Etienne Rohacs, 56 Rue d'Eaubonne, Saint-Gratien, France
Filed Feb. 23, 1966, Ser. No. 537,601
Claims priority, application France, Mar. 9, 1965, 8,443
7 Claims. (Cl. 188—90)



A braking hydraulic decelerator in which the decelerator is simultaneously supplied directly from the cooling

system of the vehicle and directly from an auxiliary supply reservoir.

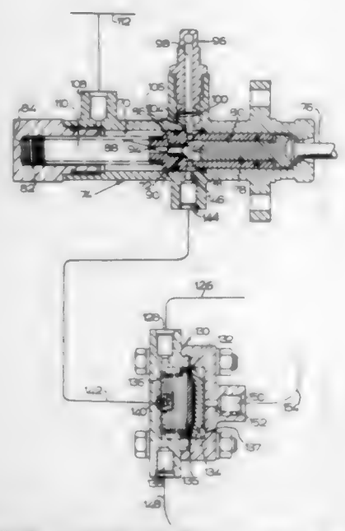
3,373,848
VISCOSITY INDEPENDENT HYDRAULIC FLOW REGULATOR
Kermit I. Harner, Windsor, Conn., assignor to United Aircraft Corporation, East Hartford, Conn., a corporation of Delaware
Filed Feb. 24, 1966, Ser. No. 529,797
4 Claims. (Cl. 188—97)



Damping of a hydraulic servo system is effectuated by disposing a variable volume chamber at one end of a servo valve which is in communication with an inertia tube and chopper. The chopper is sequenced in time relation relative to the flow in the inertia tube such that the velocity of the flow in and out of the tube never reaches its terminal value.

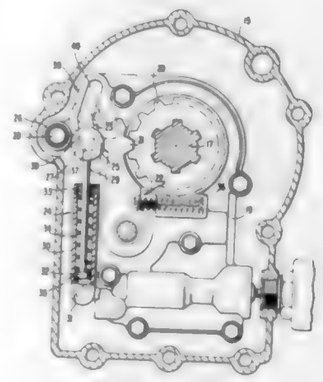
3,373,849
BRAKES AND BRAKING SYSTEMS
Glyn Phillip Reginald Farr, Kenilworth, England, assignor to Girling Limited, Birmingham, England
Filed June 24, 1966, Ser. No. 560,132
Claims priority, application Great Britain, June 26, 1965, 27,179/65
10 Claims. (Cl. 188—152)

A servo assisted vehicle brake in which the brake



mounting includes relatively displaceable members which together define a servo hydraulic cylinder and piston and are displaced in a direction to increase the pressure of fluid within the servo cylinder in response to brake drag force on braking. The brake includes a hydraulic actuator which is supplied with hydraulic fluid under pressure from a master hydraulic cylinder and piston and the pressurized fluid from the servo cylinder is applied to the piston in the master hydraulic cylinder to increase the pressure of the fluid applied to the piston in the brake applying direction to thereby create the servo effect on braking.

3,373,850
PARKING LOCK MECHANISM FOR VEHICLES, ESPECIALLY MOTOR VEHICLES
Josef A. Helmer, Aich, Kreis Nurtingen, Germany, assignor to Daimler-Benz Aktiengesellschaft, Stuttgart-Unterturkheim, Germany
Filed June 24, 1966, Ser. No. 560,173
Claims priority, application Germany, June 26, 1965, D 47,603
23 Claims. (Cl. 192—4)

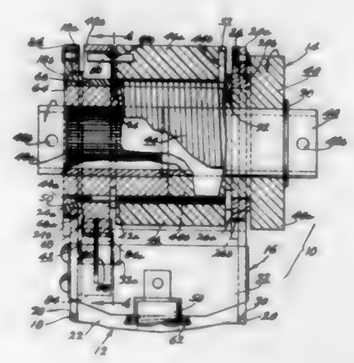


A parking lock mechanism for vehicles, especially motor vehicles having automatically shifting change-speed transmissions, particularly change-speed transmissions actuated by a pressure medium and provided with a hydrodynamic transmission part or the like connected ahead of the change-speed gear, in which the pressure for shifting the change-speed gear is influenced by a control or regulating device dependent on the output rotation speed, which control device is arranged within a cover adjoining the change-speed gear housing and separated therefrom by a partition wall, and to which is coordinated a housing part accommodating the supply and discharge, and whereby a toothed locking detent or locking pawl serves as parking lock means which is pivotally connected at one end and is provided at the other end with tooth means for the lateral engagement into the teeth provided at the circumference of the output shaft and disposed within the housing part, which locking detent or pawl is brought into and held in engagement by means of an actuating roller supported in a frictionless manner and movable by means of an elastic linkage between an abutment and the detent, and whereby the disengagement of the locking detent—after removal of the roller pressure—takes place automatically by the circumferential force of the output shaft by means of a corresponding beveling of the two toothed systems.

3,373,851
CLUTCH AND FRAME UNIT
John S. Baer, Medford Lakes, N.J., assignor to Precision Specialties, Inc., Pitman, N.J., a corporation of Missouri
Filed Feb. 11, 1966, Ser. No. 526,911
17 Claims. (Cl. 192—12)

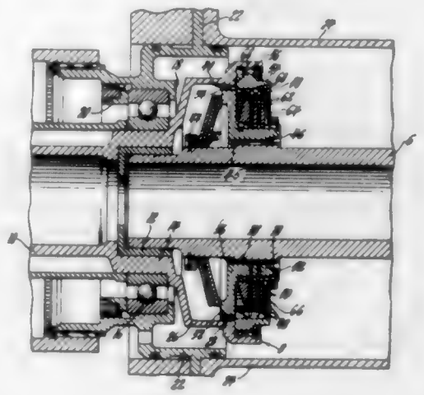
A clutch unit is provided having rotatable members including a driving hub, a driven hub and a tubular shaft providing support of the driving hub and the driven hub,

at least one of the hubs being rotatable relative to the shaft. A frame is supported by at least one of the rotatable members and includes a bearing between the at least one rotatable member and the frame. Clutch means is supported by at least one of the hubs for coupling the driving hub to the driven hub, and actuator means is supported by the frame in a position to cooperate with the clutch means to actuate the clutch means between engagement and disengagement. The tubular shaft is adapted



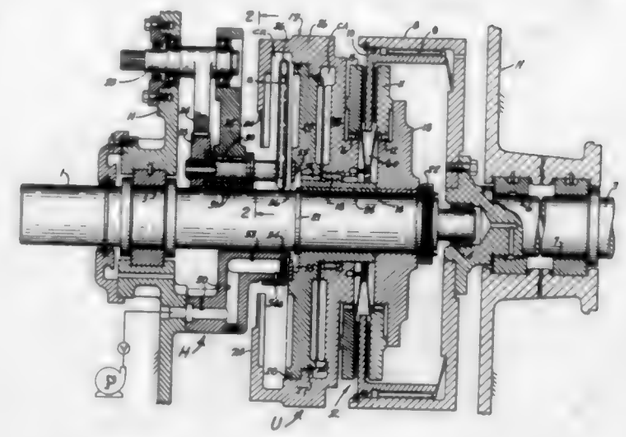
to receive and be connected to a power shaft for transmitting or receiving power. Brake means is disclosed for association with the clutch means for stopping the driven hub after the clutch means is disengaged. Means is disclosed coupled to the frame for preventing backup of the driven hub in a situation where the clutch means might otherwise reengage. Also, means is disclosed for adjustment of the stop position of the driven hub relative to the clutch means.

3,373,852
SAFETY COUPLING
Cyril M. Hawkins, Indianapolis, Ind., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed May 20, 1965, Ser. No. 457,304
5 Claims. (Cl. 192—48)



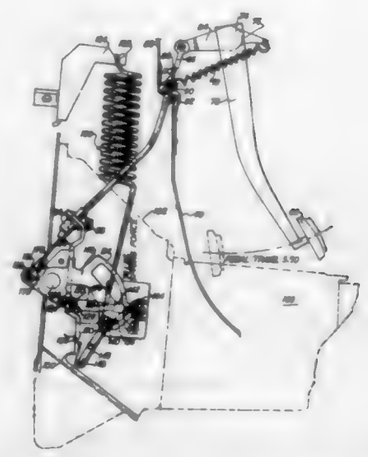
A safety coupling which transmits an unlimited amount of torque in one direction through an intermediate member movably splined on one shaft and spring urged into positive engagement with a second shaft. The safety coupling will transmit a limited amount of torque in the opposite direction by virtue of the spring. A friction clutch couples the intermediate member to the second shaft to hold the positive clutch out of ratcheting engagement beyond the negative torque limit.

3,373,853
HYDRAULICALLY ACTUATED MECHANISM
George R. Aschauer, Racine, Wis., assignor to Twin Disc Clutch Company, Racine, Wis., a corporation of Wisconsin
Filed Apr. 29, 1966, Ser. No. 546,227
4 Claims. (Cl. 192—85)



Hydraulically actuated mechanism, such as a clutch or the like, in which the actuating fluid is introduced from a stationary or non-rotating parts and is directed into a rotating part having retaining means for then channelling the fluid to the actuating chamber or other locations. Thus the fluid is injected as a stream and drawn into the rotating part by centrifugal force. An adjusting scoop tube is also used for removing fluid in combination with the above means for introducing the fluid, which combination provides an efficient, sensitive and accurately controllable mechanism.

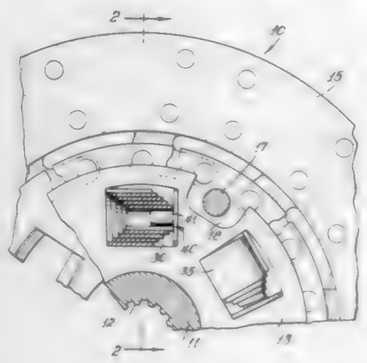
3,373,854
FRICTION CLUTCH OPERATOR HAVING A LINKAGE SYSTEM WITH A VARIABLE MECHANICAL ADVANTAGE
Etienne F. Masalskis, Oak Park, Mich., assignor to Ford Motor Company, Dearborn, Mich., a corporation of Delaware
Filed Jan. 5, 1966, Ser. No. 518,819
8 Claims. (Cl. 192—99)



This specification describes a friction clutch mechanism having a personally operable clutch operating lever and a friction clutch disc pressure plate. The mechanical connection between the personally operable lever and the clutch pressure plate shifts the latter to a clutch disengaging position. The clutch disengaging force is opposed by a clutch linkage return spring. Provision is made for reducing the mechanical advantage of the spring as the

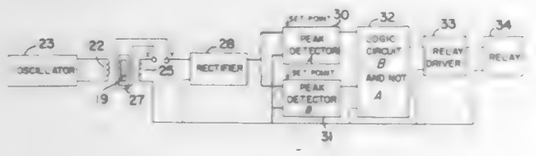
pressure plate moves away from its clutch engaging position thereby relieving the effort required to disengage the clutch.

3,373,855
VOLUTE SPRING CLUTCH DAMPER
Roger K. Ericson, Arlington Heights, Ill., assignor to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Filed May 25, 1965, Ser. No. 458,707
1 Claim. (Cl. 192—107)



A clutch device having a hub and an integral annular flange projecting radially from the hub with a friction disc supported on the hub at one side of the flange and a drive washer supported at the other side of the flange. The flange having a plurality of aligned apertures with volute spring means disposed within the apertures and adapted to transmit drive between the flange disc and the hub flange.

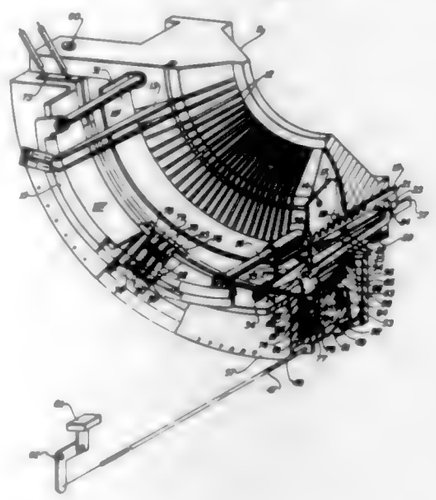
3,373,856
METHOD AND APPARATUS FOR COIN SELECTION
Norbert L. Kusters and Malcolm P. MacMartin, Ottawa, Ontario, Canada, assignors to Canadian Patents and Development Limited, Ottawa, Canada, a corporation of Canada
Filed May 23, 1966, Ser. No. 551,992
Claims priority, application Canada, Jan. 18, 1966, 950,098
12 Claims. (Cl. 194—100)



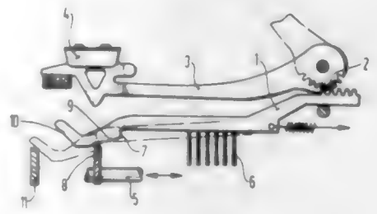
1. A method of testing coins comprising passing an alternating magnetic field through the coin to be tested, measuring the variation in the field strength due to the coin, and applying the measurement so obtained to discrimination means such that coins causing a variation in field strength that lie within a pre-determined range are found to be acceptable and all others rejected.

3,373,857
MECHANISM FOR POWER OPERATING TYPE ACTIONS BOTH TO AND FROM THE PRINTING POINT
Lloyd J. Lapointe, West Hartford, Conn., assignor to Litton Business Systems, Inc., a corporation of New York
Filed Mar. 29, 1966, Ser. No. 538,302
8 Claims. (Cl. 197—14)

A typewriter having a common cyclic reciprocatable actuator and type actions arranged to be coupled selectively to the actuator which is operative under spring power to drive an action to printing position, and under motor power to drive said action from printing to returned position.



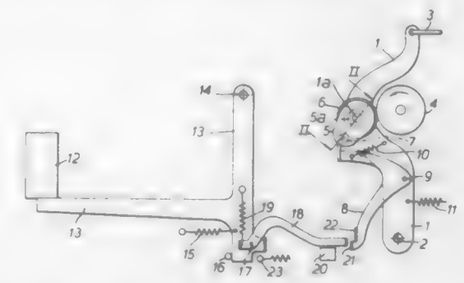
3,373,858
DRAWBAR ARRANGEMENT FOR SELECTOR BAR TRANSLATORS
Horst Stahl and Rudolf Rekewitz, Munich, Germany, assignors to Siemens Aktiengesellschaft, a corporation of Germany
Filed Mar. 11, 1966, Ser. No. 533,696
Claims priority, application Germany, Mar. 15, 1965, S 95,956
5 Claims. (Cl. 197—17)



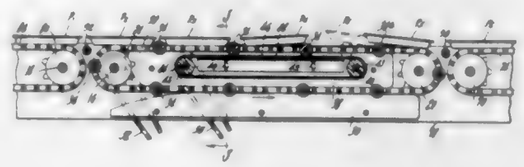
An actuating mechanism for selector-bar translators, utilizing a plurality of function-executing members, each of which is operatively coupled to an actuating drawbar, selection of a drawbar being determined by the positions of a plurality of selector bars operatively related thereto, whereby the selected drawbar may drop by movement transverse to its normal operating movement for engagement with an actuating move member movable in actuating direction over a predetermined path, in which means are provided for lifting all non-selected drawbars off of the selector bars, such means being operable during actuating movement of the actuating member and acceleration of the selected drawbar.

3,373,859
INTERMITTENT POWER TAKEOFF DEVICES
George F. N. Oliver, Bean, near Dartford, Kent, England, assignor to Oliver Pell Control Limited
Filed Oct. 17, 1966, Ser. No. 587,251
7 Claims. (Cl. 197—17)

In intermittently operated power-driven mechanism in which the drive is obtained by bringing a rotatably mounted cam into frictional engagement with a continuously driven roller, the cam is frictionally coupled to a circular disc which is rotatable about the same axis as the cam and is normally in engagement with the roller, so that the disc is rotated and tends to rotate the cam, the latter being normally held against rotation by a withdrawable detent. With this construction it can be arranged that the peripheral speed of the cam is already substantially equal to the peripheral speed of the roller at the moment when the two come into frictional engagement, thereby preventing wear and shock loading of the parts. The mechanism is suitable for operating the type bars of power driven typewriters and is described in its application to such machines.

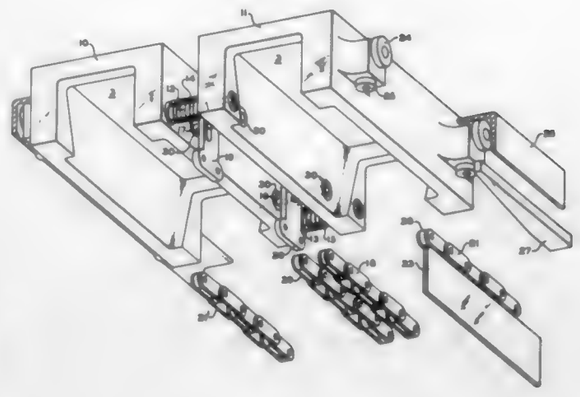


3,373,860
CONVEYOR SYSTEM
George C. Lindgren, North Reading, and James R. Cowdery, Andover, Mass., assignors to J. W. Greer Company, Wilmington, Mass., a corporation of Massachusetts
Filed June 2, 1965, Ser. No. 460,722
1 Claim. (Cl. 198—34)



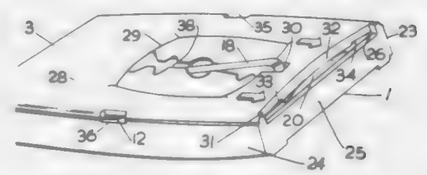
1. A method of conveying containers comprising: continuously sequentially discharging in timed relationship and in one direction a plurality of containers being transported by a first conveying means engaging the bottom portions only of said containers onto a second conveying means having an elongated traverse continuously moving forwardly in said one direction and having a plurality of container receiving portions spaced in said one direction with auxiliary container moving means located between adjacent portions of said container receiving portions, respectively, such that said bottom portions of sequential ones of said discharged containers are deposited on one of said container receiving portions or in part on the one of said auxiliary container moving means located rearwardly adjacent one of said container receiving portions not having one of said containers in its entirety deposited therein; advancing each of said containers deposited on an auxiliary container conveying means to the container receiving portion located in said one direction with respect thereto by movement of said auxiliary container conveyor means in engagement with the bottom surface of said container deposited in part thereon prior to the discharge of the next sequential container of said containers from said first conveying means; and transferring said containers being transported by said traverse at a location remote from said discharge portion of said first conveying means to other means.

3,373,861
SEALING PACKAGES
Andrew J. Gass, Summit, N.J., assignor to Phillips Petroleum Company, a corporation of Delaware
Original application June 24, 1964, Ser. No. 377,671, now Patent No. 3,331,183. Divided and this application Apr. 7, 1967, Ser. No. 629,160
4 Claims. (Cl. 198—131)



Pocket means for supporting containers therein for subsequent covering, said pockets having interior walls shaped to support the sides of the packages therein and being slidably biased away from one another, said pocket means also carrying rotatable means for coacting with guide means.

3,373,862
RAZOR BLADE DISPENSER
Marjorie Doreen Minchin, 154 Victoria Ave., Borrowash, Derby, England
Filed Aug. 6, 1965, Ser. No. 477,880
Claims priority, application Great Britain, Aug. 8, 1964, 32,386/64; Nov. 19, 1964, 47,074/64
5 Claims. (Cl. 206—16)

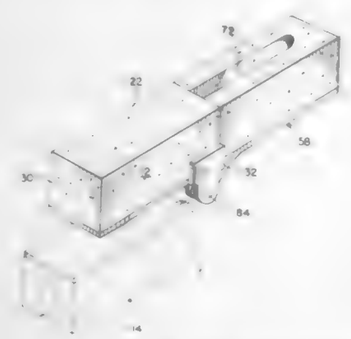


1. A naked razor blade dispenser comprising a casing having a top formed with a thumb opening and a blade exit end portion, an end wall having an upper blade exit portion which forms with the blade exit end portion of the casing top a blade exit slot; ramp means in the casing and extending from side-to-side of the casing and inclining from a location on the casing floor spaced from said end wall upwardly and forwardly toward said blade exit slot; and on the underside of said blade exit end of the casing top and on the top side of said ramp means, arcuate surfaces cooperating in resilient, substantially closed, exit relationship with each other.

3,373,863
COMBINED HOLDER AND UTENSIL FOR A FEVER THERMOMETER
Leonard Afton, 4880 N. Marine Drive, Chicago, Ill. 60640
Filed Aug. 8, 1966, Ser. No. 571,113
6 Claims. (Cl. 206—16.5)

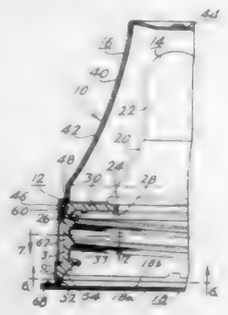
A holder for a fever thermometer which enables the thermometer to be introduced into the oral cavity without

removing the thermometer from the holder. A hinged section of the holder swings to an out-of-the-way position



to expose the bulb end of the thermometer for such oral introduction.

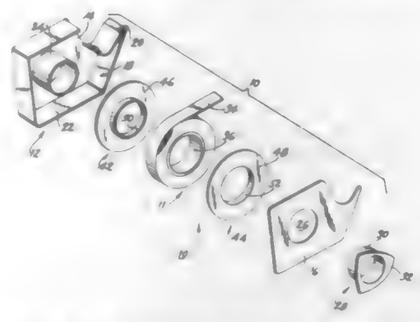
3,373,864
PRESTERILIZED NIPPLE PACKAGE
Raymond W. Barton, Evansville, Ind., and John K. Neely, Williamsport, Pa., assignors to Mead Johnson & Company, Evansville, Ind., a corporation of Indiana
Filed Aug. 2, 1966, Ser. No. 569,699
3 Claims. (Cl. 206—46)



A sterile package for a nipple and retaining ring having an outer cover member and a removable closure seal. The outer cover is cup-like with a top portion and a cylindrical skirt which surrounds the nipple retaining ring. The retaining ring, and the nipple mounted in it, are held within the cover member and cannot fall out when the seal is removed. Ribs on the retaining ring lock with grooves on the outer cover member so that the retaining ring can be attached to a bottle before the cover member is removed.

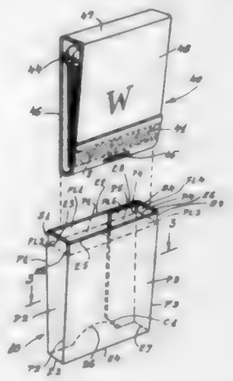
3,373,865
DISPENSER FOR PRESSURE-SENSITIVE TAPE
Jesse R. Hollins, 1059 E. 22nd St., Brooklyn, N.Y. 11210
Filed Mar. 10, 1966, Ser. No. 533,300
6 Claims. (Cl. 206—52)

1. A portable pressure-sensitive adhesive tape dispenser, said dispenser including a multi-convoluted wound roll of tape, the diameter of the roll being greater than the width of the roll, the roll having a pair of spaced opposed circular side faces defined by the edges of the convolutions of the tape, at least the radially inward face of the tape being covered by a layer of a pressure-sensitive adhesive, a cylindrical sleeve about which the tape is wound, said sleeve having its edges in alignment with the side faces of the roll, a housing containing and rotatably carrying the roll of tape, said housing comprising two broad substantially flat spaced generally parallel interconnected walls, a support intermediate the walls on which the sleeve of the tape roll is journaled for rotation about an axis generally perpendicular to the walls and a cap interposed between a side face of the tape roll and an interior surface of a housing wall, the cap comprising a flat disc of a size sufficiently large to substantially cover the said side face of the roll, and further comprising a cylindrical hub integral and concentric with the disc, said hub being disposed between the sleeve of the tape roll and said support, the lower side face of the tape roll overlying the disc of the cap when the tape dispenser is stored with the walls of the housing substantially horizontal with said face lowermost and after a passage of time becoming sticky by the exposure of the pressure sensitive adhesive at said side face, and said side face adhering to the interior face of said disc of the cap, the cap thereupon adhering to and rotating with the roll of tape and thereby preventing inoperativeness of the dispenser caused by adherance of the sticky face of the roll to the housing wall, the outermost convolution of the tape being freed from edgewise adherence to the disc of the cap as said convolution is unwound from the roll.



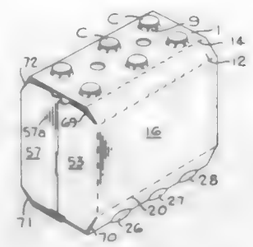
3,373,866
COVER LOCK OR SHROUD FOR BOOK MATCH FOLDERS
Theodore Will, Syosset, N.Y., assignor to Fund Del Inc., Syosset, N.Y., a corporation of New York
Filed June 10, 1966, Ser. No. 556,687
5 Claims. (Cl. 206—29)

1. A combined matchbook folder or the like and safety reusable cover lock or shroud, a matchbook folder being formed by a substantially rectangular strip of flexible sheet material, said strip having a plurality of transverse folds defining and joining a plurality of panels, a first one of said panels being narrow and connected to a second longer panel by a first fold, a plurality of match layers having matches joined at base ends of the layers, said base ends being interposed between the first and second panels, fastener means engaging the match layers and the first and second panels to hold the match layers in the folder, a striking surface disposed along the outer surface of said narrow panel, said first panel forming a part of a front side of the folder, the second panel forming a rear imperforate cover side of the folder, a narrow third one of the panels joined to the second panel by a second fold and defining a top imperforate cover panel of the folder, a fourth longer panel joined to the third panel by a third fold and defining a front imperforate cover panel for the folder in cooperation with the first panel when disposed thereunder so as to form a complete inner cover for the matches, and an outer safety reusable cover lock or shroud adapted to be slidably and removably disposed over said matchbook folder comprising a tapered tubular body of rectangular section and having opposite open top and bottom ends, and opposite closed front, back and sides, said outer safety cover being formed from a trimmed strip of flexible sheet material, having a plurality of preformed vertical folds, as opposed to the transverse folds of the matchbook folder, defining and joining a plurality of preformed panels, having a front wall, superimposed and sealed rear wall and two side walls, an open top end and narrower open bottom end, said front and side walls tapering downwardly and inwardly, a first narrow inner back panel to receive adhesive being part of a superimposed rear cover panel, a second narrower tapered panel connected to the first panel by a vertical fold slitted at the top end, defining a first outer side cover panel, a third larger panel joined to the outer first side cover panel by a second vertical fold slitted at the top end, and defining an outer front cover panel, a fourth narrow tapered panel of similar dimensions as the second narrow tapered panel joined to the outer front cover panel by a third vertical fold slitted at the top end, defining a second outer side cover panel, a fifth larger panel joined to the second outer side cover panel by a fourth vertical fold slitted at the top end, and when superimposed and adhered to the first narrow panel, defining a rear outer cover panel, said slitted folds defining flexible expandable, springy flap-like portions at the top of the panels and thereby opening and providing pressurized hold and release on front and rear cover panels of the inner matchbook, said superimposed and adhered rear outer wall providing a double thickness whereby reinforced compression is exerted on the rear inner cover panel of the matchbook for frictionalized hold and withdrawal of the inner matchbook whereby to form a complete outer cover adapted for said inner match folder to be inserted therein, through the top open end, the width of the top open end of the outer cover lock being narrower than the top cover panel of the inner book match to expand the flexible, expandable springy



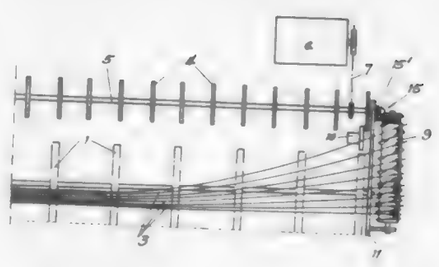
flap-like portions of the panels when the matchbook is inserted in the cover lock, the matches having two panels, namely the front outer cover panel of the cover lock and the front inner cover panel of the matchbook in front of the matches, two panels, namely, the rear outer cover panel of the cover lock and the rear inner cover panel of the matchbook behind the matches, a single top inner cover panel of the matchbook covering the top of the matches and the single outer side cover panels of the cover lock covering the open sides of the matches, when the matchbook is inserted into the safety reusable cover lock in closed condition, said outer reusable cover lock being unattached to and the inner matchbook being removable therefrom by pushing up the matchbook from the narrow open bottom end of the outer cover lock out of the top open end thereof and grasping both ends of the inner top cover panel of the matchbook and pulling the complete inner matchbook out of the cover lock from its top open end for opening and the use of the matchbook, and thereafter reinserting the matchbook through the top open end into the outer safety cover lock, for locking the inner cover of the matchbook, and doubling protection, said cover lock being slidably and removably disposed on the matchbook in an intermediate position between opposite ends thereof, said cover lock being substantially equal in length to said inner matchbook to cover the striking surface of the inner book match when the matchbook is inserted in the cover lock.

3,373,867
ARTICLE CARRIER
Prentice J. Wood, Jonesboro, Ga., assignor to The Mead Corporation, a corporation of Ohio
Continuation-in-part of application Ser. No. 407,779, Oct. 30, 1964. This application May 22, 1967, Ser. No. 640,078
4 Claims. (Cl. 206—65)



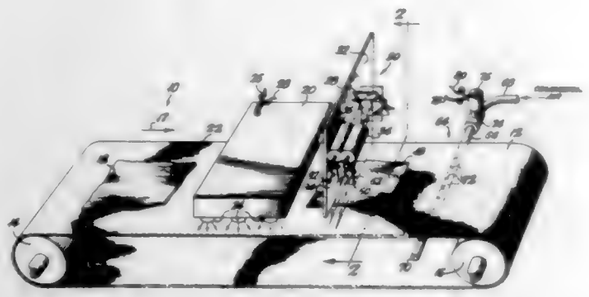
An article carrier of the wrap-around type having top, bottom and side panels interconnected to form a tubular structure is provided with end panels which are foldably joined to each end edge of each side wall and which are interlocked along their inner edges. The overall effective width of each pair of end panels at each end of the carrier is somewhat greater than the spacing between the end edges of the side walls so that, when the panels are interlocked and closed, an over-center toggle action is effected which serves to bias and hold the end panels closed.

3,373,868
APPARATUS FOR SELECTING RODLIKE MEMBERS
Jean Missioux, Sannois, Pierre Soubrier, Courbevoie, and Jean Vennat, Drancy, France, assignors to Botalam, Paris, France, a corporation of France
Filed Nov. 17, 1965, Ser. No. 508,298
Claims priority, application France, Nov. 19, 1964, 995,469; Mar. 12, 1965, 8,987
9 Claims. (Cl. 209—97)



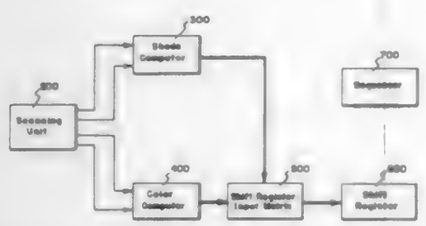
An apparatus having conveyor means for moving, selecting and separating a plurality of rods or the like in a continuous manner comprises an accelerator located along one edge of the conveyor for engaging the rods whereby they may be moved individually through a separator and thereafter grouped and bundled. A selector means, which may be a variable pitch screw, receives the said ends of the rods and moves them from the accelerator to the separator, provided that the rods are of a specified length. The said ends of the rods are moved forwardly at a speed which is greater than the conveyor speed whereby the rods are transferred one at a time by the separator. A rod counting means is positioned in the vicinity of the selector means whereby the engaged ends of the rods can be counted so as to control the number thereof placed in each group during the bundling operation. The short rods are not engaged by the screw member and are subsequently moved along the conveyor into a separate storage zone.

3,373,869
TOWEL SORTER HAVING AN INFRARED DETECTOR
Benard Burson, Jr., Austin, Tex., assignor to Burson Electronics, Inc., Austin, Tex., a corporation of Texas
Filed Aug. 23, 1965, Ser. No. 481,620
17 Claims. (Cl. 209—111.5)



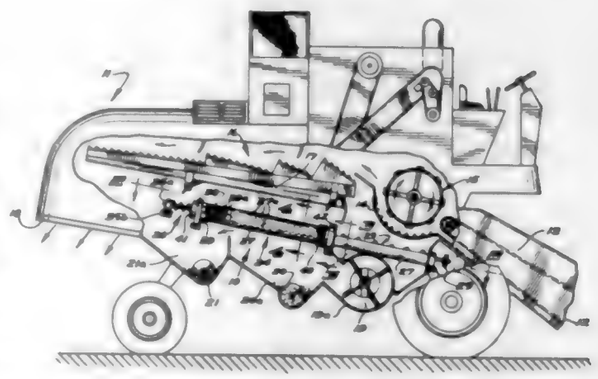
Disclosed is a system for detecting foreign matter in articles and particularly abrasive materials remaining in towels cleaned by a commercial laundry. The towels pass along an open mesh conveyor belt beneath one or more heat lamps where they are heated several degrees above ambient. Downstream of the heat lamps is an infrared detector which is scanned across the towel to sense variations in re-emitted infrared radiation. The detector output is gated by a visible light system sensing the presence of a towel. A towel with too much abrasive is ejected by an air stream from below passing through the conveyor belt.

3,373,870
CIGAR CLASSIFICATION APPARATUS
James H. Black, Quinton, and Charles E. Coleman and Vernon C. Stant, Richmond, Va., assignors to The American Tobacco Company, New York, N.Y., a corporation of New Jersey
Filed July 8, 1966, Ser. No. 563,906
6 Claims. (Cl. 209—111.6)



1. Apparatus for classifying an object in one of a plurality of categories associated with color and shade levels comprising:
(a) multichromatic light means for illuminating said object;
(b) first photoelectric means for generating a reflection signal corresponding to the intensity of light in a spectral range reflected from said object;
(c) second photoelectric means for generating a first color signal corresponding to the intensity of light of a first color in the spectral range reflected from said object;
(d) third photoelectric means for generating a second color signal corresponding to the intensity of light of a second color in the spectral range reflected from the object;
(e) electronic means for dividing the first color signal by the sum of the first and second color signals to produce a color quotient signal;
(f) means responsive to the magnitude of the color quotient signal for selecting one of a plurality of color level signals;
(g) means responsive to the magnitude of the reflection signal for selecting one of a plurality of shade level signals;
(h) means responsive to the color level and shade level signals for placing the object at a location corresponding tothe category associated with the color and shade levels represented by those signals.

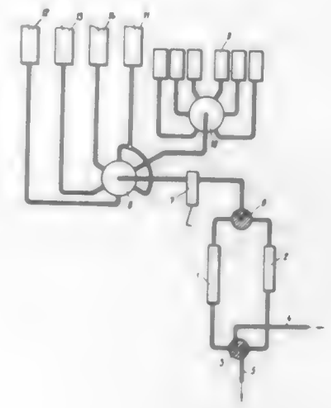
3,373,871
SEPARATING SIEVES FOR COMBINES
Calvin J. Huether, Regent, N. Dak. 58650
Filed Apr. 7, 1965, Ser. No. 446,240
10 Claims. (Cl. 209—284)



This invention relates to a separating device for installation in agricultural combines designed to specifically replace the flat separating sieves now utilized in such machines. The separating sieve structure as provided herein includes a first grain receiving section designed to initially receive a partially separated grain therein and which includes a plurality of drive auger members to displace this received grain in a separating sieve section. A plurality of individual open-topped auger housing compartments are provided such that a certain amount of the grain received therein will be a portion to each auger and will not tend to collect on one side of the device if the device should, for example, be operating on an incline. The received grain is delivered by the augers to aligned separating conduits which conduits are provided with a plurality of passages extending radially therethrough and which include a first set of passages and a second set of passages of substantially different sizes. The conduits are rotated in counter rotation to the augers and a working effect is produced on the grain such that further separation is afforded and the completely threshed grain is delivered to the first set of passages and the partially separated grain is delivered through the second set of passages where it will be returned to the initial grain receiving section for rethreshing.

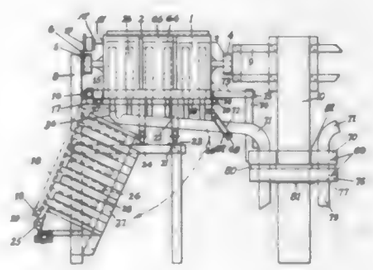
3,373,872
APPARATUS FOR CARRYING OUT A RAPID CHROMATOGRAPHY OF AMINO ACID AND SIMILAR MIXTURES
Jiří Hrdina, Prague, Czechoslovakia, assignor to Ceskoslovenska akademie ved, Prague, Czechoslovakia, a corporation of Czechoslovakia
Filed Mar. 31, 1965, Ser. No. 444,247
Claims priority, application Czechoslovakia, Apr. 13, 1964, 2,139/64
3 Claims. (Cl. 210—198)

A chromatographic apparatus particularly for amino acids and similar mixtures in which a pump feeds eluents



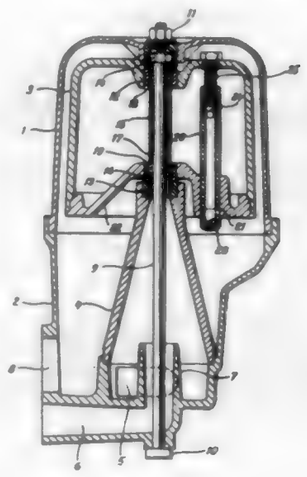
from their containers and samples to be analyzed from their respective containers into one or two columns.

3,373,873
MULTIPLE ELEMENT, HORIZONTALLY ROTATING, FILTER PANS HAVING PIVOTING BOTTOMS
Alfred H. Parmentier, 3 La Bruyere, Lillois, Brabant, Belgium
Filed Mar. 17, 1966, Ser. No. 535,071
Claims priority, application Luxembourg, May 12, 1965, 48,582
4 Claims. (Cl. 210—236)



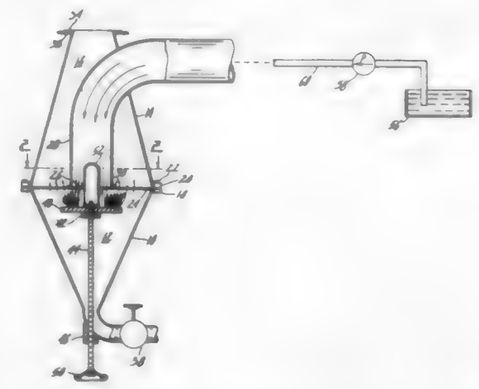
A continuous rotary filter adapted for operation under vacuum or under pressure, comprising a plurality of filtering pans mounted for rotation in a horizontal plane around a vertical axis; a plurality of filter cells in each pan; a bottom for each pan pivotally secured thereto along one edge by a hinge having a horizontal axis; watertight seal between each pan and its bottom extending around the periphery of the bottom; means for holding each bottom in close engagement with its pan during a portion of the rotary travel thereof; means for releasing each bottom for swinging movement downwardly about the horizontal hinge during another portion of the rotary travel thereof; means for applying a vacuum to the interiors of the cells, or for distributing liquid under pressure to the exteriors of the cells, during the first-mentioned portion of the rotary path of travel and connections between these means and the pans for removing liquid passing through the cells; means for removal of solids deposited on the cells during the other portion of the rotary path of travel; and means for thereafter swinging each bottom upwardly into watertight engagement with its pan.

3,373,874
CYCLONE-CENTRIFUGE SEPARATOR
Paul Kompert, Stockholm, Sweden, assignor to Alfa-Laval AB, Stockholm, Sweden, a corporation of Sweden
Filed Oct. 12, 1965, Ser. No. 495,041
Claims priority, application Sweden, Oct. 14, 1964, 12,349/64
10 Claims. (Cl. 210—261)



A centrifuge rotor has one end provided with an inlet disposed at the rotor axis, the rotor also having an outlet for centrifugally cleaned liquid; and a cyclone has a tangential inlet for liquid to be cleaned and an outlet for liquid cleaned by the cyclone action. The cyclone has a narrow end on which the centrifuge rotor is journalled for rotation and which forms a second outlet for material separated from the liquid by the cyclone action; and releasable means are provided to clamp the cyclone and rotor together with said second outlet of the cyclone opening into said axial inlet of the rotor.

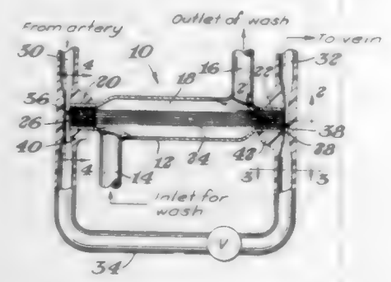
3,373,875
APPARATUS FOR SCREENING PULP
Garo Krikorian, Paxton, Mass., assignor to Rice Barton Corporation, Worcester, Mass., a corporation of Massachusetts
Filed June 1, 1965, Ser. No. 460,252
2 Claims. (Cl. 210—305)



1. A liquified pulp screening apparatus having, in combination, a housing providing therein a pulp slurry flow channel, a screen interposed in said channel, said housing providing at one side of said screen an upstream flow area and above said screen a downstream flow area, a baffle disposed within said upstream flow area having an impact face adjacent and underlying said screen and having the

edges thereof spaced from said housing providing egress for rejects below said baffle, an adjustable support on which the baffle is adjustable toward and away from the screen, and a pulp slurry inlet conduit extending through a central portion of said screen having an orifice directing inflowing slurry directly against said impact face thereby diverting the flow against the inflowing slurry producing turbulence and a flow of said turbulent slurry over the screen area and through the screen.

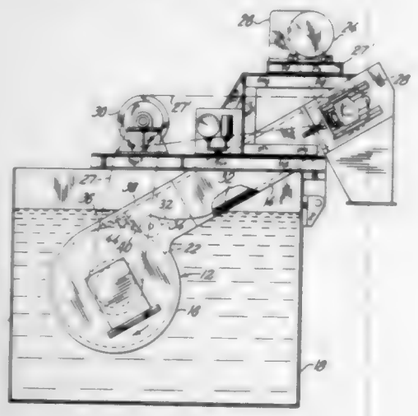
3,373,876
ARTIFICIAL BODY ORGAN APPARATUS
Richard D. Stewart, Midland, Mich., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware
Filed May 12, 1966, Ser. No. 549,662
4 Claims. (Cl. 210—321)



An artificial organ apparatus, such as a hollow fiber artificial kidney, including a substance exchanging element having an inlet and outlet for blood.

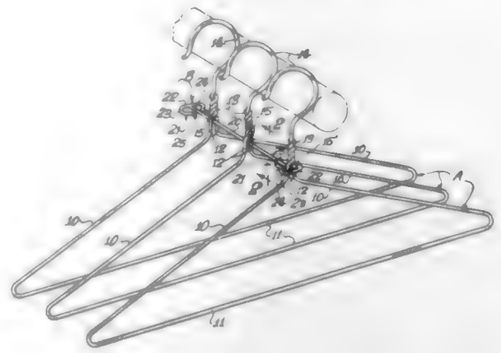
A header assembly coupled to the blood inlet and another header assembly coupled to the blood outlet, each header assembly having an input and output end and a transverse flow path intermediate of the input and output end and a Venturi flow path across the junction with the transverse flow path. The output end of one header is coupled to the input end of the other header. The input of one header is to be coupled to a source of blood and the output of the other header is coupled to blood return means.

3,373,877
FILTER DEVICE
James M. Stewart, Dearborn, and Sark Pashaian, Monroe, Mich., and Paul N. Romack, Youngstown, Ohio, and Orlan M. Arnold, Grosse Pointe Park, Mich., assignors to Ajem Laboratories, Inc., Livonia, Mich.
Filed Sept. 22, 1964, Ser. No. 398,446
2 Claims. (Cl. 210—401)



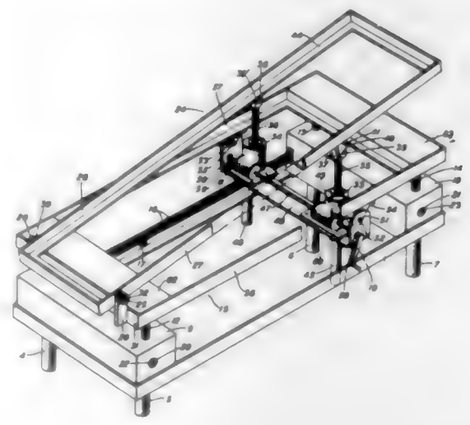
A filter assembly having a rotatable permeable drum and a filter medium transporting means to carry filter medium over the permeable surface of the drum, and a suction connection to the interior of the drum. The assembly being movably mounted so as to dip into a tank of filterable liquid. The drum being rotatably and slidably mounted on stub shafts on the assembly frame at either end, so that the drum is rotatably and removeably positioned.

3,373,878
COAT HANGER COUPLER AND ASSEMBLY
Maurice L. Daitch, 3807 Scadlock Lane, Sherman Oaks, Calif. 91403
Filed Mar. 22, 1966, Ser. No. 536,466
4 Claims. (Cl. 211—119)



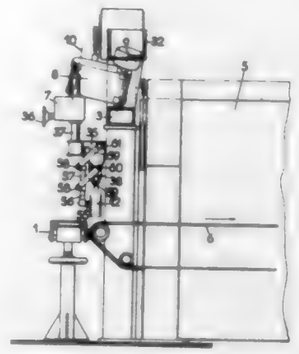
Disclosed herein is an assembly of coat hangers of the common twisted-wire type, in combination with a coupler, likewise of wire, comprising one or more coupler bars extending through the yoke that is immediately below the twisted connection between the two hanger arms of the hanger, and which provides a support from which some of the hangers can be suspended in the event another hanger of the assembly is grasped by its supporting hook and used as a handle to support the assembly. The coupler further includes means to engage the upper sides of the hanger arms to transmit support to the coupler from one or more hangers which are directly supported from a person's hand or from some external support.

3,373,879
ELEVATING AND TILTING FRAME STRUCTURE
Anthony J. Verini, 30 Lenox Ave., Greenbrook, N.J. 08812
Filed Mar. 9, 1966, Ser. No. 532,995
5 Claims. (Cl. 214—1)



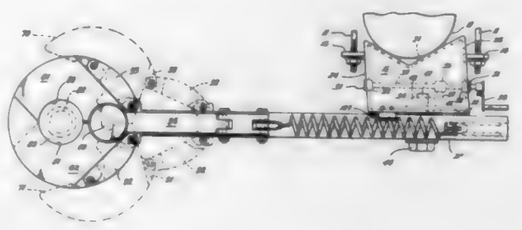
A vertically adjustable frame structure is disclosed utilizing a pivotally mounted jack-actuated control arrangement for tilting an elevated support platform to desired sloping angles and heights. Control and linking shaft arrangements are used for controlling a pair of jacks mounted on a pivotally secured U-shaped bracket for facilitating the platform tilting action with reduced actuating force by personnel and reduced frictional forces on the jacks.

3,373,880
AUTOMATIC TRANSFER MECHANISM FOR BOTTLES
Michel Dubesset, Complegne, France, assignor to Societe Anonyme dite: Ateliers de Construction de Complegne, Complegne, Oise, France
Filed June 27, 1966, Ser. No. 560,592
Claims priority, application France, July 15, 1965, 24,758, Patent 1,450,805
6 Claims. (Cl. 214—1)



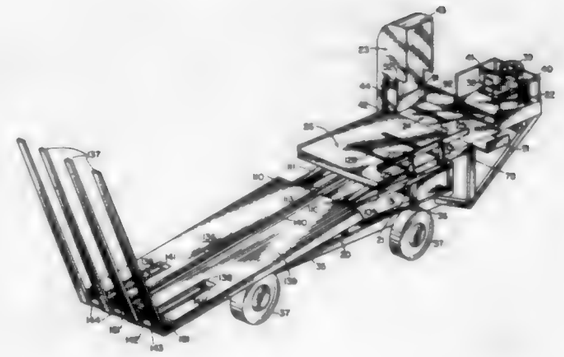
1. A machine for transferring a row of articles from a first position to a second position, said machine comprising elongated gripping means for simultaneously gripping all of the articles in said row, at least two arms pivotally attached to said gripping means at points spaced longitudinally therealong, individual pivot means for each arm on which said arms are mounted to swing between a position supporting said gripping means in its first position and one supporting said gripping means in its second position, said pivot means and arms constituting a parallellogram linkage for swinging said gripping means, and said pivot means being inclined away from a point intermediate said first and second gripping means positions, so that said gripping means is successively raised and lowered as it is swung between its two positions.

3,373,881
PIPE STABILIZER
Ottis W. Frogge, Oklahoma City, Okla., assignor to M-C-M Machine Works, Inc., Oklahoma City, Okla., a corporation of Oklahoma
Filed Mar. 9, 1966, Ser. No. 533,035
7 Claims. (Cl. 214—2.5)



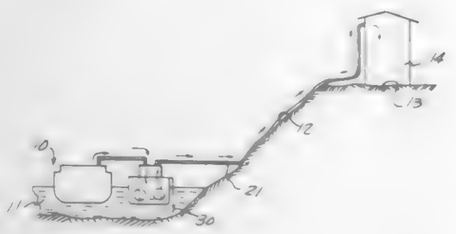
1. A stabilizer including
an arm pivotally mounted for motion between a lower position and an upper position,
jaw means pivotally mounted on the arm,
spring means holding said jaws in open position while said arm moves between said positions,
torque means to rotate said arm from said lower to said upper position,
stop means to block the travel of said arm when it reaches said upper position, and
means connecting said torque means to said jaw means to move said jaw means to closed position upon further actuation of said torque means but only after said torque means has moved said arm to said upper position against said stop,
said spring means exerting sufficient force to keep said jaw means fully open during the entire motion of said arm from said lower to said upper position despite the action of said torque means thereon tending to close the jaws during elevation of said arm from said lower to said upper position.

3,373,882
BALE LOADING AND STACKING DEVICE
Stanley L. Forest, Royal City, Wash. 99357
Filed Apr. 14, 1966, Ser. No. 542,635
5 Claims. (Cl. 214—6)



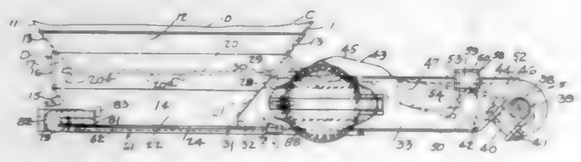
1. A bale loading and stacking device of the nature aforesaid comprising, in combination:
a steerable vehicle having a prime mover supplying power for motion and appurtenant systems carried thereon;
an operation deck, in a forward upper position thereon, having centralized operating controls accessible therefrom;
an elevator structure, in the forward position, having means to convey bales presented thereto to a transfer deck adjacent the upper part thereof;
a transfer deck communicating transversely from the upper portion of said elevator to a bale cart rearwardly adjacent thereto, said deck having first means of conveying bales therealong to a medial transfer portion and second means of transferring bales therefrom to a bale cart;
a bale cart adjacent said transfer deck moveable therefrom to and onto a rearwardly positioned bale stacker, said cart having means of laterally and vertically positioning bales thereon;
a bale stacker pivotably communicating with said vehicular frame, adapted to receive an array of bales from said bale cart and store them;
means of rotating said bale stacker rearwardly to deposit bales carried thereby upon a supporting surface; and
a pusher means of separating said vehicle from said deposited bales.

3,373,883
BARGE UNLOADING SYSTEM
Werner Ostberg, Milan, and Michael D. Challis, Ann Arbor, Mich., assignors to Dundee Cement Company, Dundee, Mich.
Filed Nov. 17, 1966, Ser. No. 595,259
1 Claim. (Cl. 214—14)



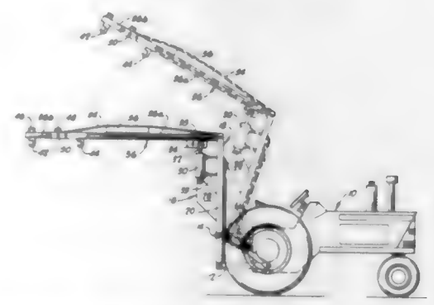
A cement unloading system for transferring dry cement from a barge to a highly elevated silo on a river bank employing an unloading barge with vacuum and pressure equipment.

3,373,884
SELECTIVE PNEUMATIC AND GRAVITY UNLOADING HOPPER CAR
George B. Dorey, Westmount, Quebec, Canada, assignor to Continental Transport Appliances Limited, Montreal, Quebec, Canada, a corporation of Canada
Filed Feb. 14, 1966, Ser. No. 526,996
4 Claims. (Cl. 214—83.18)



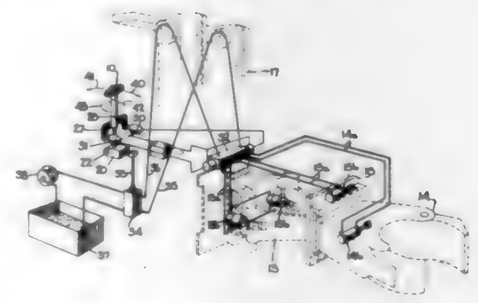
1. In a hopper car having an opening for selective discharge of lading either by gravity or pneumatic action, in combination,
(a) a sliding gate for the opening;
(b) a four-sided chute-like receptacle below the gate for directing the flow of lading from the discharge opening,
(c) one of the sides of the receptacle extending transversely beneath the gate,
(d) laterally spaced extension wall members projecting forwardly from the said transverse wall to support the gate in open position,
(e) a shiftable floor member arranged to funtion in one position as closure for the receptacle for operation as a pneumatic unloader and shiftable to a storage position beneath the extension wall members to adapt the car for gravity unloading, and
(f) a conduit system extending transversely to the path of movement of the gate including:
(1) a centrally located box-like casing disposed between the extension wall members in juxtaposition to the transverse wall of the receptacle,
(2) a communicating opening between the chute receptacle and the casing portion of the conduit for admission of lading into the conduit system,
(3) end conduit sections extending laterally from the respective side extension walls to present air and lading exit openings for connection with a source of reduced pressure,
(4) air inlet openings at the opposite ends of the central casing section for the admission of entraining air,
(5) valves for metering the entraining air,
(6) control rods for operating the air inlet valves from a location adjacent the remotely located exit opening whereby the stream of air enters at the distal end of the casing and flows along the length of the communicating opening.

3,373,885
LOADING ATTACHMENT
Virgil E. Allison, Rte. 1, Box 92, Morris, Okla. 74445
Filed July 8, 1966, Ser. No. 563,876
3 Claims. (Cl. 214—131)



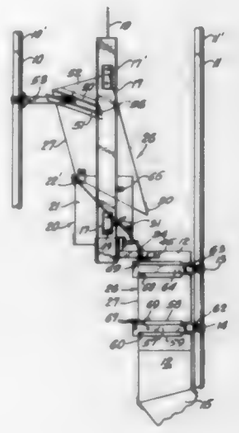
A load-lifting apparatus useful in combination with a self-powered vehicle having a three point hitch and including a vertically extending boom supporting assembly of generally rectangular configuration, an elongated boom having an end pivotally connected to the upper end of the boom supporting member for pivotation about a horizontal axis, a hydraulic cylinder support plate secured to the boom supporting member intermediate its length, and a hydraulic piston and cylinder assembly spaced from the boom supporting assembly, supported at one of its ends by the hydraulic cylinder support plate and connected at its other end to the elongated boom between the ends thereof. The vertically extending boom supporting assembly includes a pair of horizontally spaced, parallel, vertically extending beams which are connected at their lower ends to the outer hitch links of the three point hitch, and which are connected at their upper ends to a horizontal rod which journals a transversely extending sleeve to which the pivoted end of the elongated boom is secured.

3,373,886
MULTIPLE LOAD MANIPULATOR
Bronislaus I. Ulinski, Jenkintown, Pa., assignor to Eaton Yale & Towne Inc., a corporation of Ohio
Filed Sept. 22, 1965, Ser. No. 489,147
2 Claims. (Cl. 214—653)



Relates to a control handle for controlling the manipulation of at least three load manipulating devices on the carriage of a lift truck. Movement of the handle in a fore-and-aft direction controls the direction of fluid to an electromagnetic valve which in turn controls fluid to each of the three load manipulating devices. The arrangement is such that control of any one device may be made in any fore-and-aft position of the control handle simply by rotating the control handle to actuate the electromagnetic valve.

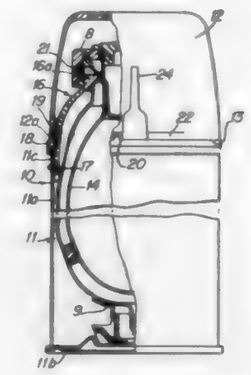
3,373,887
MATERIAL HANDLING APPARATUS WITH A TWO SECTION BUCKET ASSEMBLY
Fritz J. Nesslinger, College Point, and Arthur C. Borgman, Franklin Square, N.Y., assignors to Harsco Corporation, Harrisburg, Pa., a corporation of Delaware
Filed Feb. 3, 1966, Ser. No. 524,803
6 Claims. (Cl. 214—703)



1. Material handling apparatus for installation and operation in hoisting towers and wherein a bucket open at its top end is mounted in operative relation to a hopper open at its top end, said apparatus including hoisting means arranged and adapted to move said bucket vertically in a hoisting tower, said bucket including a base having an inclined material supporting floor and spaced side walls, a back wall and an open front, said hoisting means operative to limit the movement of said base to a vertical rectilinear path, and a tiltable top pivotally supported on said base and having a front wall and spaced side walls positioned for telescoping with and between the side walls of said base to retain a charge of concrete in the bucket, a latch pivoted on said base at each side thereof and operatively arranged and adapted to releasably retain said top in bucket closing and material confining position, latch actuating means on said hopper operatively positioned in the path of vertical movement of said latch and arranged and adapted to move the latch angularly into top releasing position with upward travel of the bucket and into top latching position with downward travel of the bucket, and top tilting means operatively arranged and adapted to tilt the top toward material releasing position with upward travel of said bucket and to return said top to bucket closing position with downward travel of said bucket, and a detent positioned and adapted to limit said angular top releasing movement of said latch.

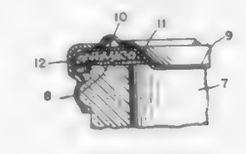
3,373,888
NON-BINDING CONTAINER AND COVER
George W. Fuller, Hampton, Conn., assignor to King-Seeley Thermos Co., Ann Arbor, Mich., a corporation of Michigan
Filed Apr. 3, 1967, Ser. No. 627,734
4 Claims. (Cl. 215—13)

Provides vacuum ware comprising an evacuated filler received in a holder having a breast at its upper end and a cup or cover threaded onto the breast, particularly characterized by co-engageable radial camming means on the



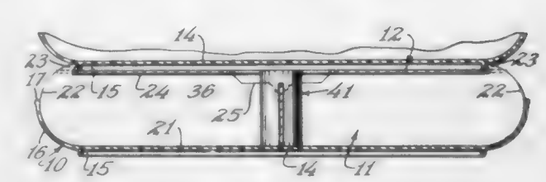
cup and breast which limit the threading-on movement of the cup and limit frictional binding between the cup and breast to less than the entire engaged areas thereof.

3,373,889
PRESSURE SEALING JAR LID
John S. Giles, Wayne, Ill., assignor to Phoenix Metal Cap Co. Inc., Chicago, Ill.
Filed May 31, 1961, Ser. No. 113,719
1 Claim. (Cl. 215—40)



1. A sealing lid for face-to-face engagement with the smooth lip of a receptacle, said lid having an inner homogeneous thermoplastic lining formed of a synthetic thermoplastic polymeric material containing wholly embedded discrete particles of inert material with those particles adjacent the surface of said lining projecting out of the normal plane of said surface and although wholly coated by said thermoplastic material producing a rough uneven surface pressure resistant at atmospheric temperature to form a rough venting surface but being yieldable at higher processing temperatures to form a sealing surface.

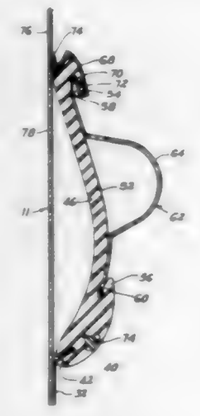
3,373,890
CONTAINER FOR CONTAINING FROZEN FOOD
Paul K. Schilling, St. Paul, Minn., assignor to Plastics, Inc., St. Paul, Minn., a corporation of Minnesota
Filed July 5, 1966, Ser. No. 562,814
6 Claims. (Cl. 220—22)



The invention relates to a serving dish structure designed for use by airlines and the like. The structure includes a dish having upwardly extending peripheral walls terminating in a peripheral edge. A divider structure is provided to divide the dish into sections. The divider section extends above the level of the peripheral dish edge and

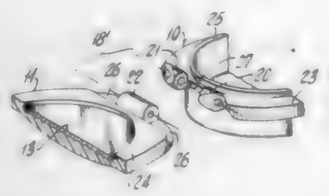
supports a disc-like cover in spaced relation to the dish. The dish is provided with a circular supporting flange extending downwardly therefrom. The divider structure includes upwardly extending projections at their outer extremities, extending above the level of the cover which is radially slotted to accommodate the projections. The circular flange of the dish is designed to extend between the upwardly extending projections of the divider structure of a similar container, holding them vertically aligned.

3,373,891
SEAL FOR FLOATING TANK ROOF
Joseph V. Kidd, Houston, Tex., assignor to Helmerich & Payne, Tulsa, Okla., a corporation of Delaware
Filed Apr. 6, 1965, Ser. No. 445,919
5 Claims. (Cl. 220—26)



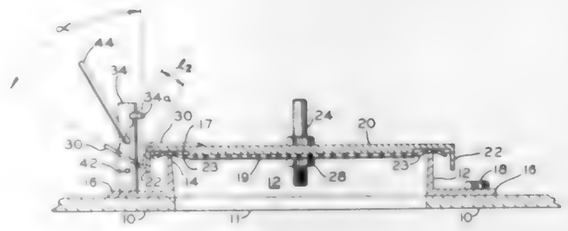
A secondary seal connecting a floating roof of a storage vessel to the wall of the storage vessel. The seal is arcuately configured and has a stiffening member positioned thereon. A sleeve is provided on the upper surface of the seal adjacent the sealing lip, the sleeve being less resilient and of a lower coefficient of friction than the sealing lip.

3,373,892
LADY'S COMPACT CONSTRUCTION
William James Landen, Cheshire, Conn., assignor to The International Silver Company, Meriden, Conn., a corporation of Connecticut
Filed Mar. 18, 1966, Ser. No. 535,400
1 Claim. (Cl. 220—31)



The invention contemplates essentially a two-piece plastic container construction, particularly useful as a lady's compact, wherein the cooperative hinge elements are integrally formed upon molding the lid or cover part and the body part, respectively, assembly being completed merely by press-fit insertion of a hinge pin through aligned bores in the hinge elements. The hinge elements are so configurated that, when the container is closed, the hinge is virtually unnoticable from above, so that the aesthetic appearance of the container design may be unmarred; the configuration of the hinge elements is further such that the lid may be opened at least 180° from closed position, and to an extent permitting positive support of both lid and body parts on a single horizontal working surface, to facilitate automated assembly of mirror and powder-cake elements into the container.

3,373,893
FLOATING HINGED COVER
Evalds Dunkelis, Glen Ellyn, Ill., assignor to GPE Controls, Inc., Morton Grove, Ill., a corporation of Illinois
Filed Mar. 2, 1966, Ser. No. 531,226
8 Claims. (Cl. 220—38)

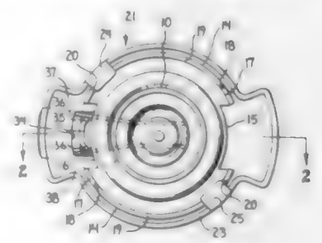


1. In a removable hinged closure assembly adapted to permit access through an opening in a wall and having a seat surrounding said opening and a cover movable between open and closed positions, said cover being adapted to engage said seat in said closed position, the combination of:

a post member assembly affixed to said wall and extending in a first direction;

and a hinge member attached to said cover, a clearance portion between two edges of said hinge member at least partially surrounding said post member, the line between said two edges being arranged at an angle to said first direction when said cover is in a closed position, whereby said edges fit more closely about said post member assembly when said cover is in a closed position than when said cover is tilted toward an open position.

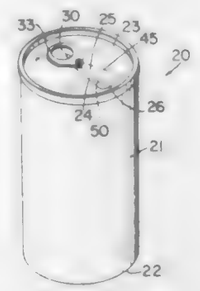
3,373,894
LOCKING, PRESSURE-RELIEF RADIATOR CAP
Glen A. Johnson, Connersville, Ind., assignor, by mesne assignments, to Stant Manufacturing Company, Inc., a corporation of Delaware
Filed Oct. 1, 1965, Ser. No. 492,041
5 Claims. (Cl. 220—40)



A cap for the filler neck of the radiator of the cooling system of an internal combustion engine, said cap including means engageable with a cammed surface associated with such a filler neck to secure said cap in place, a valve which is resiliently held in sealing relation with the mouth of such a filler neck when such means is so engaged, a lever operable while said means is so engaged to lift said valve out of such sealing relation, and means moving with said lever and cooperating with a portion of a conventional filler neck to restrain the cap against

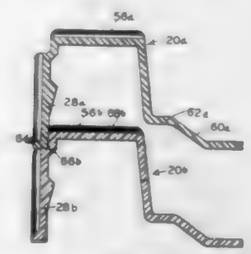
movement tending to disengage said first-named means until said lever has been operated so to lift said valve.

3,373,895
PULL TAB OPENING MEANS AND METHOD OF MAKING SAME
Horst F. W. Arfert, Richmond, Va., assignor to Reynolds Metals Company, Richmond, Va., a corporation of Delaware
Filed May 17, 1966, Ser. No. 550,759
32 Claims. (Cl. 220—54)



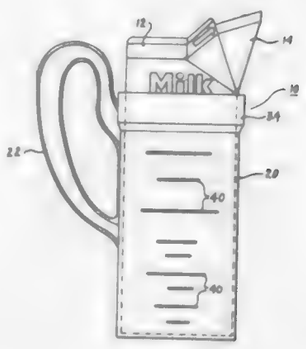
1. A container means having non-detachable opening means in wall means thereof comprising, first and second elongated strip means provided in said wall means alongside each other and having common end means, said first strip means having fastening means in its end portion arranged opposite said common end means and said second strip means having attached end means attached to said wall means adjoining said fastening means, and pull means fastened to said first strip means by said fastening means, said first and second strip means being easily and sequentially severed to define an opening in said wall means by pulling said pull means with a force of comparatively small magnitude in a direction generally transverse said wall means to thus form combination strip means, whereby said combination strip means is held to said wall means by said attached end means and has an overall length defined by said first and second strip means pulled approximately end to end while being held together by said common end means, said overall length enabling said combination strip means to be moved away from said opening for easy dispensing of the contents of said container means therethrough.

3,373,896
CONTAINER LID
Paul Davis, Beverly, Mass., assignor to Sweetheart Plastics, Inc., Wilmington, Mass., a corporation of Maryland
Filed Jan. 3, 1966, Ser. No. 518,054
10 Claims. (Cl. 220—60)



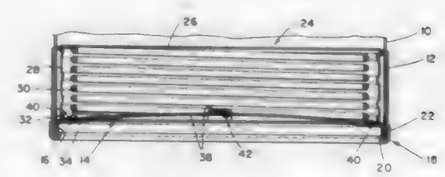
Recessed container covers of improved design are provided for use with tub-type containers. The recessed covers define an overfill channel and preferably define complementary stacking means enabling positive stacking and rapid release of an individual cover from a stack.

3,373,897
CARTON HOLDER AND CONTAINER
Clifford L. Haines, P.O. Box 3, Bristol, Ind. 46507
Filed Sept. 17, 1965, Ser. No. 488,005
4 Claims. (Cl. 220—85)



A holder for milk cartons and the like having four panels forming a rectangular holder portion with side walls enclosing a substantial portion of the side walls of the carton. A handle attached to one of the panels extends upwardly above the side walls to a point near the top of the carton, and a lug disposed in the inner wall of one of the panels near the bottom thereof holds the milk carton in the holder.

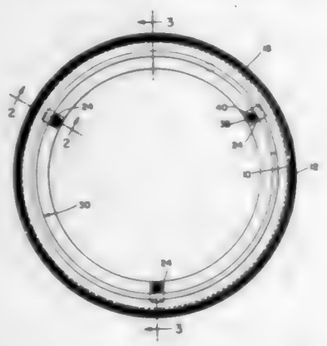
3,373,898
ROVING CAN WITH CROSS MEMBER SPRING RETAINER
Herbert J. Witzgall, Norristown, Pa., assignor to The Budd Company, Philadelphia, Pa., a corporation of Pennsylvania
Filed Mar. 31, 1966, Ser. No. 539,136
2 Claims. (Cl. 220—93)



1. In a container comprising a roving can of generally cylindrical configuration, a container body substantially open at the center, a bottom member for the container body, said bottom member including a peripheral depending flange juxtaposed to the body interior, and an annular inwardly directed flange formed substantially as a continuation of said depending flange, a movably mounted piston in said can having a piston depending flange thereon, a coil spring interposed between the upper surface of said piston, surrounded by said piston depending flange, and supported at its lower end upon said bottom member, said spring, upon depression of said piston by material weight thereon, being confined within a space defined by the piston, the piston depending flange and the can bottom member, cross-bracing disposed over the open portion of said container body and being affixed to said annular flange and adapted to serve as a support for said spring which carries at its upper end said movably mounted piston, whereby spring pressure resulting from material carried upon the piston is resisted by said cross-bracing and said bottom member, and said open

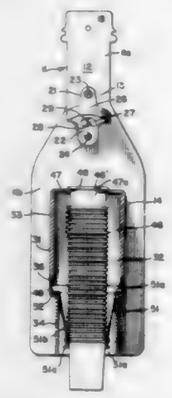
portion of said container body being adapted for substantially free discharge of material from the interior of the container below the piston.

3,373,899
ROVING CAN WITH CLAMP SPRING RETAINER
Herbert J. Witzgall, Norristown, Pa., assignor to The Budd Company, Philadelphia, Pa., a corporation of Pennsylvania
Filed Mar. 31, 1966, Ser. No. 539,218
6 Claims. (Cl. 220—93)



A roving can having an open bottom. Clamping means connect a spring to the bottom of the can with the spring disposed to carry a movable piston thereon.

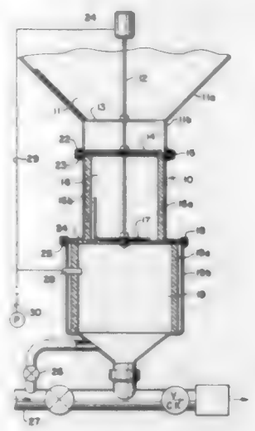
3,373,900
COMBINATION CUP DISPENSER AND CAP REMOVER
David A. Staley, Calhoun Falls, S.C.
(101 Wayside Drive, Laurens, S.C. 29360)
Filed Jan. 18, 1967, Ser. No. 610,171
8 Claims. (Cl. 221—199)



A support for the combination of a cup dispenser, a bottle cap remover and a flange on the dispenser adapted to accommodate a cup as a receptacle for removed bottle closures.

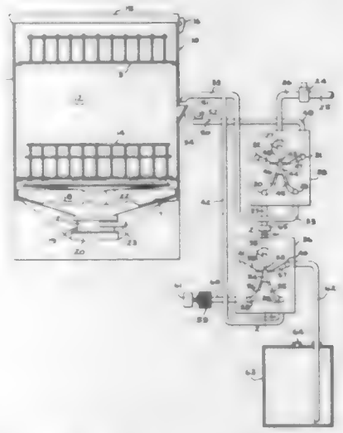
3,373,901
DISPENSER, MIXER AND FEEDER
Anton Pfeuffer, 301 E. 78th St., New York, N.Y. 10021
Filed Jan. 17, 1966, Ser. No. 521,132
3 Claims. (Cl. 222—57)

An even flow-rate device is coupled to a hopper for effecting even flow-rate of bulky material passing therethrough. The even flow-rate device comprises a first perforated member disposed adjacent the hopper and having a predetermined number of openings therethrough. A dispenser is coupled to the even flow-rate device for dispensing the bulky material to a mixing chamber. The even flow-rate device comprises a second perforated member disposed adjacent the dispenser and having a predetermined number of openings therethrough. The openings in the first and second perforated members are conically



shaped to form a smaller and a larger opening at the opposite faces of the perforated members and cutting edges are formed around the smaller openings of the first and second perforated members.

3,373,902
LIQUID DISPENSING MEANS
John C. Laufer, Sr., Louisville, Ky., assignor to General Electric Company, a corporation of New York
Filed May 25, 1966, Ser. No. 552,842
8 Claims. (Cl. 222—133)

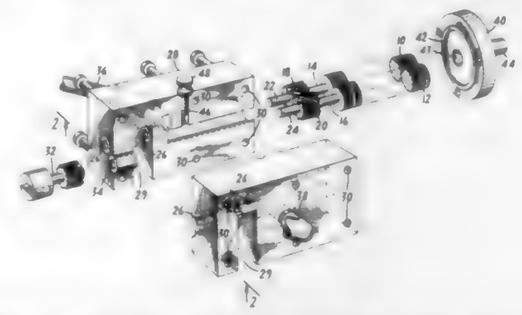


Liquid additive dispensing means for a washing machine. The dispensing means includes fluid amplifier means comprising a pair of fluid amplifiers. The first fluid amplifier selectively directs incoming water either directly into the washing machine wash chamber or into the second amplifier. When the incoming water is directed into it, the second amplifier aspirates the additive from a container and directs a mixture of it and the water into the wash chamber.

3,373,903
SELF-PURGING MIXING AND DISPENSING APPARATUS
Kenneth V. Hardman, Upper Montclair, and Alfred J. Anderson, Livingston, N.J., assignors to Hardman Incorporated, a corporation of New Jersey
Filed May 20, 1966, Ser. No. 551,663
10 Claims. (Cl. 222—142)

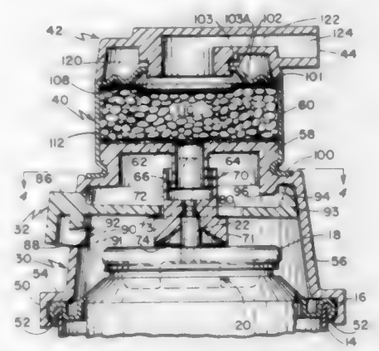
A mixing and dispensing apparatus is provided with two or more rotatable, screw-threaded rods mounted within a closely adjacent housing, the screw threads of each rod being interleaved with those of the adjacent rod. As the rods are rotated, two or more liquids are flowed

at different points into the space between the housing and screw-threads, and thereby the liquids are uniformly admixed and advanced under positive pressure out through a discharge opening. Continued rotation of the rods with



cessation of the liquid flow purges the space between the housing and the screw-threads of liquid residue, and this is aided by venting the space to the atmosphere to eliminate the pulling of vacuum or cavitation of liquids within the interior of the apparatus.

3,373,904
HEATER FOR MATERIAL DISPENSED FROM A CONTAINER
Alan B. Lowry, Canton, Mass., assignor to The Gillette Company, Boston, Mass., a corporation of Delaware
Filed May 5, 1966, Ser. No. 547,898
18 Claims. (Cl. 222—146)



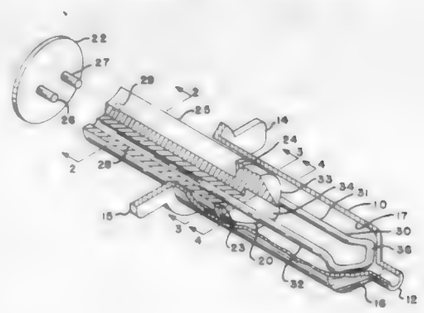
A heat exchanger for an aerosol soap dispensing package includes an aluminum chamber 1.35 inch in diameter, of 0.025 inch wall thickness in which is disposed a mass of aluminum shot at least 0.050 inch in diameter which is compressed to a density of 85% of solid aluminum and a resulting height of 0.42 inch. Discs of expanded aluminum are positioned above and below the compressed mass of shot. The inlet of the chamber is connected via a sleeve coupling to the valved outlet of the pressurized dispensing package and the 0.100 inch diameter outlet of the chamber opens into a larger rectangular discharge nozzle. The sleeve coupling has a flange which is engaged by a fulcrumed actuator lever which, when moved down, opens the package's valve. In latched position the enlarged end of the actuator lever fits tightly into the heat exchanger support shroud to minimize entry of and accumulation of moisture within the shroud.

3,373,905
LIQUID DISPENSING MEANS
John C. Laufer, Sr., Louisville, Ky., assignor to General Electric Company, a corporation of New York
Filed June 17, 1966, Ser. No. 558,371
9 Claims. (Cl. 222—193)

1. Means to dispense a liquid from a container into a receptacle comprising:
   (a) a fluid amplifier having a main inlet, at least one control inlet, a first outlet and a second outlet,
   (b) means interconnecting said first outlet with the container,
   (c) said second outlet communicating with the receptacle,
   (d) said means interconnecting said first outlet with the container including means to prevent flow in a direction from said first outlet toward the container but to allow flow in the opposite direction,
   (e) means interconnecting said main inlet with a source of liquid under pressure, and

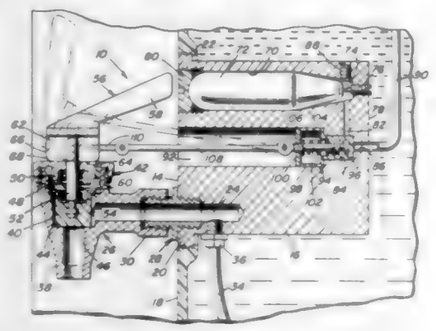
   (f) means to control the admission of control fluid to said control inlet whereby the liquid entering said fluid amplifier through said main inlet is selectively directed out through either of said first and second outlets,
   (g) said fluid amplifier being adapted to aspirate liquid from the container in through said first outlet to mix with the liquid entering said main inlet when the control fluid entering through said control inlet directs the flow out through said second outlet.

3,373,906
SYRINGE WITH STIRRER
Edward G. De Hart and Miner D. Allen, Cambridge, Mass., assignors to De Haart, Inc., Arlington, Mass., a corporation of Massachusetts
Filed Feb. 10, 1967, Ser. No. 615,144
4 Claims. (Cl. 222—235)



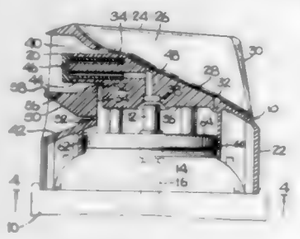
A plastic syringe with a stirrer which telescopes into the piston as the syringe is discharged is described. This device permits the use of syringe as sales package and dispensing device for preparations which must be mixed or blended just prior to use. The embodiment shown employs a hairpin-like loop, the legs of which slip into longitudinal holes in the piston or plunger of the syringe. Mixing requires the rotation of stirrer and piston within the syringe cylinder.

3,373,907
CONTROL UNIT FOR LIQUID DISPENSING
John A. Batrow, P.O. Box 402,
Branford, Conn. 06406
Continuation of application Ser. No. 553,347, May 27, 1966. This application Apr. 27, 1967, Ser. No. 634,147
10 Claims. (Cl. 222—399)



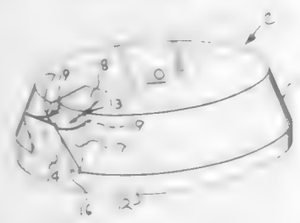
A self-contained liquid dispensing unit, mountable on a liquid container, incorporating a pressurized gas container and means for effecting a controlled introduction of the gas into the liquid container solely during the dispensing of the liquid.

3,373,908
ACTUATOR CAP WITH FRANGIBLE GUARD
Philip L. Crowell, Racine, Wis., assignor to S. C. Johnson & Son, Inc., Racine, Wis.
Filed Dec. 13, 1965, Ser. No. 513,426
3 Claims. (Cl. 222—402.13)



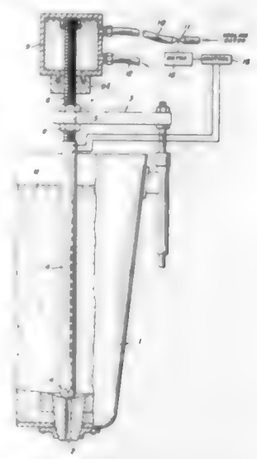
An overcap for aerosol dispensing containers having a removable lock member normally positioned to prevent discharge, wherein said overcap including the lock member is of unitary molded construction.

3,373,909
CLOSURE CAP AND POURING SPOUT
Samuel L. Belcher, Toledo, Ohio, assignor to Owens-Illinois, Inc., a corporation of Ohio
Filed Dec. 15, 1966, Ser. No. 601,979
2 Claims. (Cl. 222—531)



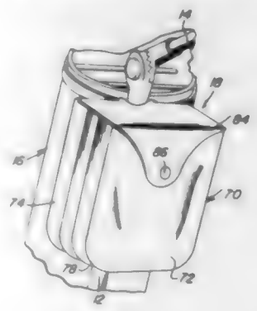
This invention is a dispensing-type of closure cap comprising a disk-like top or panel, at the periphery of which is a depending flared wall which is connected at its lower margin to a coaxial cylindrical attaching skirt for securing the cap to a container, the flared wall having a dispensing opening and pour-spout with the latter hinged to the cap at about the juncture of the flared wall and skirt.

3,373,910
STOPPER ROD WITH TEMPERATURE RESPONSIVE COOLING MEANS
Crawford B. Murton, Churchill Borough, Allegheny County, Pa. (1906 Brushcliff Road, Pittsburgh, Pa. 15221)
Filed Oct. 20, 1965, Ser. No. 498,527
6 Claims. (Cl. 222—559)



A stopper rod consisting of relatively high conductivity material with a collant being applied to the top of the rod only to extract heat conducted through the rod from its lower end.

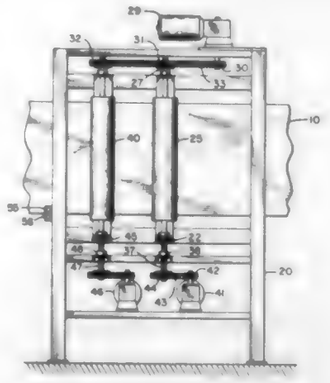
3,373,911
GOLF CART MOUNTED SHOE PACK
Melvin J. Kebelbeck, 304 Sunnyside Drive, Eugene, Oreg. 97402
Filed Nov. 25, 1966, Ser. No. 597,106
4 Claims. (Cl. 224—29)



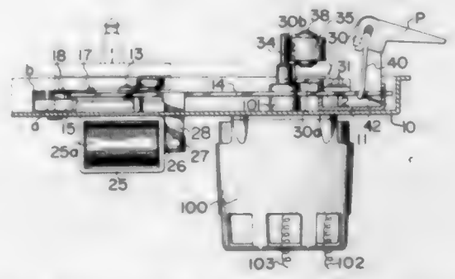
This disclosure is directed toward a receptacle adapted for attachment to a golf bag cart and to removably alternately receive therein street and golf shoes and also to a removable weatherproof cover for the receptacle.

3,373,912
AUTOMATIC POSITIONING OF CONTINUOUSLY MOVING WEBBING
James W. Toensing, Minneapolis, Minn., assignor, by mesne assignments, to Buckbee-Mears Company, St. Paul, Minn., a corporation of Minnesota
Filed Oct. 14, 1965, Ser. No. 495,955
11 Claims. (Cl. 226—20)

For handling a strip of webbing which is continuously moving lengthwise, rollers are provided for laterally positioning the web. A pair of rollers lie across the webbing on opposite sides of the web and pinch the webbing between them when they are moving the webbing one way or the other transverse to the direction of travel of the webbing. The rollers have only a limited degree of travel crosswise of the webbing so in the event they have not properly positioned the webbing when they reach this limit, they are separated, returned to a starting position, then again closed together to pinch the webbing and again moved across the webbing to position the webbing. These steps are repeated until the webbing is properly located. The positioning is accomplished by a single pair of rollers or by two cooperating pairs. When the rollers of one pair are closed together pinching the webbing, the rollers of the other pair are separated.



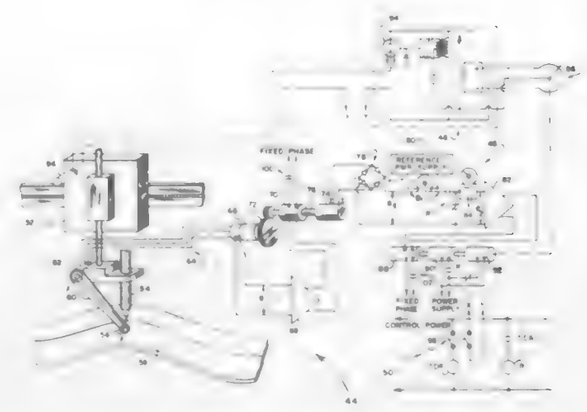
3,373,913
TAPE DRIVE CONTROL MECHANISM OF MAGNETIC TAPE RECORDERS
Katsuya Atsumi, Tokyo, Japan, assignor to Akai Electric Company Limited, Tokyo, Japan
Filed May 16, 1966, Ser. No. 550,502
Claims priority, application Japan, May 17, 1965, 40/28,655
4 Claims. (Cl. 226—176)



A tape drive control mechanism for a magnetic tape recorder having a plurality of control buttons for controlling a capstan drive arrangement includes a pinch roll mounted on a pivotable arm and connected by linkage to one of the buttons. When the button is depressed the pinch roll moves to engage the capstan, the linkage operates a rotatable cam carrying wheel which in turn operates a switch controlling an electromagnet linked to the linkage. The electromagnet pulls the linkage to engage the pinch roll with the capstan and is held in this engagement by a spring loaded locking member operating on the button after the cammed wheel allows the electromagnet to be deenergized.

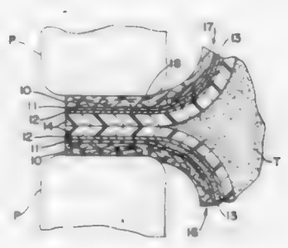
3,373,914
AUTOMATIC WELDING SPEED CONTROLLER
William A. Wall, Jr., Madison, Ala., assignor to the United States of America as represented by the Administrator of the National Aeronautics and Space Administration
Filed Dec. 30, 1965, Ser. No. 517,869
10 Claims. (Cl. 228—8)

1. In a device for welding curved surfaces, an automatic welding torch speed controller comprising:
(a) a welding torch mounted on a carriage having a carriage drive motor,
(b) a velocity tracker, responsive to the movement of the torch,
(c) an analog generator operatively connected to the velocity tracker, for generating a voltage proportional to the instantaneous speed of the tip of said torch,
(d) reference voltage supply means in circuit with the said analog generator, for supplying a voltage representing a desired constant speed for the tip of the welding torch,



(e) servoamplifier means connected to the outputs of the said analog generator and the said reference voltage supply means for comparing the two voltage outputs and furnishing a difference voltage,
(f) motor governor means for said carriage drive motor, connected to said servoamplifier means, whereby the speed of the motor may be controlled in accordance with the difference voltage, so as to maintain a substantially constant work speed for the tip of the said welding torch.

3,373,915
MOLDABLE POUCH MATERIAL
William E. Anderson and George P. Wiederecht, Bloomsbury, N.J., assignors to Riegel Paper Corporation, New York, N.Y., a corporation of Delaware
Filed June 28, 1965, Ser. No. 467,363
9 Claims. (Cl. 229—3.5)

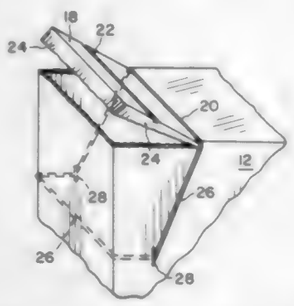


The disclosure is directed to a laminated packaging material including an outer glassine layer moldably bonded to an inner metal foil layer by a wax layer and including a continuous heat activatable coating interposed between the glassine and foil layers, which heat activatable layer is adapted to unite the glassine and foil layers upon subjecting said laminate to heat sealing temperatures and pressures.

3,373,916
CONTAINER DISPENSER AND CLOSURE
Anthony Montagano, 45 Eastview Ave., Pleasantville, N.Y. 10570
Filed Apr. 3, 1967, Ser. No. 628,007
7 Claims. (Cl. 229—7)

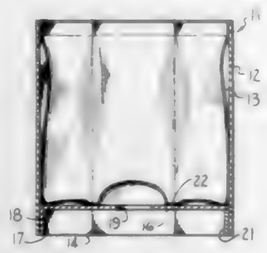
A dispenser and closure arrangement for a container

in which the flap of the closure element, when lifted from the container, automatically remains open and, when



closed, automatically retains the closure element in a sealed position on the container.

3,373,917
FOLDABLE CONTAINER
Robert C. Cox, 600 16th St., Oakland, Calif. 94612
Filed May 10, 1966, Ser. No. 548,954
10 Claims. (Cl. 229—14)



A foldable container is described which is erectable from a substantially flat collapsed condition to a distended condition of expanded volume. The container includes a flexible liquid impervious liner which is secured adjacent the upper end of a foldable outer casing of form retentive material so as to depend from such upper end into the casing interior upon erection. The container also includes a brace element which is hingedly secured to the interior of the casing adjacent its lower end so that it may be selectively positioned to brace a casing in distended position to prevent collapse thereof, and simultaneously provide its supporting base to the lower end of the liner.

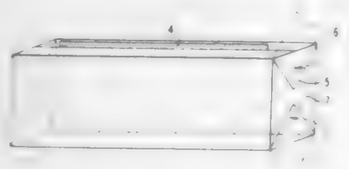
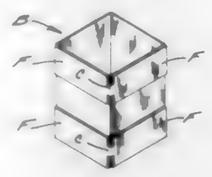
MOISTURE PROOF PACKAGE
Adam Krings, Bonn, Germany, assignor to Dynamit Nobel Aktiengesellschaft, Troisdorf, Germany
Filed Aug. 9, 1966, Ser. No. 571,223
Claims priority, application Germany, Sept. 2, 1965, D 31,896
6 Claims. (Cl. 229—14)



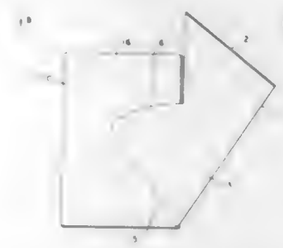
The present disclosure relates to packages. More particularly, the present invention relates to a protective covering for the moisture-proof packaging of objects, for example, ammunition having calibres from 20 to 40 millimeters wherein a six-sided rectangular box is folded from a flat rectangular pouch sealed on three edges, open on the fourth edge and having an air exhaust tube.

3,373,919
COMPOSITE PACKAGE
Wilbur A. Schaich, Maumee, Ohio, assignor to Owens-Illinois, Inc., a corporation of Ohio
Original application July 22, 1964, Ser. No. 385,831, now Patent No. 3,324,214, dated June 6, 1967. Divided and this application Feb. 13, 1967, Ser. No. 616,755
1 Claim. (Cl. 229—14)



A composite package comprising a continuous liner member positioned in a paperboard box having internal surfaces wherein said liner member contacts said internal surfaces in point-by-point contact.

3,373,920
CONTAINER
Yukio Kusunoki, 19 Kakano-cho, Toyama-shi, Japan
Filed Feb. 8, 1966, Ser. No. 536,169
Claims priority, application Japan, May 6, 1965, 40/35,521
3 Claims. (Cl. 229—23)



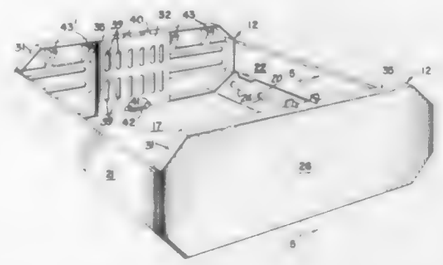
A container having generally rectangular lid and main body members folded from paperboard blanks and the like, characterized in that the body member has an open top and that the lid member is open at each end and includes a bottom wall contained between parallel lateral walls of the main body member, a pair of side walls each including at one vertical edge an intermediate portion carrying an arcuate guide surface, and a top wall. The aforementioned intermediate portions of the side walls of the lid member extend through corresponding angularly arranged linear slits contained within the lateral walls of the main body member, the length of the slits being equal to the radius of curvature of the arcuate guide surfaces.

This invention relates to a container made of paper, plastics, or the like. The container of this invention has a lid means whose guide portion is inserted through the slit of the main body, thus rendering the lid means movable, which opens and closes the upper side of the main body in accordance with the movement while pushing the bottom up and down obliquely.

3,373,921
SHIPPING CONTAINER
Walton B. Crane, Arcadia, Calif., assignor to Allied Plastics Company, Los Angeles, Calif., a corporation of California
Filed Nov. 17, 1966, Ser. No. 595,097
14 Claims. (Cl. 229—23)

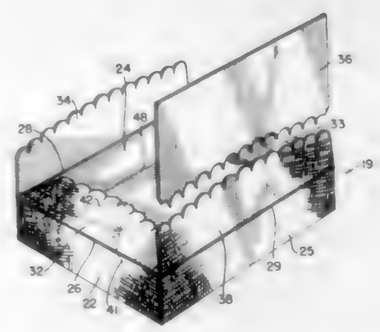
1. A tray-like container which is fabricated from a blank formed of a relatively thin sheet material and a

pair of rigid end frame members, each of which has a compressive strength substantially greater than that of said blank, said blank providing a bottom wall forming panel and side wall forming panels which form, when the container is set up, a bottom wall and side walls connected to the side edges of the bottom wall, said end frame members each having planar surfaces of substantial widths along at least portions of its top and bottom edges and said end frame members being positioned, one each, at opposite ends of said bottom wall forming panel at substantially right angles thereto with the bottom edge surfaces in engagement therewith and projecting upwardly



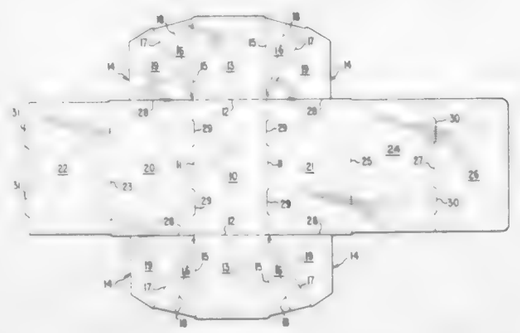
therefrom at substantially right angles, connecting panel means connected to said side wall panels at the opposite ends of said blank and end panel means connected to said bottom wall forming panel at the opposite ends thereof, said connecting panel means and said end panel means at each end of said blank being disposed in overlying relationship with the associated one of said frame members, and means securing said connecting panel means and said end panel means in such relationship to the associated one of said end frame members, whereby the weight of a plurality of like containers, when disposed in stacked relation, is supported by said end frame members.

3,373,922
CONTAINER AND BLANKS FOR MAKING THE SAME
Richard M. Watts, Henrico County, Va., assignor to Reynolds Metals Company, Richmond, Va., a corporation of Delaware
Filed July 16, 1965, Ser. No. 472,537
19 Claims. (Cl. 229—33)



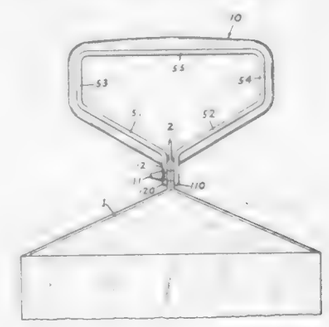
This disclosure relates to a preassembled collapsible container which serves the dual purpose of containing a product, such as a food product, for example, for sale thereof and then may be used to define a comparatively deep serving receptacle or dish from which such food product may be eaten merely by severing away a portion of the top wall of such container and folding the remaining portion of such top wall outwardly to define vertical extensions for its side walls.

3,373,923
EXPANDABLE TRAY CARTON
Homer A. Martelli, Westwood, N.J., assignor to Union Camp Corporation, New York, N.Y., a corporation of Virginia
Filed Aug. 12, 1966, Ser. No. 572,082
1 Claim. (Cl. 229—34)



An expandable carton comprising bottom, sides and ends, the ends having flaps on each side, each flap comprising a scored web portion and a terminal portion, each side having a hinged overlapping portion, the overlapping side portions being provided with locking lips fitting into slots in the bottom. When the carton is assembled, the end flaps are folded at 90° and are sandwiched between the sides and their overlapping portions, as the latter portions are folded over to fit within the carton, with the locking lips inserted in the bottom slits. The outer edges of the web and terminal portions are so shaped that the ends move freely to expand the carton until the outer edges of the terminal portions contact the hinge portion connecting the sides and their overlapping portions.

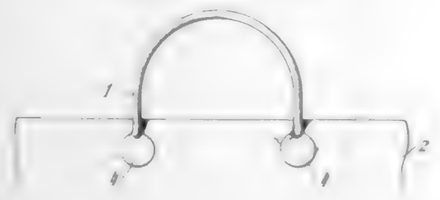
3,373,924
CONTAINER HANDLE
Frank R. Linda, South Norwalk, Conn., and Leigh D. Leiter, Philadelphia, Pa., assignors to International Paper Company, New York, N.Y., a corporation of New York
Continuation-in-part of application Ser. No. 521,362, Jan. 18, 1966. This application July 6, 1966, Ser. No. 565,045
16 Claims. (Cl. 229—52)



A handle to assist in carrying, moving and pouring from paperboard containers, in which the handle is constructed from a single loop of material provided with a horizontal hand grip side, two vertical sides respectively attached to the two ends of the hand grip side, and two inwardly sloping sides, each of which is attached at one end to a respective one of the vertical sides at a selected acute angle, and each of which terminates at the other end in an element of a closure mechanism, the length of each sloping side and said acute angle being selected to bring said ends of said sloping sides which terminate in

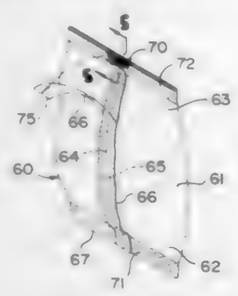
closure mechanism elements into contact with one another.

3,373,925
CARRIER BAGS AND HANDLES FOR ATTACHMENT THERETO
Harry Frederick Gatward, 72 Tottenham Court Road, London, England
Filed Aug. 12, 1965, Ser. No. 479,084
8 Claims. (Cl. 229—54)



A paper bag having a handle of plastics material heat sealed thereto. The handle being formed of a ribbon-like strip which can be helically wound to form a gripping portion. The bonding of the handle to the bag being reinforced by patch securing the handle ends between the bag and patch.

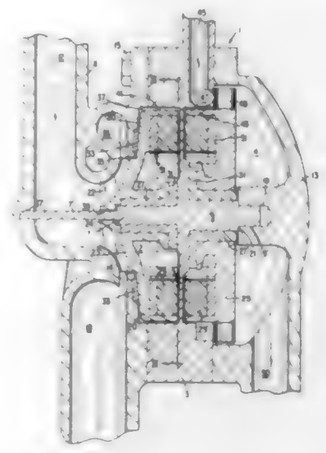
3,373,926
SEAMED CONTAINER WITH EASY OPENING FEATURE
Walter A. Voigtman, Sr., Beaumont, Tex., and Florren E. Long, La Grange, Ill., assignors to Continental Can Company, Inc., New York, N.Y., a corporation of New York
Filed May 14, 1965, Ser. No. 455,699
18 Claims. (Cl. 229—66)



1. A readily openable package comprising a generally tubular body, said body having first and second end portions, transverse sealing means sealing one of said end portions, means closing the other of said end portions, said body having contiguous longitudinal edge portions extending from said first end portion toward said second end portion, a sealing strip overlying said edge portions, means securing a major portion of said strip to said longitudinal edge portions, and means preventing said securing means from securing a minor tab portion of said strip to said one end portion whereby said tab portion remains free of said body and can be grasped and pulled for at least partially removing the major portion of the strip from the body incident to the removal of the packaged product through said body between the longitudinal edge portions thereof.

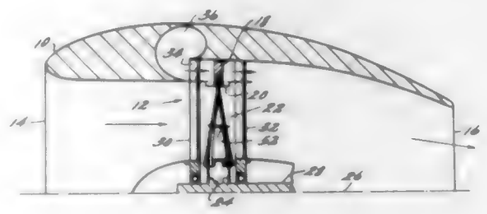
3,373,927
FLUID COMPRESSOR
Kenneth H. Miller, Syracuse, N.Y., assignor to Carrier Corporation, Syracuse, N.Y., a corporation of Delaware
Filed June 1, 1966, Ser. No. 554,417
6 Claims. (Cl. 230—116)

1. Fluid compression apparatus comprising:
a central frame member including a diaphragm formed thereon;
an impeller shaft on the diaphragm projecting substantially normal thereto;
impeller bearing means having an upstanding flange portion engaging said diaphragm;
an impeller mounted on said impeller bearing means, said impeller having blades formed thereon and a radially extending portion;
a cover connected to the central frame member and forming therewith a compressor section enclosing said compressor impeller, said cover having a process fluid inlet passage, a diffuser passage, a collection chamber, and a process fluid outlet passage formed therein;



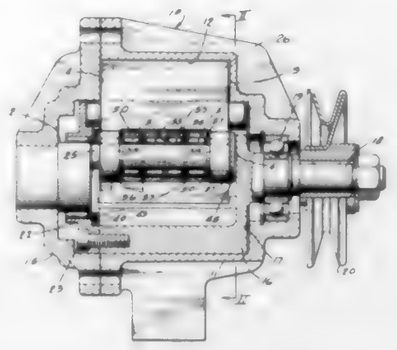
a thrust bearing affixed to the inner face of said cover for bearing engagement with the radially extending portion of said impeller;
magnetic means mounted on the back of said impeller on said radially extending portion; and
means positioned on the opposite side of the diaphragm magnetically coupled to said magnetic means for rotating said impeller.

3,373,928
PROPULSION FAN
John R. Erwin, Wyoming, Ohio, and Arthur P. Adamson, Marblehead, Mass., assignors to General Electric Company, a corporation of New York
Filed Aug. 29, 1966, Ser. No. 575,795
12 Claims. (Cl. 230—116)



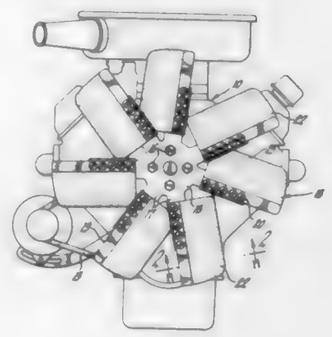
The invention is directed to a quiet aircraft propulsion fan that uses many short-chord airfoils in a bicycle-spoke arrangement to hold the tip turbine buckets. Angling and slanting of the airfoils provides triangular support for stiffness and the system employs the airfoils in a number which, multiplied by the speed, produces a minimum of 14,000 cycles per second or above the generally audible sound level.

3,373,929
VANE ASSEMBLY FOR ROTARY VANE COMPRESSORS
Donald W. Partain, Rocky River, Ohio, assignor to TRW Inc., Cleveland, Ohio, a corporation of Ohio
Filed Nov. 15, 1965, Ser. No. 507,749
6 Claims. (Cl. 230—157)



Sliding vane type of pump or air compressor in which a rotor rotates about an axis eccentric of the axial center of the pump housing and sliding vanes extend from hubs journalled on anti-friction bearings mounted on a common shaft, concentric with the axial center of the housing for the compressor. In order to provide a pump in which the air has no entrained lubricant, the vanes have clearance with the wall of the pumping chamber. The hubs are arranged along the shaft in interleaving relation with respect to each other and positioner bearings in the form of washers are disposed between the interleaving hubs of the vanes. Other positioner bearings are disposed between the end hubs and opposite ends of the pumping chamber. These positioner bearings are made from materials capable of running as a bearing surface without lubrication. In order to keep lubricant leakage to a minimum, one end hub is sealed by a disc forming an end positioner bearing and the positioner bearings between the hubs take up clearance between the other hubs and seal the space between these hubs making it necessary for the lubricant to travel the entire length of the shaft if there should be any tendency for lubricant in the bearings to leak out.

3,373,930
FAN STRUCTURE
John D. Rom, Royal Oak, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Apr. 29, 1966, Ser. No. 546,322
5 Claims. (Cl. 230—270)

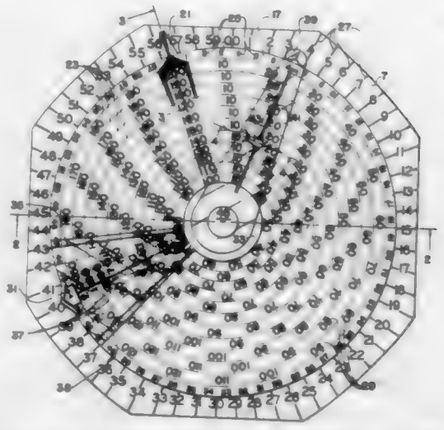


This invention relates to a speed and temperature-responsive fan having fan blades supported upon support arms extending outwardly from a fan hub and wherein the blades are spaced from the hub by the support arms. The blades are forward of a composite assembly of coextensive sheets of plastic and sheet steel bonded together by a thermosetting adhesive to provide a unitary blade structure responsive to rise of temperature to cause the blades to bend about the longitudinal blade axis to increase air displaced at any given speed of rotation and wherein the blades are responsive to increase in speed of rotation to decrease the air displaced at any given blade temperature upon increase in speed of rotation of the blade. The quantity of air displaced per revolution is a function of both fan blade temperature and speed which increases with temperature rise and decreases with increase of fan speed.

3,373,931
LOCKING AND ALARM DEVICE
Emil Mogler, Heilbronn (Neckar), Germany, assignor to Kassenfabrik Emil Mogler, Heilbronn (Neckar), Germany
Filed Oct. 22, 1965, Ser. No. 501,980
Claims priority, application Germany, Dec. 3, 1964, M 63,450
9 Claims. (Cl. 235—22)

A pre-settable locking device for preventing the unauthorized opening of a cash register drawer, which device includes a pivotable locking means movable between a locking position and an unlocking position, a plurality of positioning elements capable of being set in either one of two stable positions, and a plurality of levers arranged to be actuated from outside the drawer, the locking means being movable into its unlocking position for permitting the drawer to be opened only when those levers associated with positioning elements in one stable position are actuated, while those levers associated with the remaining positioning elements are not actuated.

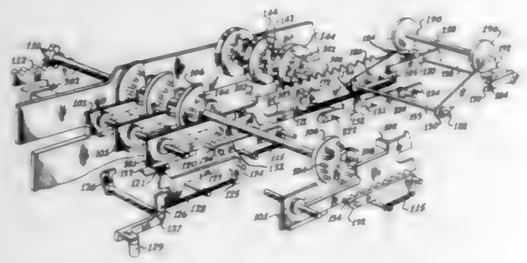
3,373,932
TIME, SPEED AND DISTANCE COMPUTER
John W. Copeland, 161 S. Oliver, Wichita, Kans. 67218
Continuation-in-part of application Ser. No. 436,129, Mar. 1, 1965. This application Oct. 20, 1965, Ser. No. 498,977
4 Claims. (Cl. 235—61)



This invention relates to computing devices, more particularly to computing devices for correlating time, speed and distance variables. Still more specifically this inven-

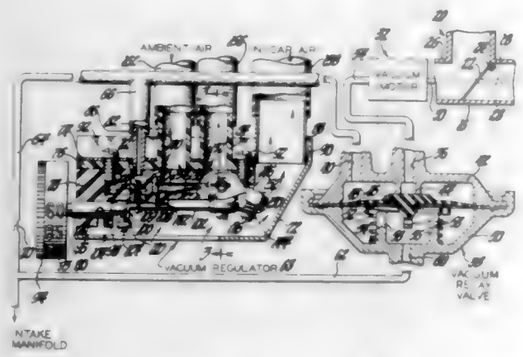
tion relates to computing devices which utilize linear scales that are easy to read and to interpolate, and which has a clock mechanism in conjunction therewith, which devices are simple to manipulate in operation. Additionally, this invention relates to a computing device easily usable by airline pilots to set forth current time past the hour, miles travelled from a given checkpoint, the estimated time of arrival, total flying time required, and time elapsed since passing last checkpoint.

3,373,933
MULTIPLE-COLUMN SETUP SYSTEM
Frederick W. Pfleger, 1152 Barbara Drive, Cherry Hill, N.J. 08034
Filed Mar. 28, 1966, Ser. No. 538,009
19 Claims. (Cl. 235—61)



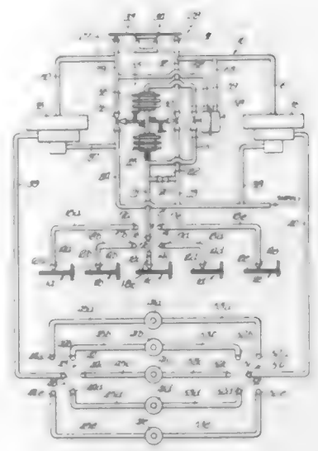
This invention is concerned essentially with a multiple-column setup mechanism wherein a plurality of setup members are respectively provided with operating members independently movable into and out of operative position. A cyclical drive is arranged for driving relation with the operating members in operative position, while control means effect movement of the operating members into and out of operative position and stop means are selectively locatable to interrupt shifting movement of the settable members.

3,373,934
AUTOMOTIVE TEMPERATURE CONTROL SYSTEM WITH INSIDE AND OUTSIDE AIR TEMPERATURE SENSING
William H. Kolbe, Birmingham, and Edward W. Yott, St. Clair Shores, Mich., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Jan. 26, 1967, Ser. No. 611,928
7 Claims. (Cl. 236—13)



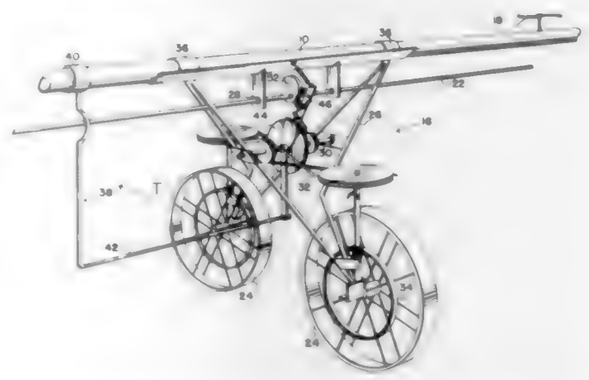
This invention relates to systems for automatically controlling the temperature of a passenger compartment in an automobile and includes a vacuum modulating valve for regulating heat flow with that valve being responsive to changes in ambient and in-car air temperatures.

3,373,935
MULTIPLEX PNEUMATIC CONTROL UNIT
David H. Thorburn, Oak Park, Ill., assignor to The Powers Regulator Company, Skokie, Ill., a corporation of Illinois
Filed Oct. 15, 1965, Ser. No. 496,629
10 Claims. (Cl. 236—82)



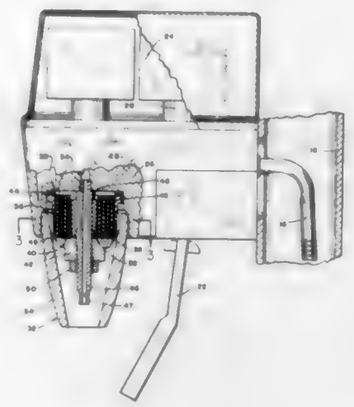
A multiplex digital pneumatic control system, employing a single signal generating device in conjunction with a plurality of analog pressure signal sources and a plurality of pressure pulse operated regulatory devices. The signal generating device is adapted to convert analog pressure signals to digital or pulsed pressure signals, and may employ negative feedback control. Switch means provide selective simultaneous connection of one each of the plurality of analog signal sources and the plurality of pulse operated regulatory devices with the signal generating devices.

3,373,936
IRRIGATION SYSTEMS
Rufus J. Purtell, Brownfield, Tex., assignor to The J. B. Knight Co. Inc., Brownfield, Tex., a corporation of Texas
Continuation-in-part of applications Ser. No. 26,636, Apr. 19, 1960, and Ser. No. 338,768, Jan. 20, 1964. This application Nov. 26, 1965, Ser. No. 509,900
13 Claims. (Cl. 239—1)



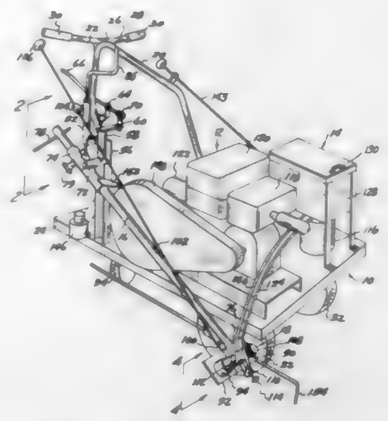
In an irrigation system, misalignment of a pipe supported by vehicles is detected by a stiff leg attached to the pipe. Upon misalignment the stiff leg moves a shield between a ratchet and dog, thus inactivating the drive to the vehicles.

3,373,937
CARBONATED WATER DISPENSING NOZZLE
Rudolph A. Yuza, Westchester, Ill., assignor to The Bastian Blessing Company, Chicago, Ill., a corporation of Illinois
Filed Apr. 11, 1966, Ser. No. 541,548
9 Claims. (Cl. 239—11)



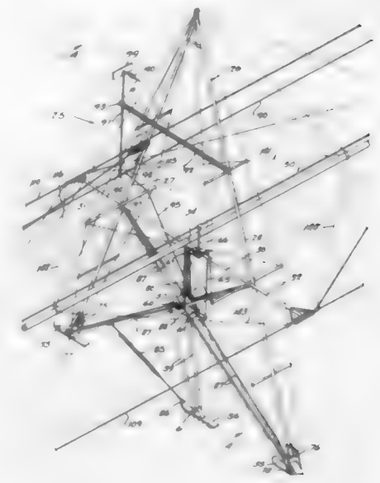
A carbonated water dispenser in which concentric sleeves are closely spaced in a radial direction to provide a nonturbulating and nonaccelerating flow at a gravity flow rate during dispensing operation and a capillary action during resting conditions for retaining CO_2 gas in the carbonated water while lowering the pressure thereon to atmospheric pressure for use.

3,373,938
BOOM DIRECTED SPRAY MARKING DEVICES
Harold C. Sweet, New Hudson, Mich., assignor to H. C. Sweet Co., Inc., New Hudson, Mich., a corporation of Michigan
Filed Mar. 7, 1966, Ser. No. 532,231
18 Claims. (Cl. 239—148)



A nozzle-supporting boom is mounted on a portable wheeled frame carrying a paint storage tank and a self-contained source of air pressure. A paint spray nozzle mounted on the boom can be rotated to selected positions to mark horizontal and vertical surfaces. The nozzle-carrying end of the boom can be raised and lowered as well as moved between lateral positions relative to the frame by the operator so that the nozzle can produce a stripe on a raised surface as well as the ground when the frame is advanced along a predetermined path by the operator.

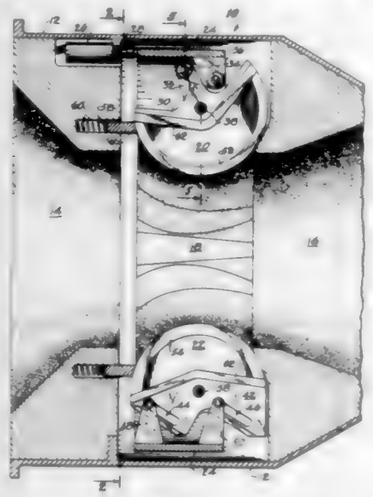
3,373,939
SELF-PROPELLED IRRIGATION SYSTEM OF THE RECIPROCABLE CABLE TYPE WITH MOBILE SUPPORTS ACTUATED BY PROPELLING SHOES
Leo J. Dowd, 117 S. Parkway, Columbus, Nebr. 68601
Filed July 1, 1966, Ser. No. 562,183
5 Claims. (Cl. 239—177)



1. A self-propelled irrigation system comprising an upstanding water-supply conduit, an elongated horizontally disposed water-distributing pipe having one end pivotally connected to said supply conduit for movement of said distributing pipe about said supply conduit as an axis, a main mobile support disposed transversely of said distributing pipe adjacent the other end thereof and fixedly carrying said distributing pipe, a plurality of discharge nozzles spaced along said distributing pipe between the ends thereof for spraying water onto the land as said distributing pipe moves about said supply conduit as an axis, a plurality of intermediate mobile supports arranged transversely of and at spaced locations, along said distributing pipe between said main support and said one end of said pipe, means on each intermediate support supporting the adjacent portion of said distributing pipe, a reciprocable flexible member disposed in parallel spaced relation with respect to said distributing pipe and having one end operatively connected to said supply conduit and having the other end operatively connected to the other end of said distributing pipe, each of said main and intermediate supports being provided with a ground-engaging propelling shoe and a shoe arranged in linear alignment with respect to said propelling shoe and slidably engaging the ground, a main ratchet drive wheel means on said main support and drivingly connected to said flexible member, a subsidiary ratchet drive wheel means on each of said intermediate supports and drivingly connected to said flexible member, a first means drivingly connecting the propelling shoe on each of said intermediate supports to the adjacent subsidiary ratchet drive means, a second means drivingly connecting the propelling shoe on said main support to said main ratchet drive wheel means also on said main support, and a control means operatively connected to the ratchet wheel of each subsidiary ratchet drive wheel means and operable to activate the ratchet wheel and the attendant propelling shoe of an intermediate support in accordance with lagging of and out of longitudinal alignment of said intermediate support with the main support and the other intermediate supports, and operable to deactivate the ratchet wheel and the attendant propelling shoe of said intermediate support in accordance with restoration of said inter-

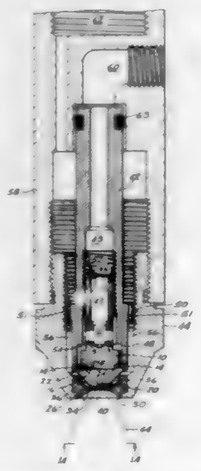
mediate support to the position of longitudinal alignment with the main support and the other intermediate supports.

3,373,940
VARIABLE AREA EXHAUST NOZZLE
Joseph F. Loprete, Wayne, N.J., Sanford Flanzenbaum, New York, N.Y., and John R. Campbell, North Haledon, N.J., assignors to Curtiss-Wright Corporation, a corporation of Delaware
Filed July 12, 1965, Ser. No. 470,986
20 Claims. (Cl. 239—265.15)



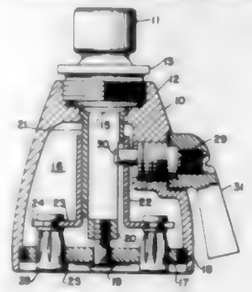
A variable area exhaust nozzle has, in the throat section thereof, a plurality of accurately shaped segments stacked in a side-by-side relationship around the nozzle axis. The radial inner surface of the segments defines a substantially smooth inner surface portion of the nozzle throughout. Means are provided for moving the segments toward and away from the nozzle axis to vary the cross sectional area of the throat section. As the segments move toward and away from the nozzle axis, alternate segments are movable relative to immediately adjacent segments such that the inner surface of the nozzle section remains substantially smooth.

3,373,941
NOZZLE
Orvis A. Davis, Sr., Gibsonia, Pa., assignor to Gulf Research & Development Company, Pittsburgh, Pa., a corporation of Delaware
Filed Feb. 3, 1966, Ser. No. 524,672
12 Claims. (Cl. 239—291)



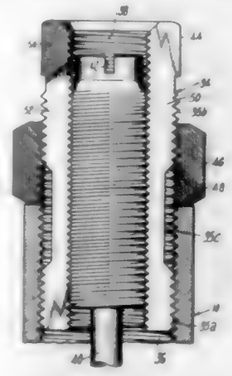
1. A nozzle comprising first means for discharging an axial spray, second means in said nozzle for charging a pressurized fluid in the direction of the periphery of said spray, said second means comprising channel means for charging separate streams of said fluid in collision course toward each other to form a resultant stream of said fluid having a low velocity, said second means also comprising passageway means in the zone of collision of said fluid streams which is substantially lateral with respect to said channel means to direct said resultant fluid stream in the direction of the periphery of said axial spray.

3,373,942
PLASTIC SHOWER HEAD PLUNGERS
Edward A. Roman, Wilmington, and Arthur Anthony Fiorentino, Newark, Del., assignors to Speakman Company
Filed Oct. 5, 1965, Ser. No. 493,063
4 Claims. (Cl. 239—460)



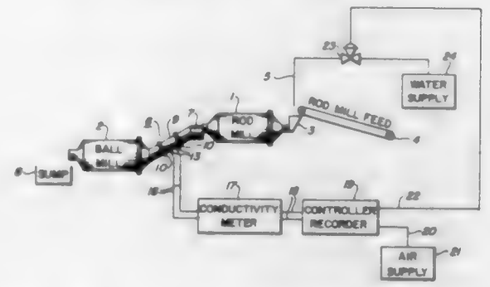
A shower head plunger made from a material having toughness, anti-liming, low water absorptivity and good dimensional stability characteristics is the subject of the instant invention. One of the following resins is used: polycarbonate, phenoxy resin or polyphenylene oxide.

3,373,943
FUEL INJECTION NOZZLE AND ADJUSTING MEANS THEREFOR
Vernon D. Roosa, P.O. Box 1440, West Hartford, Conn. 06101
Filed June 3, 1966, Ser. No. 555,152
8 Claims. (Cl. 239—533)



1. In a fuel injection device, a nozzle body having a valve chamber, a plunger valve of smaller cross section than said chamber disposed in the chamber, a guide supporting the plunger valve for reciprocating movement longitudinally within the chamber, a spring biasing the plunger valve toward a valve seat having a discharge orifice and adjusting and locking means for setting the spring biasing force and the lift of the valve from the valve seat, said adjusting and locking means comprising an externally and internally threaded spring adjusting sleeve threadably engaging mating threads provided by the nozzle body, a concentric lift stop pin threadably engaged with the inner threads of said sleeve, and a lock nut threadably engaged with the outer threads of said sleeve and engageable with a shoulder provided by said nozzle body wherein the improvement comprises a longitudinal portion of the spring adjusting sleeve spanning said shoulder provided by the nozzle body being externally unthreaded to permit elongation and a gradual change in pitch of the internal threads upon the tightening of the lock nut so as to lock the stop pin in position.

3,373,944
METHOD AND APPARATUS FOR CONTROLLING CONSISTENCY
Lloyd V. Fegan, Jr., Lebanon, and Amable E. Emond, Reading, Pa., assignors to Bethlehem Steel Corporation, a corporation of Delaware
Filed Feb. 24, 1966, Ser. No. 529,820
8 Claims. (Cl. 241—15)



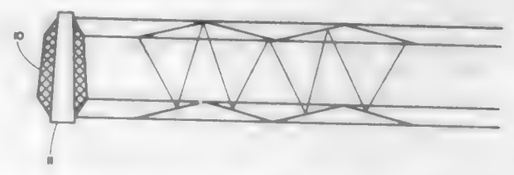
7. Method for continuously controlling and maintaining at a desired value the consistency of an electrically conductive mixture, said mixture including solids and a liquid continuously being added to said solids, said method comprising:

(a) forming a moving stream of said mixture, said stream having a depth varying directly with variations in the consistency of said mixture, there being a predetermined depth of stream corresponding with the desired value of consistency,

(b) measuring the resistance of said mixture in a portion of said stream by passing an electrical current between two fixed spaced stations in said stream and through the mixture between the two said stations,

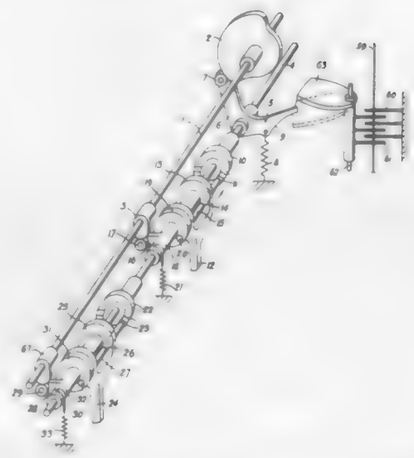
(c) regulating the flow of liquid to said solids to increase the flow of liquid when the resistance of said mixture between the two stations decreases below a predetermined value corresponding to an increase in the depth of said stream above a predetermined value and alternatively to decrease the flow of liquid when the resistance of said mixture between the two stations increases above the predetermined value corresponding to a decrease in the depth of said stream below the predetermined value.

3,373,945
WINDING OF YARN
Bryan K. Johnson, Abergavenny, England, assignor to British Nylon Spinners Limited, Pontypool, England
Filed Mar. 2, 1965, Ser. No. 436,664
Claims priority, application Great Britain, Mar. 11, 1964, 10,192/64
5 Claims. (Cl. 242—18)



Yarn is traversed to and fro along a rotating bobbin during the winding thereof on the bobbin with a cyclically varying traverse stroke. The length of yarn laid in one cycle of varying traverse strokes or in a low whole number multiple thereof is at least substantially equal to the length of yarn formed into a given textile article of required defined dimensions.

3,373,946
COP EXCHANGING APPARATUS
Vladimir Prasil, Brno, Czechoslovakia, assignor to Elitex, Zavody textilniho strojirenstvi, Liberec, Czechoslovakia
Filed Sept. 6, 1966, Ser. No. 577,487
Claims priority, application Czechoslovakia, Sept. 8, 1965, 5,505/65
10 Claims. (Cl. 242—35.6)

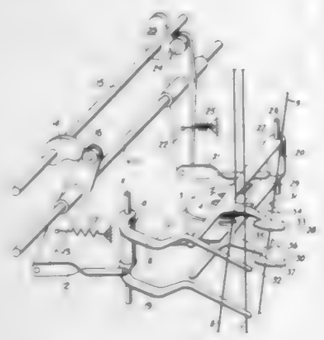


1. Cop exchanging apparatus for a winding machine, comprising, in combination, actuating means controlled by the winding machine upon a yarn breakage or exhaustion of a supply cop to perform an actuating motion; cop exchanging means; coupling means having a normal coupling position for coupling said actuating means with said cop exchanging means, and an inoperative position wherein said actuating means and said cop exchanging means are decoupled; control means for said coupling means; connecting means for connecting said actuating means with said control means for placing during said actuating motion said coupling means in said inoperative position for preventing actuation of said cop exchanging means upon a yarn breakage; and sensing means for sensing a yarn wound off a supply cop and located to respond to the exhaustion of a yarn, but not to a yarn breakage, said sensing means controlling said connecting means to render the same inoperative when responding to the exhaustion of the yarn of a supply cop so that said coupling means remains in said normal coupling position and said actuating means actuate said cop exchanging means to effect the substitution of a new full cop for the exhausted cop.

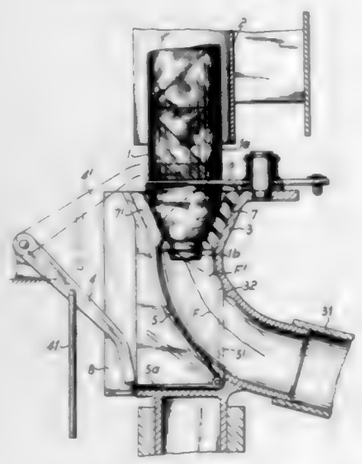
3,373,947
YARN POSITIONING AND TYING DEVICE
Vladimir Prasil, Brno, Czechoslovakia, assignor to Elitex, Zavody textilniho strojirenstvi, Liberec, Czechoslovakia
Filed Sept. 6, 1966, Ser. No. 577,506
Claims priority, application Czechoslovakia, Sept. 8, 1965, 5,503/65
10 Claims. (Cl. 242—35.6)

1. Yarn end tying apparatus comprising, in combination, a tying device having first and second receiving means for yarn ends and adapted to tie yarn ends in said first and second receiving means to each other; yarn inserting means mounted for movement toward and away from said tying device and having two first yarn holding means passing said first receiving means, and a second yarn holding

means passing said second receiving means during movement of said inserting means; and drive means for moving said inserting means so that a broken yarn end located in the path of movement of one of said first yarn holding means, or a new yarn end located in the path of movement of the other of said first yarn holding means, is engaged by the respective first holding means and inserted into said first receiving means while another yarn end located in the path of movement of said second yarn holding means is engaged by the same and inserted into said second receiving means whereby either a broken yarn end or a new yarn end is tied by said tying device to said other yarn end.

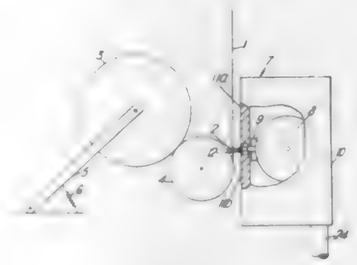


3,373,948
METHOD AND DEVICE FOR PNEUMATICALLY REMOVING THE TIP OR FOOT BUNCH FROM SUPPLY COILS
Hans Raasch, Rheydt, Germany, assignor to Walter Reiners, Monchen-Gladbach, Germany
Filed Nov. 30, 1966, Ser. No. 598,063
Claims priority, application Germany, Dec. 2, 1965, R 42,113
5 Claims. (Cl. 242—35.6)



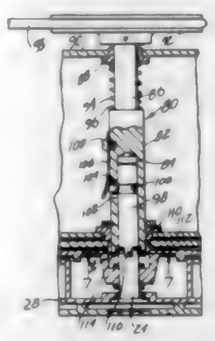
Supply coil is readied for subsequent processing by removing a tip or foot bunch therefrom by subjecting the bunch to be removed to the action of an air current supplied by a suction tube for relatively short time intervals until a thread end is exposed. The exposed thread end is clamped at a clamping location with a clamping device located in an opening of the suction tube between the intervals during which the bunch is subjected to the air current. The supply coil and the clamping location are relatively movable by means of a thrust member while the thread is clamped so as to mechanically draw off the thread end from the supply coil.

3,373,949
YARN WINDING MECHANISM
Ian Henry Swallow, Goytre, Monmouthshire, England, assignor to British Nylon Spinners Limited, Pontypool, Monmouthshire, England, a corporation of Great Britain
Filed Oct. 4, 1965, Ser. No. 492,653
Claims priority, application Great Britain, Oct. 21, 1964, 42,939/64
8 Claims. (Cl. 242—43)



A yarn traversing mechanism for a rotating yarn package includes means for lubricating the sliding surfaces in the mechanism and means for preventing contamination of the yarn with lubricant. The mechanism includes a horizontally disposed, grooved barrel cam, a cam follower, parallel upper and lower guide tracks for the follower, a yarn guide carried by the follower and disposed on the opposite side of the guide tracks from the cam. Reduced pressure on the cam side of the guide tracks causes an air stream to pass through the space between the tracks, thereby preventing passage of lubricant in the opposite direction.

3,373,950
REEL DRIVE ARRANGEMENTS
Yale J. Greenberg, Canton, Mass., assignor to Keystone Camera Company, Inc., Boston, Mass., a corporation of Massachusetts
Filed Nov. 23, 1964, Ser. No. 412,948
6 Claims. (Cl. 242—55.13)



1. Reel drive apparatus for use with transducing equipment of the type in which a flexible record member is moved past a station in an information transfer operation, comprising

a casing having a compartment for receiving a magazine that supports two spaced reels for transport of a flexible record member,

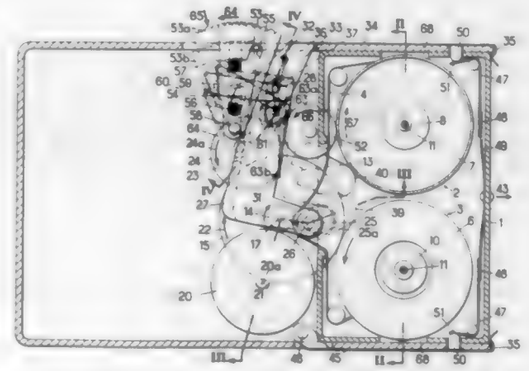
reel drive means disposed in said casing having a pair of concentric drive elements,

means for frictionally coupling said drive elements together,

one of said drive elements including coupling means for engaging in driving relation one of said magazine supported reels,

and the other of said drive elements including coupling means for engaging in driving relation, the second magazine supported reel so that said record member in a first position of said magazine may be transferred in one direction from one reel to the other by a frictionally coupled drive and in a second position of said magazine may be transferred in the reverse direction by a direct drive.

3,373,951
DRIVE MEANS FOR MINIATURE TAPE RECORDERS
Jean Mazoyer, 6 Rue des Clamarts, Nogent-sur-Marne, Seine, France
Filed Nov. 5, 1965, Ser. No. 506,486
6 Claims. (Cl. 242—55.13)



A drive system for miniature magnetic recorders, characterized by the fact that it comprises a symmetrical magazine containing a magnetic tape mounted on two reels. The reels each consist of a hub having a first flange rigidly connected on one end and a second flange engaged by friction on the other end. The mechanism for driving the tape and reels comprises, in combination, a capstan rigidly connected to a large wheel which is driven by frictional contact between its periphery and an electric micro-motor, the large wheel frictionally driving an inertia flywheel and an engaged wheel of the take-up reel; a presser roller mounted on an oscillating arm to press the magnetic tape against the capstan; a transmission roller, which rolls on the first flange of the feed reel and contributes to the braking thereof; and finally, a control member consisting of a movable part which in a first position displaces the oscillating arm to move the presser roller away from the capstan and, in a second position, elastically presses a small roller between the periphery of the flywheel and the periphery of the transmission roller so as to effect high speed rewinding of the magnetic tape.

3,373,952
DRUM WINDER FOR PAPER AND THE LIKE
Edward J. Klaczkiewicz, Wilmington, Del., assignor to Beloit Eastern Corporation, Downingtown, Pa., a corporation of Delaware
Filed Jan. 7, 1966, Ser. No. 519,206
13 Claims. (Cl. 242—66)

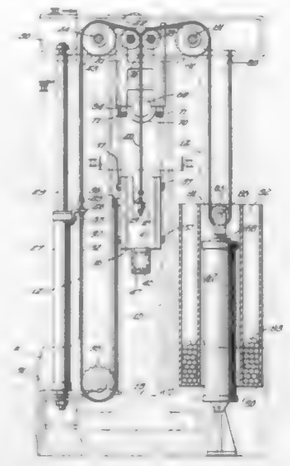
1. A drum winder for webs of paper and the like comprising:

a frame structure having a pair of parallel laterally spaced upright posts at each end of said frame structure,

a pair of horizontal parallel spaced power driven winder drums disposed between said posts adjacent the lower ends thereof,

parallel spaced guides extending vertically along each of said posts on opposite sides of the space between said winder drums,

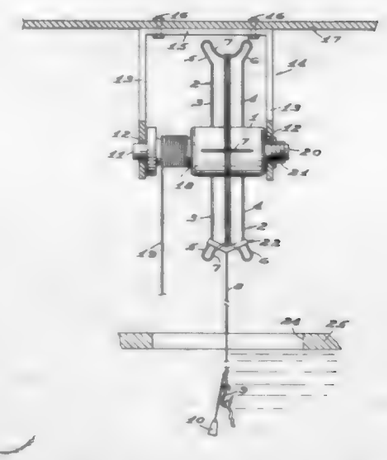
core shaft slides disposed between and slidably guided in said guides,



fluid pressure operated means vertically moving said core shaft slides along said posts,

and a core shaft journalled in said core shaft slides between said guides.

3,373,953
FISHING REEL CONSTRUCTION
Aaron M. Grove, 526 N. Antler St., Gladwin, Mich. 48624
Filed May 25, 1966, Ser. No. 552,763
8 Claims. (Cl. 242—104)

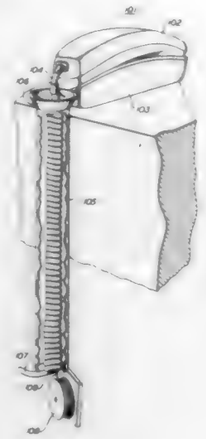


A fishing reel having a rotatable drum from which extends a plurality of radial spokes having free ends about which a fishing line may be wound circumferentially of the drum and including an elastic band mounted on and surrounding one of the spokes at its free end so as to overlie a selected number of convolutions of the line.

3,373,954
RETRACTILE TELEPHONE CORD STORAGE ARRANGEMENT
Harry A. Hilsinger, Jr., Hope Township, Warren County, N.J., assignor to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York
Filed Mar. 11, 1966, Ser. No. 533,637
10 Claims. (Cl. 242—107)

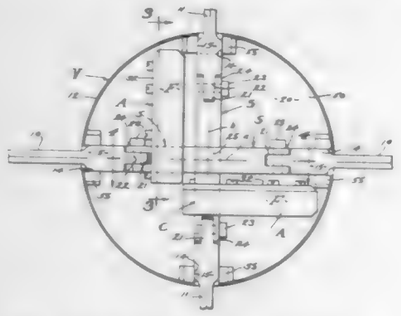
In a retractile coiled cord arrangement for an electrical appliance for a telephone handset, a retracting wire

mounted on a spring-loaded drum has its free end affixed to the cord near its operating end so that upon the release



of tension on the wire, the coiled cord is automatically retracted and stored within an accommodating tube.

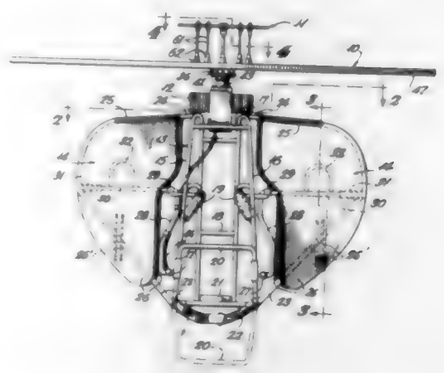
3,373,955
PITCH AND YAW ACTUATOR ASSEMBLY FOR VEHICLE GUIDANCE SURFACES
Paul Huska, 739 Moreno, Los Angeles, Calif. 90049
Filed May 25, 1964, Ser. No. 369,903
6 Claims. (Cl. 244—3.21)



5. A pitch and yaw actuator assembly for installation on a transverse bulkhead member within a cylindrical vehicle body and comprising in combination, a pair of identical right angularly related and interesecting shafts to be independently revolved in diametrically disposed axes, an actuated element coupled to each opposite end of each shaft, an offset saddle at the center of at least one shaft whereby said shaft clears the other said shaft for independent revolvement, and a pair of identical actuators and one coupled to each shaft and each actuator comprising a frame with a chamber therein and with bearings rotatably supporting one of said shafts at and inward of the coupling at one end thereof and with the opposite ends of said shaft extending free from the bearings, said chamber of the frame being disposed radially of the shaft carried in said bearings and disposed adjacent to the other right angularly related shaft, and there being means operable within said chamber to revolve the shaft.

3,373,956
OVERHEAD ROTOR AIRCRAFT
Walter K. Owens, Crestview, Fla., assignor to Souri, Inc., Pensacola, Fla., a corporation of Florida
Continuation-in-part of application Ser. No. 430,282, Feb. 4, 1965. This application Sept. 7, 1966, Ser. No. 577,662
7 Claims. (Cl. 244—4)

A single passenger overhead sustaining rotor aircraft in which said rotor has automatic gyroscopic cyclic pitch control means for the individual rotor blades operable in response to tilting of the depending aircraft structure



away from the vertical, in combination with manually controllable fins which are constantly subjected to the downward air stream produced by the rotor.

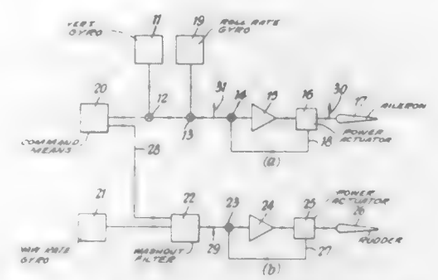
3,373,957
REMOTE VEHICLE CONTROL
Wolfgang Budde, 758 E. 24th St., Erie, Pa. 16500
Filed Mar. 28, 1966, Ser. No. 537,724
5 Claims. (Cl. 244—75)

The present invention involves a control for model airplanes. The control is made up of a conventional receiver on the airplane, which transmits signals to the control surfaces of the airplane. The transmitter is a multi-tone or multi-channel transmitter and is controlled by signals from four sectors of a surface that conforms to a part of a sphere. A joy stick is supported above the surface with its center of rotation at the center of curvature of the sphere, and the operator can move the joy stick to move the contact thereof selectively over the several sectors and hereby control the flight of a model airplane. The control of the joy stick relative to the control surface is exactly the same relative to the airplane as a joy stick connected directly to the controls of a conventional airplane would be for corresponding maneuvers.

3,373,958
AIRCRAFT TURN ENTRY
George E. Sims, Century Works, Lewisham, London, SE. 13, England
Filed Aug. 6, 1965, Ser. No. 477,886
Claims priority, application Great Britain, Aug. 10, 1964, 32,478/64
2 Claims. (Cl. 244—77)

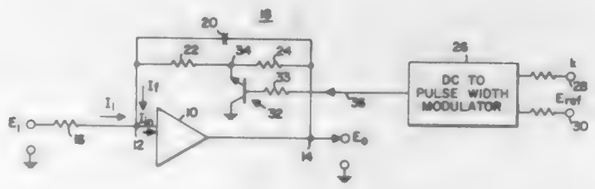
An aircraft control system having an aileron control loop and a rudder control loop, which latter includes a yaw rate gyro and a wash-out filter having yaw rate

its input, and interconnects the aileron and rudder control loops by connecting the aileron loop roll command input



to the input of the rudder loop wash-out filter. Rudder response upon termination of a turn is improved.

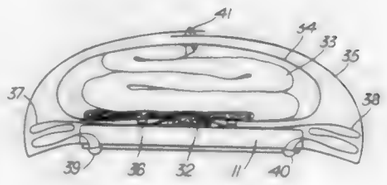
3,373,959
CONTROL APPARATUS
John F. Petersen, New Brighton, Minn., assignor to Honeywell Inc., Minneapolis, Minn., a corporation of Delaware
Filed Oct. 21, 1965, Ser. No. 499,386
6 Claims. (Cl. 244—77)



1. Computing means comprising in combination:
a D-C amplifier, having input and output terminals;
means connected to the amplifier input terminal, causing a current directly proportional to a first signal to flow thereinto;
a network connected between the amplifier output and input terminals, comprising a capacitor and tapped resistor, in parallel;
a pulse width modulator, providing a train of periodic pulses, the width of the pulses linearly decreasing and increasing as a second signal increases and decreases respectively; and,
switching means connected to the resistor tap, responsive to the pulses and interrupting resistive current flow, in said network, between amplifier input and output terminals in coincidence with the pulses.

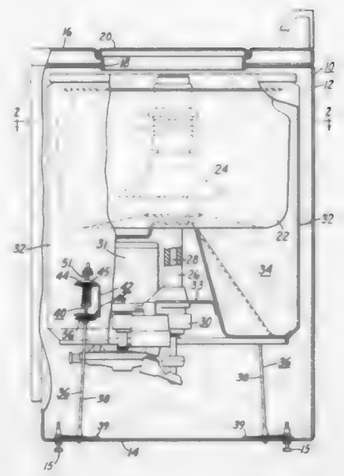
6. In aircraft attitude control apparatus, a computing means comprising in combination:
a D-C amplifier, having input and output terminals;
means connected to the amplifier input terminal causing a current which is a function of the vertical acceleration of the aircraft flow thereinto;
a network connected between the amplifier output and input terminals, comprising a capacitor and tapped resistor, in parallel;
a pulse width modulator, providing a train of periodic pulses, the width of the pulses linearly decreasing and increasing as cosine ϕ, where ϕ is the angle of bank of the aircraft, increases and decreases respectively;
switching means connected to the resistor tap, responsive to the pulses and interrupting resistive current flow, in said network, between amplifier input and output terminals, in coincidence with the pulses;
second switching means, responsive to the pulses and interrupting the current that is a function of the vertical acceleration of the aircraft, in coincidence with the pulses; and,
servo means connected to the output of the amplifier, operating the aircraft elevator surface to prevent loss of altitude of the craft in a banked turn.

3,373,960
PARACHUTES
John Rothwell Mitchell, Woking, Surrey, England, assignor to G. Q. Parachute Company Limited, Woking, Surrey, England, a British company
Filed July 25, 1966, Ser. No. 567,656
Claims priority, application Great Britain, July 27, 1965, 32,078/65; Oct. 14, 1965, 43,623/65
6 Claims. (Cl. 244—148)



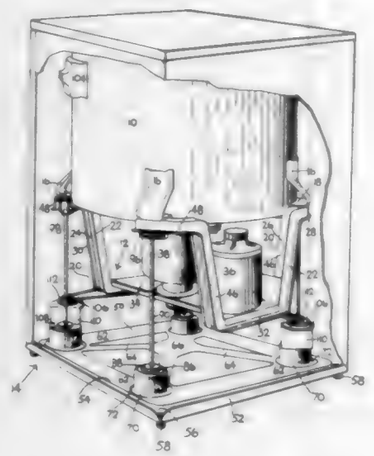
A parachute enclosed within an inner bag, the inner bag being composed of sections unattached to each other except through loops at each end thereof, the inner bag being enclosed within an outer bag, a force means also within the outer bag engaging the inner bag to force the inner bag and parachute from the outer bag upon opening of the outer bag, the outer bag having releasable means holding the same closed.

3,373,961
SUSPENSION SYSTEM
George B. Long, Dayton, Ohio, assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Dec. 20, 1965, Ser. No. 514,911
8 Claims. (Cl. 248—18)



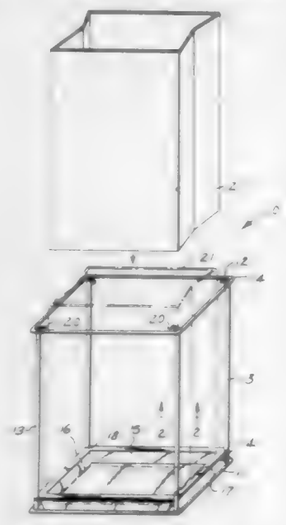
In the preferred form, a suspension system for a domestic washing appliance having a water container in combination with a spin tub and a means to rotate the spin tub, all supported from a base frame by springs on a plurality of supporting rods used in conjunction with plural snubbing devices mounted on each support rod to give a high snubbing restraint at and below critical speed and a lesser restraint above critical speed.

3,373,962
WASHING MACHINE SUPPORT STRUCTURE
William M. Blaiklock, London, Ontario, and Donald L. Allen, Don Mills, Ontario, Canada, assignors to General Steel Wares Limited
Filed Dec. 29, 1965, Ser. No. 517,228
1 Claim. (Cl. 248—18)



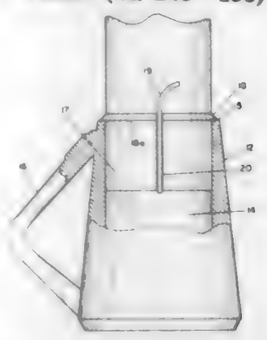
The upright tub of a washing machine is supported upon the base by flexible rods; the lower ends of the rods are rigidly secured in the base and the upper end of each rod is encased in rubber-like material which attaches the rod to the tub.

3,373,963
BAG HOLDING DEVICE
Jolene Snell, 20—56 29th St., Long Island City, N.Y. 11105
Filed Aug. 4, 1965, Ser. No. 477,239
3 Claims. (Cl. 248—97)



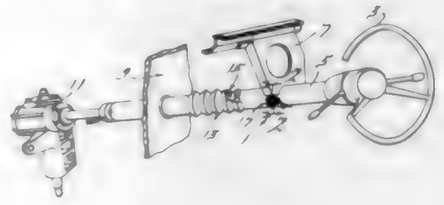
A bag holding device formed of a wire or rod formed cage which may be rectangular or otherwise shaped to form a hollow cage-like enclosure for receiving a paper or bag or other material which is to be filled with garbage or other refuse. The cage has upright corner rods or wires with top and bottom frames, and there is a bottom tray portion which is slidable from bottom to top of the cage, and which is weighted to normally be at the bottom to lower the center of gravity to avoid accidental tipping over. The tray portion is dished upwardly to retain any liquid contents of the garbage to avoid soiling the floor beneath, and when the garbage bag is to be emptied, the tray can be pushed upwardly on its track guides formed by the uprights of the cage, to push the bag out of the device into a garbage can or the like without soiling the hands, stops being provided at the top and bottom of the cage to retain the tray within the cage.

3,373,964
LAMP CONSTRUCTION
Gary A. Bunders, R.R. 2, Box 66, S. Marquette, Prairie du Chien, Wis. 53821
Filed May 5, 1966, Ser. No. 547,910
1 Claim. (Cl. 248—158)



The combination of a lamp standard and an imperforate mug supporting the standard. The mug has a cylindrical receptacle portion and the standard has a lower connection portion removably received in the receptacle portion of the mug. The standard has an integral annular flange engaging the rim of the mug. The connector portion and the annular flange have an upright laterally open groove therethrough receiving the electrical cord extending from the bottom of the lamp standard.

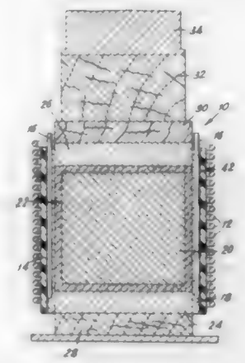
3,373,965
RELEASABLE STEERING COLUMN CLAMP
Alfred A. Bien, Birmingham, and Ronald M. Gerweck, Royal Oak, Mich., assignors to Chrysler Corporation, Highland Park, Mich., a corporation of Delaware
Filed June 8, 1966, Ser. No. 556,096
16 Claims. (Cl. 248—226)



1. A clamp for frictionally securing an elongate member to a support means comprising preformed portions on said member adapted to receive fasteners, each of said preformed portions having an opening therethrough extending to one edge thereof, fasteners adapted to extend through said support means and said openings for securing said member to said support means, at least one of said fasteners including a frictional clamp for exerting a predetermined frictional gripping force on said preformed portions adjacent at least one of said openings, said preformed portions being adapted to slip out of said frictional clamp for releasing said member when the frictional gripping force is overcome by a force on said member.

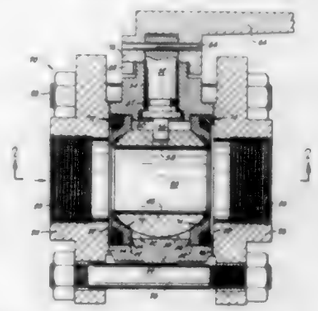
3,373,966
APPARATUS FOR FORMING LARGE CARBONACEOUS BODIES
Gayle L. Rowe, Parma Heights, and Joe R. Wilson, North Olmsted, Ohio, assignors to Union Carbide Corporation, a corporation of New York
Filed Dec. 1, 1965, Ser. No. 510,921
5 Claims. (Cl. 249—80)

1. In an apparatus wherein a large carbonaceous body is produced by the application of high pressure and temperature, said high temperature being produced by the electro-magnetic field of an induction heating means, the improvement which comprises a fiberglass mold shell, a refractory liner adjacent to said fiber glass shell, and



cooling means positioned between said shell and said liner, cooling means being so structured and so positioned as to be minimally affected by said electromagnetic field whereby said shell is cooled during the application of heat to said body.

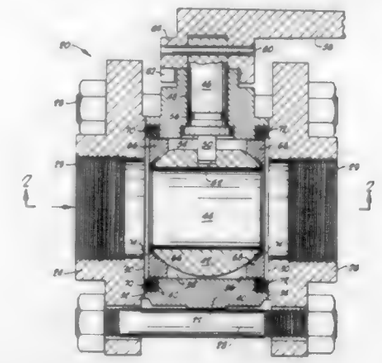
3,373,967
BETWEEN-FLANGE BALL VALVE
Domer Scaramucci, 3245 S. Hattie, Oklahoma City, Okla. 73129
Filed Apr. 12, 1965, Ser. No. 447,282
17 Claims. (Cl. 251—148)



A ball valve including a tubular body having counterbored upstream and downstream end faces. A ball is positioned in the tubular body between a pair of seals which each include a high strength seating ring having a portion positioned in one of the counterbores and axially slidable in such counterbore parallel to the direction of fluid flow. Each seating ring has a frusto-spherical front face configured to sealingly engage the ball and an outer face facing toward the nearest end face of the valve body. An elastic material sealing ring is adhered to each seating ring and is dimensioned to bear resiliently against the wall of the respective counterbore receiving a portion of the seating ring to which it is bonded, and is also dimensioned to extend beyond the nearest end face of the valve body in its relaxed condition, so that assembly of the valve between two flanged members contacting the end faces places the sealing ring in compression and in sealing engagement with said flanged members.

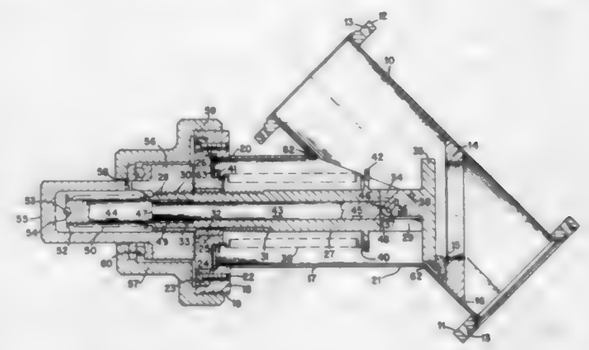
3,373,968
BETWEEN-FLANGE BALL VALVE WITH SLIDABLE SEATS
Domer Scaramucci, 3245 S. Hattie, Oklahoma City, Okla. 73129
Filed Apr. 12, 1965, Ser. No. 447,448
16 Claims. (Cl. 251—148)

A floating ball-type valve wherein the seating rings are slidable in the valve chamber with upstream and downstream movement of the ball. Each seating ring has an elastic material seal ring bonded around the outer periphery thereof positioned to form a seal between the seating ring and the body and between the body and a pipe flange



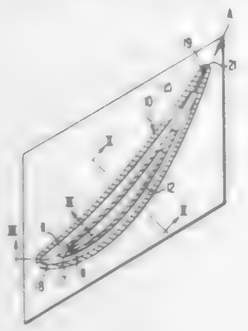
secured to the respective end of the body. Each seal ring also functions to urge the respective seating ring against the ball, whereby the upstream seat provides an upstream seal for the valve when the valve is closed.

3,373,969
VALVE FOR VACUUM SERVICE
Matthew J. Teitt, Trafford, Pa., assignor, by mesne assignments, to the United States of America as represented by the United States Atomic Energy Commission
Filed Oct. 6, 1965, Ser. No. 493,597
2 Claims. (Cl. 251—229)



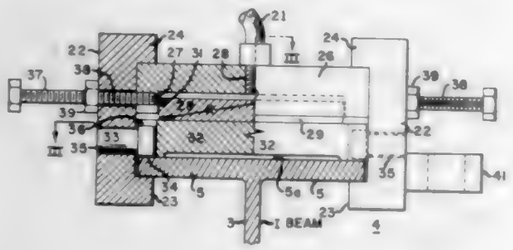
1. A valve for vacuum service comprising:
(a) a housing containing a valve member and a valve seat therein;
(b) a stem assembly disposed within said housing comprising an outer member and an inner member slidably disposed within said outer member;
(c) means for first causing combined axial movement of the outer member and the inner member while the valve member is proximate the valve seat and for secondly causing relative axial movement of the outer member with respect to the inner member while the valve member is distant the valve seat;
(d) said valve member, adapted for sealing engagement with the valve seat, being mounted to the outer member and cammed to the inner member of the stem assembly so that combined axial movement of the outer member and the inner member causes axial movement of the valve member and relative axial movement of the outer member with respect to the inner member causes pivotal movement of the valve member,
whereby the valve member moves from sealing contact with the valve seat to a position allowing substantial unimpeded flow through the valve.

3,373,970
GAS TURBINE BLADE
Heinz Brockmann, Fellbach-Wurttemberg, Germany, assignor to Daimler-Benz Aktiengesellschaft, Stuttgart-Unterturkheim, Germany
Filed Dec. 9, 1966, Ser. No. 600,540
Claims priority, application Germany, Dec. 11, 1965, D 48,895
12 Claims. (Cl. 253—39.15)



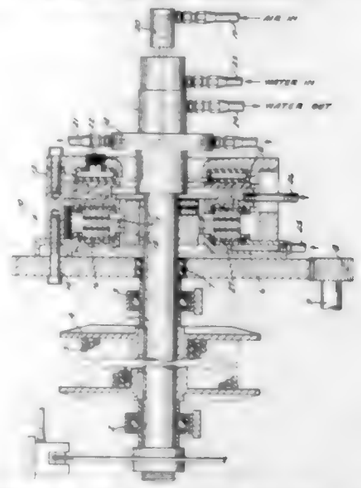
The present disclosure relates to a blade for a gas turbine, particularly a turbine to be used in a flight propulsion unit. The blade is constructed of inner and outer substantially identically contoured hollow blade members, which are connected together by cooling fins or ribs that extend substantially in the plane of propulsion gas flow. A cooling fluid is introduced into the inner hollow blade and is discharged through radially elongated slots in the forward edge of the inner blade against the interior surface of the outer hollow blade forward edge. The cooling fluid will travel from the forward edge between the inner and outer hollow blade members rearwardly where it is discharged through radially elongated slots in the rearward edge of the outer hollow member smoothly into the flow of propulsion gases so that it will not disturb the flow of propulsion gases and enhance the aerodynamic effect of the turbine blade. The blade construction may be employed in either a rotating blade or a stationary guide vane.

3,373,971
HYDRAULIC GRIPPER FOR DERRICK JACK
Henry B. Chambers and Clair W. Tellefson, Santa Barbara, Calif., assignors to Hydranautics, Santa Barbara, Calif., a corporation of California
Filed Feb. 1, 1966, Ser. No. 524,041
8 Claims. (Cl. 254—107)



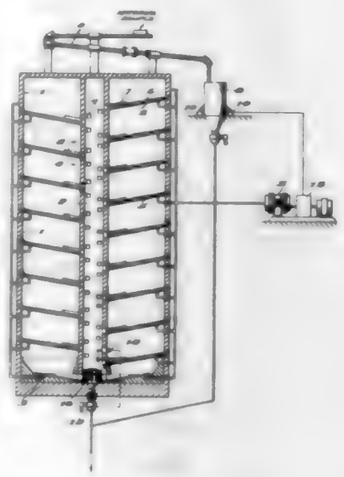
A double flanged member such as an I beam is gripped by a pair of smooth jaws on one side of the flanges and by a smooth shoe or shoes on the other side of the flanges, and the shoe and jaws are mechanically interconnected to move together longitudinally but with a universal motion to fit irregularities of the flanged member. A hydraulic motor moves the shoe toward the jaws. The gripper acts as an anchor for pulling or pushing heavy objects supported on the I beam.

3,373,972
SLIP CLUTCH CONSTANT TENSION WINCH
Earl A. Peterson, 11221 Loch Lomond Drive, Los Alamitos, Calif. 90720
Filed Aug. 25, 1966, Ser. No. 575,095
5 Claims. (Cl. 254—187)



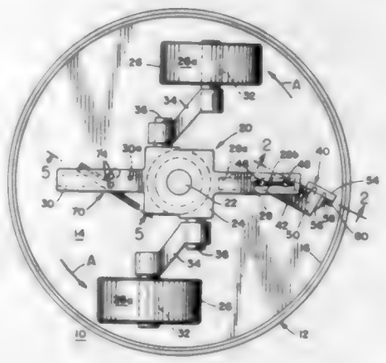
The combination of a constant tension winch with a constantly slipping clutch provides a mechanism when the load attached to the winch has a constant tension thereon, so that this load will not move relative to the winch. The amount of slippage of the clutch can be varied to alter the tension on the winch as might be required. Even though the load is stationary at times, the clutch is still slipping during the periods of movement or non-movement of the load.

3,373,973
MIXING APPARATUS FOR BLENDING BULK MATERIAL
Hans-Joachim Schmidt-Holthausen, Hamburg-Sasel, Germany, assignor to Fuller Company, Catasauqua, Pa., a corporation of Delaware
Filed Apr. 13, 1967, Ser. No. 630,600
Claims priority, application Germany, Apr. 16, 1966, P 39,218
13 Claims. (Cl. 259—4)



A mixing silo for blending dry bulk material having a vertically disposed mixing chamber arranged within the silo. The mixing chamber carries a plurality of material inlets at various levels for receiving material which is thereby blended in the mixing chamber and discharged by gravity through the outlet in the bottom of the silo.

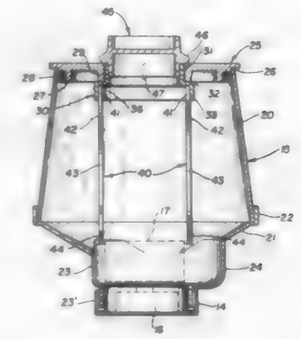
3,373,974
ROTARY MIXER
Elbert C. Troy, Highland Park, Ill., assignor to National Engineering Company, Chicago, Ill., a corporation of Delaware
Filed Feb. 8, 1967, Ser. No. 614,669
13 Claims. (Cl. 259—107)



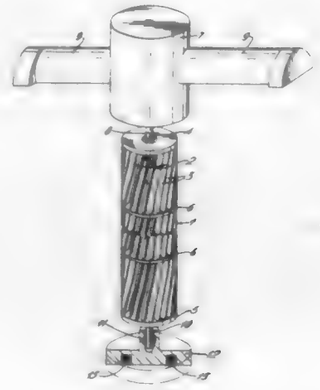
A rotary mixer for particulate material, such as foundry sand and the like, including a mixing chamber having a bottom wall and an upstanding peripheral sidewall with a mixing head mounted for rotation in said chamber about an upstanding axis inwardly of the sidewall. The mixing head includes a pair of outwardly extending support arms and a pair of inner and outer plow assemblies mounted on the arms. The outer plow assembly includes a plow having a planar advancing face sloping upwardly of the bottom wall and rearwardly in a direction opposite the movement of the plow into the material. This plow includes an outer and inner end and is positioned with the outer end trailing the inner end in a direction opposite the direction of movement of the plow into the material. The plow is supported from one of the support arms on the mixing head by a downwardly extending leg intermediate the ends of the plow which acts as a divider for dividing the material inwardly and outwardly thereof as it flows over the upper edge of the plow. The mixing head includes an inner plow assembly supported from the other arm of the mixing head which includes an inner plow having inner and outer planar advancing faces. The outer face is sloped upwardly and rearwardly in a direction opposite the movement of the plow into the material and the inner face is generally normal or perpendicular of the bottom wall.

3,373,975
BLENDER AND BUILT-IN SPATULA
George L. Congdon, Fort Atkinson, Wis., assignor to Scovill Manufacturing Company, New Haven, Conn., a corporation of Connecticut
Filed Mar. 15, 1966, Ser. No. 534,358
7 Claims. (Cl. 259—120)

A power operated blender provided with a built-in spatula for removing ingredients from the blender container wall and directing them toward the agitator-cutter of the blender without interruption of blender operation, comprising an open top ingredient container having a reduced diameter lower portion, an agitator-cutter unit located in the said portion, a removable cover provided with a central opening closing the top of the container, a knob rotatable in the cover opening, and a spatula detachably connected to and rotatable with the knob while the blender is in operation and the cover is in place. The knob is removable from the spatula and cover to permit adding ingredients through the cover opening while the blender is in operation. The spatula includes a hub and two blades attached to the hub in parallel transversely spaced apart relationship, said blades each having an edge portion slightly spaced from the inner surface of the container side wall and an inwardly directed portion terminating adjacent the agitator-cutter of the blender in said reduced diameter portion of the container.



3,373,976
FLOW MACHINES
Nikolaus Laing, Aldingen, near Stuttgart, Germany, assignor to Laing-Vortex, Inc., New York, N.Y., a company
Continuation-in-part of application Ser. No. 450,749, Apr. 26, 1965. This application Feb. 17, 1966, Ser. No. 528,204
3 Claims. (Cl. 259—135)

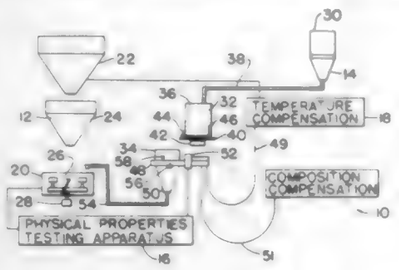


1. A mixer comprising a long bladed cylindrical rotor having forwardly curved blades and adapted for vertical mounting in a fluid to be mixed, a foot bearing of self-aligning type mounted in a magnetic foot with said bearing being connected to the lower end of said rotor, and drive means for the rotor at the upper end.

3,373,977
GRANULAR MATERIAL CONDITIONING APPARATUS
Harry W. Dietert, Kerrville, Tex., assignor to Harry W. Dietert Co., Detroit, Mich., a corporation of Michigan
Continuation-in-part of application Ser. No. 391,420, Aug. 24, 1964. This application June 10, 1966, Ser. No. 556,616
4 Claims. (Cl. 259—154)

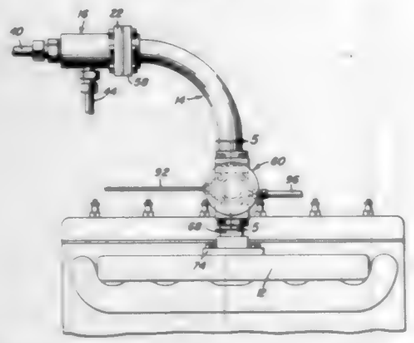
Apparatus for mixing foundry sand and additives therefor, including a mixer for the foundry sand and additives, means for metering additives into the mixer, means for testing the final physical properties of the mixed foundry sand and additives in the mixer, and means for compensating the metering means in accordance with the

final physical properties of the foundry sand and additives in the mixer and for the initial physical properties of the



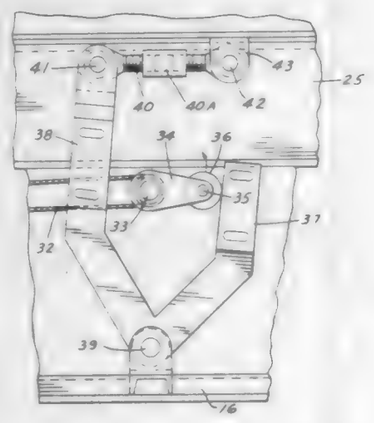
foundry sand, including the initial temperature and composition of the foundry sand.

3,373,978
CHARGE-FORMING DEVICE FOR INTERNAL COMBUSTION ENGINES
Orland W. Ellis, 411 Gibbs Road, Warrington, Fla. 32507
Filed Oct. 12, 1965, Ser. No. 495,244
1 Claim. (Cl. 261—16)



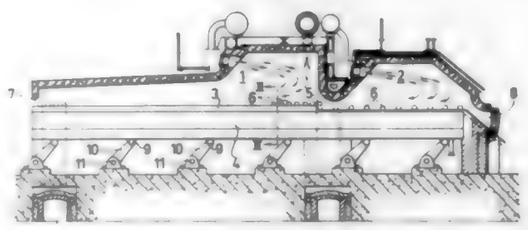
An apparatus utilizing a relatively small quantity of air under pressure to form a partial vacuum adjacent a jet of pressurized air for drawing quantities of liquid fuel into said jet of air to be broken up into fine droplets and at least substantially vaporized by said jet of air, the jet of air and vaporized fuel being then discharged into the inlet end of intake air passage means of an associated internal combustion engine subject to engine vacuum and subsequently mixed with metered fresh air before passing out the outlet end of said intake air passage means.

3,373,979
CONTINUOUS FORGE FURNACE
Russell B. Hammond, 2620 Crane, Detroit, Mich. 48214
Filed June 1, 1966, Ser. No. 554,477
2 Claims. (Cl. 263—6)



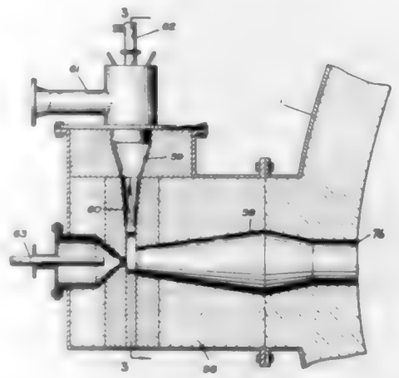
This application discloses a continuous forge furnace, in which the workpieces are moved through the heat zone by means of a pair of stationary side rails of refractory material and a vertically and laterally reciprocable center rail, which is actuated by motor driven push rods and pivoted yokes. The center refractory rail is provided with a declining angular discharge end.

3,373,980
WALKING BEAM FURNACE FOR EFFECTING DIFFERENT FEED SPEEDS OF THE CHARGE
Tage Ansheim Borgkvist, Stockholm, Sweden, assignor to Aktiebolaget Tabougnar, Stockholm, Sweden, a Swedish joint-stock company
Filed June 2, 1966, Ser. No. 554,736
Claims priority, application Sweden, Feb. 28, 1966, 2,573/66
6 Claims. (Cl. 263—6)



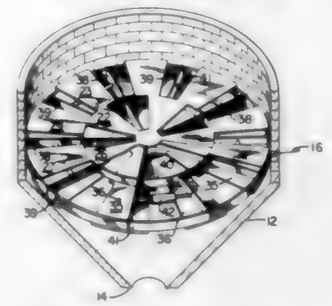
A walking beam furnace comprises a pre-heating zone and a final heating zone arranged to give charges different feed speeds through the zones over a stationary hearth. The walking beams extend in an undivided manner through all zones of the furnace and are arranged to be reciprocated at different levels in relation to the stationary hearth so as to effect the feed of the charge.

3,373,981
APPARATUS FOR OPERATING A BURNER FIRED SHAFT FURNACE
Harro Taubmann, Niederhochstadt, Taunus, and Hubert Boderke, Hemkenrode uber Braunschweig, Germany, assignors to Didier-Werke A.G., Wiesbaden, Germany
Filed May 26, 1965, Ser. No. 459,071
Claims priority, application Germany, May 29, 1964, W 36,875
2 Claims. (Cl. 263—29)



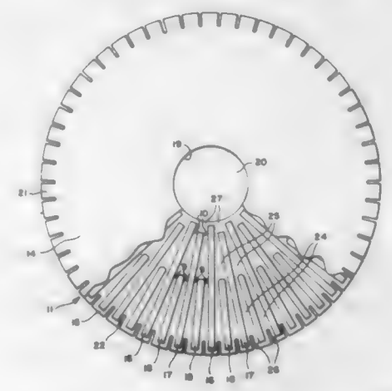
The quantity of fuel required for the heat treatment of the material is subdivided differentially or uniformly to the individual burners so that the combustion in the burners of the individual burner planes or levels takes place differentially or uniformly stoichiometrically, sub-stoichiometrically or super-stoichiometrically and the quantity of cool air is measured or dosed. In this way, the heat distribution in the furnace can always be adapted to the particular heat treatment to be carried out. When the burner is operated sub-stoichiometrically, the present invention employs stage burners provided with two combustion chambers and interposed guide or conduit means with the first combustion chamber located at the inlet end of the second combustion chamber and at substantially right angles thereto. Such a construction of the burners makes it possible to realize a relatively strongly reduced combustion without difficulties. Honeycomb-like nozzle blocks may be arranged in the outlet openings discharging into the furnace shaft in order to improve the penetration effect of the outflowing gases through the loose material being treated and such blocks may, of course, also be built into burners which do not operate according to the two-stage principle.

3,373,982
RADIAL GRATE FOR SHAFT KILNS
John B. Jones, Jr., Denver, Colo., assignor, by direct and mesne assignments, to The Battelle Development Corporation, Columbus, Ohio, a corporation of Delaware
Filed Oct. 20, 1965, Ser. No. 498,891
9 Claims. (Cl. 263—29)



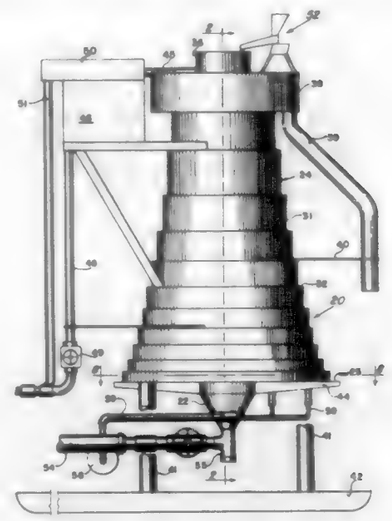
A discharge mechanism for shaft furnaces having narrow, concentric radial openings extending outwardly from the furnace center, with a retarder plate mounted under each opening, to prevent direct vertical movement of material, and an oscillating pusher bar is mounted on each retarder plate in close proximity to the edges of the openings pushes material from both sides of the plate, discharging it from the furnace. Each opening has radially directed side edges so that oscillation of the pusher bar pushes material uniformly from each plate, providing uniform flow of material across the lateral extent of the furnace.

3,373,983
SEPARATOR PLATE
Carl G. A. Johnson, Rocky River, and James L. Whitten, Fairview Park, Ohio, assignors to The Alloy Engineering Company
Filed Jan. 7, 1966, Ser. No. 519,210
24 Claims. (Cl. 263—47)



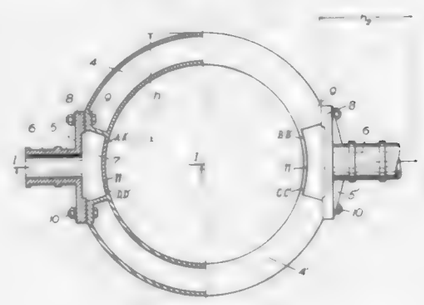
A separator for supporting coiled strip in an annealing furnace including a support plate and a plurality of ribs secured to the plate to define fluid passages extending from the outer perimeter of the separator to a central opening.

3,373,984
APPARATUS FOR THE CONTINUOUS PRODUCTION OF COPPER
Thomas Valle, Idaho Springs, Colo., assignor to The Fall River Exploration and Mining Company, Idaho Springs, Colo., a corporation of Colorado
Filed Oct. 22, 1965, Ser. No. 501,196
10 Claims. (Cl. 266—12)



The described apparatus for the continuous production of copper embodies a central vertical core member surrounded by a stack of spaced plates enclosed within a housing and defining a plurality of reaction chambers. The plates include a plurality of nozzles. A liquid-solid slurry is introduced into the top of the central core, flows downwardly through the core, and then upwardly through the reaction chambers. The nozzles direct the slurry into a swirling, mixing flow through each chamber.

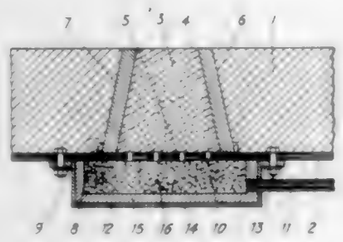
3,373,985
ANNULAR SUPPORT RING FOR CONVERTERS
Peter Puxkandl, Linz, Austria, assignor to Vereinigte Österreichische Eisen- und Stahlwerke Aktiengesellschaft, Linz, Austria, a company of Austria
Filed Jan. 29, 1964, Ser. No. 340,916
Claims priority, application Austria, Feb. 28, 1963, A 1,595/63
3 Claims. (Cl. 266—36)



1. A metallurgical vessel comprising upper and lower sheet metal portions and a load-bearing middle portion wherein said middle portion comprises two spaced symmetrical segment members rigidly and undetachably connected to said upper and lower vessel portions with the respective ends of the segments facing each other, said segment members having a double-wall hollow structure, one wall thereof being rigidly and undetachably connected to the upper and lower vessel portions, two flat metal plates welded respectively to the facing ends of the two segment members to complete the middle portion of the

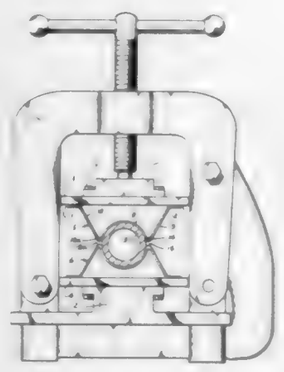
vessel, and a pair of trunnion-carrying connecting members removably mounted to the outer sides of said facing ends of said segment members by releasable screw connections, a cavity remaining between each trunnion-carrying connecting member and the corresponding flat metal plate.

3,373,986
METALLURGICAL VESSEL WITH SAFETY DEVICE
Etienne Spire, Westmound, Montreal, Quebec, Canada, assignor to L'Air Liquide, Societe Anonyme pour l'Etude et l'Exploitation des Procedes Georges Claude
Filed June 11, 1965, Ser. No. 463,176
Claims priority, application France, June 18, 1964, 978,778, Patent 1,407,225
5 Claims. (Cl. 266—39)



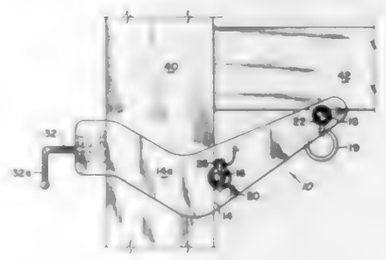
Under a porous plug **3** intended for insufflating a gas into molten metal is a blast box **12**. Said box is filled with refractory material granules **16** which retain the molten metal in case it would leak through or around the plug. A metal plate with openings **10** may be located between the porous plug and the granules.

3,373,987
PIPE VISE
Sanford W. Herrington, 606 Roddy, Clute, Tex. 77531
Filed Feb. 23, 1965, Ser. No. 434,601
6 Claims. (Cl. 269—275)



1. A pipe vise, including a pair of vise jaws, a rigid base on each jaw, means for moving the jaws relatively toward and away from one another, a pipe gripping member on each base, each pipe gripping member comprising a flexible, substantially non-stretchable section having a concave pipe engaging surface and thrust members carried by the base and convergingly inclined in a direction away from the base and attached to the section adjacent opposite longitudinal edges of the section so as to locate the concave surface spaced from the base and opposite the concave surface of the other section for receiving a pipe therebetween, the angular inclination of said thrust members with respect to the base being equal, said thrust members having sufficient stiffness to cause said sections to flex and contract around the pipe, as said jaws are moved relatively toward one another, and each of said concave surfaces being substantially a half cylinder, when said sections have been so flexed and contracted, so that there is clearance between the opposite longitudinal edges of said sections.

3,373,988
REMOVABLE BEAM SEAT
Michael J. McKelvey, 1304 Berryman Ave., Bethel Park, Pa. 15102
Filed Sept. 22, 1965, Ser. No. 489,333
6 Claims. (Cl. 269—309)

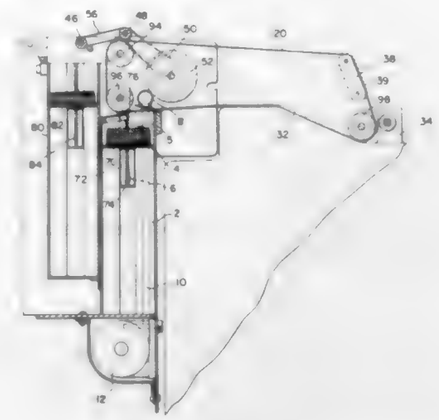


1. A removable beam seat for temporarily supporting a horizontal beam in position realtive to a vertical column comprising:
(a) a first lever;
(b) a second lever identical in size and shape to said first lever, said levers adapted to be positioned on either side of said vertical column;
(c) a fulcrum bar fixed to said first lever near the center thereof and extending perpendicularly thereto;
(d) a seat bar fixed to said second lever near one end thereof and extending perpendicularly thereto;
(e) securing means associated with said fulcrum bar and said second lever for clamping said first and second levers to each other securely about said vertical column;
(f) adjustment means fixed to the end of each of said first and second levers remote from said one end and operable to contact said vertical column and vary the effective distance between the end of each of said levers and said fulcrum bar when said beam seat is clamped upon said vertical column;
(g) said first and second levers, said fulcrum bar and said adjustment means each being in firm contact with said vertical column and said seat bar being supported horizontally by said levers at a spaced distance from said vertical column when said beam seat is in position on said vertical column.

3,373,989
AUTOMATIC FOLDED MATERIAL CONVEYOR
John E. Le Baron, Exeter, N.H., assignor to Tab Products Company, San Francisco, Calif., a corporation of California
Filed Mar. 18, 1966, Ser. No. 535,487
13 Claims. (Cl. 271—2)

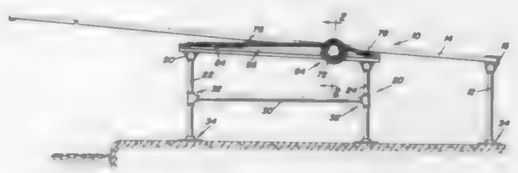
1. A method for automatically conveying a plurality of individual pieces of materials having a fold to a printer, comprising:
A. feeding a stack of said individual pieces to a slotted moving conveyor belt;
B. creating a suction force directly above the top piece of the stack with a vacuum device, forcing the fold of successive pieces into engagement with successive slots in the conveyor belt;
C. conveying the engaged pieces to the printer via the conveyor belt.

7. A method for disengaging a series of flaps of folded material being carried on slots of a conveyor belt comprising:
A. contacting the flaps being carrird between an eject belt and the conveyor belt;



B. rotating the eject belt at a faster speed and in a direction opposite to the conveyor belt, thereby discharging the flaps from the slots.

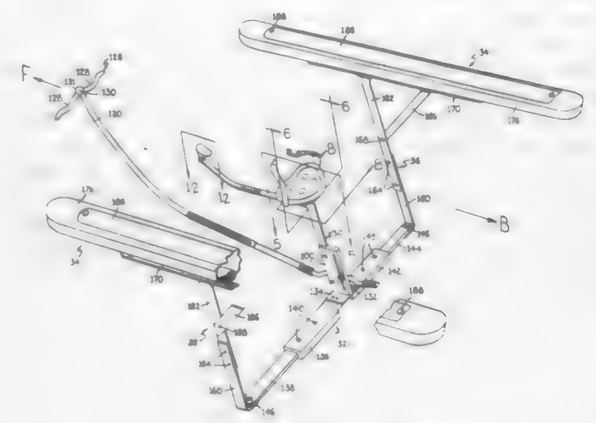
3,373,990
ADJUSTABLE FULCRUM FOR DIVING BOARD
Walter J. Riniker, 1059 Aileen St., Lafayette, Calif. 94549
Filed July 27, 1965, Ser. No. 475,133
6 Claims. (Cl. 272—66)



An elongated generally cylindrical fulcrum member extending transversely beneath a diving board intermediate its opposite ends and rollingly supported for rolling movement longitudinally of the diving board, sprocket means carried by said fulcrum member and elongated chain means entrained over and at least slightly bowed by said sprocket means and generally paralleling the board with means anchoring the opposite ends of the chain relative to a support structure from which the fulcrum member is rollingly supported with the anchor means at one end of the chain including spring means anchoring the corresponding end of the chain means in a manner such as to lengthwise tension the chain.

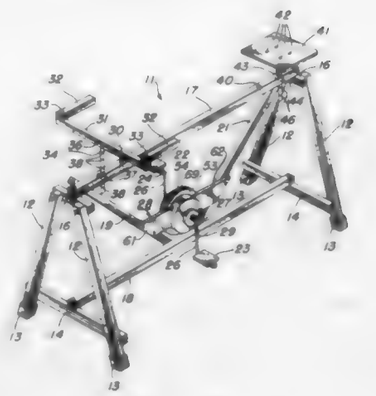
3,373,991
MOBILE SWIMMING SUPPORT AND INSTRUCTION APPARATUS
Harry R. Smalley, 1616 Mount Eagle Place, Alexandria, Va. 22302
Filed Apr. 29, 1965, Ser. No. 452,464
5 Claims. (Cl. 272—71)

A support apparatus for swimmers having a mobile base with adjustable and resilient torso support, an adjustable and resilient auxiliary head support attachment, and an auxiliary dual purpose attachment to support either the arms or legs of swimmers. The apparatus with auxiliary attachments provides the resilient support function, supporting swimmers partially submerged in water,



while not impeding natural swimming movements of swimmers.

3,373,992
BICYCLE EXERCISER
Gilbert K. Luderman, 3548 College Ave., San Diego, Calif. 92115
Filed Sept. 17, 1965, Ser. No. 488,052
2 Claims. (Cl. 272—73)



2. In a bicycle exerciser having a frame with handle bars and a seat mounted thereon and first and second rotatable pedals carried thereby, the improved pedal impedance means comprising:
a liquid bath mounted between said first and second pedals;
said first and second pedals being operably connected to an axle, said axle passing through said liquid bath; and
a paddle wheel carried by said axle and positioned within said liquid bath.

3,373,993
RESISTANCE EXERCISER AND BRAKEABLE MOBILE CARRIAGE
Carl W. Oja, 2190 Marshall Ave., St. Paul, Minn. 55104, and Richard L. Scheuerman, Inver Grove, Minn., assignors, by mesne assignments, to said Carl W. Oja, St. Paul, Minn.
Filed Oct. 26, 1964, Ser. No. 406,265
7 Claims. (Cl. 272—81)

6. A mobile carriage assembly capable of being braked against movement, comprising a base frame, casters supporting said base frame, and brake means, said brake means comprising plungers having friction-surfaced ends capable of elevating said base frame and supporting it

in said elevated condition with support removed from said casters, said plungers being mounted near the location of said casters on said base frame to depend downwardly from said base frame and be movable slidably in an essentially vertical direction, shiftable means adapted to act upon said plungers to slidably elevate and lower the same, pivotable means carried on said base frame in a position horizontally displaced from said shiftable means, said pivotable means being pivotable about a vertical axis, means extending horizontally from said pivotable means to said shiftable means and adapted to transfer motion from said pivotable means to said shiftable means, and handle means for pivoting said pivotable means between one position causing elevation of said plungers and another position causing lowering of said plungers to brake said carriage against movement.

7. Apparatus for aiding the support of weak limbs during therapeutic exercise movement of the same, said apparatus being mobile and adapted to be moved into a position behind an upright individual whose arms require said aid, the essential features of said apparatus, comprising, in combination, (1) a carriage comprising a base frame, (2) at least one upright standard supported from said base frame, (3) at least one essentially horizontal supporting arm mounted at the upper terminus of said upright standard, with the forward end of said arm cantilevered outwardly from said upright standard, pivot joint means rendering a substantial portion of the cantilevered end of said arm adjustable from said operative essentially horizontal position to an inoperative collapsed position, (4) resistance means mounted on said apparatus, said resistance means being adjustable to provide varying degrees of resistance as determined by an operator, (5) a flexible connecting line extending from said resistance means toward the forward cantilevered end of said arm over guide means carried on said arm to a downwardly freely suspended terminal position, and (6) means to adjust the height of said supporting arm.

3,373,994

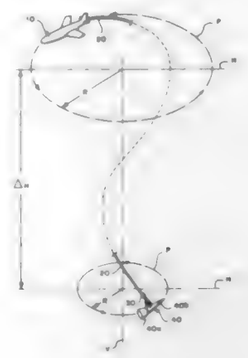
METHOD OF ACHIEVING VERTICAL DISPLACEMENT OF A TOWED TARGET FROM A TOWING AIRCRAFT

Wilmer C. Woodward, Blue Bell, Pa., assignor to the United States of America as represented by the Secretary of the Navy

Filed Jan. 25, 1966, Ser. No. 522,989
3 Claims. (Cl. 273—105.3)

1. In a target system, the method of positioning a towed target at a predetermined vertical distance below the towing aircraft so that the aircraft is at an altitude beyond the range of the weapons being used against the target, comprising:

continuously flying the towing aircraft in a predetermined fixed orbit calculated to achieve a desired vertical distance of the target below said towing aircraft;



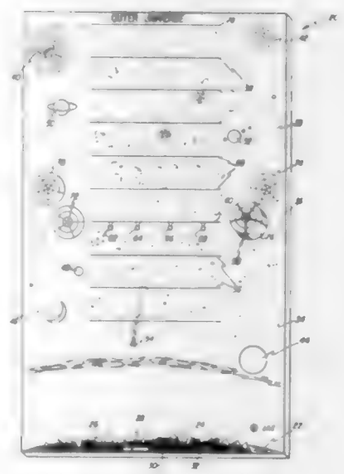
and maintaining said towing aircraft in said predetermined fixed orbit.

3,373,995

SPACE GAME HAVING MULTIPART COUNTERS AND MULTIPART PLAYING PIECES

James A. Fors, 4958 W. Parker Ave., Chicago, Ill. 60639

Continuation of application Ser. No. 753,379, Aug. 5, 1958. This application Jan. 24, 1964, Ser. No. 341,482
5 Claims. (Cl. 273—134)



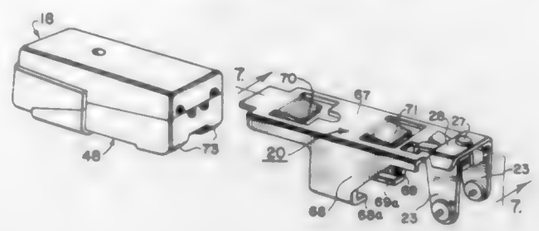
1. A game comprising a game board having indicia thereon simulating a cross section of space extending out from the earth, indicating a starting place for each player on the surface of the earth and indicating a division between two parts of space, one adjacent to the earth and the other remote, said board also having thereon a series of spaced apart lines substantially parallel to the said surface of the earth for indicating steps of movement, one being located substantially at said division and others being located on opposite sides of said division, the one most remote from the starting place being the winning line, a selector device operable in turn by each player to give positive and negative indications according to chance, and a set of playing pieces for each player including a multipart counter movable on said board from one of said starting places to said winning line and providing means for indicating cumulatively the number of negative limitations accruing to each player up to a predetermined maximum, one part of the said counter being separated from the remainder for each such negative indication, and means comprising multipart playing pieces for indicating the number of times each player's counter has achieved the said line located substantially at the division, one part of said last named playing piece being placed on the board each time said last named line is achieved.

3,373,996

CARTRIDGE MOUNTING ASSEMBLY

Seymour Kessler, Wilmette, Ill., assignor to Zenith Radio Corporation, Chicago, Ill., a corporation of Delaware

Filed Aug. 25, 1965, Ser. No. 482,403
5 Claims. (Cl. 274—24)



1. In a phonograph for reproducing sound from records, a tone arm and cartridge assembly comprising:

a first cartridge casing section;

a second cartridge casing section mating with said first section, at least one of said casing sections having a notch extending at least partially across one side thereof, and at least one of said casing sections having a channel formed therein, said casing sections defining in assembled relation an interior cavity;

a record engaging stylus;

transducer means occupying said cavity and having a portion thereof extending exteriorly of said casing to operatively engage said stylus for developing an electrical signal proportional to the physical movement of said stylus;

means for maintaining said cartridge casing sections in demountable assembled relation and consisting essentially of a bracket comprising a first surface portion adjacent the side of one of said casing sections opposite that mating with the other of said casing sections and having a side portion extending from said first surface portion and terminating in an inwardly facing portion, said first surface portion having bias means engaging said adjacent casing section for yieldably urging said assembled cartridge firmly into engagement with said inwardly facing portion and preventing movement of said cartridge with respect to said bracket means when said inwardly facing portion resides in said notch of one said casing sections and whereby said assembled cartridge is easily withdrawn from said bracket means by simultaneously forcing said cartridge upward against said bias means and longitudinally with respect to said bracket;

and means including said bracket means for mounting said cartridge to said tone arm.

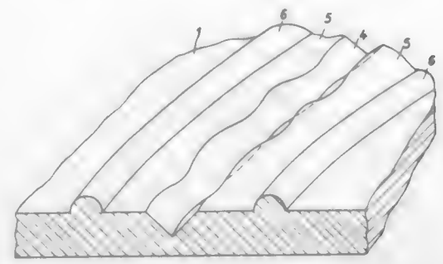
3,373,997

RECORD

Walter Berndt, Ulm (Danube), and Horst Redlich, Berlin-Wilmersdorf, Germany, assignors to Telefunken Aktiengesellschaft, Berlin-Charlottenburg, Germany

Filed Mar. 18, 1965, Ser. No. 440,888
Claims priority, application Germany, Mar. 19, 1964, T 25,845
2 Claims. (Cl. 274—42)

A recording disc having an erasable magnetic track and a non-erasable mechanical track. The disc is provided with a ridge which follows the Archimedean spiral substantially about the center of the disc and which defines, between successive ridges, a magnetic recording track. The mechanical track, consituted by a laterally modulated groove, is cut into and is positioned substantially at the center of the magnetic recording track, the width of the



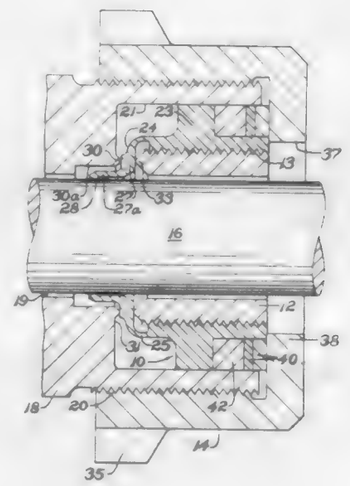
magnetic track being great enough to accommodate the maximum lateral groove deflections, peak to peak.

3,373,998

DIAPHRAGM SEAL WITH A TUBULAR EXTENSION CARRYING THE SEALING EDGE

Ludwik S. Bialkowski, Troy, Ohio, assignor to The B. F. Goodrich Company, New York, N.Y., a corporation of New York

Filed Oct. 14, 1965, Ser. No. 495,778
10 Claims. (Cl. 277—110)



A diaphragm-type fluid pressure seal useful for static reciprocating or rotary service on rods or in cylinders has its annular sealing edge formed on a tubular extension of the diaphragm which is generally concentric with the surface against which the seal is made. Deflection of the diaphragm alters the circumferential length of the sealing edge and therefore the sealing load. Although the seal is rigid and preferably of metal, the tubular extension has adequate flexibility so that it can conform to non-circularity, eccentricity and is better able to withstand side loads or wobble motions of the part engaged by the sealing edge.

3,373,999

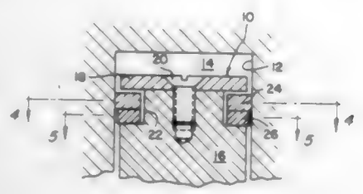
PISTON RINGS

Robert E. Jepsen, Emmaus, Pa., assignor to Air Products and Chemicals, Inc., Allentown, Pa., a corporation of Delaware

Filed July 26, 1965, Ser. No. 474,781
2 Claims. (Cl. 277—193)

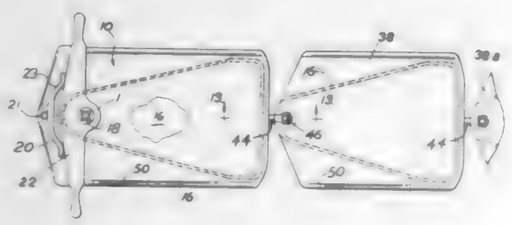
A pair of fluid sealing piston rings in which the upper ring is a split ring readily expandable into sealing engagement with the cylinder and the lower ring is a nonsplit,

integral ring having a normal outer diameter less than that of the cylinder. Fluid passages admit high-pressure fluid



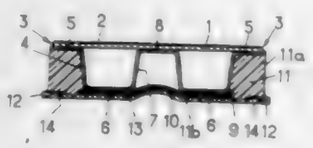
to the interior of the integral ring so as to expand it into sealing engagement with the cylinder only when such fluid pressure exceeds a predetermined value.

3,374,000
COMBINATION VEHICLE
Ervin H. Wetzel, 1440 Lawrence Ave., Lake Forest, Ill. 60045
Filed Apr. 25, 1966, Ser. No. 544,858
2 Claims. (Cl. 280—8)



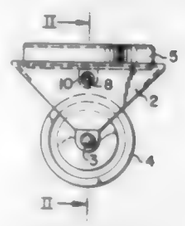
A vehicle for coasting or the like has a supporting platform provided with means for removably associating therewith mobil supporting units such as wheel units or runner units. A simple socket arrangement is provided for this purpose. For enlarging the vehicle a trailer unit is provided connectable with the basic vehicle.

3,374,001
METALLIC SKI
Antoine Joseph Georges Baudou, Les Eglisottes, Gironde, France
Filed Sept. 10, 1965, Ser. No. 486,268
Claims priority, application France, Aug. 12, 1965, 28,225, Patent 1,459,879
11 Claims. (Cl. 280—11.13)



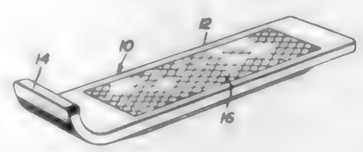
A ski comprising an elongated metallic upper plate, a channel member having laterally projecting flanges having their longitudinal edge portions secured to and registering with the longitudinal edge portions of said upper plate. The channel member has a bottom divided by a longitudinal corrugation which extends upwardly to the level of said flanges, an elongated metallic lower plate spaced from said upper plate by said channel member and is provided with a shallow groove seated in said corrugation. The upper plate is secured along its longitudinal edge portions to said flanges and centrally to said corrugation, while the lower plate is fixed to the bottom of said channel member, the space between said flanges and above said bottom plate being filled with a moldable material.

3,374,002
ONE-WHEELED ROLLER SKATE
Samuel Lewis, 670 Riverside Drive, New York, N.Y. 10031
Filed June 3, 1966, Ser. No. 555,106
2 Claims. (Cl. 280—11.24)



1. A roller skate comprising, in combination:
(a) support means defining a supporting platform;
(b) a wheel;
(c) bracket means securing said wheel to said support means for rotation about an axis substantially parallel to said platform, said platform having a medium plane transverse of said axis through said wheel; and
(d) securing means for securing the foot of a wearer to said platform in a position in which said foot is elongated substantially parallel to said platform and to said plane,
(e) said support means including a plate member, said bracket means being fixedly mounted on one side of said plate member,
(f) said securing means including two jaw members mounted on said plate member and projecting from the other side of said plate member on opposite sides of said median plane, and
(g) adjusting means for moving said jaw member relative to each other on said plate member in the direction of said axis,
(h) the dimension of said platform in the direction of said median plane being not substantially greater than the width of said platform in the direction of said axis.

3,374,003
SNOW SKI BOARD
John L. Fulsom, 2747 Wismer Road, Overland, Mo. 63114
Filed Jan. 12, 1966, Ser. No. 520,117
3 Claims. (Cl. 280—18)

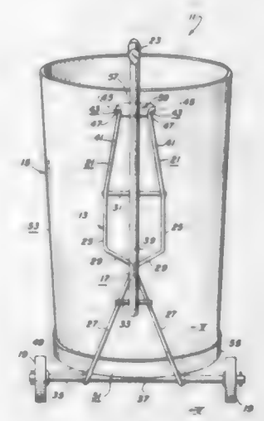


An elongated generally planar body including a forwardly and upwardly curving toe portion, being of a width slightly greater than the width of the shoe and of a length approximately five times it width and including depending opposite side runners spaced inwardly from the corresponding side edges of the body but depending from the outer half portion of the corresponding side of the body.

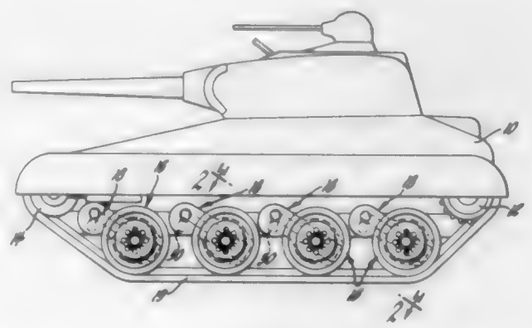
3,374,004
TRASH HANDLING APPARATUS
Ray D. Oliver, Rte. 3, Perryville, Mo. 63775
Filed Oct. 19, 1966, Ser. No. 587,876
5 Claims. (Cl. 280—47.26)

1. Trash handling apparatus comprising a cart and a container; said cart including upstanding support structure, ground engageable wheel means rotatably mounted

on the lower portion of said support structure, handle means fixed on the upper portion of said support structure, a pair of substantially short oppositely projecting generally horizontal prong portions individually movably supported from said support structure and spring means for yieldably urging said pair of prongs apart and substantially in opposite directions, said pair of prongs being adapted to be manually manipulated simultaneously equidistantly between a first arrangement in which said pair of prongs are arranged substantially together and a second arrangement in which said pair of prongs are arranged substantially apart; said container being generally barrel shaped and including a bottom portion and an upstanding circumferential walled body portion including a vertical wall portion defining a horizontally elongated through opening, said container being removably fitted on said cart with said oppositely projecting prongs being arranged in said second arrangement and extending through said elongated opening and engaging said vertical wall portion.

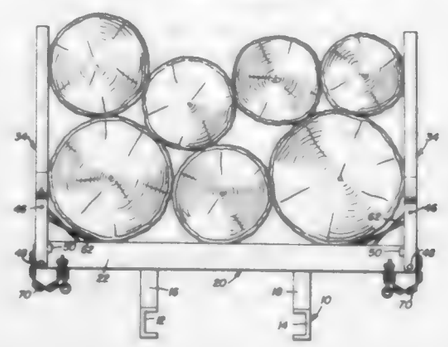


3,374,005
INDEPENDENT WHEEL SUSPENSION
Richard H. Donlon, Haunstetten, Germany, and Henry Sinko, Bay Village, Ohio, assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Aug. 26, 1965, Ser. No. 482,689
5 Claims. (Cl. 280—124)



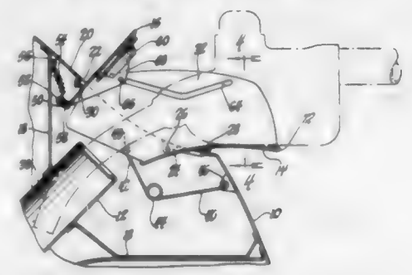
A vehicle suspension unit having a hollow arm pivotally connected adjacent one end to the vehicle and having a road wheel rotatably mounted on the arm adjacent the other end thereof. A spring device is located within the arm for movement therewith and for cushioning oscillatory movement of the arm relative to the vehicle. Means are also provided for pivotally connecting one end of the spring device to a fixed point adjacent the connection between the arm and the vehicle.

3,374,006
LOGGING BUNK
Wilmer R. Possinger and Wilson W. Myers, Port Angeles, Wash., assignors to Lincoln Welding, Inc., Port Angeles, Wash., a corporation of Washington
Filed Feb. 16, 1966, Ser. No. 527,820
8 Claims. (Cl. 280—145)



An elongated logging bunk defining body having corresponding ends of a pair of elongated stakes pivotally secured to its opposite ends for rotation about generally parallel axes extending transversely of the stakes and the body, the body being tubular and a pair of flexible tension members extending longitudinally of the body each including an end portion secured to the corresponding stake at a point spaced from the axis of rotation thereof and the adjacent portions of said body with the free end portions of the tension members passing downwardly through openings formed in the top wall of the body and extending outwardly of the ends of the body remote from the stakes to which the tension members are secured.

3,374,007
TANK FILLER ARRANGEMENT
Anthony J. Ingolia, St. Clair Shores, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed June 9, 1966, Ser. No. 556,503
6 Claims. (Cl. 280—152)

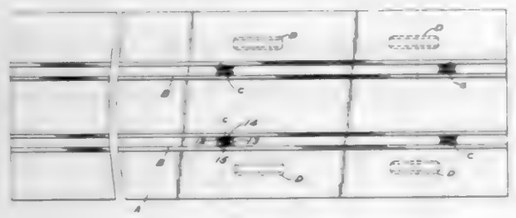


An automobile fuel tank filler arrangement including two covers which are simultaneously operable, one cover being a sealing closure and the other being ornamental ordinarily but also serving as a trough support for a gas pump nozzle during tank filling.

3,374,008
VEHICLE TIE-DOWN STRUCTURE
Donald J. Blunden, Southfield, James E. Black, Jr., Trenton, Louis K. De Shetler, Allen Park, and Eugene D. Gotcher, Gibraltar, Mich., assignors to Whitehead & Kales Company, River Rouge, Mich., a corporation of Michigan
Filed July 18, 1966, Ser. No. 565,970
8 Claims. (Cl. 280—179)

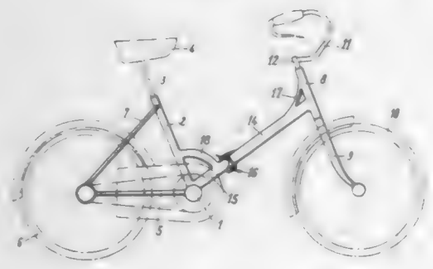
1. A vehicle tie-down structure, comprising a longitudinally extending rail adapted to be anchored lengthwise upon a longitudinally extending deck of a transport

vehicle and having an upright side wall provided with a plurality of longitudinally spaced openings, a carriage carried by and adjustable lengthwise of said rail, a rotatable stub shaft extending transversely of said carriage, a ratchet gear fixed to said stub shaft, a stub shaft movable in one direction transversely of said carriage to an extended position engaging a selected opening in the upright side wall of said rail to hold said carriage in adjusted position and movable in the opposite direction to a retracted position withdrawn from the opening in the upright side wall of said rail, means for tying down and holding a vehicle after said carriage has been held in adjusted position, including a flexible element connected to said rotatable stub shaft and adapted to be connected to a part of the vehicle, said flexible element being adapted to be wound on said rotatable stub shaft and tensioned thereby during rotation thereof, a pawl rotatably mounted on said carriage and movable from an inoperative position withdrawn from said ratchet gear to an operative position



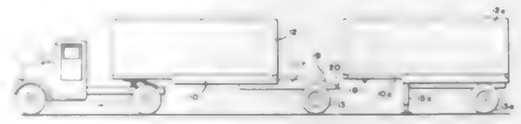
in engagement with a selected tooth of said ratchet gear to hold the latter against rotation after said flexible element has been attached to a vehicle and has been tensioned, and means for preventing movement of said transversely movable stub shaft in said opposite direction from its extended position and withdrawal thereof from the opening in the upright side wall of said rail when said pawl is in its operative position, said means comprising a flange on said transversely movable shaft, a lug on said pawl disposed alongside said flange in said operative position of said pawl and said extended position of said transversely movable shaft so that upon initial movement of said transversely movable shaft in said opposite direction from its extended position said lug will engage said flange and prevent further movement of said transversely movable shaft in said opposite direction, said lug on said pawl, when said pawl is in inoperative position, clearing said flange to permit movement of said transversely movable shaft in said opposite direction to its retracted position.

3,374,009
FOLDING BICYCLE
André Jeunet, 24 Ave. de Besacon, Dole, Jura, France
Filed Mar. 14, 1966, Ser. No. 534,073
Claims priority, application France, Mar. 24, 1965, 10,466
4 Claims. (Cl. 280—287)



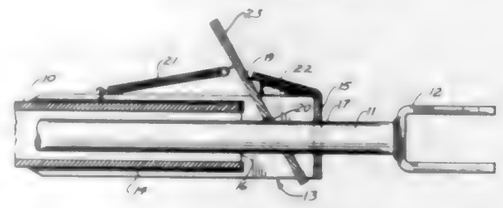
A folding bicycle has a main frame member in the form of a single tubular beam comprised by two aligned tube sections hinged together for relative vertical swinging movement about a horizontal axis disposed below the beam at an oblique angle to the axis of the beam. In this way, weight on the bicycle is transmitted as compression acting lengthwise in the beam. A lock for maintaining the bicycle extended comprises a pair of radial ribs one on each beam section and a wing nut for releasably securing them together. The pivotal connection comprises a yoke on one beam section that receives a sleeve on the other beam section, with a pivot pin extending through the yoke and sleeve.

3,374,010
COUPLEABLE CHASSIS
Joseph G. Crockett, Lynnfield, Mass., and Roy C. Belcer, Opp, Ala., assignors of one-half to XTRA, Inc., Boston, Mass., a corporation of Massachusetts, and one-half to Dorsey Trailers, Inc., Elba, Ala., a corporation of Delaware
Filed May 6, 1966, Ser. No. 548,106
9 Claims. (Cl. 280—415)



A chassis module which may be used as an individual trailer unit coupled to a highway tractor or in tandem when longitudinally coupled with an identical module to form a double-length trailer. The tandem arrangement is accomplished by sliding a sub-chassis rearwardly from the chassis module to provide the fifth wheel for attachment of the second module. The modules are rigidly coupled longitudinally and the respective wheels of the module bogies are joined to provide a single load distributing bogie.

3,374,011
ADJUSTABLE FARM IMPLEMENT TONGUE
John A. Schipper, Aplington, Iowa 50604
Filed Feb. 4, 1966, Ser. No. 525,064
1 Claim. (Cl. 280—478)



A telescoping implement tongue having a locking means which is engaged by pulling on the tongue and is easily releasable. The inner bar is readily adjustable to various lengths by the telescopic action so that it may be extended for connection to a pulling device.

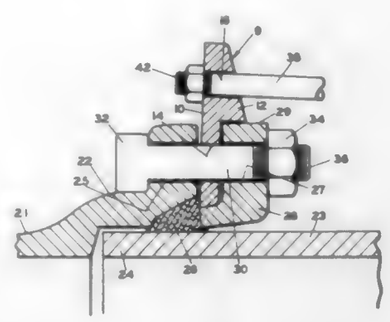
ERRATUM

For Class 280—512 see:
Patent No. 3,374,268

3,374,012
TIE LUG
Paul V. Metcalfe, Columbus, Ohio (367 Riverside Drive, Tequesta, Fla. 33458), and James D. Ford, 1479 Blaine Drive, Columbus, Ohio 43227
Filed Sept. 12, 1966, Ser. No. 578,752
8 Claims. (Cl. 285—114)

This invention relates to improvements in tie lugs for use in plumbing installations. More particularly the invention concerns a lug for anchoring the end of a tie rod at a bell flange and spigot pipe joint and for sealing more effectively the bell flange and spigot joint. One portion of

the lug designated herein as the lower portion of the lug is positioned on a bolt which connects the bell flange and the gland and is inserted between said bell flange and said gland. The other end of the lug designated herein as the upper portion is formed to hold securely the end of a

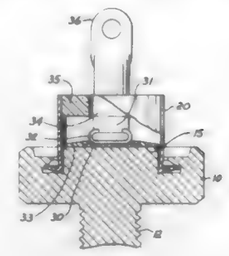


tie rod. The tie lug is designed in such a manner that when the tie rod is tightly anchored to the lug, pressure is thereby exerted on the gasket between the bell flange and the gland with the result that a more effective seal is achieved.

3,374,013
HOSE CONTAINMENT DEVICE
Albert L. Clay, Mystic, and Alfred W. Fidrych, Stonington, Conn., assignors to The Kellems Company, Incorporated, Stonington, Conn., a corporation of Connecticut
Filed Sept. 25, 1964, Ser. No. 399,214
4 Claims. (Cl. 285—114)

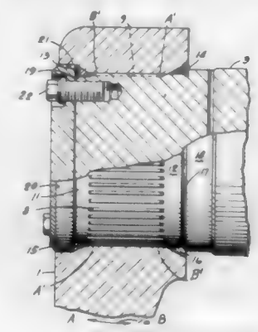
1. The combination of a supply pipe for fluid under high pressure, a delivery pipe spaced from said supply pipe, a length of hose provided at its two ends with coupling members and coupled at one end to said supply pipe and coupled at its other end to said delivery pipe, and hose containment means for safety containing said hose in the event of failure thereof or failure of either of said coupling joints, said hose containment means being separate from the hose and permitting the hose to flex substantially normally, and including elongated woven structure means composed of strands interwoven in open mesh fashion and mounted in surrounding relation on said entire length of hose, the outer hose gripping end portions of said woven structure means being located on the end portions of said hose inwardly of said coupling joints, a support associated with and located outwardly of each of said coupling joints and being fixed with relation to the pipe associated with such joint, and means securely connecting said outer end portions of said woven structure means to said supports, said connecting means extending from said end portions in by-passing relation to and independently of the coupling joints to directly connect the outer ends of said woven structure means to said supports, thereby eliminating abnormal stress on the coupling joints.

3,374,014
SWAGED SEALS
Francis R. Kull, Warminster, and Ronald Waeltz, Hatboro, Pa., assignors to Standard Pressed Steel Co., Jenkintown, Pa., a corporation of Pennsylvania
Filed July 27, 1965, Ser. No. 475,059
4 Claims. (Cl. 287—20.3)



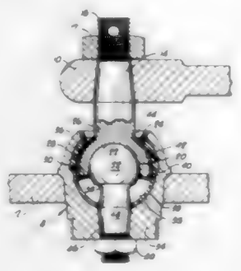
1. In combination, a base member and a cap adapted to be interlocked, said cap having a tube part of circular cross section, said base member having an annular groove adapted to concentrically receive the leading end portion of the tube part, said tube end portion terminating at a sharp annular edge and having an outwardly cantilevered circumferential flange whose outer edge lies in a plane intersecting the axis of the tube part at a point inboard the sharp annular edge; swaged material from the outer wall of the groove pressing against the flange surface around its entire upper periphery, the flange being deflected and bent downwardly to a position in which the outer peripheral portions of the bottom surface of the flange are spaced from and not in contact with the base and the leading end of the tube immobilized by the sharp annular edge of the tube part being driven into and below the surface of a shoulder of base material projecting into the groove to interlock and seal the cap and base, said interlock being characterized in that an elastic stress is induced and maintained in the flange by the co-action of the swaged material pressing against the upper surface of the flange and the immobilization of the tube end.

3,374,015
METHOD OF COUPLING SHAFT TO ARM TO TRANSMIT TORQUE AND MOMENT WHICH ARE NOT COPLANAR
Paul E. Gies, Amherst, N.Y., assignor to Houdaille Industries, Inc., Buffalo, N.Y., a corporation of Michigan
Filed July 22, 1965, Ser. No. 474,126
3 Claims. (Cl. 287—53)



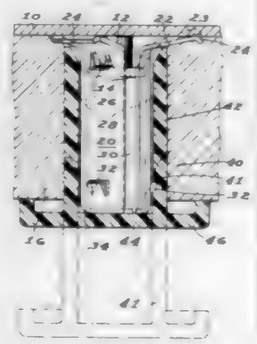
A torque transmitting assembly having a shaft mounted for rotation which is splined to a torque arm at one end thereof and wherein first and second cylindrical rings are disposed at opposite edges of the splined shaft region to maintain the radial alignment between the shaft and externally fitted arm. A locking plate is bolted to the shaft and engages one of the cylindrical rings to hold the rings in position and thereby prevent peening of the splined surfaces due to the twisting or torqueing of the arm relative to the shaft.

3,374,016
BALL JOINT
James O. Melton, Norman, and Thomas B. Wilkinson and James H. Jackson, Oklahoma City, Okla., assignors to Jamco, Inc., Oklahoma City, Okla., a corporation of Oklahoma
Filed Aug. 19, 1965, Ser. No. 481,015
15 Claims. (Cl. 287—87)



A ball joint having a spindle adapted to be connected at one end to one of two members movable relative to each other, and having a ball-receiving socket at the other end. A housing surrounds the socket and has an aperture therein accommodating the spindle. The housing is adapted for connection to the other of the two members. A ball fits in, and is engaged by, the socket, and a stud interconnects the ball with the housing at a point on the opposite side of the housing from the spindle-accommodating aperture therethrough.

3,374,017
RETAINER ASSEMBLY
Engelbert A. Meyer, Union Lake, Mich., assignor to Warren Fastener Corporation, Mount Clemens, Mich., a corporation of Michigan
Filed Mar. 31, 1966, Ser. No. 539,127
7 Claims. (Cl. 287—189.35)



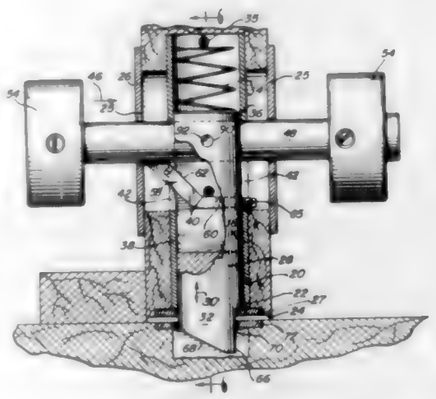
This disclosure relates to a retainer assembly adapted to secure a structural member to a support, including a headed button secured to the support, a metal clip secured beneath the button head having downwardly facing locking spurs, and a retainer formed of a material softer than the clip spurs telescopically received over the clip and deformably retained thereon by the spurs.

3,374,018
SNAP-ACTION CATCH
Ernst Adam Lust, Industriestrasse 13–15, Lampertheim, Hesse, Germany
Filed Jan. 6, 1966, Ser. No. 519,113
Claims priority, application Germany, Jan. 8, 1965, L 49,670
6 Claims. (Cl. 292—45)

A catch mechanism for latching a door member in an associated frame member. The mechanism comprises at least one forked element mounted for pivotal movement on either the door or the frame, a catch pin for each forked element mounted on the other of the two for engaging the forked element, a resilient thrust rod slidably mounted in the same member as the forked element, means connecting the forked element and the thrust rod for displacing the thrust rod as the forked element moves

pivotally, a roller secured to the thrust rod and movable together with the thrust rod, a peg fixed in the path of the roller such that as the roller passes over the peg, the thrust rod being resilient is laterally deformed. The peg is positioned relative to the roller so that it is in engagement with the roller when the forked element is positioned for the door to be either opened or closed.

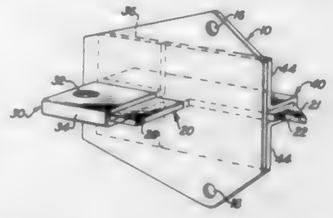
3,374,019
LOCK ASSEMBLY WITH PRIVACY MEANS
Albert C. Sanowskis, Chicago, Ill. (16600 Patricia Ave., Tinley Park, Ill. 60477)
Filed Oct. 23, 1965, Ser. No. 503,366
8 Claims. (Cl. 292—170)



A push-pull type lock device mountable in a door and incorporating a hollow housing in which a retractile spring biased latch bolt is slidably movable in a first direction and a straight hollow member is engaged at right angles to said housing and bolt through aligned transverse passages formed therein and is movable in a second direction at right angles to said first direction, the hollow member carrying a cam surface bearing arm adapted to contact a pin carried in the latch bolt to retract the bolt on movement of the hollow member, said hollow member also carrying, disposed entirely therewithin, a solid member having a reduced thickness portion in which a lug is ridable between a condition blocking movement of said hollow member and said latch bolt and a condition freeing

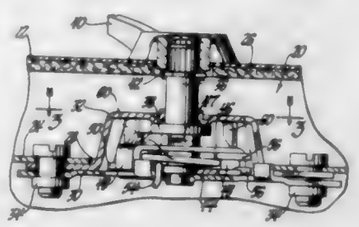
the same, thereby to comprise privacy lock means disposed entirely within the intersecting portions of said latch bolt, said housing and said hollow member. The invention also provides a dead-bolt means operable to immobilize the latch bolt independent of the means to immobilize the hollow member's movement but releasable by release of said last mentioned means.

3,374,020
LATCH MECHANISM
Robert D. W. Berg, 9200 Upton Ave. S., Bloomington, Minn. 55431
Filed May 2, 1966, Ser. No. 546,767
6 Claims. (Cl. 292—175)



A locking unit for a closure comprising a rigid L-shaped latch bolt which is spring projected and secured to a mounting plate by a pair of U-shaped brackets.

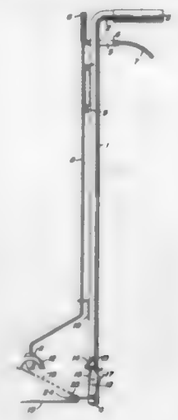
3,374,021
LATCH OPERATING ASSEMBLY
Ronald S. Gulette, Warren, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Nov. 23, 1966, Ser. No. 596,676
5 Claims. (Cl. 292—336.3)



1. In a vehicle body having a door and a door latch, latch operating means comprising, support means on the door, operating handle means mounted on said support means for rotation about an axis between a nonactuating and a latch actuating position, actuating means rotatably mounted on said support means in axially spaced relation to said handle means and being connected to said latch for actuation thereof, and connecting means responsive to rotation of said handle means from said nonactuating toward said latch actuating position thereof to move axially of said handle means to connect said handle means and said actuating means for simultaneous rotation and actuation of said latch, said actuating means being free of connection with said handle means by said connecting means in the nonactuating position of said handle means.

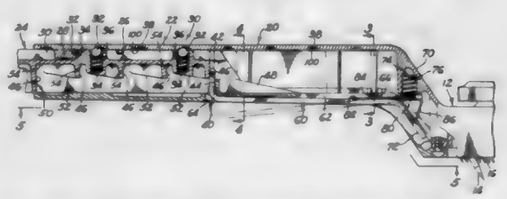
3,374,022
COMBINATION OBJECT MOVING DEVICES AND CANES OR WALKING STICKS
Howard L. Tagg, 17 Hawk Lane, Levittown, N.Y. 11756
Filed Feb. 8, 1966, Ser. No. 525,983
5 Claims. (Cl. 294—2)

The combination object moving device and cane or walking stick is a cane with a lever under the handle moving a spring-returned push rod downward on far side from handle, the bottom end of push rod fitted with a flat footed but undercutted edge and underside part at 90 degrees to axis of push rod, its feet mating in parallel plane with an object receiving plate at bottom of rod. The object receiving plate is pivoted to swing up at an angle position for storage against the object holding piece to



provide clearance from ground for use of the device as cane or walking stick. The object receiving plate is moved down from storage position by pushing the push rod, and is held in position by springs. The plate is returned by pushing against the ground or a walk. Special pick-up means can be fastened to an auxiliary rod attachable to the object receiving plate.

3,374,023
KNEE-ACTUABLE CARPET STRETCHER WITH ADJUSTABLE-LENGTH SHANK
Harvey J. Hill, Monterey Park, and Nicholas Giandomenico, Covina, Calif., assignors to Roberts Consolidated Industries, Inc., City of Industry, Calif., a corporation of California
Filed Apr. 4, 1966, Ser. No. 539,965
8 Claims. (Cl. 294—8.6)

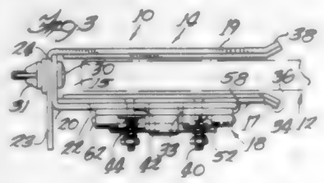


An adjustable-shank knee-actuable carpet stretcher having a trigger-operated laterally-movable stop acting in shear between a laterally-extending fixed stop on one shank member and each of a series of longitudinally-spaced laterally-extending fixed stops on another shank member telescopically connected to the first. Mechanism for releasably latching the shank members in their different relative longitudinal positions for indexing purposes, and for simultaneously longitudinally biasing the shank members relative to each other in directions to maintain the movable stop in positive engagement with the two fixed stops between which it is inserted, so as to prevent rattling.

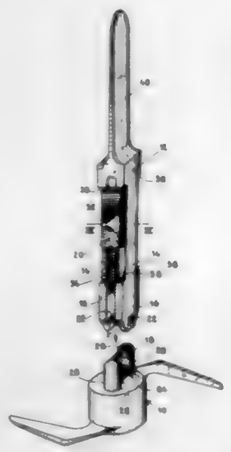
3,374,024
HANDLING DEVICE
Jesse Le Roy Reynolds, Decatur, Ill., assignor to Woare Builders Supply Company, Decatur, Ill., a partnership
Filed June 17, 1965, Ser. No. 464,752
6 Claims. (Cl. 294—16)

A handling device for flat panels is provided which includes a U-shaped recess within which is a plate which cooperates with one side of the U to grip the panel. The plate is moved by a cam attached to the pivot of a handle

which pivots upward and outward about a line parallel to the side of the U to which it is attached and perpendicular to the base of the U so that a workman standing on one side of the panel grips and lifts the panel in one movement.

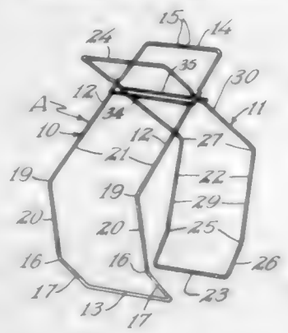


3,374,025
GRIPPERS FOR HANDLING OBJECTS
Jean Mantelet, Paris, France, assignor to Moulinex Societe Anonyme, Bagnolet, France
Filed June 3, 1966, Ser. No. 555,171
Claims priority, application France, June 14, 1965, 20,680
5 Claims. (Cl. 294—16)



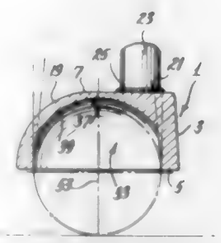
A gripper for handling an object, comprising a fork having two resilient limbs with jaws adapted to resiliently engage the object, and a releasing thrust element having an active part in the form of a pair of blades which insert between the limbs of the fork and the sides of the object to move the jaws out of the object-engaging positions.

3,374,026
MEAT TONGS
Lawrence J. Coleman, 304 Northwest Bank Bldg., St. Paul, Minn. 55101
Continuation-in-part of application Ser. No. 402,308, Oct. 7, 1964. This application Oct. 3, 1966, Ser. No. 583,739
4 Claims. (Cl. 294—16)



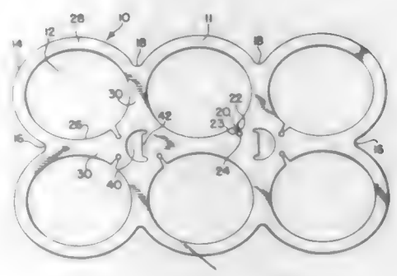
This invention involves a pair of tong arms pivotally connected in intersecting relation. The tong levers are rectangular, elongated, loop-shaped members, one end of each loop forming the handle and the other end forming the gripping ends of the lever arms. The tong arms are bent transversely to provide an intermediate section, a handle section which is substantially longer than the intermediate section, and a gripping section substantially shorter.

3,374,027
GOLF BALL RETRIEVING CLUB
Charles D. Jacobs, 1100 S. Lakeside Drive, Lake Worth, Fla. 32566
Filed Sept. 24, 1964, Ser. No. 399,008
10 Claims. (Cl. 294—19)



A golf ball holding cavity formed in the bottom wall of the head of a golf club. The walls of the cavity are rigid and spaced apart a distance to slightly compress a golf ball inserted therein at the diametrical mid-portion thereof, thus frictionally and releasably holding the ball in the cavity.

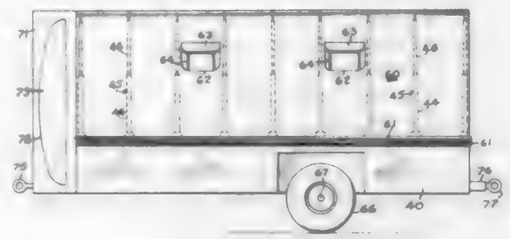
3,374,028
CONTAINER CARRIER
Herbert J. Wanderer, Elmhurst, Ill., assignor to Illinois Tool Works Inc., Chicago, Ill., a corporation of Delaware
Filed Apr. 27, 1967, Ser. No. 634,255
4 Claims. (Cl. 294—87.2)



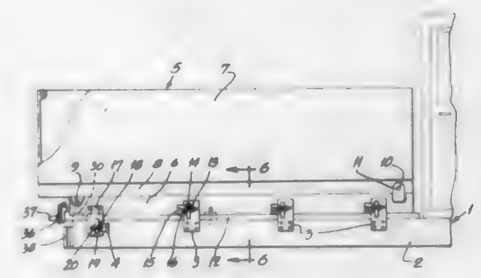
Container carrier formed of plastic sheet material having a plurality of apertures therein for receiving and holding peripheral enlargements at one end of a plurality of containers. The plastic material has at least one notch projecting into the body thereof from each of the apertures. The notches serve to facilitate the initial attachment of the carrier to the plurality of containers and also permit the easy removal of containers from the carrier.

3,374,029
TRAILER CONSTRUCTION
Joseph K. Barker, Rte. 2, Abingdon, Va. 24210
Filed Oct. 14, 1965, Ser. No. 496,071
7 Claims. (Cl. 296—28)

A vehicle body, and more specifically, a trailer body, is made up of hollow structural elements of square cross section, including upper and lower side frame members and vertical members, the upper members being made up of short aligned sections cut off square at their ends and welded in solid abutting relationship with the adjacent flat surfaces of the vertical members, all outer surfaces of the upper and lower side frame members and the vertical members being flush in a common vertical plane so that a closure and rigidifying panel can be secured to all of such flush faces.

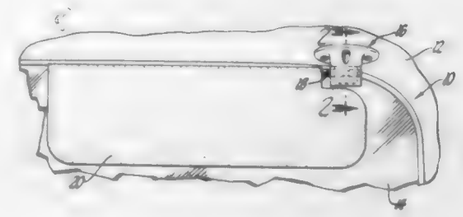


3,374,030
DETACHABLE CONNECTION OF A VEHICLE BODY TO A CHASSIS
Romeo Brisebois, 75 Archambault St., L'Assomption, Quebec, Canada
Filed Dec. 23, 1965, Ser. No. 515,939
Claims priority, application Canada, Dec. 23, 1964, 919,479, Patent 734,310
9 Claims. (Cl. 296—35)



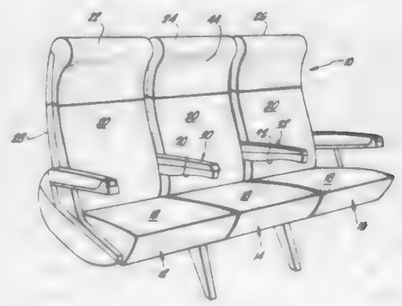
This invention concerns trucks having a body detachably connected to the chassis by means of inter-engageable wedging and anchoring members, firmly held in position by anchoring rods attached to the chassis and detachably engaging the body.

3,374,031
SUNSHADE SUPPORT ASSEMBLY
Floyd I. Dully, Detroit, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Apr. 25, 1966, Ser. No. 544,893
5 Claims. (Cl. 296—97)



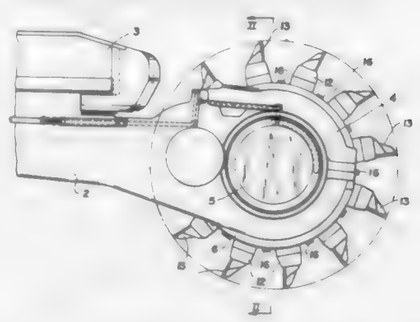
1. A sunshade support assembly comprising, in combination, support means adapted to be fixedly mounted on a vehicle body, a pair of generally telescopically movable members, means rotatably mounting one of said members on said support means, the other of said members being supported on the one member and including at least a pair of spaced clamping portions movable relative to each other, a sunshade support rod located between said portions and being clamped thereby upon relative movement of said portions, cooperating cam means on said members operative upon telescopic movement of said members relative to each other to move said clamping portions relative to each other and into clamping engagement with said support rod, and resilient means biasing said members relative to each other.

3,374,032
AIRCRAFT SEAT
Frank J. Del Giudice, Seattle, Wash., assignor to Hardman Tool and Engineering Company, Los Angeles, Calif., a corporation of California
Filed Feb. 13, 1967, Ser. No. 615,462
12 Claims. (Cl. 297—394)



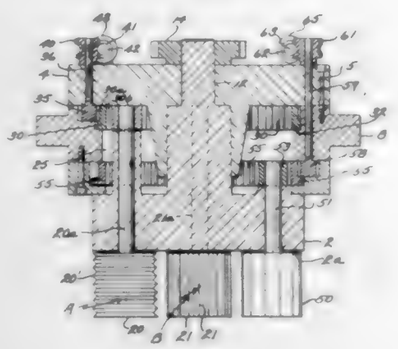
A multiple seat assembly for aircraft having three passenger seats mounted on a frame. Each seat has a headrest above its back in position to cushion a passenger's head. The middle headrest may be removed and positioned above its seat's bottom between the end seats to form an armrest and seat divider. When a three-seat arrangement is desired, armrests between adjacent seats are lowered from the seat's back.

3,374,033
CUTTER HEAD HAVING FLUID SUPPLY MEANS
Einar M. Arentzen, Charleroi Borough, Washington County, Pa., assignor to Lee-Norse Company, Charleroi, Pa., a corporation of Delaware
Filed Feb. 21, 1966, Ser. No. 528,726
2 Claims. (Cl. 299—81)



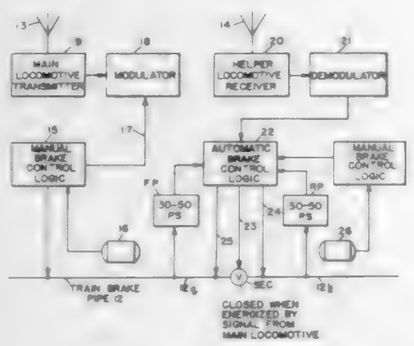
A cutter head for mining machines, which includes a plurality of spaced cutter bits peripherally carried by a rotatable cutter wheel. A plurality of fluid supply nozzles are alternately arranged with the cutter bits and connected to a source of fluid, such as water, through a valving arrangement whereby fluid is supplied through each of the nozzles only when the cutter bits thereadjacent are actually engaged in cutting.

3,374,034
ADJUSTABLE APPARATUS FOR PULVERIZING SOLID MATERIALS
Guy O. Conner, Cleveland Heights, Ohio, assignor to Rolls-Royce of Canada, Limited, Lachine, Quebec, Canada
Filed Nov. 19, 1965, Ser. No. 508,655
9 Claims. (Cl. 299—86)



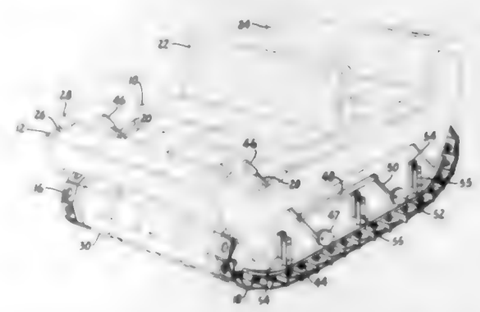
A pulverizing head comprising a large mass for pulverizing solid materials and wherein the head is rotatable in a first direction on an axis that is parallel to and spaced from the material to be pulverized. The head includes at least one breaker element which may be somewhat cylindrical in configuration and rotatably mounted on the head on an axis that is also spaced from and parallel to the rotatable axis of the head. The breaker element is rotable about its axis in a direction that is opposite to the direction of rotation of the head. Adjustable drive means are provided to adjust the relative rotation between the head and each of the breaker elements mounted thereon such that at the instant when the breaker element is brought into engagement with the surface to be pulverized the rotational speed of the breaker elements and the head are synchronized whereby a peripheral point or projection on any one of said breaker elements is disposed so that its linear velocity due to the rotation of the head is substantially equal and opposite to the linear velocity of said projection due to the rotation of the breaker element whereby substantially compressive forces only are applied by said element perpendicularly against the surface to be pulverized.

3,374,035
BRAKE CONTROL SYSTEMS FOR MULTIPLE UNIT TRAINS
James Y. Howard, Spencerport, N.Y., assignor to General Signal Corporation, Rochester, N.Y., a corporation of New York
Filed July 1, 1966, Ser. No. 562,247
8 Claims. (Cl. 303—20)



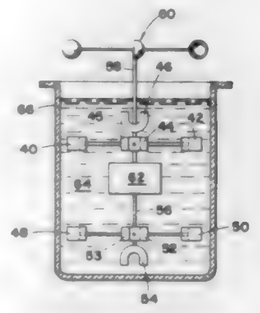
1. A brake control system for a multiple unit train having a main locomotive at the head of the train and a helper locomotive at an intermediate point in the train, each of the locomotives having air brake control apparatus, comprising, communication means for communicating brake control signals from the main locomotive to the helper locomotive, a brake control air line extending throughout substantially the entire length of the train for controlling application of brakes by the respective cars of the train in accordance with air pressure in the air line, sectionalizing means controlled by at least one of the brake control signals communicated from the main locomotive for sectionalizing the brake line at the location of the helper locomotive in the train into forward and rear control sections, and means effective when the brake line is sectionalized for controlling the rear section of the line by the air brake control apparatus associated with the helper locomotive in accordance with the brake control signals communicated from the main locomotive.

3,374,036
RETRACTABLE CLEAT
Hugh H. Shaw, Salinas, Calif., assignor to Domino Sugar Company, a corporation of Delaware
Filed May 17, 1966, Ser. No. 550,808
2 Claims. (Cl. 305—13)



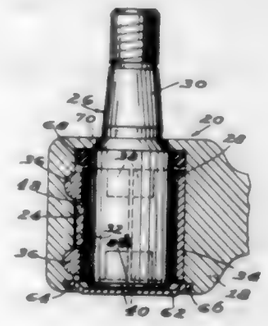
A retractable cleat for track laying vehicles having a resilient cushion and support portion for attachment at the marginal edges of the vehicle tracks and self cleaning features for cleaning snow and ice from the cleat during operation.

3,374,037
MAGNETIC BEARING
Sanford M. Weinberger, Philadelphia, Pa., assignor to General Electric Company, a corporation of New York
Filed Dec. 21, 1964, Ser. No. 420,024
4 Claims. (Cl. 308—10)



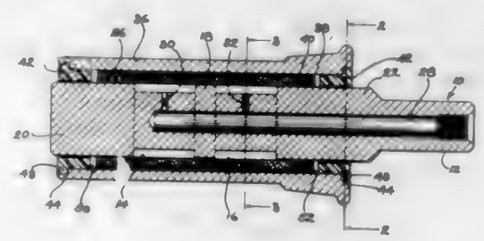
1. A position-seeking device comprising:
a source of magnetomotive force having magnetic poles;
a magnetic fluid whose viscosity and fluidity are substantially independent of any magnetic field applied to it surrounding the said poles;
container means bounding the same fluid and generally conforming to the shape of the said source of magnetomotive force.

3,374,038
PIVOTAL JOINT
William C. Welmer, Detroit, Mich., assignor to Moog Industries, Inc., St. Louis, Mo., a corporation of Missouri
Filed Mar. 23, 1966, Ser. No. 536,824
13 Claims. (Cl. 308—66)



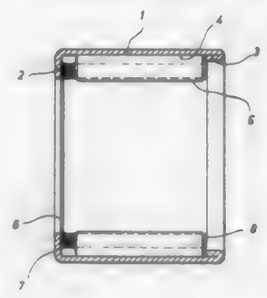
1. A self-adjusting idler arm assembly, comprising: an idler arm having a socket defined therein, a stud having a substantially cylindrical head received within said socket, a bearing comprising two separate bearing halves disposed about said head within said socket, said bearing halves providing substantially cylindrical bearing pads in bearing engagement with said head forming at least a four-point support for said head said points being initially substantially equally spaced about the circumference of said head, and a wedge means continuously and non-reversibly urging one bearing half against said head and said head against the other bearing half to maintain said four-point support of said stud head.

3,374,039
ANTIFRICTION BEARING
Donald A. Voorhies, West Hartford, Conn., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Sept. 1, 1965, Ser. No. 484,315
9 Claims. (Cl. 308—107)



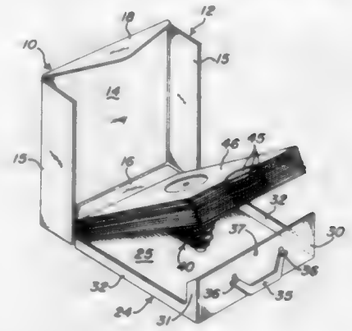
An air bearing of the externally pressurized type in which the stationary support includes a hub and a chamber which opens onto the inside of a porous sleeve portion so that the pressurized air fed to the chamber permeates through it into a controlled clearance between the sleeve and a rotatable shell which surrounds it. The shell includes end bushings spaced from the end faces of the porous member so that the air supports the shell and centers it on the hub. In one embodiment, the end bushings are spaced from the hub outboard of the porous sleeve with the space between the hub and the end bushings providing a restricted leakage path for the air. In a modification, one end of the shell is completely sealed and a valving arrangement is provided at the other end to center the shell on the hub.

3,374,040
ANTIFRICTION BEARINGS WITH CYLINDRICAL ROLLERS
Georg Schaeffler, Herzogenaurach, Germany, assignor to Industriewerk Schaeffler OHG, Herzogenaurach, Germany, a corporation of Germany
Filed Aug. 15, 1966, Ser. No. 572,279
Claims priority, application Germany, Sept. 7, 1965, J 14,183
2 Claims. (Cl. 308—213)



1. An antifriction bearing comprised of a thin-walled outer race with rims at both ends, one of the said rims being directed substantially radially inwardly and the other is directed axially inwardly to the bearing and the height of the latter rim corresponding approximately with the wall thickness of the race, a comb-cage therein with an outer diameter identical to or smaller than the inner diameter of the rim directed axially inwardly to the bearing and with the end ring connecting the bars of the cage abutting against the radially directed rim and cylindrical rollers between the bars of the cage which abut directly against the rim directed axially inwardly to the bearing.

3,374,041
CARRIER FOR DISK RECORDS
Golden C. Davis, 420 S. Spring St., Springfield, Ohio 45505
Filed May 10, 1967, Ser. No. 637,418
11 Claims. (Cl. 312—10)

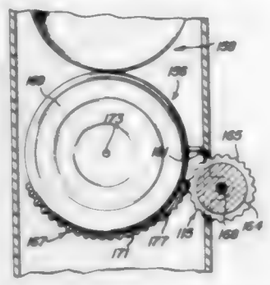


A case for protecting, preserving, storing and transporting disk records, formed with mating case members hinged together and incorporating collapsible spring means carried by one case member and extending towards the other case member for maintaining the records in flat stacked relation when the case is closed to prevent warping of the records, and for supporting the records in a conveniently accessible position when the case is open.

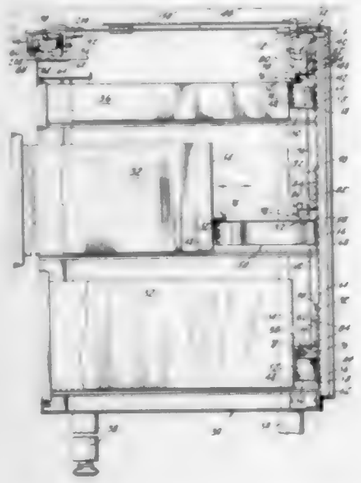
3,374,042
TOILET TISSUE DISPENSER
James A. Smith, 520 Hilda St., Morgan City, La. 70380
Filed Sept. 27, 1966, Ser. No. 582,454
7 Claims. (Cl. 312—39)

1. A toilet tissue dispenser comprising elongated upstanding guide means adapted to support a plurality of toilet tissue rolls stacked in side-by-side relation therefrom

for free downward guided movement therealong, said guide means including roll retaining means spaced above the lower end thereof and adapted to releasably support the lowermost roll in said stack against downward movement past said retaining means, said guide means including roll journaling means disposed below said retaining means adapted to removably rotatably journal a roll of tissue after it has passed down said guide means past said roll retaining means, said roll retaining means including an actuator journaled from said guide means and operative, in response to its rotation, to cause said lowermost roll to move downwardly along said guide means past said retaining means for subsequent journaling from said roll journaling means, said roll retaining means including upwardly opening cradle means journaled from said guide means for oscillation between an upright upwardly opening position adapted to cradle said lowermost roll from beneath and an inverted downwardly opening position allowing downward movement of said lowermost roll therefrom and defining an abutment for the next to the lowermost roll in said stack.

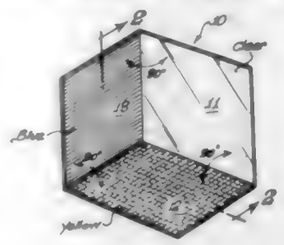


3,374,043
LEVER CONTROLLED COMPONENT LOCKING AND MOVING ARRANGEMENT FOR CABINETS
Otto Lewin, York, Pa., assignor to The Leopold Company, Burlington, Iowa, a corporation of Delaware
Filed Feb. 15, 1967, Ser. No. 616,250
24 Claims. (Cl. 312—219)



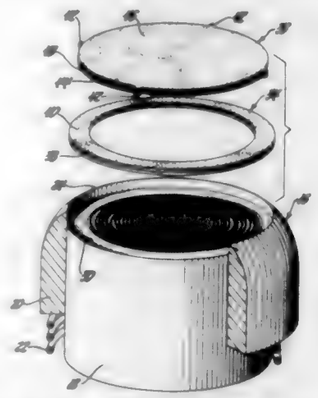
A lever, controlled component latching and moving apparatus for a cabinet utilizing a first leaf-type spring to urge the component from a position confined within the cabinet to a position exposed from the cabinet and a second leaf type spring to latch the component in its position confined within the cabinet and against the bias of the first spring. A lever is provided for each component to remove the latching spring from its latching position and permit the other spring to move the component and a lock actuated plate is provided to prevent actuation of the levers and lock all components in place. Information carrying buttons may furthermore be provided to indicate the nature of the components and connectors utilized between lock actuated plates of adjacent cabinets to permit the utilization of a single lock for locking plural cabinets.

3,374,044
FILTERED WAVE-ENERGY CORNER-REFLECTOR
Howard F. Benson, Pomona, Calif., assignor to General Dynamics Corporation, Pomona, Calif., a corporation of Delaware
Filed Nov. 3, 1964, Ser. No. 408,530
7 Claims. (Cl. 350—102)



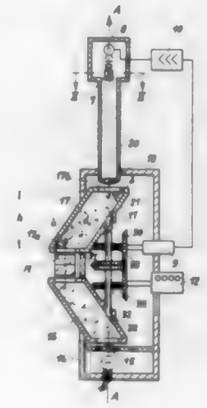
This disclosure is directed to a reflector device adapted to receive wave-energy from a source and to reflect it back so encoded that physical orientation of the point source relative to the reflector may readily be determined. More particularly, the illustrated reflector is in the form of a corner-reflector comprising three relatively fixed planar reflectors so disposed that each reflector is perpendicular to the other two. Two of the reflectors are each covered with a filter, while the third reflector is left unfiltered. The filters utilized for illustration are primary color filters, for example, one of the filters is a primary yellow, while the other is a primary blue. Orientation of the wave-energy source relative to the reflector is determined by the particular type of wave-energy being reflected back toward the source, whether, as illustrated, it be basically green, yellow-green, blue-green, etc. The wave-energy reflected will be dependent on the type of filters utilized and the angle at which an incident beam strikes the device.

3,374,045
DIELECTRIC HEAT AND PRESSURE EMBOSSED REFLECTOR ASSEMBLY
John J. Mance, Huntington Woods, and Ralph M. Stallard, Rochester, Mich., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Original application May 15, 1963, Ser. No. 280,681. Divided and this application Oct. 17, 1966, Ser. No. 587,032
1 Claim. (Cl. 350—105)



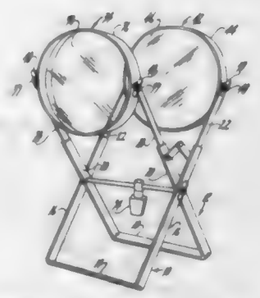
A dielectric heat and pressure embossed reflector assembly door trim panel. The reflector assembly comprises a sheet of opaque vinyl fused to the cover sheet of the trim panel. A sheet of translucent acrylic resin having a plurality of V-shaped grooves formed in one surface thereof is bonded to the acrylic sheet by a layer of adhesive having a plurality of glass beads disposed therein. A metallic rim surrounds the sheet of acrylic resin and is fused to the cover sheet.

3,374,046
READING MICROSCOPE WITH INTERPOLATION PRISM
Kurt Räntsch, Heidenheim, and Adolf Weyrauch, Wetzlar, Germany, assignors to Carl-Zeiss Stiftung, Wurttemberg, Germany, a corporation of Germany
Filed Mar. 26, 1964, Ser. No. 355,044
Claims priority, application Germany, Mar. 29, 1963, Z 10,023
3 Claims. (Cl. 350—112)



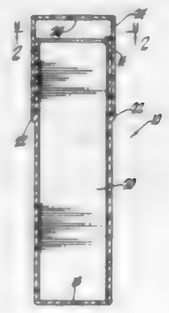
A reading microscope comprising a microscope objective, a parallel mirror arrangement consisting of two similar rhombic prisms arranged to be rotatable about the optical axis of the objective, a transparent measuring scale arranged between said two rhombic prisms and having at least one scale line adapted to be projected by one rhombic prism of said mirror arrangement into the microscope, a servo system controlled by a photoelectric cell for rotating said mirror arrangement so as to bring the image of said scale line in coincidence with a fixed mark in the object plane of the microscope, and means for passing a beam of illuminating light through the other one of said rhombic prisms and through said transparent measuring scale.

3,374,047
MAKEUP AID WHICH INCLUDES A MAGNIFYING LENS IN FRONT OF A MIRROR
Azeline D. Gatchell, Boston Hill Road, Andover, Conn. 06232
Filed Apr. 16, 1964, Ser. No. 360,456
4 Claims. (Cl. 350—199)



1. The combination in a makeup aid or the like of first and second upright support means each having a pair of spaced interconnected legs, means pivotally connecting the legs of said first and second support means so that lower end portions thereof engage and rest upon a flat horizontal surface with the upper portions spaced apart, a mirror supported between the legs of one of said first and second support means, a magnifying glass supported between the legs of the other of said support means so as to be aligned with the mirror for viewing therethrough, and means releasably holding the first and second support means in selected pivotally adjusted positions to vary the spacing between said magnifying glass and the mirror.

3,374,048
DISPENSING AND STORAGE CONTAINER
Toivo W. Koskinen, 317 N. Main St., Romeo, Mich. 48065
Filed Apr. 5, 1966, Ser. No. 540,375
1 Claim. (Cl. 401—98)



A storage and dispensing container and, more specifically, a container including a housing of flexible organic polymeric material adapted to receive and slidably support a stick of material, and including a cap removably disposed about an open end of the housing with an end wall of the cap disposed in spaced relation to the open end of the housing so that the container may be inverted to allow the stick of material to slide out of the open end of the housing and abut the end wall of the cap to position a predetermined length of the stick out of the housing whereupon the walls of the housing may be grasped and flexed inwardly to frictionally engage the stick for engaging the stick with an article upon removal of the cap.

3,374,049
TABBING MECHANISM
Craig V. Taylor, Canoga Park, Calif., assignor, by mesne assignments, to Craig V. Taylor and Carl De Wald, both of Van Nuys, Calif.
Filed Apr. 19, 1966, Ser. No. 543,681
7 Claims. (Cl. 401—171)

A tabbing machine is described in the following specification, which takes the form a long tubular instrument which is intended to apply an adhesive under the tabs

of composition asphalt, or the like, type of roof shingles, so as to provide a seal for the shingles. The instrument has an internal pressurized supply of adhesive which is discharged at the bottom thereof between a pair of especially configured blades, the blades extending up under the roof shingles when the instrument is in use.

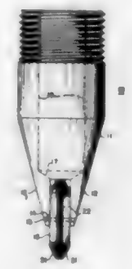
3,374,050

Herbert Rabin, 2935 Kanawha St. NW. 20015, and Harold S. Goulart, 227 Valley Ave. SE. 20032, both of Washington, D.C.

Filed Oct. 22, 1965, Ser. No. 502,730

1 Claim. (Cl. 401—208)

This invention is directed to a paint dispenser in which a small beveled wheel that is knurled on its circumference and has chamfered sides, is rotatable in a slot cut in the end of a cone that is machined on the end of a short rod. The short rod is provided with an axial passage which permits electrically conducting ink to flow from a marking pen reservoir secured to the upper end of the short rod down to the small wheel rotatable in the opposite end of the short rod. Since the wheel is chamfered on the sides, paint flows down over the side of the wheel onto the center portion thereof which contacts a recording paper upon which the wheel is rotated. Surface tension



between the paper and the paint applies paint onto the recording paper such that the center portion of the conductive line applied to the surface is thicker than the outer surface edges of the line.

CHEMICAL

POLYURETHANES MADE FROM DIISOCYANATES OF DIAMINO CARBOXYLIC ACID ESTERS IN LEATHER TREATMENT AND THE SO-TREATED LEATHER

John D. Garber, Allendale, Gordon M. Ide, Morristown, and Frederick M. Meigs, Westfield, N.J., assignors to Merck & Co., Inc., Rahway, N.J., a corporation of New Jersey

No Drawing. Filed Nov. 24, 1964, Ser. No. 413,611

12 Claims. (Cl. 8—94.21)

1. The method for improving leather comprising treating it with an aqueous emulsion of an isocyanate terminated adduct, said adduct produced by reacting a mixture comprising:

(A) a diisocyanate within generic formula

$$OCN-(CH_2)_n-\underset{\displaystyle COOR}{\underset{|}{CH}}-NCO$$

wherein *n* is selected from the group consisting of 3 and 4; and R is an alkyl radical of 8–20 carbon atoms; and

(B) a polyol whose average molecular weight is at least 700, whose ratio of the number of carbon atoms to the number of hydroxyl radicals therein is at least 15 and being free of other functional groups which will react to any significant degree with (A) at 25°–80° C.; the NCO/OH ratio in said mixture being in the range of about 1.3 to about 2.0.

3,374,052

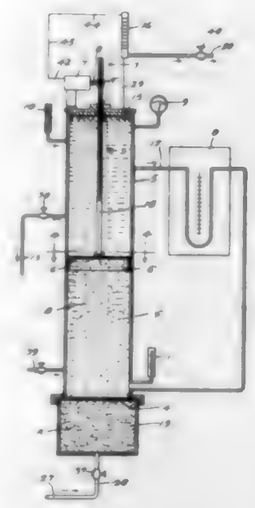
SYSTEM FOR SOLID PARTICLES-FLUID CONTACT OPERATIONS

Liang-Tseng Fan, 2059 College View Road, Manhattan, Kans. 66502, and Chin Yung Wen, % Department of Chemical Engineering, West Virginia University, Morgantown, W. Va. 26506

Continuation-in-part of application Ser. No. 292,408, July 2, 1963. This application Dec. 20, 1965, Ser. No. 524,360

15 Claims. (Cl. 23—1)

An apparatus and method for producing and utilizing a convertible fluidized bed having an upper phase in which the particles are closely packed in nonfluidized relation



and a relatively less dense fluidized phase below the upper phase is disclosed.

3,374,053

PROCESS FOR PREPARING VANADIUM OXYCHLORIDE

Albert Krettler and Ernst Dönges, Frankfurt am Main, Germany, assignors to Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Bruning, Frankfurt am Main, Germany, a corporation of Germany

No Drawing. Filed June 22, 1965, Ser. No. 466,481

Claims priority, application Germany, June 27, 1964, F 43,283

4 Claims. (Cl. 23—21)

A process has been provided for preparing vanadium oxychloride by reacting vanadium pentoxide with a chlorinating agent in the presence of an excess of vanadium oxychloride as the reaction medium. A suitable chlorinating agent is thionyl chloride. Improved yields on absolute as well as space-time basis are obtained.

3,374,054

METHOD OF RECOVERING FLUORINE, ALUMINUM AND SODIUM COMPOUNDS FROM ELECTROLYTIC FURNACE WASTES

Sven Gregert Terjesen and Arnfinn Ve, Trondheim, Norway, assignors to Elektrokemisk A/S, a corporation of Norway

No Drawing. Continuation of application Ser. No. 548,337, May 6, 1966, which is a continuation of application Ser. No. 315,341, Oct. 10, 1963. This application June 16, 1967, Ser. No. 646,736

9 Claims. (Cl. 23—88)

9. The method of recovering fluorine, aluminum and sodium compounds from aluminum electrolytic furnace wastes which comprises leaching said furnace wastes with an aqueous solution of alkali to extract said fluorine, aluminum and sodium compounds, mixing with the leach liquor at a pH from 7.5 to 13 a liquid containing hydrogen fluoride to form a precipitate of said fluorine, aluminum and sodium compounds without determining in advance the precise quantities of said compounds that are dissolved in said leach liquor, then mixing with the resulting precipitate-containing liquor at a pH from 2.0 to 6.0 a liquid containing aluminum trifluoride to form a further precipitate of said fluorine, aluminum and sodium compounds again without determining in advance the precise quantities of said compounds that are still dissolved in said precipitate-containing liquor, whereby substantially all of the fluorine, aluminum and sodium in said leach liquor and in said first and second liquids is recovered.

3,374,055

EXTRACTION OF PHOSPHORIC ACID AND THE PURIFICATION THEREOF

Ernest Michel Villalon, Attichy, Oise, France, assignor to Compagnie des Gelatines Francaises, Paris, France, a joint-stock company of France

Filed Sept. 24, 1963, Ser. No. 311,029

Claims priority, application France, Nov. 12, 1962, 915,417; June 4, 1963, 937,585

12 Claims. (Cl. 23—107)

7. A process comprising the steps of: treating a charge containing tri-calcium phosphate with an aqeuous solution of phosphoric acid at a concentration of about 80–150 g./l. and at not greater than about 20° C. to obtain a solution of mono-calcium phosphate; passing a first portion of said resulting aqueous solution of mono-calcium phosphate over a first strongly acidic cation-exchange resin in the acid form to recover the quantity of phosphoric acid necessary for said treatment of tri-calcium phosphate; recycling said recovered phosphoric acid to said tri-calcium phosphate treatment; passing the second portion of said aqueous solution of mono-calcium phosphate over a second strongly acidic cation-exchange resin regenerated in a sodium cycle; and recovering from said second resin a solution of alkaline mono-sodium phosphate.

8. A process comprising the steps of: treating tri-calcium phosphate with phosphoric acid at a concentration of about 80–150 g./l. and at not greater than about 20° C.; treating the resulting aqueous solution of mono-calcium phosphate with sulphuric acid to precipitate the major portion of Ca^{++} as $CaSO_4$; purifying the resultant solution by removing the calcium sulphate which has precipitated; and passing the resulting aqueous solution over a strongly acidic cation-exchange resin, whereby pure phosphoric acid is recovered.

3,374,056

PROCESS FOR INCREASING THE THERMAL STABILITY OF SYNTHETIC FAUJASITE

Philip K. Maher, Baltimore, and Carl V. McDaniel, Laurel, Md., assignors to W. R. Grace & Co., New York, N.Y., a corporation of Connecticut

No Drawing. Filed Dec. 3, 1964, Ser. No. 415,781

3 Claims. (Cl. 23—112)

A process for increasing the thermal stability of crystalline zeolites, which is characterized by immersing the zeolite in an aqueous electrolytic solution, continuing the immersion until ion exchange equilibrium is obtained between the zeolite and solution and then steeping the zeolite in said solution at a temperature of from 80 to 120° C. for at least an additional 2 hours.

3,374,057

PROCESS FOR ION EXCHANGING CRYSTALLINE ZEOLITES WITH NITROGENOUS BASES

Carl V. McDaniel, Laurel, and Philip K. Maher, Baltimore, Md., assignors to W. R. Grace & Co., New York, N.Y., a corporation of Connecticut

No Drawing. Filed Sept. 27, 1965, Ser. No. 490,685

3 Claims. (Cl. 23—112)

1. In the process of nitrogen base exchange of synthetic faujasite having an alkali metal content of less than 3 percent, expressed as the alkali metal oxide, the improvement which comprises maintaining in a solution containing the nitrogen base, an aluminum ion concentration greater than 3 weight percent, expressed as aluminum sulfate, and thereby protecting the crystalline structure of the synthetic faujasite from degradation during the base exchange process.

3,374,058

PROCESS FOR PREPARING A CRYSTALLINE ZEOLITE

Carl V. McDaniel, Laurel, and Philip K. Maher and William E. Waxter, Baltimore, Md., assignors to W. R. Grace & Co., New York, N.Y., a corporation of Connecticut

No Drawing. Filed Dec. 8, 1964, Ser. No. 416,897

3 Claims. (Cl. 23—113)

A process of preparing a synthetic crystalline zeolite having the following mole ratio composition:

$$(0.1 \text{ to } 0.4K_2O:0.9 \text{ to } 0.6Na_2O):A_2O_3:3\text{–}6SiO_2:0\text{–}9H_2O$$

which is characterized by utilizing specific mole ratio quantities of the reactants and further characterized in one embodiment by first aging a mixture containing Na_2O, SiO_2, Al_2O_3 and H_2O before adding the K_2O component.

3,374,059

PREPARATION OF NITROSYL ACID SULFATE

Louis Linguenheld, St-Genis Laval, Rhone, and Philippe Perras, Lyon, Rhone, France, assignors to Rhone-Poulenc S.A., Paris, France, a corporation of France

No Drawing. Filed Mar. 16, 1964, Ser. No. 352,356

Claims priority, application France, Apr. 9, 1963, 930,947

2 Claims. (Cl. 23—139)

Nitrosyl acid sulphate is prepared by the reaction under anhydrous conditions at −5° to +5° C. of sulphur dioxide with nitric acid in the presence of a chlorinated aliphatic hydrocarbon diluent.

3,374,060

PRODUCTION OF MONOMERIC ISOCYANIC ACID

Günter Oertel, Cologne-Flittard, Hans Holtschmidt, Leverkusen, and Karl-Friedrich Zenner, Cologne-Flittard, Germany, assignors to Farbenfabriken Bayer Aktiengesellschaft, Leverkusen, Germany, a corporation of Germany

No Drawing. Filed Dec. 13, 1965, Ser. No. 513,589
10 Claims. (Cl. 23—151)

A process for producing monomeric, isocyanic acid by reacting hydrogen halide with an alkali, alkaline earth or ammonium cyanate in an inert organic solvent and under substantially anhydrous conditions. The process also optionally utilizes catalytic amounts of water or dimethylformamide.

3,374,061

PROCESS FOR OBTAINING SULFURIC ACID

Haldor Topsøe, Vedbak, Denmark, and Gerard Thareau, Aubervilliers, France, assignors to Societe Nationale des Petroles d'Aquitaine, Paris, France

Continuation-in-part of application Ser. No. 388,808, Aug. 11, 1964. This application Jan. 31, 1967, Ser. No. 613,981
Claims priority, application France, Aug. 13, 1963, 944,563
6 Claims. (Cl. 23—167)

A process and apparatus for the manufacture of sulphuric acid by absorbing a hot, humid gaseous stream containing sulphuric oxide in an aqueous sulphuric acid solution, the volume and concentration of which are maintained constant throughout the process. The sulphuric acid solution is continuously recycled through the absorber zone and the temperature of the recycled stream adjusted to maintain the sulphuric acid concentration therein constant. A volume of the sulphuric acid solution equal to the incremental portion formed by absorption of SO_3 and water vapor from the gaseous feed stream is continuously removed from the absorber, thereby maintaining the volume of the sulphuric acid solution recycled through the absorber substantially constant. The incremental volume of sulphuric acid is continuously recovered and concentrated to the required degree by flow countercurrent to the hot gaseous feed stream prior to contacting the latter with the sulphuric acid solution in the absorber.

3,374,062

PROCESS FOR REFINING SANDS

Frank W. Bowdish, 2440 11th St., Sparks, Nev. 89431

Continuation-in-part of application Ser. No. 296,466, July 22, 1963. This application Oct. 10, 1966, Ser. No. 585,602
16 Claims. (Cl. 23—182)

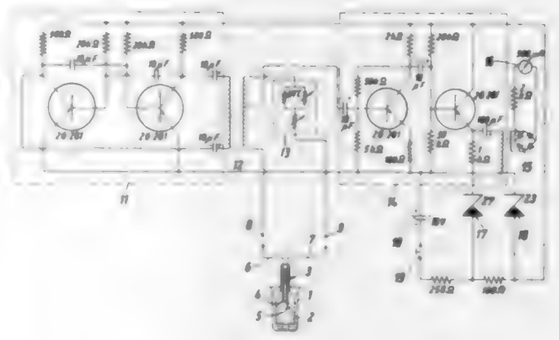
The invention is addressed to the refinement of sand having more than 0.5% by weight iron and a substantial amount of feldspar by the combination of steps which includes a first magnetic separation for splitting the effluent from the separator into one portion having a high iron content which is discarded and a product portion in which the iron content is less than 0.15% by weight. The product portion is heated to an elevated temperature and loaded into a leaching tank to form a column therein. A leaching solution formed of an aqueous solution of sulphuric acid and alkali metal chloride is preheated to a temperature within the range of 180° to 225° F. and introduced into the tank from the bottom side at a rate sufficiently slow to enable the leaching solution to rise through the column of hot sand whereby the first portion introduced will remain at the top of the column whereby the portion of the leaching solution at the top will contain the major portion of the iron dissolved from the sand so that removal of an increment of the upper portion of the column of leaching solution will effect removal of the major portion of the iron content, the leaching solution is then allowed to drain downwardly from the tank for re-use in subsequent leaching operations while the column of sand is cleansed with wash water the initial portions of which are added to form a part of the leaching solution.

3,374,063

METHOD OF DETERMINING HEMOGLOBIN IN BLOOD

Hans Günter Nöller, Fasanenweg 4, Heidelberg, Germany

Filed May 27, 1964, Ser. No. 370,523
Claims priority, application Germany, May 29, 1963, N 23,243
3 Claims. (Cl. 23—230)



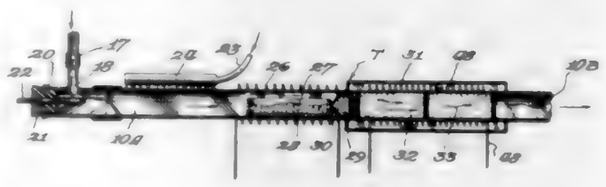
The hemoglobin content of a blood specimen is determined by mixing the same with hydrochloric acid and measuring the decrease in conductivity of the acid solution which results from formation of practically non-conductive acid hematin and is proportional to the hemoglobin originally present. Other electrolytes which form non-conductive compounds with hemoglobin may be substituted for hydrochloric acid. The generated signal modified in response to the sensed resistance may further be modified in response to the temperature of the mixed specimen.

3,374,064

OXYGEN ANALYZER

Orville L. Kolsto, Round Lake, Ill., assignor to Abbott Laboratories, North Chicago, Ill., a corporation of Illinois

Filed May 20, 1963, Ser. No. 281,542
2 Claims. (Cl. 23—253)



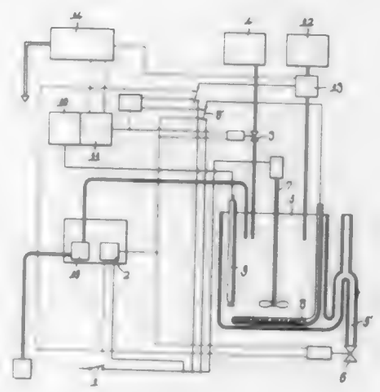
1. In an apparatus for analyzing the oxygen content of chemical compounds a closed tubing having a proximal solid inlet, a proximal gas inlet and a distal gas outlet, a combustion chamber within the tubing communicating with the inlets, means for heating the combustion chamber, a first carbon chamber communicating with the combustion chamber and distally located therefrom, a second carbon chamber located between and communicating with said first chamber and the gas outlet, said first chamber containing elemental carbon and said second chamber containing platinized carbon, means for heating the carbon chambers, means for cooling the proximal portion of the tubing between the solid inlet and the combustion chamber, and a ferromagnetic pilot within the proximal portion of said tubing freely movable therein between and in direct horizontal alignment with the solid inlet and the first carbon chamber.

3,374,065

BIOCHEMICAL OXYGEN DEMAND CONTINUAL DETECTING APPARATUS

Hideo Suzuki, Kanazawa-ku, Yokohama, Japan, assignor to Toyo Giken Company Limited, Tokyo, Japan, a corporation of Japan

Filed Dec. 16, 1964, Ser. No. 418,790
Claims priority, application Japan, Dec. 20, 1963, 38/68,313
1 Claim. (Cl. 23—253)



An apparatus for the automatic detection of the B.O.D. value, comprising a container and means for injecting a test material into the container. Means are provided for injecting a non-organic acid into the container to form a mixture. Means for mixing and heating the mixture causes a removal of the basic group, such as carbonate, bi-carbonate or carbonate anhydride, etc. During this stage, means for continuously detecting the lowering pH value causes a valve to close, thereby closing the non-organic acid injecting means when a low pH value is reached. Means for injecting an alkaline having a predetermined density into the mixture is provided and a recording meter is provided for showing the pH value increase. A measuring means determines the B.O.D. value by measuring an operating period of the alkaline injecting means over a pH value range indicating the volatile organic acid alkalinity.

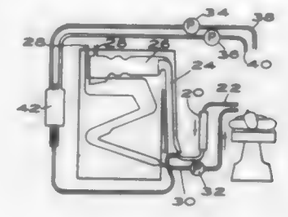
3,374,066

THERMOSTABILIZER FOR EXTRACORPOREAL OXYGENATOR

William E. Farrant, 5224 St. Antoine, Detroit, Mich. 48202

Filed June 15, 1964, Ser. No. 375,236
10 Claims. (Cl. 23—258.5)

1. In an oxygenator provided with a blood inlet tube and a blood outlet tube, a thermostabilizer having a blood conduit portion and a heat exchange portion associated with the blood conduit portion to control the temperature of the blood passing therethrough, said blood conduit portion coupled at opposite ends within one of the blood tubes of the oxygenator forming a blood passageway portion thereof, said blood conduit portion having an internal blood containing volume per unit of length equal to the internal blood containing volume per the same unit of length of the blood tube of the oxygenator within which said blood conduit portion is coupled and having an internal surface per the same unit of length and over which the blood passes therethrough substantially greater in area than the internal surface per the same unit of length of the blood tube over which the blood passes and within which said blood conduit is coupled.



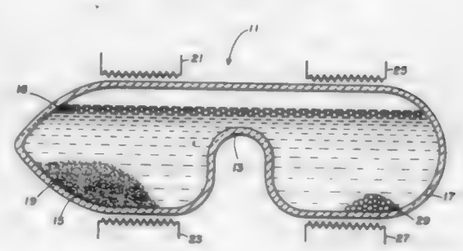
4. In an oxygenator having a blood tube adapted to be connected with a patient to establish blood communication between the oxygenator and the patient, a thermostabilizer having a blood conduit portion and a heat exchange portion, said heat exchange portion surrounding the blood conduit portion to control the temperature of the blood passing therethrough, said blood conduit portion coupled at opposite ends within said blood tube to form a blood communicating portion of said tube, said blood conduit having an internal blood containing volume per unit of length equal to the internal blood containing volume per the same unit of length of the blood tube within which the blood conduit is coupled, said blood conduit portion being removably replaceable within the surrounding heat exchange portion of the thermostabilizer whereby it may be removed therefrom and another blood conduit portion inserted therein.

3,374,067

PROCESS OF GROWING CUBIC ZINC SULFIDE CRYSTALS IN A MOLTEN SALT SOLVENT

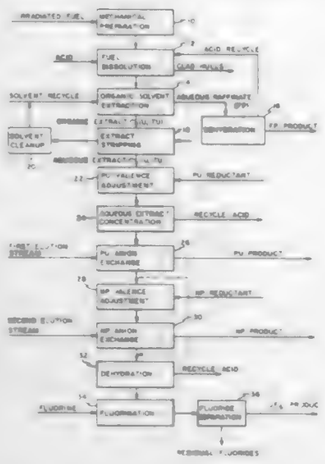
Rowland E. Johnson and Sidney G. Parker, Dallas, Tex., assignors to Texas Instruments Incorporated, Dallas, Tex., a corporation of Delaware

Filed Dec. 8, 1965, Ser. No. 512,400
10 Claims. (Cl. 23—305)



1. A method of forming cubic crystals of zinc sulfide in a molten solvent comprising, placing a solution of zinc sulfide in a molten salt selected from the group consisting of potassium chloride, sodium chloride, sodium bromide, sodium iodide, calcium chloride, potassium sulfide, and zinc chloride, in contact with an excess quantity of zinc sulfide raw material in a first region at a temperature T_1, contacting said solution with a second region displaced from said first region while maintaining said solution in the vicinity of said second region at a temperature T_2, said temperature T_1 being greater than said temperature T_2 and T_2 being less than about 1000° C., but above the melting point of the solvent, whereby the raw material in said first region is in effect transported by the medium of said solution to crystallize out said zinc sulfide and to form cubic crystal zinc sulfide product in the said second region.

3,374,068
IRRADIATED FUEL REPROCESSING
Otto D. Erlandson, Saratoga, and Burton F. Judson, Monte Sereno, Calif., assignors to General Electric Company, a corporation of New York
Filed Nov. 17, 1966, Ser. No. 595,151
8 Claims. (Cl. 23—326)



This describes a process for the reprocessing of irradiated fuel from nuclear chain fission reactors, and in particular discloses an improved chemical process capable of separating certain transuranic irradiation products from one another and from uranium and fission products. In this process the bulk of the fission products formed by irradiation of the fuel is first separated as a mixture without partition from the uranium and transuranics (plutonium and neptunium) by extraction with an organic solvent, the fission products stream is dehydrated and calcined and these materials are recovered as an oxide mixture, the uranium and transuranics are recovered from the solvent as a mixture with substantially reduced amounts of fission products, the transuranics are separated from the uranium (and from each other if desired) by contact with and elution from anion exchange resins, the uranium stream is dehydrated and calcined to produce uranium oxide containing trace fission oxides, this substantially plutonium-free oxide mixture is fluorinated, and uranium hexafluoride is recovered as a product substantially free of fission product fluorides.

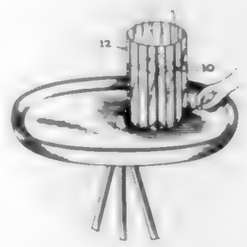
3,374,069
PREPARATION OF METAL CARBONATES BY CO_2 - PRESSURIZING ANHYDROUS METAL ACETATES
Earl L. Head, Los Alamos, N. Mex., assignor to the United States of America as represented by the United States Atomic Energy Commission
No Drawing. Filed Mar. 16, 1967, Ser. No. 624,667
1 Claim. (Cl. 23—345)

In a method of forming metal carbonates by pressurizing acetate solutions in a carbon dioxide atmosphere, the improvement wherein the said acetate is anhydrous and is selected from the group consisting of the rare earth acetates, thorium acetate, uranyl acetate and yttrium acetate.

3,374,070
METHOD OF PRODUCING A PREPARED QUICK-IGNITING CHARCOAL FUEL
Claude E. Davis, Fullerton, Calif., assignor of ten percent to Collins Mason, Los Angeles, and ten percent to William R. Graham, Palos Verdes Estates, California
No Drawing. Continuation-in-part of abandoned application Ser. No. 259,716, Feb. 19, 1963. This application Jan. 10, 1966, Ser. No. 519,468
3 Claims. (Cl. 44—6)

1. The method of producing a readily flammable wax-coated and impregnated charcoal body which consists of the sequential steps of separately heating wax to its melting temperature; submerging said charcoal body in said molten wax and maintaining it so submerged while further heating the molten wax to at least twice the temperature of its melting point, whereby to evacuate entrapped moisture and gases from said charcoal body to produce voids therein; then cooling said molten wax and charcoal body to the melting temperature of said wax whereby to cause said wax to fill said voids, and then removing said charcoal body from said molten wax.

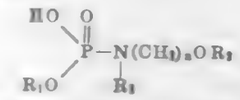
3,374,071
FIRE KINDLING DEVICES
Henry A. Corriher, Jr., and Lawrence M. Mason, both of P.O. Box 7427, Atlanta, Ga. 30309
Filed May 27, 1963, Ser. No. 283,361
15 Claims. (Cl. 44—38)



1. A kindling device for igniting solid fuel such as charcoal briquettes or lumps comprising the combination of a container member having substantially upright walls formed of combustible material and adapted to contain a quantity of said solid fuel, and an enclosing member comprising a generally imperforate tube of relatively incombustible material adapted to be positioned about the container member with portions of substantial area spaced therefrom so as to expose substantial areas of the container member walls for burning and thereby define a plurality of circumferentially spaced upright flues between said container member and enclosing member and extending the full height of the container member, said enclosing member having an opening in at least its lower portion for admission of air to said flues to support combustion of fuel in the container member and said enclosing member being adapted to provide lateral support for said solid fuel after the container member has partially burned away.

3,374,072
GASOLINE COMPOSITION
John F. Deffner, Glenshaw, Pa., assignor to Gulf Research & Development Company, Pittsburgh, Pa., a corporation of Delaware
No Drawing. Filed Mar. 23, 1966, Ser. No. 536,639
13 Claims. (Cl. 44—58)

A gasoline motor fuel having improved detergency characteristics is obtained by incorporating a small amount of an amidophosphate in the fuel. The amidophosphate has the general formula:

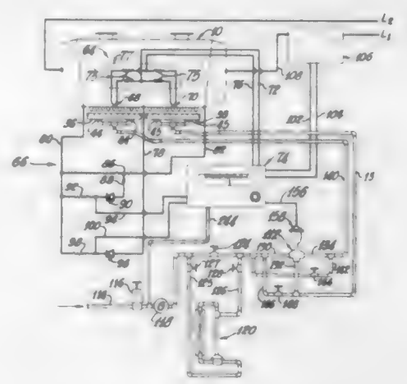


Examples of amidophosphates falling within the above formula are dimethyl N-cocooxypropylmonoamidophosphate; distearyl N-cocooxypropylmonoamidophosphate; di(butoxyethyl) N-methoxypropylmonoamidophosphate; di(butoxyethyl) N - butoxypropylmonoamidophosphate and di(butoxyethyl) N-cocooxypropylmonoamidophosphate.

3,374,073
OXIDIZED, DEGRADED INTERPOLYMER OF ETHYLENE AND PROPYLENE AND FUEL COMPOSITION CONTAINING THE SAME
William C. Gergel, Mayfield Heights, Ohio, assignor to The Lubrizol Corporation, Wickliffe, Ohio, a corporation of Ohio
No Drawing. Filed June 23, 1964, Ser. No. 377,382
8 Claims. (Cl. 44—62)

1. A hydrocarbon fuel composition comprising a major proportion of a hydrocarbon fuel oil and from about 0.001 to about 3% by weight of an oxidized, degraded interpolymer of propylene and ethylene prepared by contacting an interpolymer of propylene and ethylene having a molecular weight of from about 50,000 to about 800,000 with an oxygen containing gas at a temperature of at least 100° C. for a time sufficient to reduce the molecular weight to a value within the range extending from about 3,000 to about 5% less than the molecular weight before degradation, said interpolymer comprising from about 20 to about 66 mole percent of propylene and from about 33 to about 80 mole percent of ethylene.

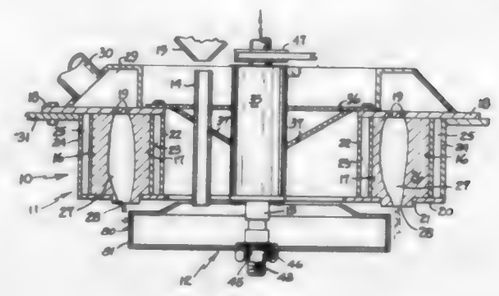
3,374,074
METHOD FOR PRODUCTION OF MINERAL FIBERS
Robert G. Russell, Granville, Ohio, John H. Willis, Anderson, S.C., and William C. Shafer, Vestal, N.Y., assignors to Owens-Corning Fiberglas Corporation, a corporation of Delaware
Continuation-in-part of application Ser. No. 214,247, Aug. 2, 1962. This application Apr. 25, 1967, Ser. No. 633,604
5 Claims. (Cl. 65—2)



The invention embraces a method of control of an air cooling system for two groups of glass streams flowing from groups of orifices of a stream feeder involving the delivery of air from groups of porous shield members, the feeder being utilized as a resistance thermometer wherein the two halves or sections of the feeder floor are utilized as two resistors in a bridge circuit for automatically and selectively regulating the amount of air delivered from each group of porous shield members whereby more stable thermal balance is maintained between the groups of glass streams.

3,374,075
METHOD AND APPARATUS FOR PRODUCING FIBROUS MATERIAL
Robert Earl Maddox and Robert Edward Hengstler, Richmond, Ind., and Stanley George Benner, South Plainfield, N.J., assignors to Johns-Manville Corporation, New York, N.Y., a corporation of New York
Filed Oct. 7, 1965, Ser. No. 493,823
5 Claims. (Cl. 65—6)

A centrifugal rotor and gas blast mineral fiber formation and attenuation process comprising the adjustment of the distance between the source of the attenuating gas

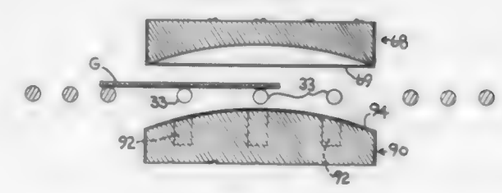


blast and the periphery of the filament forming rotor to control the diameter of the fibers produced, and means therefor comprising an adjustable rotor shaft.

3,374,076
METHOD FOR PRODUCING HERMETIC GLASS TO METAL SEALS
Terry P. Smith, Raleigh, N.C., assignor to Corning Glass Works, Corning, N.Y., a corporation of New York
Filed Sept. 28, 1964, Ser. No. 399,563
7 Claims. (Cl. 65—18)

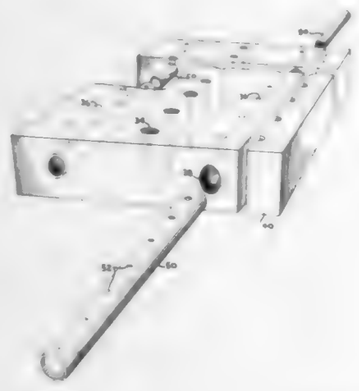
1. A method for producing a hermetic glass to metal seal which meets exacting requirements of dimension and configuration consisting essentially of the steps of: grinding a glass to an ultrafine particle size such that about 99% will pass through a 200 mesh screen and at least 90% through a 325 mesh screen, said glass having substantially the same thermal expansion characteristics as the metal to which it will be sealed, mixing the ultrafine glass with a binder to form large aggregates, pressing the aggregates and the metal to form a compact of the desired shape and heating said compact to a temperature in excess of the softening point of the glass for a time sufficient to form a hermetic seal.

3,374,077
METHOD OF PRESS BENDING GLASS SHEETS BETWEEN COLD OPPOSED SHAPING MOLDS
James H. Cypher, New Kensington, Pa., assignor to Pittsburgh Plate Glass Company, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Nov. 18, 1964, Ser. No. 412,083
3 Claims. (Cl. 65—104)



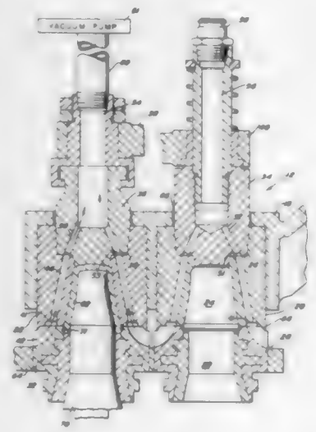
Press bending a glass sheet by sandwiching a heat-softened sheet between relatively cool, relatively massive complementary shaping members to bend the sheet to its desired shape and maintaining the shaping members in contact with the bent glass sheet for sufficient additional time to cool the glass surfaces to a temperature at which the surfaces remain stiff enough to resist deformation of the shaped sheet during its transfer to a cooling zone, but insufficient time to lower the interior temperature of the glass to below the strain point.

3,374,078
APPARATUS FOR SUPPORTING AND HEATING GLASS SHEETS ON A GAS BED
Thomas G. Wright, Pittsburgh, Pa., assignor to Pittsburgh Plate Glass Company, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Dec. 24, 1964, Ser. No. 421,028
6 Claims. (Cl. 65—182)



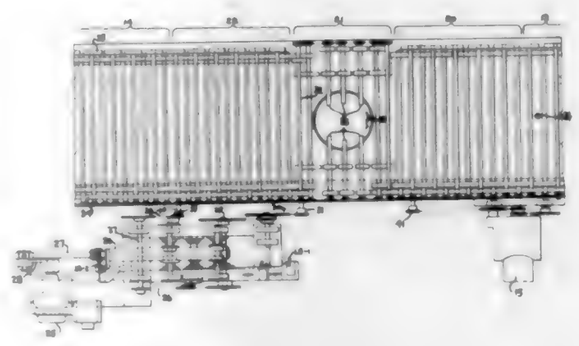
An apparatus for uniformly supporting glass sheets of different widths on a fluid support provided by flowing fluid from outlets in a bed thence across the bed and through exhaust conduits in which a removable member having orifices some of which are smaller than the exhaust outlets are detachably mounted below the bed and positioned so that a small orifice in the member cooperates with an exhaust gas outlet to restrict the flow of exhaust gas from the exhaust conduit.

3,374,079
APPARATUS FOR MOLDING GLASS
Donald H. Daly, Winchester, Ind., assignor to Maul Brothers, Inc., Millville, N.J., a corporation of New Jersey
Filed Oct. 29, 1964, Ser. No. 407,324
5 Claims. (Cl. 65—232)



Apparatus for forming hollow glass articles from sequentially supplied charges of glass to a mold. Air passages are provided in the baffle, mold and in the neck mold therebelow. A vacuum pump is utilized to draw air from the atmosphere through air passages to effect cooling of the neck mold, mold and baffle which permits the apparatus to run more rapidly.

3,374,080
GLASS SHEET PRESS BENDING APPARATUS WITH CONVEYING ROLLER RECESSES
Robert W. Wheeler, Pittsburgh, Pa., assignor to Pittsburgh Plate Glass Company, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Nov. 18, 1964, Ser. No. 412,084
3 Claims. (Cl. 65—273)



Apparatus for shaping glass sheets conveyed horizontally on a roller conveyor between upper and lower glass shaping members having complementary shaping surfaces. The lower shaping member has a substantially continuous shaping surface except for a small portion thereof notched to provide clearance for movement between a retracted position below the conveyor and a glass engaging position above the conveyor and is preferably convex in elevation. The glass engaging areas of the shaping members are preferably, but not necessarily, within 25 percent of one another.

3,374,081
PRECIPITATION OF MINERALS FROM BRINES
John J. Miller, West Chicago, Ill., assignor to Ocean Minerals, Inc., West Chicago, Ill., a corporation of Illinois
No Drawing. Continuation-in-part of application Ser. No. 158,607, Dec. 11, 1961, which in turn is a continuation-in-part of application Ser. No. 836,052, Aug. 26, 1959. This application May 28, 1965, Ser. No. 459,944
9 Claims. (Cl. 71—11)

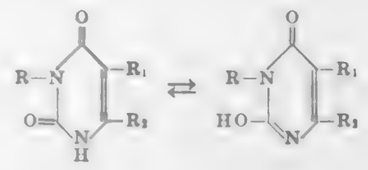
Treatment of saline water with lignin compounds, proteinaceous compounds and tannins to precipitate major and trace minerals therefrom, the lignin compounds being such materials as waste pulp digestor liquors, fibrous vegetation and decomposition products thereof, and the proteinaceous compounds being material such as compost materials.

3,374,082
HERBICIDAL METHODS AND COMPOSITIONS COMPRISING 2-AMINO AND LOWER ALKANOAMIDO-5-HALOTHIAZOLES
Alan J. Lemin, Richland Township, Kalamazoo County, Mich., assignor to The Upjohn Company, Kalamazoo, Mich., a corporation of Delaware
No Drawing. Filed Jan. 25, 1965, Ser. No. 427,918
13 Claims. (Cl. 71—90)

It has been discovered that certain 5-halo-2-amino (or alkanoamido) thiazoles are effective herbicides. Some of the compounds are old, but some, e.g., N-(5-chloro-2-thiazolyl)propionamide are new and especially effective herbicides. The compounds are prepared by halogenating a 2-amino-thiazole or a 2-alkanoamidothiazole according to known methods. The compounds are effective against crabgrass, wild oats, quackgrass, bindweed, lambsquarters, pigweed, and other weeds. New compositions for the control of weeds are described.

3,374,083
METHOD FOR THE CONTROL OF UNDESIRABLE VEGETATION WITH 3,5,6-SUBSTITUTED URACILS
Harvey M. Loux, Hockessin, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
No Drawing. Continuation-in-part of application Ser. No. 416,158, Dec. 4, 1964. This application Feb. 4, 1966, Ser. No. 525,107
The portion of the term of the patent subsequent to Feb. 15, 1983, has been disclaimed and dedicated to the public
2 Claims. (Cl. 71—92)

1. A method for the control of undesirable vegetation, said method comprising applying to a locus to be protected a herbicidally effective amount of a compound of the formula



where
R is selected from the group consisting of
alkyl of 1 through 10 carbon atoms,
substituted alkyl of 1 through 8 carbon atoms, wherein said substitutent is selected from the group consisting of bromine, chlorine, hydroxy, alkoxy, alkoxycarbonyl, and cyano,
aryl of 5 through 10 carbon atoms,
substituted phenyl, wherein said substituent is selected from the group consisting of chlorine, bromine, fluorine, alkoxy of 1 through 5 carbon atoms, alkyl of 1 through 6 carbon atoms, nitro, trifluoromethyl, 1,2-tetramuthylene, and 1,2-trimethylenylene,
aralkyl of 5 through 13 carbon atoms,
substituted aralkyl of 5 through 13 carbon atoms, wherein said substitutent is selected from the group consisting of chlorine, nitro, alkyl, and alkoxy,
tetrahydronaphthylalkyl,
alkenyl of 3 through 8 carbon atoms,
alkynyl of 3 through 8 carbon atoms,
cycloalkyl of 3 through 12 carbon atoms,
substituted cycloalkyl of 3 through 12 carbon atoms, wherein said substitutent is selected from the group consisting of bromine, chlorine, methoxy, and alkyl,
cycloalkenyl of 4 through 12 carbon atoms, substituted cycloalkenyl of 4 through 12 carbon atoms, wherein said substituent is selected from the group consisting of bromine, chlorine, methoxy, and alkyl,
cycloalkyl alkyl of 4 through 13 carbon atoms,
cycloalkenyl alkyl of 5 through 13 carbon atoms,
(substituted cycloalkyl)alkyl of 5 through 14 carbon atoms, wherein said substituent is selected from the group consisting of bromine, chlorine, methoxy, and alkyl, and
(substituted cycloalkenyl)alkyl of 5 through 14 carbon atoms, wherein said substituent is selected from the group consisting of bromine, chlorine, methoxy, and alkyl;
R_1 is selected from the group consisting of
chlorine, fluorine, bromine, iodine, methyl, ethyl, propyl, butyl, methoxy, ethoxy, propoxy, butoxy, nitro, alkoxymethyl of 2 through 6 carbon atoms, hydroxy alkyl of 1 through 2 carbon atoms, alkylthio containing 1 through 4 carbon atoms, bromomethyl, fluoromethyl, and chloromethyl;
R_2 is selected from the group consisting of
cycloalkyl of 3 through 7 carbon atoms, alkenyl of 3 through 5 carbon atoms, alkylthio of 1 through 4 carbon atoms, alkylthiomethyl of 2 through 3 carbon atoms, and alkoxymethyl of 2 through 5 carbon atoms;
with the further proviso for said formula that when R_2 is cycloalkyl of 3 through 7 carbon atoms, R_1 can be hydrogen.

3,374,084
METHOD OF COMBATTING THE GROWTH OF UNDESIRED PLANTS
Johannes Wijma, Van Houtenlaan, Weesp, Netherlands, assignor to North American Philips Company, Inc., New York, N.Y., a corporation of Delaware
No Drawing. Original application Feb. 26, 1965, Ser. No. 435,736. Divided and this application June 7, 1967, Ser. No. 644,102
8 Claims. (Cl. 71—94)

Use of N-substituted methyl-2,6-dichlorothiobenzamide as herbicidal agents. Examples are N-hydroxymethyl-2,6-dichlorothiobenzamide and N-n-propoxymethyl-2,6-dichlorothiobenzamide.

3,374,085
PROCESS FOR PRODUCING AGGREGATE CONTAINING OXYGEN STEEL PROCESS DUST
Joseph K. Stone, Berkeley, Calif., assignor to Kaiser Industries Corporation, Oakland, Calif., a corporation of Nevada
No Drawing. Continuation-in-part of application Ser. No. 419,604, Dec. 18, 1964. This application June 13, 1966, Ser. No. 558,542
9 Claims. (Cl. 75—3)

A usable ferrous material, especially for feeding to an oxygen steel-making furnace, is produced by agglomerating dust recovered from the gases issuing from a basic oxygen steel-making furnace by admixing therewith from 10% to 70% of particles of not less than 20 microns diameter and comprising a material compatible with iron in steel-making operations, and with a cementitious agent, mixing thoroughly to form a uniform mass and then forming the mass into shapes such as pellets or others, the cementitious agent being advantageously a cokable carbonaceous material or a calcium aluminate cement.

3,374,086
PROCESS FOR MAKING STRONTIUM-BEARING FERROSILICON
Henry G. Goehring, Jr., Niagara Falls, N.Y., assignor to Union Carbide Corporation, a corporation of New York
No Drawing. Filed June 16, 1965, Ser. No. 464,581
2 Claims. (Cl. 75—10)

1. A process for producing strontium-containing ferrosilicon having a low calcium content which comprises smelting in a submerged arc furnace a mixture of quartzite, celestite and carbonaceous reducing agent to provide an alloy containing 15 to 55% strontium and 40 to 75% silicon, the strontium to calcium ratio in the celestite being at least 10:1; and subsequently adding the aforesaid alloy to molten ferrosilicon containing at least 98.5% Fe+Si, the amount of alloy added being sufficient to provide a strontium content of at least 0.5%.

3,374,087
PRODUCTION OF IRON
C. F. Gray, Baton Rouge, La., assignor to Esso Research and Engineering Company, a corporation of Delaware
Filed Nov. 10, 1965, Ser. No. 507,137
10 Claims. (Cl. 75—26)

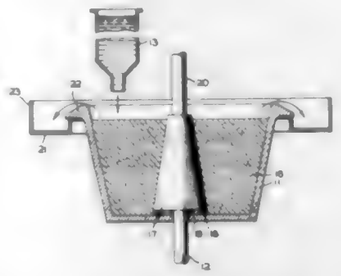
The present invention is concerned with a process for the production of metallic iron from particulate iron ores. Ore, which contains a considerable amount of gangue, is fed into the process, separated into a series of beds, fluidized by gas, and progressively reduced at elevated temperatures. The specific improvement takes advantage of the staging and the fact that certain amounts of gangue can prove beneficial in suppressing bogging, and utilizes a combination of magnetic separation and gas elutriation steps for retention of critical portions of gangue within the fluidized beds while the ore is being reduced. In accordance therewith, magnetic separation and elutriation steps can be employed in those beds wherein ore is being reduced to magnetic oxide of iron, and in the final bed where the ore is metallized.

3,374,088
METHOD FOR PRODUCING LOW SILICON FERROMANGANESE ALLOYS
Henry Epstein, Bethlehem, and Victor Alfred Neubaum, Coopersburg, Pa., assignors to Bethlehem Steel Corporation, a corporation of Delaware
No Drawing. Filed Feb. 16, 1966, Ser. No. 527,759
2 Claims. (Cl. 75—60)

1. A method of reducing the silicon content of a continuously flowing substantially horizontal molten stream of ferromanganese flowing through a trough, said stream being about 2 inches to about 8 inches deep, comprising blowing about 60 cubic feet to about 75 cubic feet per minute of a commercially pure oxygen onto the surface of the flowing stream of molten ferromanganese at a velocity of 700 feet per second to about 1000 feet per second through a lance, said lance being located in a vertical plane passing through the longitudinal axis of the trough and being disposed at an angle to the vertical of about 15° to about 45° and having its nozzle about 2 inches to about 8 inches above the surface of the stream.

3,374,089
CENTRIFUGAL SEPARATION
Grover C. Robinson, Jr., and Ogle R. Singleton, Jr., Richmond, and Walther Schmidt, Henrico County, Va., assignors to Reynolds Metals Company, Richmond, Va., a corporation of Delaware
Filed Feb. 26, 1965, Ser. No. 435,596
7 Claims. (Cl. 75—68)

Aluminum-silicon alloys containing at least 50 wt. percent of aluminum and 20 wt. percent of silicon are beneficiated by melting the alloy, cooling the melt in a quiescent state to cause formation of a skeletal crystal-



line solid phase having entrained therein residual liquid phase, and centrifugally separating the liquid phase from the solid phase.

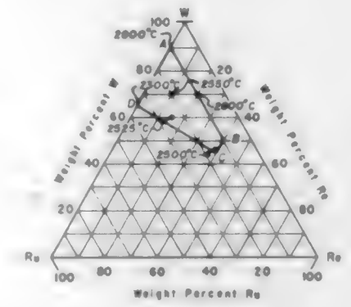
3,374,090
PROCESS FOR THE EXTRACTION OF METALS
Archibald William Fletcher and Douglas Stewart Flett, Stevenage, England, assignors, by mesne assignments, to Thorium Limited, London, England
No Drawing. Filed Mar. 22, 1965, Ser. No. 441,902
6 Claims. (Cl. 75—97)

A method of recovering metal values from an aqueous phase in which the aqueous phase is mixed with an organic phase containing a dissolved metal salt of napthenic acid so as to exchange metal ions between the two phases.

3,374,091
TREATMENT OF COPPER LEACH SOLUTIONS
Henry J. Tschirner and Lester A. Williams, Kansas City, Mo., assignors to Monsanto Company, St. Louis, Mo., a corporation of Delaware
No Drawing. Filed May 28, 1965, Ser. No. 459,925
9 Claims. (Cl. 75—120)

1. A process for treating a solution containing dissolved nonferrous metal values and tin and lead impurities to simultaneously remove the lead and tin impurities therefrom comprising the steps of contacting said solution with a mixture of calcium hydroxide and magnesium hydroxide, and removing the solid material formed in said solution therefrom, thereby also removing a substantial amount of said impurities.

3,374,092
HIGH TEMPERATURE BRAZING ALLOYS FOR TUNGSTEN AND TANTALUM AND ALLOYS THEREOF
James C. Marshall, Pottstown, Pa., assignor to the United States of America as represented by the United States Atomic Energy Commission
Filed Oct. 22, 1965, Ser. No. 502,707
1 Claim. (Cl. 75—134)



The present invention relates to a ternary brazing alloy for joining a refractory metal selected from tungsten, tantalum, and alloys thereof, containing a predominant amount of said metal, to themselves and to one another, consisting essentially of a ternary alloy containing 10–35 wt. percent ruthenium, 45–90 wt. percent tungsten, and the remainder rhenium, said brazing alloy having a melting point in the range 2300° C.–2800° C.

3,374,093
METHOD OF FORMING A SOLDER MATERIAL
Victor J. King, Mountain View, Calif., assignor to Lockheed Aircraft Corporation, Burbank, Calif.
No Drawing. Continuation of application Ser. No. 434,095, Feb. 19, 1965. This application Apr. 21, 1966, Ser. No. 544,121
2 Claims. (Cl. 75—135)

Method of making solder alloy compositions of thallium-indium-mercury which comprises, producing a solid phase in a liquid phase and then decanting said liquid phase.

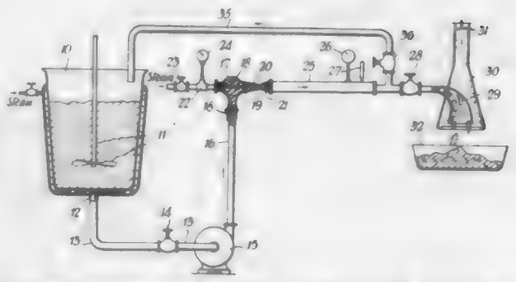
3,374,094
LITHOGRAPHIC PLATE MADE FROM AN N-VINYL-AMINE AND AN ORGANIC HALOGEN COMPOUND DISPERSED IN AN HYDROPHILIC COLLOID
Eugene Wainer, Shaker Heights, and Harry L. Fichter, Jr., Lakewood, Ohio, assignors to Horizons Incorporated, a corporation of New Jersey
No Drawing. Filed July 19, 1965, Ser. No. 473,238
12 Claims. (Cl. 96—33)

7. A method of preparing a photolithographic plate which comprises:
(1) applying a liquid composition to a support under darkroom conditions, said composition comprising at least one of each of the following constituents:
  (a) an N-vinylamine
  (b) an organic halogen compound in which at least three halogen atoms are linked to a single carbon atom, each of said halogen atoms being selected from the group consisting of Br and Cl
  (c) a triaryl compound of an element selected from the group consisting of P, Bi, Sb and As
  (d) a hydrophilic film forming binder
  (e) a volatile liquid vehicle for said constituents and
(2) drying the resulting coated article under darkroom conditions to produce a photosensitive plate.

3,374,095
GELATIN-CONTAINING PHOTOGRAPHIC LAYERS PLASTICIZED WITH POLYURETHANE
Dieter Dieterich and Otto Bayer, Leverkusen, Wolfgang Himmelmann, Cologne-Stammheim, and Hans Ulrich, Leverkusen, Germany, assignors to Agfa Aktiengesellschaft, Leverkusen, Germany, a corporation of Germany
No Drawing. Filed Mar. 25, 1964, Ser. No. 354,795
Claims priority, application Germany, Apr. 13, 1963, A 42,880
8 Claims. (Cl. 96—111)

Gelatin is effectively plasticized by a linear polyurethane of a polyether glycol or of a polyester of an aliphatic dicarboxylic acid, which polyurethane contains a tertiary nitrogen that is either quaternized, or in the form of a salt of an acid, and the polyurethane being infinitely miscible with gelatin. Such plasticizing does not interfere with the photographic use of the gelatin and provides a photographic emulsion of reduced curling tendency.

3,374,096
CONTINUOUS PROCESS FOR COOKING GELATINOUS OR GELATINIZABLE SUBSTANCES, FIBROUS MATTERS AND THE LIKE
Hans Knoch, 19 Ashbourne Road, Ealing, London W. 5, England
Filed July 5, 1963, Ser. No. 293,026
Claims priority, application Great Britain, Aug. 13, 1962, 30,887/62
1 Claim. (Cl. 99—1)



1. A continuous process for cooking gelatinous, gelatinizable fibrous and similar substances which contain material selected from the group consisting of starch and other extractable gel-forming matter, comprising:
(a) mixing such material with a minimum of liquid in a mixing zone to thereby obtain a flowable mixture,
(b) continuously withdrawing the mixture thus obtained from the mixing zone and passing it through a pumping zone so as to cause linear flow,
(c) delivering said flowable mixture to a first zone downstream of said pumping zone wherein the cross sectional area of the flowing stream is substantially increased,
(d) maintaining a pressure in said first zone which is lower than the pressure upstream of said first zone,
(e) allowing the particles of said material to expand and swell in said first zone under the influence of the reduced pressure conditions maintained in said first zone,
(f) contacting the expanded particles of said material leaving said first zone with a stream of hot, gaseous medium in a second zone that is downstream of said first zone so as to gelatinize or extract said swollen and expanded particles, and
(g) subsequently discharging the resultant product downstream of said second zone.

3,374,097
HUMECTANT
Karl Laden, Deerfield, Ill., assignor to The Gillette Company, Boston, Mass., a corporation of Delaware
No Drawing. Original application Dec. 7, 1962, Ser. No. 243,709, now Patent No. 3,235,457, dated Feb. 15, 1966. Divided and this application Apr. 5, 1965, Ser. No. 449,677
4 Claims. (Cl. 99—86)

A hygroscopic salt of 2-pyrrolidone-5-carboxylic acid, 1-methyl-2-pyrrolidone-5-carboxylic acid, 2-pyrrolidone-4-methyl-5-carboxylic acid, N-acetyl glycine, N-acetyl alanine, or alpha-acetamido butyric acid as a humectant in food products or in cellulosic materials.

3,374,098
FLAKE SALT MADE FREE-FLOWING BY APPLYING PROPYLENE GLYCOL TO THE SALT PARTICLE SURFACES
John F. Heiss, St. Clair, and Glen E. Binsley, Marysville, Mich., assignors to Diamond Crystal Salt Co., St. Clair, Mich., a corporation of Michigan
No Drawing. Filed Nov. 29, 1965, Ser. No. 510,365
4 Claims. (Cl. 99—143)

A free flowing non-caking, fine flake salt composition containing propylene glycol in an amount of about

0.005% to less than 0.05% by weight of the composition to produce a non-caking salt. This salt composition disperses, mixes and dissolves readily to improve the flavor and eating qualities of a wide range of food products.

3,374,099
ENZYME INHIBITOR FOR PREVENTING SOFTENING IN BRINED FOODS

Thomas A. Bell, John L. Etchells, and William W. G. Smart, Jr., Raleigh, N.C., assignors to the United States of America as represented by the Secretary of Agriculture

Filed Oct. 10, 1963, Ser. No. 315,416
5 Claims. (Cl. 99—156)

2. A process for preparing a moisture free concentrate of the hydrolytic enzyme inhibitor contained in the leaves of the plant sericea (*Lespedeza cuneata*) comprising:

(a) harvesting the leaves of the said plant which contain the hydrolytic enzyme inhibitor material, during the period from about June 15 to Sept. 1 by cutting the leaf carrying stalks of said plant immediately above the ground while exercising care to avoid injury to the leaves associated with the so cut stalks,

(b) extracting the harvested leaves with water at about room temperature within about 6 hours after said harvest,

(c) complexing the resulting water extract of the harvested leaves with an aqueous solution of caffeine to form a substantially water insoluble caffeine-inhibitor complex in aqueous suspension,

(d) separating the substantially water insoluble caffeine-inhibitor complex from the aqueous suspension,

(e) resuspending the separated caffeine-inhibitor complex in water to form a slurry,

(f) decomposing the caffeine-inhibitor complex in the water slurry by means of liquid-liquid extraction using a water immiscible solvent,

(g) separating the aqueous phase following the liquid-liquid extraction step of (f), which contains the enzyme inhibitor material, and

(h) freeze-drying the aqueous phase from step (g) to produce a moisture-free concentrate of the enzyme inhibitor material.

3,374,100
WATER REPELLENT COMPOSITIONS

Herman B. Goldstein, Cranston, Raymond V. Kusiak, West Warwick, Raymond J. Peltier, Cranston, and Gerhard Sprenger, Ashaway, R.I., assignors to Sun Chemical Corporation, New York, N.Y., a corporation of Delaware

No Drawing. Filed Oct. 22, 1963, Ser. No. 318,066
13 Claims. (Cl. 106—2)

1. An aqueous water repellent emulsion for application to fibrous material comprising an emulsion of from 10 to 28 percent wax, an emulsifying agent selected from at least one member of the group consisting of (a) N,N dialkyl alkylene amines, (b) fatty acid amides of N,N dialkyl alkylene diamines, (c) fatty acid esters of N,N dialkyl alkanolamines and mixtures thereof wherein the alkyl group contains from 1 to 3 carbon atoms per alkyl group and a thermally unstable zirconium salt.

3,374,101
LIGHTWEIGHT AGGREGATE FROM FLY ASH PELLETS

Thomas E. Ban, Cleveland Heights, and Carl J. Nelson, Lakewood, Ohio, assignors to McDowell-Wellman Engineering Company, a corporation of Ohio

Filed July 6, 1965, Ser. No. 469,682
8 Claims. (Cl. 106—40)

This invention is in an improved process for making lightweight aggregate material from fly ash pellets which contemplates crushing and recycling crushed indurated fly ash particles to an intermediate zone on a traveling bed of fly ash pellets whereby said particles are refired.

3,374,102
CROSS-LINKED CARBON PRODUCTS AND THEIR PREPARATION

Eugene Wainer, Shaker Heights, and Mark S. Vukasovich, Parma, Ohio, assignors to Horizons Incorporated, a corporation of New Jersey

No Drawing. Filed Feb. 1, 1963, Ser. No. 255,702
6 Claims. (Cl. 106—43)

1. In a method of strengthening carbonized organic material selected from the group consisting of carbonizable filaments and products consisting of woven, non-woven or felted carbonizable filaments without sacrificing the flexibility of said material by embrittling the resulting product, said method including carbonization of said organic material by heating said material to a temperature and in an atmosphere such that the non-carbonaceous constituents present are distilled off from said carbonizable material while said carbonizable material is supported in a manner such that the physical shape and ordered structure of the original material are retained; and thereafter strengthening said resulting carbonized product by carbiding said material; the improvement which consists in converting only up to 25 mol percent of said carbonized product to carbide of at least one element selected from the group consisting of carbide forming elements having an atomic radius not appreciably larger than 0.77 angstrom units, by heating said carbonized material to a temperature in excess of 1050° C. in an atmosphere containing as vapor a compound selected from the group consisting of halides and carbonyls of said carbide forming element which would react with said carbonized material under the conditions prevailing during said conversion to carbide; and continuing said conversion for a time sufficient for up to about 25 mol percent of said element to intrude into the ordered carbonized product and to cross-link the same.

3,374,103
COLLAGEN FIBRIL AND NEUTRAL SALT COMPOSITION

Stanley M. Barkin, Somerville, N.J., assignor to Ethicon, Inc., a corporation of New Jersey

No Drawing. Filed July 8, 1964, Ser. No. 381,251
8 Claims. (Cl. 106—161)

An improvement in the dry knot tensile strength and dry straight tensile strength of an extruded collagen suture is obtained when from about 0.01 percent to about 0.07 percent of a water soluble salt is added to the dispersion of acid-swollen collagen fibrils prior to extrusion.

3,374,104
ASPHALT COMPOSITIONS AND PROCESS FOR PREPARING SAME

Lester A. H. Baum, Cherry Hill, N.J., and Leonard Henschel, Flushing, N.Y., assignors to Mobil Oil Corporation, a corporation of New York

No Drawing. Filed Oct. 4, 1963, Ser. No. 313,761
5 Claims. (Cl. 106—273)

1. A process for preparing heat-stable thermal asphalts which comprises:

blending a resinous pitch material deficient in high-boiling aromatic oils and having a softening point (R&B) from about 75° F. to about 140° F., a specific gravity at 77° F. from about 1.0 to about 1.3 and a Conradson Carbon number from about 25 to 45%, with

a solid material containing at least about 20% by weight of high boiling aromatic oils and having a softening point (R&B) from about 80° F. to about 120° F.; a specific gravity at 77° F. from about 1.0 to about 1.3; and a Conradson Carbon number from about 20 to about 35%; and

distilling the resulting blend to recover a heat-stable thermal asphalt having a softening point (R&B) from about 150° F. to about 270° F.

3,374,105
PARTICULATE REFLECTIVE ELEMENTS AND METHOD FOR FORMING THE SAME

Rene A. Bolomey, Peekskill, N.Y., assignor to The Mearl Corporation, Ossining, N.Y., a corporation of New Jersey

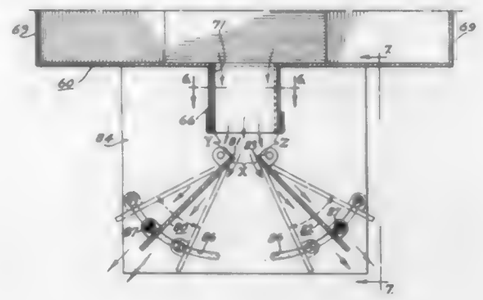
No Drawing. Filed July 2, 1964, Ser. No. 380,066
8 Claims. (Cl. 106—291)

1. A nacreous pigment consisting essentially of particulate platelets having major dimensions of from 3 to 100 microns and substantially smooth surfaces, each of said platelets being constituted of a plate-like mica particle of from 200 to 400 mesh having a surface area of from 2 to 6 square meters per gram and bearing, on each of its opposite faces, a zinc sulfide high refractive index layer having an optical thickness N*d* of from 40 to 1,000 millimicrons, wherein N is the index of refraction of the zinc sulfide layer and *d* is the thickness thereof.

3,374,106
MATERIAL DRYING METHOD AND APPARATUS

John R. Thygeson, Sr., Fox Chase Manor, Pa., assignor to Proctor & Schwartz, Inc., Philadelphia, Pa., a corporation of Pennsylvania

Filed May 14, 1964, Ser. No. 367,350
10 Claims. (Cl. 117—105.3)



A method and apparatus for treating material, particularly batts or webs of non-oriented, loosely compacted fibrous material, by conveying it through an enclosed housing having a treating chamber and treating medium conditioning means including air distribution means having an outlet port confronting the batt through which treating medium is discharged. In the form of the invention illustrated, the treating medium distribution means consists of an enlongated box having an outlet port, and baffle means comprising a pair of elongated baffle plates is provided which extends coextensively with the outlet port and angularly relative to one another and to the direction of flow of the treating medium from the outlet port. This baffle arrangement divides the flow of treating medium into three zones, two outer zones and a center zone thereby creating a pressure and velocity difference in the zones whereby treating medium diverted to the outer zones creates a suction which draws treating medium up through the batt in the center zone to create a slight lofting of the batt.

3,374,107
PROCESS FOR THE TREATMENT OF TEXTILES WITH AMINOPLASTS

James F. Cotton, Columbus, Ga., assignor to West Point-Pepperell, Inc., West Point, Ga., a corporation of Georgia

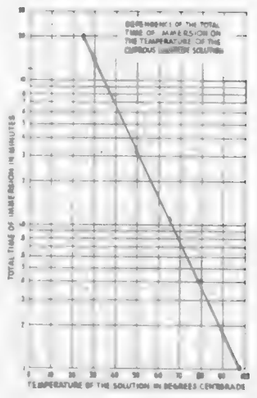
No Drawing. Continuation-in-part of application Ser. No. 301,952, Aug. 14, 1963. This application Aug. 17, 1966, Ser. No. 572,906
11 Claims. (Cl. 117—139.4)

Improved wet fixation of aminoplasts in textiles through the use of a catalyst containing an acidic component and a salt component. The acid has a dissociation constant no smaller than 10^{-6} at room temperature. The salt is an ammonium, amine or metallic salt of an organic acid showing an acidic reaction in aqueous medium. The wet fixed fabric may be dried and cured, for which a volatile acid is a preferred acid component. An epoxidized triglyceride may be fixed with the aminoplast.

3,374,108
FORMATION OF BARRIER LAYERS IN CADMIUM SULFIDE SOLAR CELLS

Basilio G. Keramidas, Cleveland, Ohio, assignor, by mesne assignments, to Kewanee Oil Company, Bryn Mawr, Pa., a corporation of Delaware

Filed June 18, 1964, Ser. No. 376,168
12 Claims. (Cl. 117—200)



This invention comprises a process for applying a "barrier layer" on a cadmium sulfide body designed for use as a photovoltaic cell comprising the steps of immersing the cadmium sulfide body in an aqueous solution of cuprous ions for a sufficient period of time, and, after removal of the cadmium sulfide body from the solution, removing any residual liquid adhering to the surface. The resultant barrier layer, which is believed to be cuprous sulfide, imparts a uniformly high efficiency to the photovoltaic cell.

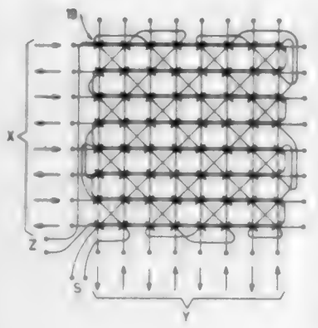
3,374,109
METHOD OF COATING A MAGNETOSTRICTIVE MATRIX PANEL WITH A DAMPING MASS AND RESULTING ARTICLE

Huibert Jacobus Hendrik van Deutekom, Emmasingel, Eindhoven, Netherlands, assignor to North American Philips Company, Inc., New York, N.Y., a corporation of Delaware

Filed July 6, 1964, Ser. No. 380,341
Claims priority, application Netherlands, July 12, 1963, 295,257
3 Claims. (Cl. 117—201)

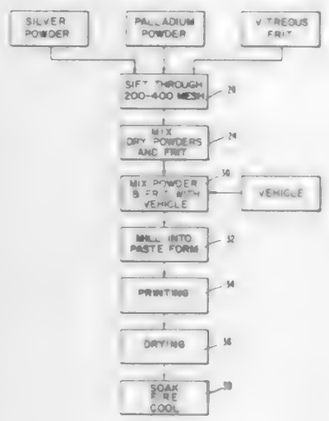
The magnetostrictive vibrations in a magnetic core

storage matrix panel are damped by coating matrix with



a mixture of a high-molecular weight polyvinylbutyral resin and a plasticizer such as tricresolphosphate.

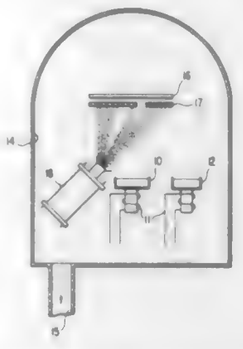
3,374,110
CONDUCTIVE ELEMENT, COMPOSITION AND METHOD
Lewis F. Miller, Wappingers Falls, N.Y., assignor to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed May 27, 1964, Ser. No. 370,467
20 Claims. (Cl. 117—212)



A conductive metallizing composition, mixed with an inert liquid vehicle, is deposited on an insulating substrate, fired at an elevated temperature, and cooled to room temperature to form a conductive element thereon comprising: a homogeneous mixture of an alloy of approximately 75 to 85 percent by weight silver, and 25–15 percent by weight palladium; and a fused vitreous frit for bonding to the dielectric comprising approximately 1–10 percent by weight of the element.

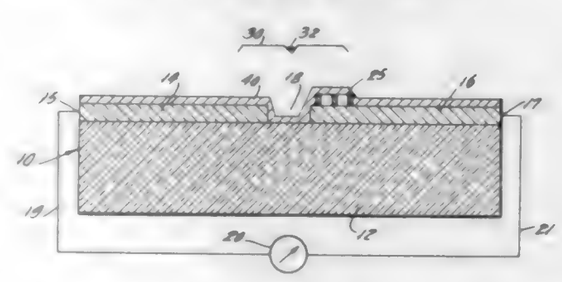
3,374,111
METHOD FOR DEPOSITING THIN DIELECTRIC POLYMER FILMS
Andrew E. Brennemann, Chappaqua, N.Y., assignor to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed June 30, 1964, Ser. No. 379,151
7 Claims. (Cl. 117—212)

Method for the deposition of thin polymeric, insulating films of epoxy resin which adhere tightly to substrate despite extreme thermal shock as encountered in cryogenic devices comprising placing substrate in low pressure chamber, generating monomeric vapors in the chamber by heating a viscous, liquid epoxy material having low vapor pressure, even at the temperature in the chamber, directing the vapors into contact with and condensing them on the substrate, if desired, controlling the pattern of deposition by a mask, and polymerizing the epoxy on the surface of the substrate by impinging charged particles, particularly, an electron beam of 300 to 2,000 electronvolts. The viscous liquid epoxy material undergoes substantially no vaporization under ambient conditions



in the vacuum chamber and vaporization of the epoxy is commenced by heating and terminated by discontinuing the heating. Further, the substrate and epoxy source are arranged so that, when the epoxy source is heated, the epoxy vapors are directed towards and primarily deposited on the substrate.

3,374,112
METHOD AND APPARATUS FOR CONTROLLED DEPOSITION OF A THIN CONDUCTIVE LAYER
David Danon, Rehovoth, Israel, assignor to Yeda Research and Development Co. Ltd., Rehovoth, Israel
Filed Mar. 5, 1964, Ser. No. 349,552
15 Claims. (Cl. 117—226)

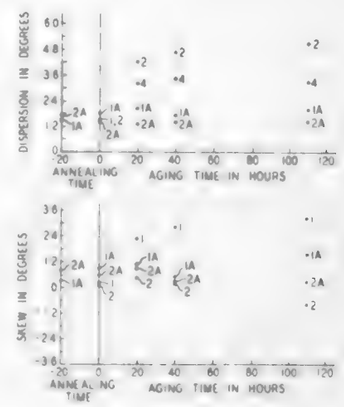


1. A method of forming a thin conductive coating of predetermined thickness, comprising the steps of: forming gap separated conductive regions upon an insulated base structure; electrically connecting said gap separated conductive regions to an impedance measuring instrument; placing a member to be coated upon a conductive region on said insulated base, adjacent said gap region; gradually applying a conductive coating by vapour deposition upon said member to be coated, and across said gap to establish an electrical path thereacross; measuring the impedance variation effected by the establishing of said conductive path across said gap; terminating the application of said conductive coating corresponding to said impedance variation being of a predetermined magnitude; removing said coated member from said base structure.

3,374,113
METHOD FOR CONTROLLED AGING OF THIN MAGNETIC FILMS BY MEANS OF AN EASY AXIS ANNEALING TREATMENT
James T. H. Chang, New Providence, Umberto F. Gianola, Florham Park, and Matthew W. Sagal, Summit, N.J., assignors to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York
Filed Jan. 13, 1965, Ser. No. 425,279
2 Claims. (Cl. 117—227)

The disclosure describes a technique for controlled aging of magnetic films, in particular, films of iron-

nickel alloys. The technique involves an easy axis treatment at moderately raised temperatures. The easy axis



anisotropy is thereby preserved during the accelerated aging period and the resulting film is stable.

3,374,114
PROCESS OF INSULATING AN ELECTRICAL CONDUCTOR WITH A POLYESTER
Maria V. Wiener, Akron, Ohio, assignor to The Goodyear Tire & Rubber Company, Akron, Ohio, a corporation of Ohio
No Drawing. Filed Mar. 13, 1964, Ser. No. 351,863
1 Claim. (Cl. 117—232)

A polyester is formed by condensing 2,6- or 2,7- or 1,5 - naphthalene dicarboxylic acid and either terephthalic or isophthalic acid with a mixture of a glycol and glycerine or other polyol containing 3 to 6 carbon atoms. The condensation reaction is stopped before gelling occurs, and the product is applied to a substrate, in solution in an organic solvent, if desired. The coated product is then heated to cross link the polyester. The coating is suitable for electrical insulation.

3,374,115
STARCH DISPERSIONS
Ernest Frank, Park Forest, and Naoyuki H. Yui, Chicago, Ill., and Anthony A. Silvasi, Hammond, Ind., assignors to American Maize-Products Co., a corporation of Maine
No Drawing. Filed June 24, 1964, Ser. No. 377,524
18 Claims. (Cl. 127—29)

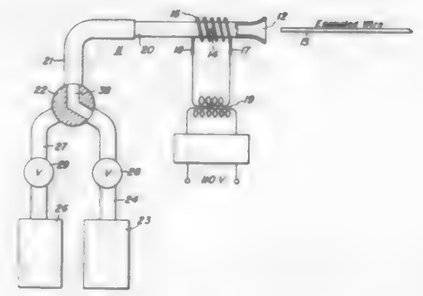
1. A method of making cooked starch dispersions of uniform reduced viscosity which comprises forming an aqueous slurry of starch granules, buffering the pH of said slurry to a value within the range from about 3.0 to about 5.0, heating said slurry to a temperature from about 212° F. to 375° F. and maintaining said slurry at the elevated temperature for from about 2 to about 90 minutes until a cooked starch dispersion of desired viscosity has formed.

13. A buffered starch composition adapted to be slurried and cooked in water to form improved starch dispersions of uniform reduced viscosity which comprises particulate starch in admixture with buffer materials in the absence of quantities of water which form a liquid slurry of the admixture, said buffer materials being other than strong mineral acids and being present in an amount effective to provide a slurry pH from about 3.0 to about 5.0 and control of said slurry pH within plus or minus 0.2 pH unit when said admixture is slurried in water, said admixture yielding said improved starch dispersions upon cooking of a slurry of said admixture at a temperature from about 212° F. to about 375° F. for from about 2 to about 90 minutes.

3,374,116
PROCESS FOR REMOVING THIN FILMS FROM VITREOUS SURFACES
Cecil R. Fetters, Toledo, Ohio, assignor to Libbey-Owens-Ford Glass Company, Toledo, Ohio, a corporation of Ohio
No Drawing. Filed Oct. 3, 1963, Ser. No. 313,438
6 Claims. (Cl. 134—2)

A method of removing thin, transparent, metal oxide films, from vitreous surfaces by exposing the filmed surfaces to the action of a solution of an organic reducing agent such as phenylhydrazine hydrochloride or oxalic acid at elevated temperatures, for a length of time sufficient to at least partially remove the film and then washing the solution from the surface.

3,374,117
PROCESS AND APPARATUS FOR THE REMOVAL OF WIRE ENAMEL INSULATION
Robert H. Savage, Scotia, N.Y., assignor to General Electric Company, a corporation of New York
Filed Jan. 31, 1964, Ser. No. 341,681
11 Claims. (Cl. 134—2)



Apparatuses and processes are described for the rapid and effective removal of organic insulating film from the surface of an electrically conducting metallic wire by the controlled application of flameless heat thereto in the presence of oxygen in a longitudinally-extending walled cavity.

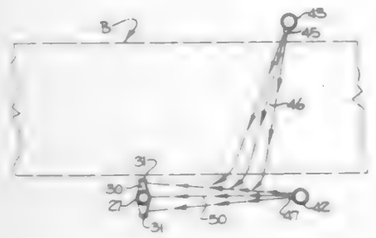
A first apparatus provides for the controlled separate but sequential admission of an oxidizing gas and a reducing gas to the same heated cavity. A second apparatus provides two heated cavities for sequential treatment of the wire, one of the heated cavities having oxidizing gas supplied thereto and the other heated cavity having reducing gas supplied thereto. Means are disclosed for automation of the sequence and timing of gas admission.

The differences in the processes depend upon the difference between the decomposition temperature of the organic enamel and the melting temperature of the metallic substrate. If this temperature difference is less than about 200° C., the wire enamel is subjected in sequence to the steps of coking, oxidizing and reducing, all conducted at elevated temperatures. If the temperature difference is greater than about 200° C., the coking step may be eliminated.

3,374,118
FLOOR CLEANING METHOD FOR TEXTILE MILLS
George Seress and Woodrow W. Hewitt, Charlotte, N.C., assignors to Parks-Cramer Company, Fitchburg, Mass., a corporation of Massachusetts
Continuation-in-part of application Ser. No. 273,884, Apr. 18, 1963. This application Sept. 6, 1963, Ser. No. 307,769
3 Claims. (Cl. 134—21)

A textile mill floor-cleaning method in which a barrier air stream adjacent the floor at one side of a machine row deflects fiber waste, being directed thereto by a cross

air stream emanating from adjacent the floor at the other side of the machine row, toward a localized suction zone which is applied adjacent the floor level at the same side



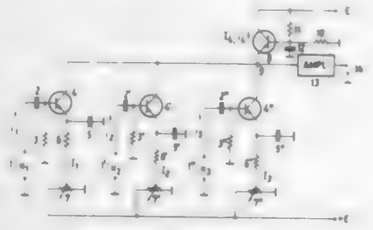
of the machine row as the barrier air stream, and wherein the barrier and cross air streams and the suction zone travel in unison in the same direction, the suction zone serving to suck in and collect the thus deflected fiber waste.

3,374,119

CIRCUIT ARRANGEMENT FOR MIXING SIGNALS

Ernst Legler, Darmstadt, Germany, assignor to Fernseh G.m.b.H., Darmstadt, Germany

Filed May 19, 1964, Ser. No. 368,554
Claims priority, application Germany, June 5, 1963, F 39,915
14 Claims. (Cl. 178—7.1)



A signal mixing arrangement for delivering an output signal with a constant level. The signals to be mixed are applied to input amplifiers having output signal currents substantially a linear function of direct currents flowing through these amplifiers. These direct currents are made adjustable. The outputs of the input amplifiers are connected to a common load which is current dependent. The impedance of the load is inversely proportional to the sum of the direct currents flowing through the input amplifiers. All of the input amplifiers may have a common load impedance in the form of the emitter-collector path of a transistor. At the amplifier end of this load an output signal with constant level is derived. The arrangement is also adapted for mixing signals of equal levels. The level of the output signal is independent of the number n of the input signals. Each input signal contributes to the level of the output signal by the factor of $1/n$ of its own level.

3,374,120

APPARATUS AND METHOD REGARDING GENERATION OF ELECTRICAL ENERGY FROM THERMAL ENERGY

Herbert E. Lawson, Glendora, Calif., assignor to Aerojet-General Corporation, Azusa, Calif., a corporation of Ohio

Continuation-in-part of application Ser. No. 833,781, Aug. 14, 1959. This application Oct. 23, 1962, Ser. No. 232,428
20 Claims. (Cl. 136—86)

1. A self-contained thermally activated galvanic battery comprising in combination:

a closed container means adapted to have, when the battery is in operation, a relatively hot region and a relatively cool region;

a cathode positioned in the relatively cool region;

an anode positioned within the container means away from the cathode;

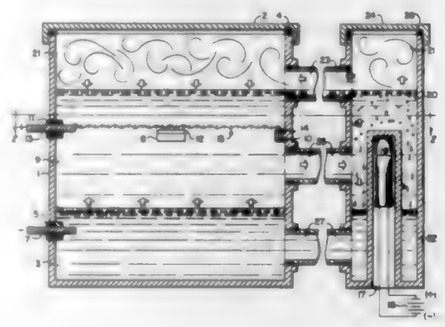
a supply of material within the closed container selected from the group consisting of the salts

of an element selected from the group consisting of the elements of Groups II and III of Period II, the elements of Groups III and IV of Period III, the elements of Groups III through VII of Series 1 of Period IV, the elements of Groups I through V of Series 2 of Period IV, the elements of Groups III through VI of Series 1 of Period V, the elements of Groups I through V of Series 2 of Period V, the elements of Groups IV through VI of Series 1 of Period VI, the elements of Groups I through V of Series 2 of Period VI, of the periodic table, and the transition elements selected from Group VIII of the periodic table;

and a halogen having an atomic weight in excess of 19 and selected from the group consisting of chlorine, bromine and iodine, and mixtures of said salts, in the relatively hot region of the battery, which material is thermally decomposable at the temperatures obtaining therein during the operation of said battery, wherein said material is thermally decomposed into its constituents in elemental form;

means within the closed container for permitting circulation of the elemental constituents of the material to the vicinity of the anode and cathode, respectively, whereby they become ionized and recombine to form the material thermally decomposable in the relatively hot region of the battery;

and means within the closed container for permitting circulation of the thermally decomposable material to said hot region from the region in which it is formed.



12. A thermally activated galvanic battery comprising in combination:

a layer of porous, electrically nonconductive, thermally stable material having dispersed therein a salt of an element from Series 2, Groups I through V, of Period VI, of the periodic table, and iodine;

two layers of an electrically conductive material separated from each other by the nonconductive material having the salt dispersed therein and each in contact therewith;

and means for heating one of the layers of conductive material.

17. A method of generating electrical energy from thermal energy comprising:

reacting bismuth ions with iodine ions to form BiI_3;

disposing the BiI_3 in a medium within which it can dissociate and its elemental constituents can migrate therethrough, said medium being in contact with an anode and a cathode;

heating the BiI_3 to decompose it into metallic bismuth and gaseous iodine thereby

causing the bismuth to contact the anode and the iodine to contact the cathode, whereby each is ionized, and

causing an excess of electrons to accumulate at the anode, a paucity of electrons at the cathode, and a difference of potential to exist between the anode and the cathode.

3,374,121

PROCESS OF SUPPLYING HYDROGEN TO A FUEL CELL WITH BOROHYDRIDE ADDUCT

John N. Hogsett, Charleston, W. Va., assignor to Union Carbide Corporation, a corporation of New York

Filed Nov. 27, 1964, Ser. No. 415,221
23 Claims. (Cl. 136—86)

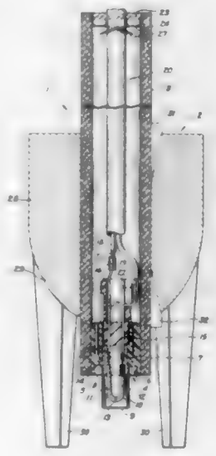
1. A process for supplying hydrogen to a fuel cell which comprises contacting (1) an adduct of (a) a metal borohydride of the group consisting of aluminum borohydride, beryllium borohydride, and zirconium borohydride and (b) an organic nitrogen compound which is composed solely of carbon, hydrogen, and nitrogen atoms, said organic nitrogen compound being a Lewis base selected from the class consisting of amines and azines, and (2) a hydrolyzing agent, and supplying the resulting hydrogen to said fuel cell.

3,374,122

EXPENDABLE IMMERSION THERMOCOUPLE INCLUDING WEIGHT

Douglas I. Cole, East Cleveland, Ohio, assignor to General Electric Company, a corporation of New York

Filed Dec. 24, 1964, Ser. No. 421,016
5 Claims. (Cl. 136—234)



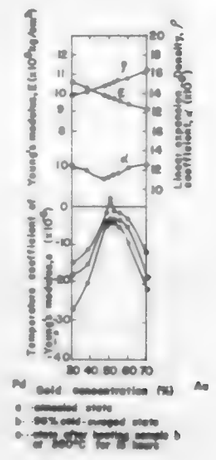
5. An immersion expendable thermocouple unit for sensing the temperature of molten metal in a bath comprising an elongated tube of heat-insulation material closed at both ends, a thermocouple element protruding from one end of the tube, an electric extension cord extending from the opposite end of the tube and electrically connected within the tube to the thermocouple element, a weight affixed to and extending around the tube adjacent the end of the tube carrying the thermocouple element, said weight having prongs extending lengthwise of the tube and beyond the thermocouple element, the part of the tube extending between the weight and the cord accommodating end of the tube being of a sufficient length to guide the unit weight end foremost in its plunge in the bath.

3,374,123

METHOD OF MANUFACTURING NON-MAGNETIC, ELASTIC ARTICLES HAVING A SMALL CHANGE OF VIBRATION AND DEFLECTION FOR TEMPERATURE CHANGE

Hakaru Masumoto, Sendai, and Takeo Kobayashi, Natori, Japan, assignors to The Foundation, The Research Institute of Electric and Magnetic Alloys, Sendai, Japan

Filed Mar. 3, 1965, Ser. No. 436,902
Claims priority, application Japan, Mar. 4, 1964, 39/11,779
3 Claims. (Cl. 148—11.5)



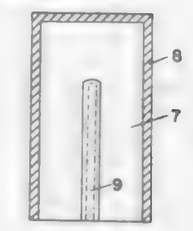
A method of manufacturing non-magnetic and elastic articles having little change in Young's modulus with change in temperature, which comprises annealing an alloy consisting essentially of about 50% gold and about 50% palladium by heating said alloy at a temperature above 600° C. for at least one minute, and then heat treating said alloy by a suitable combination of quenching, cold working, and tempering.

3,374,124

METHOD OF MAKING LITHIUM-DRIFT DIODES BY DIFFUSION

Alister J. Tavendale, Deep River, Ontario, Canada, assignor to Atomic Energy of Canada Limited, Ottawa, Ontario, Canada, a corporation

Filed Jan. 7, 1965, Ser. No. 424,099
4 Claims. (Cl. 148—186)

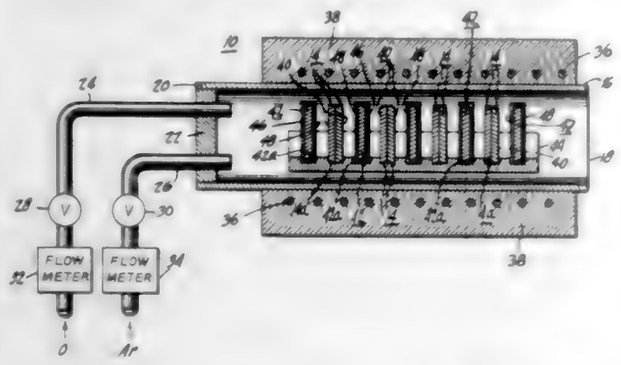


A rapid method of producing large volume lithium-drift diodes by diffusing lithium onto all but the end surfaces of a loaf or cylindrical shaped crystal of p-type material, drifting the lithium to form an intrinsic layer by the application of heat and a reverse bias voltage such that drifting takes place inwardly leaving only a small core of p-type material in the central region of the crystal.

3,374,125
METHOD OF FORMING A PN JUNCTION BY VAPORIZATION

Norman Goldsmith, Piscataway, N.J., assignor to Radio Corporation of America, a corporation of Delaware

Filed May 10, 1965, Ser. No. 454,474
14 Claims. (Cl. 148—189)



A diffusion method for producing a region of altered electrical characteristics in a semiconductive body comprises the steps of:

(a) Oxidizing a body of a nitride of a metal chosen from the group consisting of boron, gallium, indium, and aluminum to form a metal oxide,

(b) Disposing the bodies with adjacent surfaces substantially parallel to, but spaced no more than 250 mils from, each other,

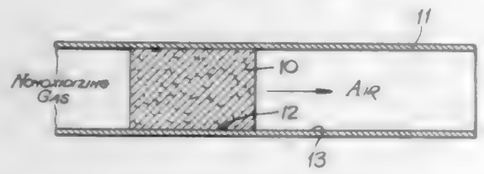
(c) Heating the bodies to vaporize the metal oxide, and

(d) Maintaining the bodies at the temperature of vaporization for at least 20 minutes to allow the metal of the metal oxide to diffuse through the semiconductive body to produce the region of altered electrical characteristics.

3,374,126
BRIGHT ANNEALING OF TUBULAR METAL ARTICLES

Allen C. Lingenfelter, Ona, W. Va., assignor to The International Nickel Company, Inc., New York, N.Y., a corporation of Delaware

Filed Oct. 8, 1965, Ser. No. 494,211
4 Claims. (Cl. 148—20.3)



In providing a bright annealed surface on the interior of a metal tube a plug is blown through the tube with a non-oxidizing gas, thereafter a non-oxidizing atmosphere is maintained in the tube, the ends of the tube are annealed, forced closed, surface ground and sealed by resistance welding and the tube is then thermally annealed with the non-oxidizing atmosphere sealed therein.

3,374,127
COMPRESSED METAL CONTAINING TERNARY EXPLOSIVE COMPOSITION

Pierre Jenner and Léon Sayous, Pau, France, assignors to Societe Nationale des Petroles d'Aquitaine, Courbevoie, France, a corporation of France

Filed Aug. 5, 1966, Ser. No. 570,624
Claims priority, application France, Aug. 13, 1965, 28,241
1 Claim. (Cl. 149—39)

This invention consists of an explosive composition consisting of a secondary explosive material, of a substance for lowering the electrical resistivity of the charge, and of an oxidizable material having intense heat release during combustion.

3,374,128
STABILIZED BLASTING COMPOSITIONS CONTAINING AT LEAST ONE IRON SULFIDE AND AN ANTACID

Bernard J. Stronza, Hagerstown, Md., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

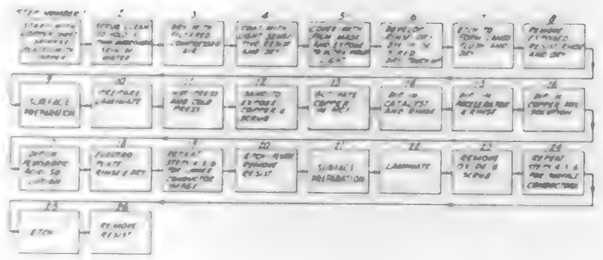
No Drawing. Filed Nov. 22, 1966, Ser. No. 596,059
7 Claims. (Cl. 149—56)

This invention relates to stabilized blasting compositions of high bulk density and high explosive strength containing iron sulfide and antacid stabilizer therefor.

3,374,129
METHOD OF PRODUCING PRINTED CIRCUITS

Gerald Boucher, Hudson, N.H., assignor to Sanders Associates, Inc., Nashua, N.H., a corporation of Delaware

Filed May 2, 1963, Ser. No. 277,646
7 Claims. (Cl. 156—3)



1. The process of producing a printed circuit which comprises the steps of starting with a sheet of metallic conductor of sufficient thickness to be capable of self-support, photographically producing on said sheet an image of lands desired, partly etching away undesired conductor leaving projecting lands, applying to the etched surface a layer of insulating material, removing a portion of said insulating material down to the level of said lands so as to expose said lands, plating on a layer of conductor over and in contact with said lands and insulating material, photographically producing on said layer an image of a first circuit, etching away undesired conductor from said last mentioned layer forming a circuit pattern interconnected with said lands, and etching the previously unetched side of said sheet to form another circuit interconnected at selected points with said first circuit.

3,374,130
ETCHING SOLUTION AND PROCESS FOR PRODUCING A NON-REFLECTIVE SURFACE ON TRANSPARENT GLASS

Albert E. Junge, New Kensington, and Joseph Chabal, Curtisville, Pa., assignors to Pittsburgh Plate Glass Company, Pittsburgh, Pa., a corporation of Pennsylvania

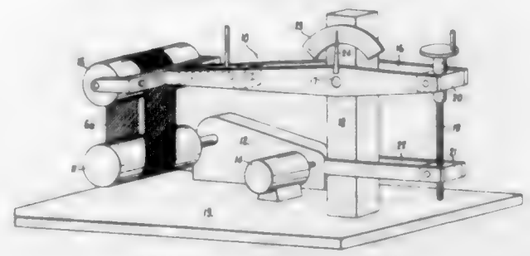
Continuation-in-part of application Ser. No. 456,963, May 19, 1965, which is a continuation-in-part of application Ser. No. 247,390, Dec. 26, 1962. This application Mar. 17, 1967, Ser. No. 623,902
19 Claims. (Cl. 156—24)

The present invention relates to an etching process for producing low specular reflecting or low image reflecting surfaces on glass. The process produces a non-glare glass by a single dip of an alkali containing glass into an etching solution of hydrofluoric acid, ammonium bifluoride, water and a viscosity control agent which controls the viscosity of the solution between 0.8 centipoise and about 75 centipoises at room temperature. The novel aqueous solution comprises hydrogen fluoride and ammonium bifluoride in which the ratio of parts by weight hydrogen fluoride to parts by weight water is between about 1.1:1 and 1.6:1. while the ratio of parts by weight ammonium bifluoride to parts by weight of water is between about 0.05:1 and 1.1:1.

3,374,131
METHOD OF BUILDING A PNEUMATIC TIRE

Vernon Eric Gough, Sutton Coldfield, England, assignor to Dunlop Rubber Company Limited, county of London, England, a British company

Filed Oct. 15, 1963, Ser. No. 316,346
7 Claims. (Cl. 156—133)

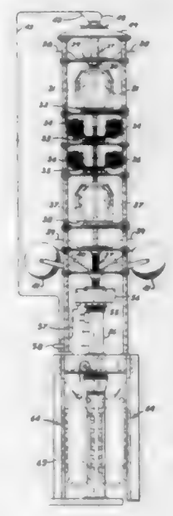


1. A method of building a pneumatic tire incorporating a cylinder having at least two layers of rubberised parallel cords, the cords in each ply layer being disposed in the crown region in the finished tire at a finished bias angle of between 5° and 30° to a circumferential line of the tire crossing the cords at a point under consideration, comprising initially forming said cylinder from layers in which the cords are disposed at bias angles substantially equal to the complementary angle to said finished bias angle, the cords of one layer crossing the cords of the other layer, and stretching said cylinder in the circumferential direction of said cylinder to increase the circumference of said cylinder until the bias angles of the cords of the two layers are reduced to said finished bias angie.

3,374,132
METHOD AND APPARATUS FOR MAKING FIBER REINFORCED ARTICLES OF CROSS SECTIONAL SHAPE OTHER THAN CYLINDRICAL

Le Roy R. Boggs, Bristol, Tenn., assignor, by mesne assignments, to Koppers Company, Inc., Pittsburgh, Pa., a corporation of Delaware

Filed Jan. 22, 1965, Ser. No. 427,312
8 Claims. (Cl. 156—171)



Equipment and method to produce continuous lengths of tubular resin articles, having a cross sectional shape other than circular, includes a core on which longitudinal as well as transverse reinforcing filaments are arranged. The core has a first cylindrical portion and a second transition portion that merges with a third portion having the shape of the desired cross section. The peripheral lengths of the cross sections of the first cylindrical, the second transitional and the third final shape portion are substantially equal. A filament winding mechanism and an article pulling mechanism are associated with the apparatus.

3,374,133
METHOD OF MAKING AIR-PERVIOUS THERMOPLASTIC-OVERLAID FABRIC

Bernard Edwards, Cranford, and Theodore Kimak, Clifton, N.J., assignors to Air Reduction Company, Incorporated, New York, N.Y., a corporation of New York

Filed Oct. 10, 1963, Ser. No. 315,293
12 Claims. (Cl. 156—220)

1. In the manufacture of an air-pervious thermoplastic-overlaid fabric, the method which comprises the steps of (1) casting thermoplastic material in the interstitially interspersed shallow hollow of a large-area mold, (2) pressing an air-pervious fabric against the mold with the cast material in the mold in an adhesive condition to effect the mutual adhesion of the fabric and the cast material, said hollow of said mold comprising a plurality of depressions separated by intervening interstices, said casting step leaving the exposed surface of the cast material in each depression slightly concave and said pressing step effecting the mutual adhesion of the fabric and said segments at the marginal portions of those segments, whereby the fabric becomes overlain by a plurality of interstitially separated segments, (3) effecting a separation between the mold on the one hand and the fabric overlain by interstitially interspersed cast material on the other, and (4) embossing the overlay material and effecting the mutual adhesion of the non-marginal portions of the segments of that material, the presence of the unadhered non-marginal portions producing an enhanced embossing effect.

4. The subject matter claimed in claim 1 wherein prior to said pressing step there has been applied to said fabric an air-pervious anchor coating of a substance to which said cast material is more readily adherent than to said fabric itself.

3,374,134
METHOD OF PRODUCING A PRESSURE SENSITIVE ADHESIVE TAPE

Harold Louis Waldman, Hazlet, N.J., assignor to Johnson & Johnson, a corporation of New Jersey

No Drawing. Filed Aug. 25, 1964, Ser. No. 392,040
4 Claims. (Cl. 156—239)

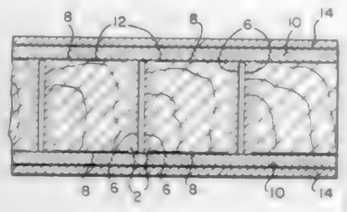
Pressure-sensitive adhesive sheets and tapes are prepared by forming a pressure-sensitive adhesive film, priming the surface of the adhesive film with a water base primer, the water base of the primer acting to prevent adhesion of the pressure-sensitive adhesive to priming equipment during the priming operation, and thereafter drying the primed adhesive surface and pressing a backing into intimate contact with the primed adhesive surface to form a strongly bonded laminate of adhesive and backing.

3,374,135
METHOD OF MANUFACTURING A SOLID-TYPE DOOR

Louis Pick, 416 Iona St., Metairie, La. 70005

Substitute for abandoned application Ser. No. 215,689, Aug. 8, 1962. This application Apr. 27, 1964, Ser. No. 364,357

1 Claim. (Cl. 156—265)



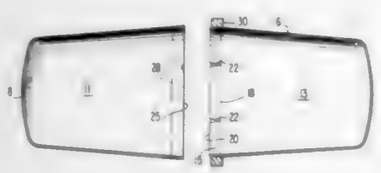
1. The method of manufacturing a solid-type door, which consists in first forming a core for the door by impregnating at least one wooden board to a relatively shallow depth with a material having a desired beneficial effect on the wood, then cutting the board into strips each having a width approximately equal to the designed thickness of the core, each of such strips having opposite impregnated surfaces and opposite unimpregnated surfaces, placing strips in side-by-side relation with the opposite impregnated surfaces of adjacent strips in abutting relation and with the opposite un-impregnated surfaces thereof in co-planar relation on the opposite side faces of the assembly of strips, and finally placing an exterior sheet covering member on at least one of the co-planar un-impregnated surfaces of the assembly of strips and uniting such sheet to such surfaces.

3,374,136
METHOD OF FORMING A STORAGE CONTAINER

Donald E. Safford, Park Forest, Ill., assignor to Sinclair Research, Inc., New York, N.Y., a corporation of Delaware

Filed July 29, 1964, Ser. No. 385,892

6 Claims. (Cl. 156—293)



A method of forming a storage tank by joining two essentially mirror image hollow conical sections, in which notches are removed from the lip of one of the sections and a compression ring is then applied around that notch lip to reduce its circumference. The notched lip is then inserted within the lip of the other section, displacing the compression ring.

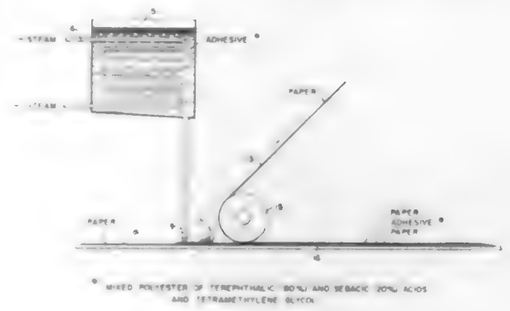
3,374,137
ADHESION OF PAPER MATERIALS

Maria V. Wiener, Akron, Ohio, assignor to The Goodyear Tire & Rubber Company, Akron, Ohio, a corporation of Ohio

Filed Nov. 10, 1964, Ser. No. 410,198

1 Claim. (Cl. 156—332)

Sheets of flexible paper are united by a hot melt of a copolyester of terephthalic acid (80 mol. percent) and sebacic acid (20 mol. percent) and tetramethylene glycol by spreading the adhesive on one sheet of the paper and then quickly pressing the other sheet on to



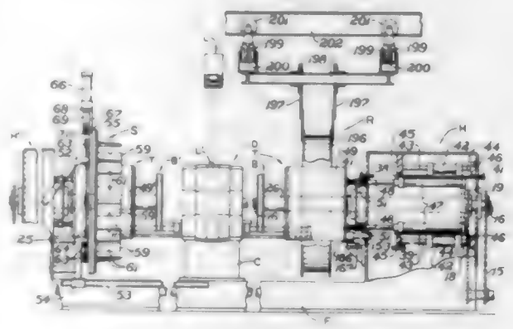
this. The adhesive sets quickly to produce a flexible laminate.

3,374,138
TIRE BUILDING MACHINE

Donald K. Porter, Cuyahoga Falls, Ohio, James W. Eckenwiler, Phoenix, Ariz., and Fred K. Barns, Ralph F. Cooper, and Walter E. Head, Akron, Ohio, assignors to The B. F. Goodrich Company, New York, N.Y., a corporation of New York

Filed May 19, 1964, Ser. No. 368,511

27 Claims. (Cl. 156—400)



A tire building apparatus comprising a tire building drum that is axially and radially expandible, with a pair of spaced bead supports having an inflatable ring and expansible flange which cooperate with a tire carcass on the drum to define a closed chamber, turn-up and turn-down means with a bead setter cooperative therewith, stitching mechanism and a centering means which provides a line image on the building drum to facilitate the building of a complete tire carcass on such drum.

3,374,139
TAPE DISPENSER WITH HAND BRAKE

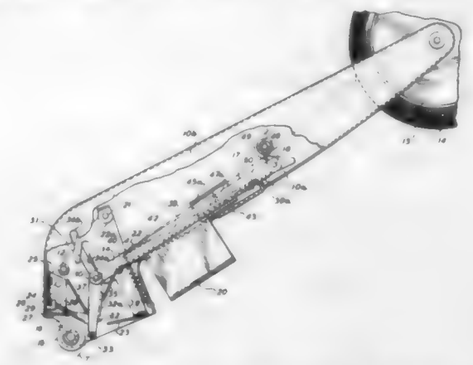
George H. Fritzinger, 18 Oakridge Road, West Orange, N.J. 07052

Filed May 10, 1965, Ser. No. 454,514

8 Claims. (Cl. 156—523)

1. A tape dispenser comprising an elongate housing having an intermediate portion adapted to serve as a handle, a rear end portion adapted for carrying a supply roll of tape and a forward head portion provided with an applicator roller for applying tape drawn from the supply roll via the intermediate handle portion; a mechanism in said head portion for cutting the tape at said roller; a projecting trigger below the handle portion adapted to be depressed by closing the grip of the second and third digits of the hand holding the dispenser for operating said cutting mechanism; and a tape brake in said handle portion including an anvil at the non-adhesive side of the tape, a cooperable brake element at the adhesive side of the tape and a finger piece at the bottom

of the handle portion directly behind said trigger in position to be depressed by the fourth and fifth digits of the hand holding the dispenser to close said brake element



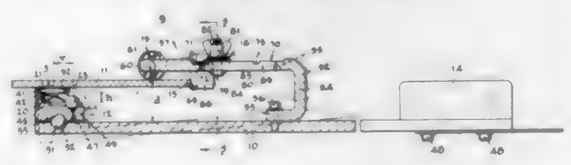
and anvil under a controlled pressure whereby to place a selective drag on the tape as the tape is dispensed while still leaving the second and third digits of the hand free to depress said trigger at will.

3,374,140
LOCATOR DEVICE

James M. Dunsmore and Harry C. Reimschussel, Toledo, Ohio, assignors to Libbey-Owens-Ford Glass Company, Toledo, Ohio, a corporation of Ohio

Filed Jan. 7, 1965, Ser. No. 424,080

15 Claims. (Cl. 156—580)



1. In apparatus for attaching a member to a glass sheet,

(a) a lever bar,

(b) pivot means carried intermediate the ends of said bar for resting the same on said sheet for swinging movement of one end of said bar toward and away from a face of said sheet, and

(c) a carrier block associated with said end of said bar for supporting said member in attaching relation to said face of said sheet as said bar end moves theretoward.

3,374,141
ETCHING PROCESS FOR PRODUCING A NON-REFLECTIVE SURFACE ON FLOAT GLASS

Albert E. Junge, New Kensington, and Joseph Chabal, Curtisville, Pa., assignors to Pittsburgh Plate Glass Company, Pittsburgh, Pa., a corporation of Pennsylvania

No Drawing. Continuation-in-part of application Ser. No. 490,710, Sept. 27, 1965, which is a continuation-in-part of application Ser. No. 252,315, Jan. 18, 1963. This application Mar. 20, 1967, Ser. No. 624,204

11 Claims. (Cl. 161—1)

The present invention relates to a process for producing a non-glare float glass product having high resolution characteristics. More particularly, the invention relates to a process of contacting a surface of a glass article with molten metal and thereafter contacting the glass article with a mat etching solution for a sufficient period of time to provide a low specular reflecting surface on those surfaces not contacted with the molten metal; the metal contacted surface retaining its highly reflective appearance. The invention provides an improvement over traditional mat etching processes inasmuch as a novel means of protecting one surface from the etching solution has been discovered.

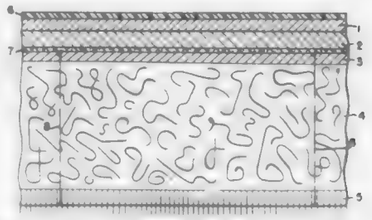
3,374,142
PROTECTIVE COVERING ARTICLE

Alois Reckl, Kelsterbach (Main), Germany, assignor to Vereinigte Glanzstoff-Fabriken A.G., Wuppertal-Elberfeld, Germany

Filed June 19, 1964, Ser. No. 376,340

Claims priority, application Germany, June 28, 1963, V 24,241

4 Claims. (Cl. 161—50)



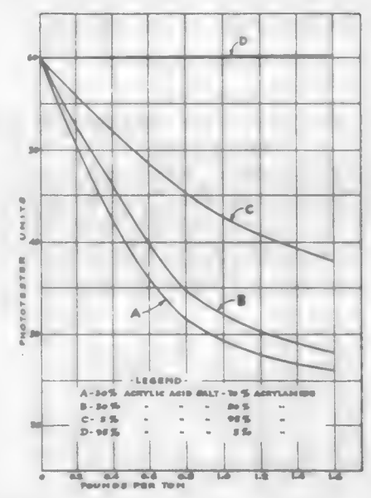
1. A multilayered, high strength, waterproof, light, protective covering article capable of insulating against heat and cold which comprises: a voluminous fleece core composed of non-adhering polyethylene terephthalate fibers having a denier of approximately 3 enclosed on either side by (1) an inner nylon true velour fabric having a thread denier of approximately 40/18 such that the pile side of said velour fabric faces away from said fleece to form the inside exterior surface of said covering and (2) a light weight woven monofil nylon fabric consisting of continuous filaments of a denier of approximately 20; quilt-stitches running through said fleece core and connecting said core to each of said nylon fabrics (1) and (2); and an outer high strength nylon fabric having a thread denier of approximately 210/36 firmly attached over said light weight fabric by an adhesive and having its exterior surface coated by polychloroprene as a waterproofing agent, said protective covering article having a maximum weight of not more than about 850 g./m.^{2}.

3,374,143
METHOD OF IMPROVING OPERATIONAL EFFICIENCY OF WHITE WATER RECOVERY SYSTEM BY TREATMENT WITH ANIONIC COPOLYMERS OF ACRYLIC ACID SALTS AND ACRYLAMIDE

William M. Stephenson, Park Forest, Ill., assignor to Nalco Chemical Company, Chicago, Ill., a corporation of Delaware

Filed June 11, 1964, Ser. No. 374,453

2 Claims. (Cl. 162—190)



This invention is concerned with improving the operational efficiency of vacuum and flotation type white water recovery systems by treating them with specific anionic copolymers of acrylic acid salts and acrylamide.

3,374,144
OPHTHALMIC COMPOSITION
Morris Emmanuel Stolar, Parsippany, N.J., assignor to Miles Laboratories, Inc., Elkhart, Ind., a corporation of Indiana
No Drawing. Filed Oct. 7, 1965, Ser. No. 493,931
3 Claims. (Cl. 167—59)

1. An ophthalmic composition which comprises an aqueous solution of from about 0.125% to about 1.0% by weight of a local anesthetic selected from the group consisting of lidocaine, tetracaine, procaine, proparacaine, benoxinate and piperocaine and an equimolar amount of sodium fluorescein, and from about 0.5% to about 5.0% by weight of water soluble liquid ethoxylated lanolin and from 0.5% to about 5.0% of polyoxyethylene sorbitan monooleate.

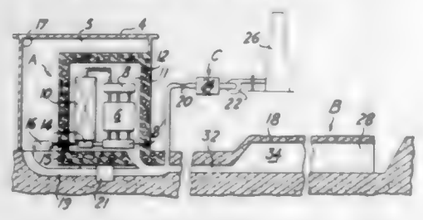
3,374,145
PREPARATIONS AND METHOD FOR TREATING INFLAMMATORY CONDITIONS
Takashi Enkoji, Park Forest, and Charles Daniel Bossinger, Kankakee, Ill., assignors to Armour Pharmaceutical Company, Chicago, Ill., a corporation of Delaware
No Drawing. Filed Mar. 11, 1965, Ser. No. 439,080
13 Claims. (Cl. 167—65)

1. A pharmaceutical preparation having anti-inflammatory activity comprising a pharmaceutically acceptable carrier and from about 1 mg. to about 8000 mg. of a member selected from the group consisting of 5-amino-1-phenyl tetrazole and its non-toxic pharmaceutically acceptable acid addition salts.

3,374,146
SUSTAINED RELEASE ENCAPSULATION
Mitchell Stanley Blicharz, Blauvelt, and Gerald James Jackson, Bardonia, N.Y., assignors to American Cyanamid Company, Stamford, Conn., a corporation of Maine
No Drawing. Filed Apr. 18, 1966, Ser. No. 543,041
3 Claims. (Cl. 167—83)

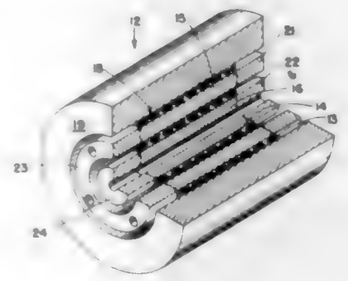
1. A cast pharmaceutical hard shell gelatin capsule product having a cross section of at least 5 mm. but below a size at which swallowing is difficult and filled with a sustained release pharmaceutical composition containing up to about 2% of an adjuvant selected from the group consisting of stearic acid, stearyl alcohol, myristic acid, myristic alcohol, glyceryl monostearate, glyceryl tristearate, glyceryl distearate, acetylated glycerides, carnauba wax, hydrogenated tallow, hydrogenated lard, soybean oil, beeswax, cetyl alcohol, polyethylene glycol having an average molecular weight of about 4,000, and mixtures thereof, together with a medicament not damaged by heating to the melting point of said adjuvant.

3,374,147
SAFETY SYSTEM FOR PRESSURE TUBE REACTORS
Didier Costes, Paris, France, assignor to Commissariat à l'Energie Atomique, Paris, France
Filed June 28, 1966, Ser. No. 561,156
Claims priority, application France, July 2, 1965, 23,368
6 Claims. (Cl. 176—37)



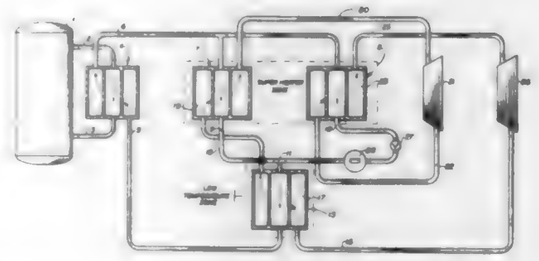
The discharge duct has vertical pillars profiled in the direction of gas flow for cooling fluid released upon failure of a reactor cooling circuit and for directing the flow of said fluid axially of the safety chamber. The discharge duct has a volume which is at least equal to that of the reactor heat exchange fluid when it is cooled. An auxiliary decontamination discharge circuit is connected in parallel with the safety chamber and includes in series, a sonic venturi tube, a bank of decontamination filters, a blower and an exhaust stack.

3,374,148
NUCLEAR REACTOR CORE FOR A ROCKET
Frank E. Rom, Avon Lake, and Armin F. Lietzke and Robert E. Hyland, Westlake, Ohio, assignors to the United States of America as represented by the Administrator of the National Aeronautics and Space Administration
Application Jan. 19, 1967, Ser. No. 610,725, which is a division of application Ser. No. 420,249, Dec. 16, 1964, now Patent No. 3,336,749, dated Aug. 22, 1967, which in turn is a division of application Ser. No. 260,085, Feb. 20, 1963. Divided and this application Aug. 7, 1967, Ser. No. 658,954
8 Claims. (Cl. 176—58)



A reactor core with a plurality of fuel elements in the form of plates of tungsten uranium dioxide matrix clad with tungsten. The plates are stacked in spaced relationship to provide passages for a liquid rocket propellant.

3,374,149
NUCLEAR REACTOR HEAT TRANSFER SYSTEM
Harold C. Parris, Los Angeles, Calif., assignor to North American Aviation, Inc.
Filed May 19, 1967, Ser. No. 641,425
7 Claims. (Cl. 176—65)

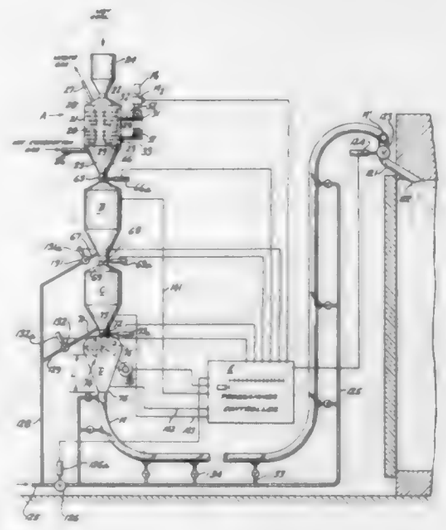


A heat transfer system having a superheater, reheater and evaporator heat exchanging modules, each having a primary liquid metal flow path and a secondary fluid flow path. The primary fluid flow paths of the superheater and reheater modules are connected in parallel with each other and in series with the primary fluid flow path of the evaporator module. The secondary fluid flow paths of the superheater, evaporator and reheater modules are connected in series through a turbine.

3,374,150
PROCESS FOR PRODUCING L-ORNITHINE
Yuichi Noguchi, Tetsuo Uno, Yoshita Kubota, and Hiroshi Hosoda, Hofu-shi, Japan, assignors to Kyowa Hakko Kogyo Co., Ltd., Tokyo, Japan, a corporation of Japan
No Drawing. Filed Apr. 22, 1965, Ser. No. 450,207
Claims priority, application Japan, Apr. 22, 1964, 39/22,386; June 27, 1964, 39/36,270
17 Claims. (Cl. 195—47)

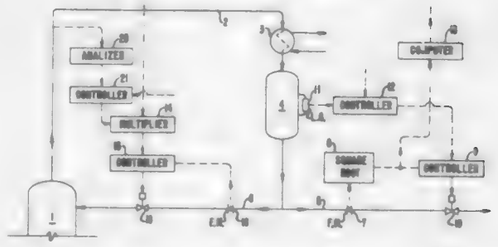
A fermentation process for producing L-ornithine which comprises culturing a microorganism capable of producing L-ornithine, such as *Micrococcus glutamicus* ATCC 13,232, in an aqueous nutrient medium under aerobic conditions in the presence of approximately 0.01 to 1.0% by weight of esters of monohydric alcohols with saturated aliphatic carboxylic acids, derivatives of the esters, especially the alkyl-substituted derivatives in the acid moiety thereof, and mixtures thereof. Exemplary esters include the alkyl esters of citric acid, succinic acid, malic acid, malonic acid, adipic acid and gluconic acid, the alkyl ester moieties thereof each having from 1 to 10 carbon atoms.

3,374,151
METHOD AND APPARATUS FOR AUTOMATICALLY CHARGING THE COKING CHAMBERS OF COKE OVEN BATTERIES
Lawrence D. Schmidt, New York, N.Y., assignor to Allied Chemical Corporation, New York, N.Y., a corporation of New York
Continuation of application Ser. No. 282,351, May 22, 1963. This application Oct. 20, 1966, Ser. No. 588,217
8 Claims. (Cl. 201—8)



1. A process for charging coal to the coking chambers of a coke oven battery in which the individual ovens are charged and discharged in timed sequence and having a confined conduit for pnuematic transport of a measured and heated coal charge said conduit extending from an inlet, longitudinally of the battery, with branches leading therefrom to each of the ovens of said battery for selectively placing the individual ovens in fluid communication with said confined conduit and interrupting such communication, comprising establishing fluid communication between said conduit and a discharged hot oven, measuring a charge of coal in a closed preheat section in controlled communication with said confined conduit, forming from said measured charge of coarsely comminuted coal capable of filling said oven and preheated to about 220° F. to about 700° F. a stream thereof suspended in pressurized inert conveying carrier gas, and rapidly feeding said pressurized stream by means of said gas in the inlet of said conduit until said charge is exhausted, pneumatically conveying said stream of coarse coal through said conduit under the influence of inert pressurized gas and into said oven while subjecting the coal to a series of jet impulses of upwardly directed high velocity jets of inert gas introduced through the bottom of said confined conduit at spaced points laterally along the length thereof, feeding said measured preheated charge until exhausted, and after completion of the feeding of the charge to said oven interrupting the fluid communication between it and said conduit, and upon completion of discharge of the next oven in the battery repeating the aforesaid steps with respect thereto.

3,374,152
APPARATUS FOR THE AUTOMATIC CONTROL OF THE QUALITY OF THE SEPARATION IN A DISTILLATION PROCESS BY MAINTAINING A CONSTANT RATIO OF VAPOR FLOW TO REFLUX FLOW
Johannes E. Rijnsdorp, Amsterdam, Netherlands, assignor to Shell Oil Company, New York, N.Y., a corporation of Delaware
Filed Jan. 18, 1965, Ser. No. 426,268
Claims priority, application Netherlands, Jan. 30, 1964, 64—773
1 Claim. (Cl. 202—158)

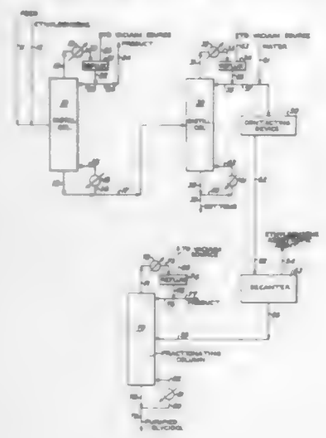


A method of controlling a distillation column wherein the ratio of internal vapor flow to internal reflux flow is maintained constant by adjusting the external reflux flow. The external reflux flow, top product flow and top product quality are measured and then combined to produce a signal related to the ratio of internal vapor flow to internal reflux flow.

3,374,153
PROCESS FOR RECOVERY OF GLYCIDOL FROM ALCOHOL BY AZEOTROPIC DISTILLATION WITH A HYDROCARBON
Anthony N. Naglieri, New York, N.Y., assignor to Halcon International, Inc., a corporation of Delaware
Filed July 25, 1966, Ser. No. 567,430
12 Claims. (Cl. 203—44)

1. A process for recovering glycidol from a feed mixture comprising glycidol, allyl alcohol and higher boiling materials, said process comprising the steps of:
(a) conducting a first distillation of feed mixtures whereby a first overhead product and a first bottoms product are obtained, said first overhead product comprising allyl alcohol and said first bottoms product comprising glycidol substantially free from allyl alcohol, and

(b) conducting a second distillation, the feed to which is said first bottoms product, in the presence of a hydrocarbon azeotropic agent which forms a low



boiling azeotrope with glycidol for the recovery, as a second overhead product, of a glycidol-azeotropic agent azeotrope.

3,374,154

ELECTROFORMING AND ELECTRODEPOSITION OF STRESS-FREE NICKEL FROM THE SULFAMATE BATH

Hugh L. McCutchen, Warwick, N.Y., assignor to The International Nickel Company, New York, N.Y., a corporation of Delaware

No Drawing. Filed July 12, 1965, Ser. No. 471,431
5 Claims. (Cl. 204—3)

1. The process for electrodepositing nickel having a controlled stress level which comprises establishing an aqueous acid sulfamate bath having a pH of about 3 to about 5 and containing about 55 to about 110 grams per liter of nickel, up to about 90 grams per liter of sulfate ion, up to about 25 grams per liter of chloride ion, a buffering amount of boric acid and a temperature of about 100° F. to about 170° F. and passing a plating current through said bath at a cathode current density up to about 300 amperes per square foot from an active nickel anode to a cathode immersed therein while subjecting said bath to anodic oxidation by supplying current in the amount of about 0.25% to about 4% of the plating current to an insoluble anode immersed in said bath to produce a nickel deposit having a controlled internal stress level over a long period of bath operation.

3,375,155

MODIFIED OXIDE-COATED ALUMINUM AND THE METHOD OF MODIFYING

Ludwig J. Weber, 6016 Birch Crest Drive, Minneapolis, Minn. 55424

Continuation-in-part of application Ser. No. 397,018, Sept. 16, 1964. This application Feb. 19, 1965, Ser. No. 434,121
23 Claims. (Cl. 204—38)

A process of improving the corrosion resistance of aluminum articles that includes removing the impurities from the article surface, then chemically or electrolytically forming an artificial aluminum oxide coating, treating the artificially oxide coated article to a dilute aqueous solution of an inorganic base such as NaOH or KOH, and thereafter treating the article to an alkaline silicate solution. Advantageously intermediate the above mentioned treatments, the article is treated to one or more of aqueous solutions of (1) organic compounds having cations of various iron group metals and anions of acetates, citrates, oxalates, tartrates, (2) organic compounds of various alkali and alkali earth metals having anions of acetates, citrates, oxalates, (3) ammonium hydroxide, (4) ammonium compounds having an anion of such acetates, citrates, carbonates, and (5) various mixtures of the above.

3,374,156

ELECTRO-DEPOSITING STAINLESS STEEL COATINGS ON METAL SURFACES

Louis Schiffman, Wyncote, Pa., and Willibald Machu, Vienna, Austria, assignors to Amchem Products, Inc., Ambler, Pa., a corporation of Delaware

No Drawing. Filed May 19, 1965, Ser. No. 457,215
4 Claims. (Cl. 204—43)

1. The method of electro-depositing a stainless steel alloy coating consisting of chromium, nickel and iron on a metal surface, said method comprising using the metal to be coated as a cathode in a plating bath consisting essentially of an aqueous solution of from 0.2 mol/liter to saturation of a salt of each of the metals in the alloy to be deposited, said salt being selected from the class consisting of sulfate salts and chloride salts of each of said metals, from 1 to 4 mols/liter of urea, at least 0.3 gram per liter of a soluble hydrazine, calculated as N_2H_4, with the balance water; maintaining the temperature of the bath at from 30° C. to 80° C., and the pH at from 1.5 to 3.5, and passing an electric current of from 0.645 to 2.148 amps./in.^{2} therethrough between an anode and the said cathode.

3,374,157

ELECTROLYTE FOR THE ELECTRODEPOSITION OF TECHNETIUM

Willard D. Box, Oak Ridge, Tenn., assignor to the United States of America as represented by the Secretary of the United States Atomic Energy Commission

No Drawing. Filed May 21, 1965, Ser. No. 457,872
2 Claims. (Cl. 204—45)

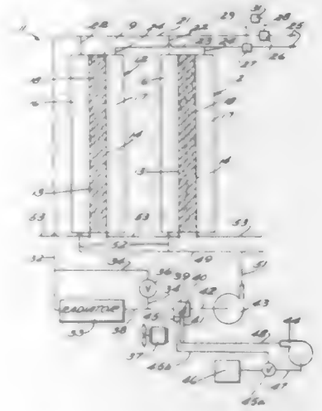
1. An electrolytic plating bath for technetium comprising an aqueous solution of sulfuric acid containing technetium as pertechnetate ion, and a stabilizing amount of a polycarboxylic acid selected from the group consisting of oxalic, gluatric, malonic, succinic, tartaric, and citric acids and ammonium salts thereof, sufficient to prevent reduction of the pertechnetate in solution to a lower oxidation state, said bath having a pH in the range of 1 to 2.

3,374,158

HIGH PRESSURE ELECTROLYSIS SYSTEM AND PROCESS FOR HYDROGEN-OXYGEN GENERATION

Albert M. Lord, Lakewood, and Thomas H. Hacha, Willoughby, Ohio, assignors to TRW Inc., a corporation of Ohio

Filed Apr. 1, 1964, Ser. No. 356,470
9 Claims. (Cl. 204—129)



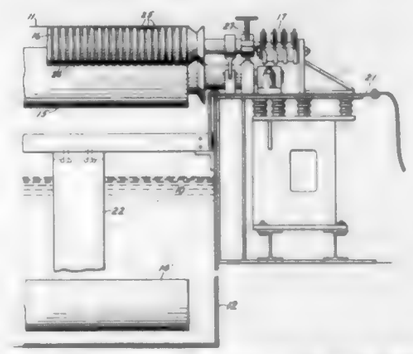
Electrolysis system for hydrogen-oxygen generation wherein a portion of one of the product gases is humidified and returned to a porous electrode in the electrolysis cell to replenish the water used up during electrolysis.

3,374,159

MARKING OF STEEL STRIP ELECTROLYTICALLY USING ELECTROLYTE ADHERING TO THE STRIP

William D. Poole, Center Valley, Pa., assignor to Bethlehem Steel Corporation, a corporation of Delaware

Filed Feb. 9, 1965, Ser. No. 431,269
7 Claims. (Cl. 204—143)



In a method of marking strip, a metal strip is withdrawn from a pickling bath, the strip carrying with it a film of pickling solution. The wet strip makes physical contact with a marking roll having electrically conductive portions and raised electrically non-conductive portions on its surface. Current from a current source passes by way of an electrode in the pickling solution to the strip as anode, and thence through the liquid film on said strip to the electrically conductive portions of the marking roll and back to the power source. Sufficient current is supplied to develop a light etch on the strip in the pattern of the electrically conductive roll surface.

3,374,160

PHOTOPOLYMERIZATION WITH O-BROMOACETOPHENONE AS A PHOTOINITIATOR

Tzu Jen Mao, Royal Oak, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

No Drawing. Filed Oct. 26, 1966, Ser. No. 589,486
5 Claims. (Cl. 204—159.23)

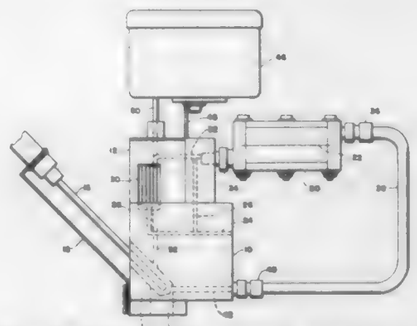
Ethylenically unsaturated organic monomers such as methyl methacrylate containing a small but effective amount of ortho-bromoacetophenone are polymerized upon exposure to ultraviolet light. Ortho-bromoacetophenone acts as a photopolymerization initiator.

3,374,161

EXTERNAL COULOMETRIC GENERATOR

Jules Zatz, Fullerton, Calif., assignor to Beckman Instruments, Inc., a corporation of California

Filed Oct. 28, 1964, Ser. No. 407,099
6 Claims. (Cl. 204—195)



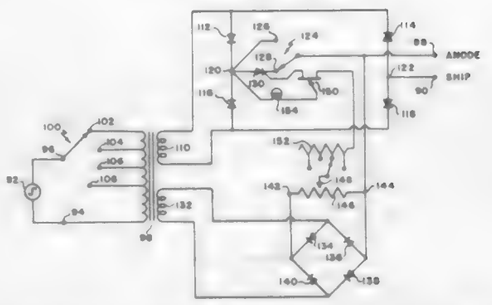
An external coulometric reagent generator for use in a process titrator, for example, including vertical electrode wires on the face of the membrane for reducing opposition to the flow of the electrolyte, a parallel upward path in the electrolyte flow-stream prior to the path leading up into the generator to permit the escape of entrapped air bubbles, and a hydrophobic filter arranged to expel any gas flowing upward through the vertical conduits and to block the flow of electrolyte.

3,374,162

CONTROL UNIT FOR AUTOMATIC CATHODIC PROTECTION

Haydn Rubelmann, 1201 McDonald Road, Norfolk, Va. 23500

Filed Aug. 21, 1962, Ser. No. 218,468
8 Claims. (Cl. 204—196)



1. In a cathodic protection system means for detecting changes in potential difference between an object being protected and a protection anode irrespective of environmental conditions or previous regulatory currents existing therebetween, comprising:

a source of power;

first and second sources of differing static electrical potential in which the said object and anode are respectively located;

threshold gating means having a first input element connected to said source of power and to said first source of potential, and a second input element connected to said second source of potential;

said gating means having a further element whereby a small operating current normally flows between said second and further elements;

means isolating said small current flow from said sources of potential;

said threshold gating means being biased to non-conduction between said first and second input elements when the potential difference between said sources of potential is at a predetermined level and being biased to conduction when the difference in potential between said sources of potential decreases from said predetermined level by a predetermined amount.

3,374,163

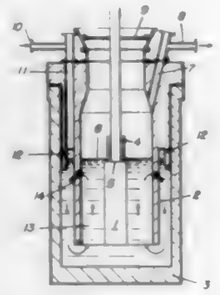
CELL FOR ELECTROLYSIS WITH MOLTEN SALT ELECTROLYTE

Edwin Meier and Erich Schweizer, Basel, Switzerland, assignor to Ciba Limited, Basel, Switzerland, a Swiss company

Filed Nov. 7, 1963, Ser. No. 322,106
Claims priority, application Switzerland, Nov. 15, 1962, 13,355/62
3 Claims. (Cl. 204—246)

An electrolytic cell is provided for the manufacture of metals of the 4th, 5th and 6th sub-groups of the Periodic Table from the halide of the metal in a molten salt electrolyte. The cell has a hollow cylindrical anode and a rod-shaped cathode. The cathode is positioned within and coaxially aligned with the anode. The anode is characterized by having a plurality of annularly-arranged holes which extend downward from the inner wall of the anode

to the outer wall of the anode. The cell has a downward-opening annular chamber positioned about the outer wall of the anode. In operation the cell is filled with a molten salt electrolyte to a level at which the surface of the electrolyte is slightly above the holes in the anode



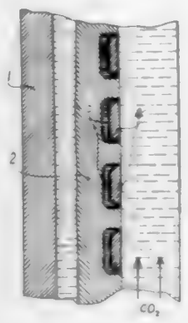
and in communication with the opening of the annular chamber. A vaporized metal halide is fed into the annular chamber from where it is introduced into the electrolyte. The holes in the anode assist the circulation of the electrolyte and facilitate the removal of the halide gases from the electrolyte in the cell.

3,374,164

ELECTROLYZER FOR SIMULTANEOUS PREPARATION OF CHLORINE AND ALKALI CARBONATES

Jan Balej, Ivo Paseka, and Jiří Vondrák, Prague, and Vojtěch Koudelka, Mlada Boleslav, Czechoslovakia, assignors to Ceskoslovenska Akademie Ved, Prague, Czechoslovakia

Filed June 10, 1964, Ser. No. 374,077
Claims priority, application Czechoslovakia, June 28, 1963, 3,729/63
11 Claims. (Cl. 204—265)



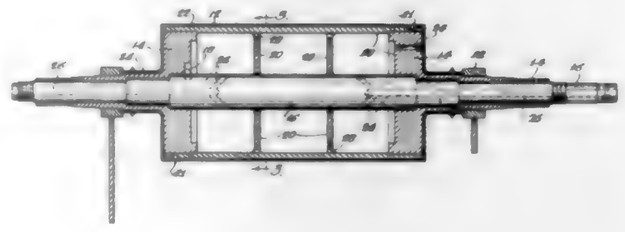
An electrolytic device for the simultaneous production of chlorine and alkaline carbonates comprises an anode, a cathode, means for introducing carbon dioxide into the cathode space, and a diaphragm which is separated from the active surface of the cathode. The diaphragm may be arranged on and adhered to a separate auxiliary screen which is spaced from the cathode and consists of an insulating material or of metal coated with an insulating surface. The diaphragm may also be arranged directly on the cathode which at the side where the diaphragm is arranged is provided with an insulating coating which separates the diaphragm from the active surface of the cathode. The cathode may consist of a screen or other apertured body and the carbon dioxide may be introduced into the space adjacent that portion of the cathode which is free of said insulating coating. The diaphragm may consist of asbestos or a plastic. The efficiency of the electrode is thus increased, since migration of the hydroxyl ions prior to carbonation is prevented.

3,374,165

CONDUCTOR ROLL

John W. O'Brien, Villa Park, and Arthur R. Stahlberg, Park Ridge, Ill., assignors to Electro-Coatings, Inc., a corporation of Delaware

Filed Feb. 18, 1965, Ser. No. 433,688
14 Claims. (Cl. 204—279)



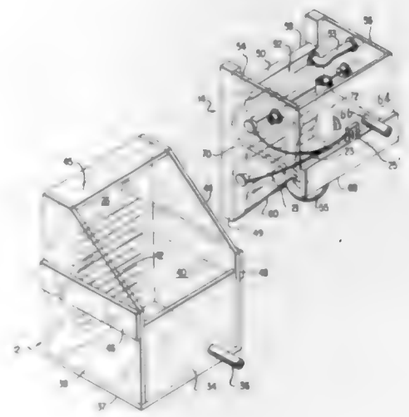
1. A conductor roll for use as an electrode in a bath of an electrolytic coating or cleaning system, which comprises a shaft, an inner, highly electrically conductive, tubular metal shell, a highly electrically conductive metal trunnion means supporting said inner shell on said shaft for rotation therewith, and a seamless, outer, centrifugally cast, electrically conductive tubular metal shell contraction fitted on said inner shell in compression force-fit with and covering the outer surface of said inner shell providing electrical connection between the inner and outer shells, the metal of said outer shell being highly resistant to acid corrosion and having lower electrical conductivity than the metal of said inner shell.

3,374,166

VERTICAL GEL ELECTROPHORESIS APPARATUS

Samuel Raymond, 4312 Osage Ave., Philadelphia, Pa. 19104

Filed Nov. 30, 1964, Ser. No. 414,654
Claims priority, application Great Britain, Sept. 21, 1964, 38,461/64
7 Claims. (Cl. 204—299)



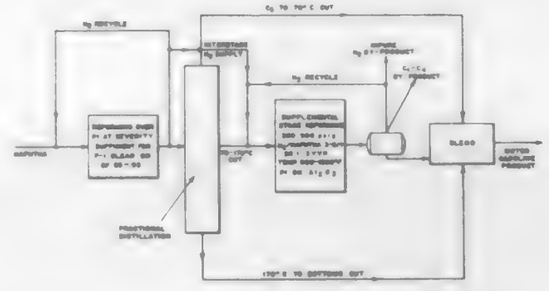
1. A vertical gel electrophoresis apparatus of the type including a lower buffer solution chamber capable of holding liquid buffer solution, an upper buffer solution chamber capable of holding liquid buffer solution, a wall of each buffer solution chamber defining a gel passageway, the gel passageway being in fluid communication with liquid buffer solution in the buffer solution chambers and, when said passageway is filled with impermeable gel free flow of buffer solution from the upper chamber to the lower chamber is prevented by said gel, an electrode in each buffer solution chamber positioned below a normal level for buffer solution therein, each electrode including means for connection to a source of D.C. current, the upper and lower buffer solution chambers and the gel passage walls being constructed of a material having electrically insulating properties at least on the surface thereof, and means for holding the upper and lower buffer solution chambers in rigid assembled relationship, the improvements comprising, an internal drain tube extending from the bottom of the upper tank upwardly a distance equal to a desired level of buffer solution in the tank, external tubular connections establishing fluid communication between the two tanks and pump means for recirculating buffer solution from the lower tank through the external tubular connections to the upper tank and then draining back to the lower tank.

3,374,167

PREPARATION OF MOTOR FUELS HAVING AN OCTANE NUMBER ABOVE 100

Robert G. Craig, Fairfax, Wilmington, Del., and Lee Friedman, Bala Cynwyd, and William A. Schwartz, Morton, Pa., assignors to Air Products and Chemicals, Inc., Philadelphia, Pa., a corporation of Delaware

Filed Mar. 1, 1966, Ser. No. 530,989
4 Claims. (Cl. 208—65)



A full range reformate having an F_1 clear octane number of about 90, and derived from hydrogenative reforming over a platinum on alumina catalyst, is fractionally distilled to separate a heart cut having an IBP of at least 70° C. and EBP below 170° C. Said heart cut is reformed at about 535° C. at about 20 atmospheres H_2 pressure at a H_2/hydrocarbon mol unit ratio of about 10 at about 3 liquid volumes of hydrocarbon per volume of platinum on alumina catalyst, and the second stage reformate is blended with the bottoms and forecut from the first stage reformate to provide full range gasoline having an F_1 clear octane number above 100. Among multi-step routes toward full range gasoline having F_1 clear octane above 100 using only reforming steps featuring platinum catalyst, this method has advantageously high yield and advantageously low deactivation rate for total platinum inventory.

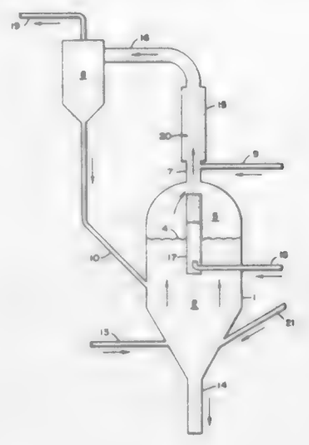
3,374,168

COKING PROCESS AND APPARATUS

William Joseph Metrailer, Baton Rouge, La., assignor to Esso Research and Engineering Company, a corporation of Delaware

Filed June 29, 1966, Ser. No. 561,519
10 Claims. (Cl. 208—127)

An upflow high temperature coking process and apparatus are described in which fluid coke is produced by pyrolysis of hydrocarbons. The fluid coke is entrained in liberated hydrogen and conveyed to a transfer line burner, heated therein and returned to the fluid coke bed to provide the endothermic heat of cracking for the coking reaction.



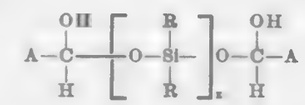
3,374,169

ORGANIC LIQUIDS THICKENED WITH TREATED SILICA MATERIALS

Nelson H. Kasten and Harry Teicher, St. Louis, Mo., assignors to Monsanto Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Filed Feb. 7, 1966, Ser. No. 525,333
12 Claims. (Cl. 252—28)

The present invention relates to a thickening agent comprising silica material such as fume silica or a silica aerogel and a silicone glycol copolymer having the general formula



wherein R is an alkyl group having 1 to 4 carbon atoms; A is either hydrogen, an alkyl group having 1 to 3 carbon atoms, or a hydroxy substituted alkyl group having 1 to 3 carbon atoms; and x is an integer representing the number of units in the molecular chain and has a value of 1 to 25. The aforesaid novel thickening agent is utilized for increasing the viscosity and thixotropy of a variety of organic liquids, such as an oleaginous liquid, a liquid organic resin, and the like. Such organic liquids containing the novel thickening agent comprise another embodiment of this invention.

3,374,170

GREASE COMPOSITION

John F. Hedenburg, Cheswick, and Chester S. Tempalski, Pittsburgh, Pa., assignors to Gulf Research & Development Company, Pittsburgh, Pa., a corporation of Delaware

No Drawing. Filed Apr. 4, 1966, Ser. No. 539,745
10 Claims. (Cl. 252—28)

3. A lubricating composition comprising a liquid polyorgano siloxane thickened to a grease consistency with about 10 to about 25 percent by weight of a polyaryl urea which prior to being incorporated into the polyorgano siloxane has been heated to a temperature of

about 450° to about 600° F. for a time sufficient to reduce the weight of the polyaryl urea by about 20 to about 40 percent, said polyaryl urea being the reaction product of an aryl isocyanate having the formula:

$$R(NCO)_n$$

where R is selected from the group consisting of arylene and C_1 to C_4 alkyl substituted arylene radicals containing not more than 12 cyclic carbon atoms and n is an integer of 2 to 3 and an aryl amine having the formula:

$$R_1(NH_2)_m$$

where R_1 is selected from the group consisting of aryl, alkaryl, aminoaryl, hydroxyaryl, cyanoaryl, haloaryl, alkoxyaryl, aryloxyaryl and aminoaryloxyaryl radicals wherein the alkyl portions of said alkaryl and alkoxyaryl radicals contain from 1 to 4 carbon atoms and m is an integer of 1 to 3 and wherein said reaction product is prepared by reacting the aryl isocyanate and the aryl amine in amounts such that the ratio of the isocyanate groups to the amine groups is within the range of about 1:1 to about 1:2 and about 0.5 to about 5 percent by weight of an auxiliary thickening agent selected from the group consisting of finely-divided silica, p-polyphenyl, and ammeline.

3,374,171

AQUEOUS LUBRICANT COMPOSITIONS CONTAINING AN ALKANOLAMINE, A SATURATED ORGANIC ACID AND A POLYOXYALKYLENE GLYCOL

Robert H. Davis, Pitman, N.J., assignor to Mobil Oil Corporation, a corporation of New York

No Drawing. Continuation-in-part of application Ser. No. 505,454, Oct. 28, 1965. This application Apr. 25, 1967, Ser. No. 633,416

10 Claims. (Cl. 252—34.7)

Lubricant compositions are provided containing a major proportion of water and minor amounts of a water-soluble alkanolamine, a saturated organic acid having from about 6 to about 9 carbon atoms per molecule and a polyoxyalkylene glycol. These compositions are particularly effective as cutting fluids in metal machining operations.

3,374,172

OIL ADDITIVES

Kenneth Charles Roberts, Mellor, and Albert William White, Bramhall, England, assignors to The Anchor Chemical Company Limited, Manchester, England, a British company

No Drawing. Filed Apr. 7, 1966, Ser. No. 540,824

Claims priority, application Great Britain, Apr. 9, 1965, 15,300/65

5 Claims. (Cl. 252—37.2)

1. An extreme pressure oil additive for lubricating oils and cutting fluids comprising

(a) a liquid reaction product of sulphur monochloride and a fatty ester, in an amount sufficient to impart extreme pressure properties when the additive is incorporated in a lubricating oil or cutting fluid, and

(b) a salt, soluble in the sulpho-chlorinated product and in the lubricating oil or cutting fluid, of a Group II metal and an acid selected from the group consisting of naphthenic acids and aliphatic carboxylic acids, said salt being present in an amount sufficient to prevent stain when the additive is incorporated in a lubricating oil or cutting fluids.

3,374,173

LUBRICANT COMPOSITIONS CONTAINING 2,4,6-TRI-AMINO-SUBSTITUTED PYRIMIDINES

Stuart Walter Critchley, Hale Barns, and Frank Lamb, Oldham, England, assignors, by mesne assignments, to Geigy Chemical Corporation, Ardsley, N.Y., a corporation of Delaware

No Drawing. Original application Nov. 9, 1964, Ser. No. 409,993, now Patent No. 3,325,496, dated June 13, 1967. Divided and this application Mar. 28, 1967, Ser. No. 626,400

Claims priority, application Great Britain, Nov. 12, 1963, 44,534/63

3 Claims. (Cl. 252—50)

Lubricant compositions are provided comprising as an essential lubricant ingredient 2,4,6-tri-amino-substituted pyrimidines. Such lubricant compositions are of especial value as high temperature lubricants or other functional fluids for use at high temperatures.

3,374,174

COMPOSITION

William M. Le Suer, Cleveland, Ohio, assignor to The Lubrizol Corporation, Wickliffe, Ohio, a corporation of Ohio

No Drawing. Filed Apr. 12, 1966, Ser. No. 541,963

11 Claims. (Cl. 252—51.5)

Nitrogen-containing compositions obtained from the reaction of an amine with a high molecular weight carboxylic acid such as a monocarboxylic acid and an alkylene or arylene dicarboxylic are useful in lubricants.

3,374,175

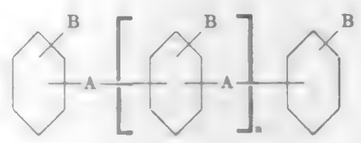
PHENYL ETHER COMPOSITIONS

Karl J. Sax, Orinda, Calif., Walfred S. Saari, Ambler, Pa., and Clarence L. Mahoney, Berkeley, Calif., assignors to Shell Oil Company, New York, N.Y., a corporation of Delaware

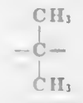
No Drawing. Continuation-in-part of abandoned application Ser. No. 701,296, Dec. 9, 1957. This application Apr. 29, 1960, Ser. No. 25,547

16 Claims. (Cl. 252—52)

6. A composition consisting essentially of a mixture of polyphenyl ethers having the general configuration



wherein n is a whole number from 2 to 6, the A's are radicals of the group consisting of oxygen and



at least one of which is oxygen and B is a radical of the group consisting of hydrogen, alpha-cumyl and tertiary-butyl, a first portion of the mixture being one in which all of the molecules have at least ⅔ of the pairs of radicals A attached to carbon atoms in the same phenyl rings in meta positions relative to each other and the second portion of the mixture being one in which all of the molecules have less than ⅔ of the pairs of radicals A attached to carbon atoms in the same phenyl ring in meta positions to each other, the mol ratio of the first portion to the second portion being between about 1:2 and about 9:1.

3,374,176

PROCESS FOR MAKING N-TYPE ZINC CADMIUM SULFIDE ELECTROLUMINESCENT MATERIAL

Ralph M. Potter, Pepper Pike, Ohio, assignor to General Electric Company, a corporation of New York

No Drawing. Continuation-in-part of application Ser. No. 19,446, Apr. 4, 1960. This application Jan. 4, 1965, Ser. No. 423,368

3 Claims. (Cl. 252—62.3)

1. The method of preparing a zinc-cadmium sulfoselenide wide band gap semiconducing phosphor having high and predominantly n-type conductivity and emission bands in the visible spectrum and being suitable for injection electroluminescence comprising preparing a solid solution of ZnS with CdS containing from about 0.3 to about 0.6 mol of Zn per total mols of Zn plus Cd and wherein the S may be partly substituted with Se, adding thereto 10^{-4} mol fraction of gallium, firing in H_2S at a temperature in the range of 750 to 900° C., and then refiring in vacuo in the presence of madmium at a temperature in the range of 750 to 900° C.

3,374,177

PRODUCTION OF A BLEACHING LIQUOR CONTAINING PERFORMIC ACID

Oswald Schmidt, Frankenthal, Pfalz, and Karl Heinz Ruecker, Ludwigshafen (Rhine), Germany, assignors to Badische Anilin- & Soda-Fabrik Aktiengesellschaft, Ludwigshafen (Rhine), Germany

No Drawing. Filed July 6, 1965, Ser. No. 469,897

Claims priority, application Germany, July 10, 1964, B 77,609, B 77,610

12 Claims. (Cl. 252—186)

A process for the production of a bleaching liquor containing performic acid by bringing together at a temperature of up to 60° C. in an acid to neutral aqueous solution (a) hydrogen peroxide and (b) at least one substance yielding either formaldehyde, a low molecular weight formic ester or a low molecular weight formamide, the hydrogen peroxide being present in an amount equivalent to one to twelve times that of the substances (b).

3,374,178

DOPED HYPOSTOICHIOMETRIC DIOXIDE NUCLEAR FUEL COMPOSITION AND METHOD OF PREPARATION

John Edward May, Wantage, England, and Richard Lloyd Stoute, Deep River, Ontario, Canada, assignors to Atomic Energy of Canada Limited, Ottawa, Ontario, Canada, a corporation of Canada

No Drawing. Filed May 3, 1965, Ser. No. 452,895

7 Claims. (Cl. 252—301.1)

1. A ceramic nuclear fuel composition comprising a hypostoichiometric dioxide of a metal selected from the group consisting of uranium and thorium and mixtures thereof with an oxygen to metal ratio in the range of about 1.90–1.998 and containing therein minor quantities of an additive oxide of a metal selected from the group consisting of yttrium, lanthanum and niobium.

7. The procedure for forming reactor fuel compositions comprising: (1) forming an intimate mixture of a hyperstoichiometric dioxide of a metal selected from the group consisting of uranium and thorium and mixtures thereof with up to about 1 atom percent of a member selected from the group consisting of the metal and metal oxides of yttrium, lanthanum and niobium; (2) sintering the mixture; and (3) thereafter reducing the dioxide to a hypostoichiometric state at a temperature in the range of about 1700–2000° C.

3,374,179

GREEN ELECTROLUMINESCENT ZINC SULFIDE PHOSPHOR

Ivie Lee Smith, Greenville, N.C., assignor to General Electric Company, a corporation of New York

Continuation-in-part of application Ser. No. 310,668, Sept. 23, 1963. This application Apr. 10, 1967, Ser. No. 633,665

5 Claims. (Cl. 252—301.6)

A green electroluminescent ZnS:CuCl phosphor of improved brightness and maintenance prepared by a single firing. A mixture of pure ZnS with from 0.2 to 1% by weight CuCl or CuBr, 0.002 to 0.3% by weight As_2O_3, or Sb_2O_3, or Bi_2O_3, or PbO as a fluxing agent, and optionally not over 1% ZnO, is fired in a loosely closed container allowing any gases to be expelled at a temperature in the range of 850 to 950° C. for a period of at least one hour.

3,374,180

PROCESS FOR PREPARING SILICA AQUASOLS

Ralph Marotta, St. Louis, Mo., assignor to Monsanto Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Filed Dec. 28, 1964, Ser. No. 421,703

3 Claims. (Cl. 252—313)

The present invention is directed to and covers a process for preparing silica aquasols containing 30% or more SiO_2 and having colloidal silica particles within the predetermined particle size range hereinafter set forth. This process consists of adding a deionized, acidic silica aquasol to an initial aqueous heel which consists essentially of an aqueous alkali silicate solution having an SiO_2/alkali metal oxide ratio of from about 2.5/1 to about 10/1, which heel weight is approximately 5 to 10% of the total acidic silica aquasol weight and said heel is, during said addition, initially at its boiling temperature at the pressure employed and is essentially maintained at such temperature during the addition of said acidic aquasol thereto, thereby causing water to evaporate from the resultant composite of said heel and acidic aquasol, said acidic aquasol being added at such a rate initially that at least from about 25% to about 30% by weight of said acidic aquasol is added at a rate equal to the rate of evaporation of water from said composite as aforesaid. The composite is then continuously heated under conditions of temperature and pressure such that water is continuously evaporated from said composite and until a final silica aquasol product containing about 30% by weight and more of colloidal silica is obtained. The above-described acidic silica aquasol is added in a total amount such as to provide a final silica aquasol having a pH in the range of 8.5 to 10.5. When the initial heel has a ratio of 2.5/1 to 4.5/1, the resultant silica aquasol has a particle size range of about 15 to 30 millimicrons. When the heel has a ratio of 5/1 to 10/1, the resultant product has a particle size of 35 to 60 millimicrons.

3,374,181

PREPARATION OF COPPER TREATER CATALYST

David S. Joy, Bartlesville, Okla., and Robert E. Dollinger, Borger, Tex., assignors to Phillips Petroleum Company, a corporation of Delaware

Filed Aug. 3, 1964, Ser. No. 386,866

10 Claims. (Cl. 252—440)

1. A process for preparing a composite comprising essentially cupric and chloride ions in concentrated aqueous solution deposited on a porous adsorbent support which comprises the steps of:

(1) maintaining an agitated moving bed of said porous adsorbent support;

(2) spraying said solution in substantial excess of the final concentration obtained in step (3) onto said support in the bed of step (1) so as to form an essentially homogeneous mixture of support and solution

at a rate to provide the desired cupric ion concentration;

(3) suspending the resulting mixture of step (2) in a fluidized bed drying zone in a hot drying gas so as to partially dry said mixture to a water content in the range of about 10 to 20 weight percent and leave a concentrated solution of cupric and chloride ions thereon; and

(4) recovering the partially dried composite essentially comprising said support impregnated with concentrated solution.

6. The process of claim **1** wherein said support is fuller's earth and said salt solution is a mixture of copper sulfate and sodium chloride.

3,374,182

CAUSTIC-TREATED ZEOLITES

Dean Arthur Young, Yorba Linda, Calif., assignor to Union Oil Company of California, Los Angeles, Calif., a corporation of California

No Drawing. Filed May 22, 1964, Ser. No. 369,611
8 Claims. (Cl. 252—455)

Adsorptive capacity and porosity of certain silica-rich zeolites, e.g. mordenite, are improved by digestion with aqueous caustic solutions to leach out a minor proportion of structural silica, without significantly altering crystal structure.

3,374,183

COPPER OXIDE-ALUMINA CATALYST COMPOSITION

Douglas E. Cooper, Birmingham, Mich., assignor to Ethyl Corporation, New York, N.Y., a corporation of Virginia

No Drawing. Continuation-in-part of application Ser. No. 26,698, May 4, 1960. This application Mar. 30, 1961, Ser. No. 99,340
15 Claims. (Cl. 252—463)

1. A method for producing a catalyst, which comprises commingling aqueous ammonia and a carbonate of copper, impregnating an alumina base with the resultant mixture, drying the impregnated base to composite with the base a compound of copper and then calcining the dried base to form a composite of alumina and an oxide of copper.

10. A catalyst composition especially adapted to catalyze the oxidation of exhaust gases, said composition consisting essentially of transition alumina impregnated with 0.5 to 25 percent by weight of copper in an oxide form, said copper oxide being characterized by having been formed by heating a residual product formed in turn by impregnating a transition alumina of the activated type and having a surface area of at least 75 square meters per gram and a silica content of 0.01 to about 5 percent with a deeply violet-colored solution formed by reacting, in the presence of water, an essentially insoluble copper compound selected from the class consisting of copper oxides, copper hydroxide and copper carbonates with an ammoniacal reagent selected from the class consisting of ammonia, ammonium hydroxide and ammonium carbonate, said solution being characterized in that substantially the only anions present are selected from the class consisting of carbonate anions and hydroxide anions.

3,374,184

COPPER CHROMITE-ALKALI METAL OXIDE HIGH SURFACE AREA HYDROGENATION CATALYST

James McEvoy, Morton, and Harold Shalit, Drexel Hill, Pa., assignors to Air Products and Chemicals, Inc., Philadelphia, Pa., a corporation of Delaware

No Drawing. Filed Mar. 11, 1964, Ser. No. 351,238
5 Claims. (Cl. 252—467)

1. The method of catalyst preparation which comprises incorporating alkali metal compound into cupric ammonium chromate, and thereafter igniting the obtained mixture at about 450–550° F. to transform the alkali metal compound to alkali metal oxide, and to decompose said chromate compound to form cupric chromite the amount of alkali metal oxide so incorproated being 0.01 to 5% by weight of the ignited catalyst, said catalyst being more selective than previously marketed copper chromite catalyst for hydrogenation of furfural to furfuryl alcohol.

3,374,185

ELECTROCONDUCTIVE COMPOSITION CONTAINING $BaPbO_3$

Tsuneharu Nitta, Osaka-fu, Hiromitsu Taki, Sakai-shi, Osaka-fu, and Kaneomi Nagase, Kyoto-shi, Kyoto-fu, Japan, assignors to Matsushita Electric Industrial Co., Ltd., Osaka, Japan

No Drawing. Filed Sept. 15, 1965, Ser. No. 487,621
Claims priority, application Japan, Sept. 17, 1964, 39/53,652; Oct. 27, 1964, 39/61,377
4 Claims. (Cl. 252—521)

Ceramic materials composed essentially of barium oxide and lead dioxide have a low electrical resistivity with a small positive temperature coefficient, and are especially useful in the making of sintered resistors, particularly thin layer resistors. The barium oxide, as barium carbonate, is intimately admixed with PbO or Pb_3O_4 and fired (calcined) at 650–800° C., after which the calcined product is crushed and dried. In use, the product may be pelletized, or formulated for use in making resistors, by admixing with refractory oxide and then converting into paste form, or it may be admixed with inert resin of high electrical resistance and used in making thin layer resistors.

3,374,186

CURING POLYEPOXIDE COMPOUNDS WITH A POLYAMINE

Franz Steden, Mannheim, and Ludwig Beer and Oskar Lissner, Ludwigshafen (Rhine), Germany, assignors to Badische Anilin- & Soda-Fabrik Aktiengesellschaft, Ludwigshafen (Rhine), Germany

No Drawing. Filed May 21, 1965, Ser. No. 457,801
Claims priority, application Germany, June 9, 1964, B 77,162
5 Claims. (Cl. 260—2)

1. In a process for the production of insoluble and infusible products by mixing polyepoxides having more than one 1,2-epoxy group in the molecule with polyamines and curing the mixture at from about 20° to about 200° C. the improvement of using a 1-aminomethyl-2-aminopropylcyclohexane as the polyamine.

3,374,187

FLAME RETARDANT COMPOSITIONS PREPARED FROM HALOGENATED 1,2-MONOEPOXYCYCLODODECA-5,9-DIENE AND ADDUCTS THEREOF

David G. Hare, Bricket Wood, near St. Albans, England, and Robert J. Stephenson, Cwmbran, England, assignors to Monsanto Chemicals Limited, London, England, a British company

No Drawing. Filed Nov. 30, 1964, Ser. No. 414,887
Claims priority, application Great Britain, Dec. 6, 1963, 48,195/63
9 Claims. (Cl. 260—2.5)

The invention comprises a flame-retardant synthetic resin material comprising a synthetic resin and as flame-retarding agent a halogenation product of 1,2-monoepoxycyclododeca-5,9-diene or a halogenation product of an adduct of 1,2-monoepoxycyclododeca-5,9-diene with a phosphorus halide or with a compound containing a hydroxylic group. The flame-retardant resin material can be a foamable resin material or a foamed resin material, for instance, a foamable or a foamed polystyrene.

3,374,188

PREPARATION OF EXPANDED CELLULAR PRODUCTS

Frank Dennis Marsh, Wilmington, Del., and Donald Nixon Thatcher, Pitman, N.J., assignors to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Filed Sept. 14, 1965, Ser. No. 487,311
4 Claims. (Cl. 260—2.5)

The process for preparing expanded cellular products comprising intimately mixing an amount of ammonium 5-azidotetrazole as a blowing agent with an organic polymer composition and heating to decompose the blowing agent.

3,374,189

2,4,6-TRISUBSTITUTED SULFONYLHYDRAZIDO-s-TRIAZINES AS BLOWING AGENTS FOR HIGH MOLECULAR WEIGHT ORGANIC POLYMERS

John E. Herweh and Algirdas C. Poshkus, Lancaster, Pa., assignors to Armstrong Cork Company, Lancaster, Pa., a corporation of Pennsylvania

No Drawing. Filed Nov. 1, 1965, Ser. No. 505,952
4 Claims. (Cl. 260—2.5)

A process for forming cellular organic polymeric compositions wherein 2,4,6-trisubstituted sulfonylhydrazido-s-triazines are incorporated in the polymer and decomposed with heat. The substituent groups on the triazine may be alkyl or arylalkylene.

3,374,190

2,4,6-TRIARYL SULFONYLHYDRAZIDO-s-TRIAZINES AS BLOWING AGENTS FOR HIGH MOLECULAR WEIGHT ORGANIC POLYMERS

John E. Herweh and Algirdas C. Poshkus, Lancaster, Pa., assignors to Armstrong Cork Company, Lancaster, Pa., a corporation of Pennsylvania

No Drawing. Filed Nov. 1, 1965, Ser. No. 505,985
6 Claims. (Cl. 260—2.5)

A process for forming cellular organic polymeric compositions wherein, 2,4,6 triaryl sulfonyl hydrazido-s-triazines are incorporated in the polymer and decomposed with heat. The aryl substituents on the triazine may be phenyl, substituted phenyl, naphthyl, and substituted naphthyl.

3,374,191

PROCESS FOR THE PRODUCTION OF ELASTOMERIC DIENE POLYMERS WITH IMPROVED PROPERTIES

Karl Nutzel, Cologne-Stammheim, Germany, assignor to Farbenfabriken Bayer Aktiengesellschaft, Leverkusen, Germany, a corporation of Germany

No Drawing. Filed Aug. 5, 1965, Ser. No. 477,593
10 Claims. (Cl. 260—5)

The cold flow characteristics of a synthetic diene polymer are improved by reacting the polymer, while dissolved in an inert hydrocarbon solvent, with a sulfur chloride.

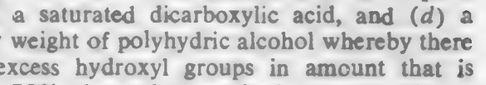
3,374,192

MODIFIED CEMENT MORTAR CONTAINING EMULSION POLYMER OF 2 METHYL α OLEFIN AND MIXED DIALKYL FUMARATE

Roman S. Slysh, Scotch Plains, and George M. Kagun, Metuchen, N.J., assignors to Esso Research and Engineering Company, a corporation of Delaware

No Drawing. Continuation-in-part of application Ser. No. 379,731, July 1, 1964. This application Nov. 18, 1965, Ser. No. 508,545
6 Claims. (Cl. 260—17)

1. A cementitious mortar composition comprising cement, water, sand and an emulsion polymer of a C_4 to C_9 2-methyl alpha olefin and a mixed dialkyl fumarate selected from the group consisting of dialkyl fumarate esters having the general formula:



wherein R_1 is a C_1 to C_3 alkyl radical and R_2 is a C_4 to C_{18} alkyl radical.

4. A composition as defined by claim **1** which also contains 0.01 to 0.25 wt. percent methyl cellulose.

3,374,193

POLYEPOXIDE FLUIDIZED BED COATING COMPOSITIONS

William T. Tsatsos, San Mateo, and Roy W. Tess, Orinda, Calif., assignors to Shell Oil Company, New York, N.Y., a corporation of Delaware

No Drawing. Filed July 19, 1965, Ser. No. 473,218
10 Claims. (Cl. 260—18)

Fluidizable polyepoxide coating compositions are prepared by (1) mixing and reacting a polyepoxide with an aliphatic polymeric fatty acid, in the presence, optionally, of reaction catalysts, epoxy curing agents and fillers, (2) adding an alkali metal hydroxide in hot aqueous medium with rapid stirring until an emulsion forms and (3) cooling the emulsion and allowing the particles to settle out.

3,374,194

COCONUT OIL MODIFIED ALKYD RESINS AND COPOLYMERS THEREOF WITH AN ALKYL ACRYLATE

Robert H. Wholf, Anaheim, Calif., assignor to Allied Chemical Corporation, New York, N.Y., a corporation of New York

No Drawing. Continuation of application Ser. No. 120,509, June 29, 1961. This application July 20, 1967, Ser. No. 658,980
10 Claims. (Cl. 260—21)

1. A method of preparing a modified alkyd resin that is capable of forming a homogeneous copolymer with an alkyl acrylate of the group consisting of methyl methacrylate and ethyl acrylate that comprises heat-reacting (*a*) from 2 to 5 parts by weight of an alpha ethylenically unsaturated organic acid, (*b*) from 25 to 60 parts by weight of coconut oil, (*c*) from 20 to 55 parts by weight of a saturated dicarboxylic acid, and (*d*) a proportion by weight of polyhydric alcohol whereby there are present excess hydroxyl groups in amount that is from 10% to 75% above that required to react stoichiometrically with the carboxyl groups of said carboxylic acid components in the presence of from 0.005% to 0.5% based on the weight of the reaction mass, of a polymerization inhibitor until an alkyd resin having an acid number of from 1 to 25 is formed.

3,374,195

POLYVINYL ALCOHOL COMPOSITIONS CONTAINING A PLASTICIZER MIXTURE

Thomas S. Bianco, Hobart, and Edouard M. Kratz, Portage, Ind., assignors to Mono-Sol Division, Baldwin-Montrose Chemical Co., Inc.

No Drawing. Filed Mar. 3, 1964, Ser. No. 349,176
7 Claims. (Cl. 260—29.6)

1. A hot and cold water soluble film-forming polyvinyl alcohol composition containing, in percentages by weight of the polyvinyl alcohol content, a plasticizer combination of about 7–17% of hydroxypropyl glycerine and about 10–20% of a low molecular weight polyethylene glycol, the total proportion of said plasticizer combination being about 22–32%.

6. An aqueous film casting composition comprising an aqueous solution containing about 20–40% by weight of polyvinyl alcohol prepared by replacement of about 80–90% of the acetate groups of polyvinyl acetate by hydroxyl groups, said polyvinyl alcohol having a viscosity of about 20–45 centipoises in 4% aqueous solution at 20° C., and a plasticizer combination of about 7–17% substantially tri-(1-methyl-2-hydroxyethyl) glyceryl ether, and about 10–20% of polyethylene glycol having an average molecular weight of about 200–300.

3,374,196

SLOW-DRYING LATEX PAINTS COMPRISING UREA-POLYOL SOLUTIONS

John A. Gillis, Woburn, and Ronald W. Hayes, Boston, Mass., assignors, by mesne assignments, to Hunt Manufacturing Co., Philadelphia, Pa., a corporation of Pennsylvania

No Drawing. Filed Mar. 27, 1964, Ser. No. 355,452
4 Claims. (Cl. 260—29.6)

1. A latex coating composition containing as a drying rate depressing additive between about 20 pounds and about 60 pounds per 150 pounds of latex solids of a solution of urea in a non-polymeric water soluble polyol, the ratio by weight of urea to the water soluble polyol in said solution being between about 1 to 3 and about 2 to 1.

3,374,197

VINYLIDENE CHLORIDE COPOLYMER COMPOSITION

Richard Jay England, Circleville, Ohio, and Ronald William Skeddle, Clairton, Pa., assignors to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Filed Apr. 7, 1965, Ser. No. 446,435
2 Claims. (Cl. 260—29.6)

1. Process for preparing a coalescible aqueous coating composition of vinylidine chloride which comprises mixing (1) between about 50% and about 75% by weight of the total solids in said blend a first aqueous vinylidene chloride copolymer dispersion containing between about 92 and about 96 parts by weight of vinylidene chloride, between about 8 and about 4 parts by weight of an alkyl acrylate wherein the alkyl group contains from 1 to 3 carbon atoms and between about 0.5 and about 5 parts by weight of itaconic acid, wherein a coalesced film of said first aqueous dispersion is characterized by an infrared reflectance ratio between about 1.25 and about 1.55 with (2) between about 50% and about 25% by weight based upon the total solids content of said blend of a second aqueous vinylidene chloride copolymer dispersion which contains between about 80 and 91.5 parts by weight of vinylidene chloride, between 20 and 8.5 parts by weight of acrylonitrile and between about 0.5 and about 5 parts by weight of itaconic acid, wherein a coalesced film of said second dispersion is characterized by an infrared reflectance ratio no greater than 1.15, and further wherein the coalesced film of said blend of dispersions is characterized by an infrared reflectance ratio between about 1.35 and about 1.50.

3,374,198

VULCANIZABLE COMPOSITIONS OF OLEFIN COPOLYMERS

Luigi Falcone, Como, and Bruno Galletti, Ferrara, Italy, assignors to Montecatini Edison, S.p.A., Milan, Italy

No Drawing. Filed Nov. 20, 1964, Ser. No. 412,841
Claims priority, application Italy, Nov. 21, 1963, 23,690/63
10 Claims. (Cl. 260—41)

Compounding of ethylene-propylene and ethylene-butene-1 copolymers with specified inorganic fillers and with substance which promotes dispersion of filler and which results in improved mechanical properties of the vulcanizate. Disperson promoter may be polychloroprene, rubbery butadiene-acrylonitrile copolymers, ethylene-vinyl acetate copolymers, butadiene-styrene-methyl vinyl pyridine terpolymers, chlorosulphonated ethylene-propylene copolymers, brominated butyl rubber, polycondensation products of sodium polysulphide with a dihaloalkane, and products obtained by grafting maleic acid or maleic anhydride onto an olefinic polymer or copolymer.

3,374,199

NON-BLOCKING POLYOLEFIN COMPOSITIONS

Hardy E. Ross and Kenneth C. Finster, Lake Jackson, Tex., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Continuation-in-part of application Ser. No. 177,206, Mar. 5, 1962. This application Nov. 1, 1965, Ser. No. 505,987
6 Claims. (Cl. 260—41)

A film-forming composition having a reduced tendency to blocking comprising a resinous olefin polymer and between about 0.02 and about 0.5 percent by weight based on the composition of finely divided calcium carbonate particles of a size within the range greater than 1 micron and up to about 100 microns.

3,374,200

FLAME RETARDANT POLYACRYLATE RESINS

William George Deichert, Flushing, N.Y., assignor to American Cyanamid Company, Stamford, Conn., a corporation of Maine

No Drawing. Filed May 23, 1966, Ser. No. 551,946
10 Claims. (Cl. 260—45.75)

Polyacrylate resins are made resistant to burning and water-induced haziness by incorporating a stannic halide and a member of the group consisting of oxalic acid, zinc acetate and trichloroacetic acid.

3,374,201

POLYESTERS FROM A MIXTURE OF DIFFERENT AROMATIC DICARBOXYLIC ACIDS

Maria V. Wiener, Akron, Ohio, assignor to The Goodyear Tire & Rubber Company, Akron, Ohio, a corporation of Ohio

No Drawing. Filed Mar. 13, 1964, Ser. No. 351,834
16 Claims. (Cl. 260—47)

Polyester which has good cut-through resistance is prepared from (a) terephthalic acid, isophthalic acid, 2,6- or 2,7- or 1,5-naphthalene dicarboxylic acid, 4,4′-diphenyl dicarboxylic acid,

$$HOOC.C_6H_4.(CH_2)_n.C_6H_4.COOH$$

or

$$HOOC.C_6H_4.O.(CH_2)_n.O.C_6H_4.COOH$$

in which n is 1 to 4, (b) a diol and (3) an hydroxy-di-acid, 15 to 50 mol percent of all of the acid being hydroxy di-acids.

3,374,202

HOMOPOLYMERIC AND COPOLYMERIC ESTERS OF DUROHYDROQUINONE

Eckhard Christian August Schwarz, Grifton, N.C., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Filed Oct. 5, 1964, Ser. No. 401,697
8 Claims. (Cl. 260—47)

Linear polymeric esters derived from at least one organic dicarboxylic acid and an organic diol constituent which is wholly or in part durohydroquinone. Fibers of these polymeric esters exhibit high modulus and high recovery.

3,374,203

TRIGLYCIDYL ETHERS AND RESINS OF TRIHYDROXYBIPHENYLS

Seymour Schmukler, Dalton, Mass., assignor to General Electric Company, a corporation of New York

No Drawing. Filed Mar. 25, 1965, Ser. No. 442,813
4 Claims. (Cl. 260—47)

Triglycidyl ethers and epoxy resins formed from tetra-substituted trihydroxybiphenyls.

3,374,204

PROCESS FOR PREPARING HIGH MOLECULAR WEIGHT POLYHYDROXY-POLYETHER RESINS

John E. Masters and Herbert P. Price, Louisville, Ky., assignors to Celanese Coatings Company, New York, N.Y., a corporation of Delaware

No Drawing. Continuation-in-part of application Ser. No. 281,356, May 17, 1963. This application Feb. 2, 1967, Ser. No. 613,426
5 Claims. (Cl. 260—47)

Soluble, fusible polymeric polyhydroxy-polyether resins prepared by reacting a mono(hydroxyaliphatic) monoglycidyl diether of a dihydric phenol with a boron trifluoride type catalyst.

3,374,205

PRODUCTION OF PERACETIC ACID

Anthony Rustin and Louis C. S. Fernandes, Shawinigan, Quebec, Canada, assignors to Shawinigan Chemicals Limited, Montreal, Quebec, Canada, a corporation of Canada

No Drawing. Filed Dec. 30, 1964, Ser. No. 422,446
9 Claims. (Cl. 260—502)

A method for the production of stable, crude peracetic acid solutions by organic liquid phase oxidation of acetaldehyde in the presence of a manganese salt as catalyst. Manganese salts also catalyze an extremely rapid decomposition of product peracetic acid; this decomposition is retarded sufficiently by the addition of water to the crude product mixture to enable more permanent methods of stabilization to be carried out.

3,374,206

POLYCONDENSING A DIENE WITH POLYTHIOFORMALDEHYDE

Bernard Gourdon, Pau, Basses-Pyrenees, France, assignor to Societe Nationale des Petroles d'Aquitaine, Paris, France

No Drawing. Filed Mar. 2, 1965, Ser. No. 436,682
Claims priority, application France, Mar. 4, 1964, 966,001
11 Claims. (Cl. 260—73)

1. A method for the preparation of diene polymers containing thiomethylene groups, which comprises reacting a conjugated aliphatic diene having from 4 to 30 carbon atoms with a polythioformaldehyde of the formula $HS(CH_2S)_nH$, wherein n is an integer from 2 to 8, in the proportion of from 0.1 to 10 moles of the polythioformaldehyde reactant per mole of the diene reactant and in the presence of a free radical polymerization catalyst, by maintaining the mixture of such materials at temperatures of from 20° to 80° C. until the rubbery polymer product is formed.

3,374,207

CONTINUOUS PROCESS FOR THE EXTRACTION OF MONOMERS AND OLIGOMERS FROM HIGHLY POLYMERIZED CAPROLACTAM GRANULES

Kaspar Ryffel and Walter Zehnder, Ems, Switzerland, assignors to Inventa A.G. für Forschung und Patentverwertung, Zurich, Switzerland

Continuation-in-part of application Ser. No. 859,528, Dec. 14, 1959. This application Nov. 12, 1964, Ser. No. 412,282
5 Claims. (Cl. 260—78)

A process for the extraction of monomers and oligomers from highly polymerized poly-E-caprolactam granules and recovery for re-use. The granulated polymer containing the monomers and oligomers is caused to slide through a vertical tube and is contacted by an extractant in countercurrent.

3,374,208

PREPARATION OF POLYESTERS FROM ALKYLENE OXIDES AND DICARBOXYLIC ACID ANHYDRIDES

Jerome A. Seiner, Pittsburgh, and Earl E. Parker, Allison Park, Pa., assignors to Pittsburgh Plate Glass Company, Pittsburgh, Pa., a corporation of Pennsylvania

Filed Oct. 19, 1962, Ser. No. 231,767
1 Claim. (Cl. 260—78.4)

1. A method of forming a polyester which comprises reacting an anhydride of a dicarboxylic acid with an alkylene oxide selected from the class consisting of ethylene oxide, propylene oxide and butylene oxide, in the substantial absence of water and in the presence of (1) a glycol, and (2) a catalyst which is a metal compound in which the cationic portion thereof is selected from the class consisting of zinc, tin, manganese, lead, nickel, cobalt and cadmium, and in which the anionic portion is selected from the class consisting of oxygen, chlorine, acetate, butyrate, phosphate, nitrate, stearate, oleate and naphthenate.

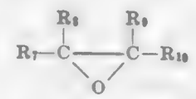
3,374,209

THERMOSETTABLE COMPOSITIONS CONTAINING POLYANHYDRIDE AND MONO-OXIRANE COMPOUNDS AND PROCESS OF MAKING

Russell G. Hay, Gibsonia, Stanley M. Hazen, Cheswick, and William J. Heilman, Allison Park, Pa., assignors to Gulf Research & Development Company, Pittsburgh, Pa., a corporation of Delaware

No Drawing. Filed Dec. 22, 1964, Ser. No. 424,470
24 Claims. (Cl. 260—78.4)

1. A new composition capable of being thermoset to a solid infusible resin having a network of ester and ether linkages, said ester linkages being formed through the interaction of anhydride and epoxide groups and said ether linkages being formed through the interaction of epoxide groups, said composition consisting essentially of a liquid solution at room temperature of a mixture of a solid compound containing at least two succinic anhydride groups in which the carbon atoms alpha to the carbonyl groups in the succinic anhydride groups are connected to each other through a single bond and a liquid mono-oxirane compound containing as its only functional group a single oxirane oxygen atom, and having the general formula:



wherein R_7, R_8 and R_9 are selected from the group consisting of hydrogen, a saturated hydrocarbon radical; an

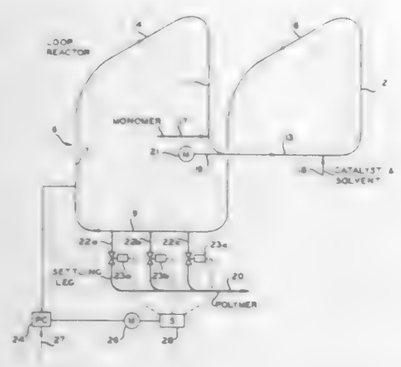
unsaturated hydrocarbon radical; a substituted saturated hydrocarbon radical; a substituted unsaturated hydrocarbon radical; and —OR, where R is a hydrocarbon radical and R_{10} is selected from the group consisting of a saturated hydrocarbon radical; an unsaturated hydrocarbon radical; a substituted saturated hydrocarbon radical; a substituted unsaturated hydrocarbon radical; and —OR, where R is a hydrocarbon radical, and wherein the unsaturation in said hydrocarbon radicals is such that the unsaturated mono-oxirane will not homopolymerize.

3,374,210
SULFONATED AROMATIC RESINS
N. William Muller, Clarendon Hills, Ill., and Harlan E. Tarbell, Elizabethton, Tenn., assignors, by mesne assignments, to Grefco, Inc., Philadelphia, Pa., a corporation of Delaware
No Drawing. Filed Sept. 20, 1965, Ser. No. 488,763
11 Claims. (Cl. 260—79.3)

Flame retarding sulfonated polyaromatic resins containing from 0.5 to 18% by weight of combined sulfuric acid, are prepared by adding gradually, with mixing, to a molten or dissolved PR resin, a solution of a sulfonating agent in an inert liquid which is preferably a lower mononitroalkane, and heating the mixture at 60° to 150° C. until all the sulfonating agent has reacted. The weight ratio of the sulfonated agent to the solvent should be within 3:2 to 1:2.

PR resins are asphalt-like residues containing a large proportion of polynuclear aromatic compounds, obtained from catalytic or thermal cracking of naphthas having an A.P.I. gravity of 40 to 60, to a product that is predominantly ethylene.

3,374,211
SOLIDS RECOVERY FROM A FLOWING STREAM
Stanley J. Marwil, Bartlesville, Okla., and Robert G. Wallace, Tokyo, Japan, assignors to Phillips Petroleum Company, a corporation of Delaware
Filed July 27, 1964, Ser. No. 385,423
2 Claims. (Cl. 260—88.2)



Removal of settled polymer from a polymerization system in a concentrated state without objectionable string formation is provided by (1) reducing the jacket coolant temperature on the settling leg by employing high coolant flow rate and low temperature difference between the coolant and the slurry; (2) providing a product settling zone having a predetermined length to internal diameter ratio; (3) providing a controlled pressure drop across the product discharge valve at the lower end of the settling leg of 20 to 45 p.s.i.g.; (4) using an instantaneous back pressure on the downstream side of the discharge valve of 100 to 200 p.s.i.g.; and (5) utilizing in the settling leg a heated flush medium to prevent precipitation of soluble polymer and to decrease the monomer solubility therein.

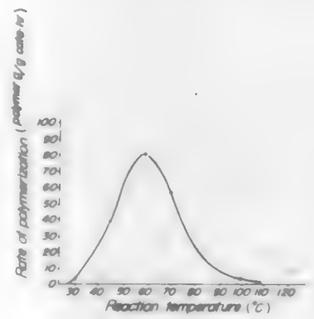
3,374,212
PURIFICATION OF POLYMERIZED OLEFINS PREPARED WITH CATALYSTS CONTAINING VANADIUM COMPOUNDS
Michael J. Marinak and George S. Fujioka, Walnut Creek, Calif., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware
No Drawing. Filed July 12, 1965, Ser. No. 471,432
7 Claims. (Cl. 260—88.2)

1. A process for removing colored vanadium constituents in catalyst residues contained in a polymer of an olefinic compound polymerized with a catalyst formed by admixing an organo-metallic reducing compound with a reducible vanadium compound, which process comprises first treating the polymer containing said catalyst residues with a solution of an oxidizing agent at a pH below 9 in an amount sufficient to oxidize the vanadium constituent to the vanadium V state and then converting the oxidized vanadium constituent to the vanadate salt form with a solution of an alkaline compound at a pH between about 9 to about 14.

3,374,213
POLYPROPYLENE POLYMERIZATION PROCESS
Donald F. Hoeg, Mount Prospect, Ill., assignor, by mesne assignments, to Rexall Drug and Chemical Company, Los Angeles, Calif., a corporation of Delaware
No Drawing. Filed Nov. 2, 1962, Ser. No. 235,122
3 Claims. (Cl. 260—88.2)

1. The process for polymerizing propylene so as to obtain a solid polymer product having decreased low temperature brittleness which comprises polymerizing the propylene feed with a stereo-specific catalyst system of titanium trichloride/triethyl aluminum, the titanium trichloride having the formula $3TiCl_3 \cdot AlCl_3$ in the presence of from 5 to 15 volume percent of ethylene based on propylene at a temperature above 100° C.

3,374,214
PROCESS FOR POLYMERIZING PROPYLENE USING A SOLID TERNARY CATALYST OF TITANIUM, ANTIMONY AND ALUMINUM
Itsuho Aishima and Yukichi Takashi, Nobeoka-shi, Japan, assignors to Asahi Kasei Kogyo Kabushiki Kaisha, Osaka, Japan, a corporation of Japan
Filed Nov. 26, 1963, Ser. No. 326,079
Claims priority, application Japan, Jan. 24, 1962, 37/52,844; May 22, 1963, 38/25,533; May 24, 1963, 38/26,267
26 Claims. (Cl. 260—93.7)



A process for the polymerization of propylene in the presence of a catalyst which contains no free aluminum trialkyl or alkyl aluminum halide and contains titanium, aluminum and antimony in an atomic ratio of

1:0.05–0.5:0.001–0.1

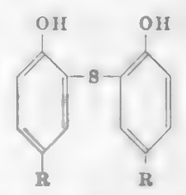
The catalyst is prepared by first reacting titanium trichloride with SbR_5, $SbAlR_8$, $SbAl_2R_{11}$ or

$[SbR_4][Al_mR_nX_{3m-n+1}]$

in an inert reaction medium at a temperature between room temperature and 150° C., removing the inert reaction medium from the solid part of the resulting product and then reacting the solid part with an aluminum trialkyl at a temperature between 30° C. and 100° C., separating the resulting solid product from the liquid phase at room temperature and washing the solid product with a hot aromatic hydrocarbon to remove therefrom any organoaluminum compounds, and thereby render the solid product free of aluminum trialkyl or alkyl aluminum halide.

3,374,215
SYNTHETIC POLYMER COMPOSITIONS HAVING A PARTICULAR RECEPTIVITY TO DYESTUFFS AND A PROCESS FOR PREPARING THEM
Vittorio Cappuccio, Terni, and Salvatore Algieri, Rome, Italy, assignors to Montecatini Edison S.p.A., Milan, Italy, a corporation of Italy
Filed Sept. 13, 1965, Ser. No. 486,622
Claims priority, application Italy, Sept. 16, 1964, 19,867/64
6 Claims. (Cl. 260—93.7)

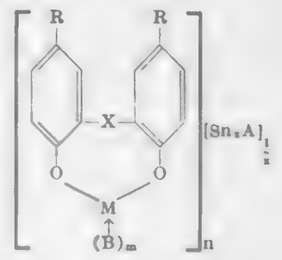
1. A polyolefin composition having a good dyeability and fastness with dispersed dyestuffs and chelating dyestuffs comprising a polyolefin and from about 0.1–10% by weight based on said polyolefin of a compound of a metal of Group II-B with a phenol sulfide of the formula



wherein R is a member selected from the group consisting of hydrogen, a straight alkyl radical having 1 to 20 carbon atoms and a branched alkyl radical having 1 to 20 carbon atoms.

3,374,216
DYEABLE POLYPROPYLENE FIBERS
Kazuo Senda, Akira Ichikawa, Takao Ohzeki, Eiji Nakajima, Minoru Sasaki and Akihiko Yasui, Ohtake-shi, and Masahiro Hirose, Yamaguchi-ken, Japan, assignors to Mitsubishi Rayon Co., Ltd., Tokyo, Japan
Filed Dec. 20, 1965, Ser. No. 515,041
Claims priority, application Japan, Dec. 22, 1964, 39/72,301; May 12, 1965, 40/27,746
4 Claims. (Cl. 260—93.7)

1. Dyeable polypropylene fibers containing an intermolecular compound of nickel or zinc phenolate and organo tin compound, represented by the general formula



(I)

wherein R is an alkyl radical having 1 to 18 carbon atoms, X is a member selected from the group consisting of S, SO and SO_2, M is a member selected from the group consisting of Ni and Zn, B is a member selected from the group consisting of H_2O, NH_3, aliphatic amines, aromatic amines and nitrogen containing cyclic aromatic compounds, *m* is zero or an integer of 1 to 2, *n* is an integer of 1 to 4, and $[Sn_xA]$ is a tin compound, selected from the compounds represented by subsequent general formulae of (II)–1 to (II)–9;

$$R_2Sn{=}O \text{ or } R_3SnOH \qquad \text{(II)–1}$$

wherein R is a member selected from the group consisting of alkyl, cycloalkyl, aryl, alkylaryl and aralkyl radicals, having 1 to 18 carbon atoms;

$$R_aSn(OCOR')_b \qquad \text{(II)–2}$$

wherein R is a member selected from the group consisting of alkyl, cycloalkyl, aryl, alkylaryl and aralkyl radicals, having 1 to 18 carbon atoms, R′ is hydrogen or a member selected from the group consisting of alkyl, cycloalkyl, aryl, alkylaryl, aralkyl, alkylene, cycloalkylene, arylene, alkylarylene and aralkylene radicals, having 1 to 18 carbon atoms, and *a* and *b* are integers of 1 to 3 which satisfy $a+b=4$;

$$R_aSn(OCOR'COOR'')_b \qquad \text{(II)–3}$$

wherein R is a member seected from the group consisting of alkyl, cycloalkyl, aryl, alkylaryl, and aralkyl radicals, having 1 to 18 carbon atoms, R′ is a member selected from the group consisting of alkylene, cycloalkylene, arylene, alkylarylene and aralkylene radicals, having 1 to 18 carbon atoms, R″ is a member selected from the group consisting of alkyl, cycloalkyl, aryl, alkylaryl and aralkyl radicals, having 1 to 18 carbon atoms and *a* and *b* are an integer of 1 to 3 which satisfy $a+b=4$;

$$R_aSn(OCOR'CONHR'')_b \qquad \text{(II)–4}$$

wherein the same significances in the general formula of (II)–3 are given for R, R′, R″, *a* and *b*;

$$R'COOSn(R)_2{-}O{-}Sn(R)_2OCOR' \qquad \text{(II)–5}$$

wherein R is a member selected from the group consisting of alkyl, cycloalkyl, aryl, alkylaryl and aralkyl radicals, having 1 to 18 carbon atoms, R′ is hydrogen or a member selected from the group consisting of alkyl, cycloalkyl, aryl, alkylaryl and aralkyl radicals, having 1 to 18 carbon atoms, or a member selected from the group consisting of monoester residues of aliphatic and aromatic dicarboxylic acid radicals, having 1 to 18 carbon atoms;

$$R_aSn(OR')_b \qquad \text{(II)–6}$$

wherein R is a member selected from the group consisting of alkyl, cycloalkyl, aryl, alkylaryl, and aralkyl radicals, having 1 to 18 carbon atoms, R′ is a member selected from the group consisting of alkyl, cycloalkyl, aryl, alkylaryl, and aralkyl radicals or a member selected from the group consisting of monoester residues of aliphatic and aromatic oxycarboxylic acid radicals and *a* and *b* are an integer of 1 to 3 which satisfy $a+b=4$;

$$R_3SnOSnR_3 \qquad \text{(II)–7}$$

wherein R is a member selected from the group consisting of alkyl, cycloalkyl, aryl, alkylaryl and aralkyl radicals, having 1 to 18 carbon atoms;

$$R_2Sn(OR')(OCOR'') \qquad \text{(II)–8}$$

wherein R is a member selected from the group consisting of alkyl, cycloalkyl, aryl, alkylaryl and aralkyl radicals, having 1 to 18 carbon atoms, R′ is a member selected from the group consisting of alkyl, cycloalkyl, aryl, alkylaryl and aralkyl radicals, having 1 to 18 carbon atoms, and R″ is a member selected from the group consisting of aliphatic and aromatic dicarboxylic monoester residual radicals, having 1 to 18 carbon atoms;

$$R_2Sn(A)_2 \qquad \text{(II)–9}$$

wherein R is a member selected from the group consisting of alkyl, cycloalkyl, aryl, alkylaryl and aralkyl radicals, having 1 to 18 carbon atoms, A is a 1,3 - dicarbonyl compound, and small *x* is dependent on the number of Sn atoms in the Formulas (II)–1 to (II)–9.

3,374,217

ISOLATION OF RESIN ACID MIXTURES RICH IN LEVOPIMARIC ACID

Hugh B. Summers, Jr., Lake City, Fla., Winston D. Lloyd, El Paso, Tex., and Glen W. Hedrick, Lake City, Fla., assignors to the United States of America as represented by the Secretary of Agriculture

No Drawing. Filed June 23, 1964, Ser. No. 377,424

7 Claims. (Cl. 260—109)

1. A process for treating pine gum containing (1) rosin comprising nonacidic components and abietic-type resin acids including levopimaric acid, (2) turpentine, (3) an amount of water not in excess of about three weight percent, and (4) acetone-insoluble solids, to recover said abietic-type resin acids rich in levopimaric acid and in essentially pure form, said process comprising:

(a) treating the pine gum with acetone at ambient temperature to dissolve the resin acids;

(b) filtering the acetone solution in the substantial absence of air to remove solids;

(c) heating the filtered acetone solution to a gentle reflux of about 56° C.;

(d) slowly adding an acetone solution containing at least one mole of 2-amino-2-methyl-1-propanol per mole of said resin acids to the gently refluxing solution of step (c) to thereby precipitate the resin acids as acid-amine salts, said acetone solution of 2-amino-2-methyl-1-propanol comprising equal quantities by weight of the amine and acetone solvent;

(e) cooling the resulting mixture of step (d) to from about 5° to 10° C. and filtering said mixture to obtain (1) a filter cake consisting essentially of a small amount of turpentine, and the bulk of the precipitated resin acids-amine salts, and (2) a filtrate comprising an acetone solution of the nonacidic components of the resin, the acetone-soluble resin acids-amine salts, any excess of the added free amine, water, and all the turpentine except for the small residual amount retained by the filter cake;

(f) reslurring the filter cake of step (e) in about from 1.7 to 2.5 liters of fresh acetone per mole of the resin acids to dissolve the residual turpentine;

(g) filtering the slurry of step (f) to obtain (1) a filter cake consisting essentially of the resin acids-amine salts free from the turpine, and (2) a filtrate comprising an acetone solution of the residual turpentine;

(h) drying the filter cake of step (g);

(i) purifying the resin acids-amine salts contained in the dried filter cake of step (h) by treating the filter cake with methanol at a temperature ranging from about 15° to 65° C. and recovering from the resulting mixture a product consisting essentially of the resin acids-amine salt containing about 33% of the levopimaric acid-amine salt;

(j) drying the purified product of step (i);

(k) enriching the dried purified product of step (j) in the levopimaric acid-amine salt by reslurrying the product in methanol not less than one time and not more than four times, the slurry in each instance being filtered after each slurrying and the final filter cake being dried after the last slurrying, thereby to obtain a filter cake of the resin acids-amine salts containing about from 65 to 95 weight percent of the levopimaric acid-amine salt;

(l) recovering the levopimaric acid from the purified and enriched filter cake of step (k) by redissolving the filter cake in methanol to produce a methanol solution wherein the weight percent of the resin acids-amine salt in the methanol ranges about from 3 to 5 weight percent, and then passing the methanol solution through a bed of a weakly-acidic ion exchange resin to decompose the acid-amine salts and obtain a methanol solution of the free resin acids rich in levopimaric acid, and an ion exchange resin-amine; and thereafter

(m) recovering the mixed resin acids, rich in levopimaric acid, from the methanol solution of these acids, by evaporating the methanol.

3,374,218

PROTECTED DERIVATIVES OF PHYSALAEMIN

Luigi Bernardi, Germano Bosisio, Roberto de Castiglione, and Onofrio Goffredo, Milan, Italy, assignors to Società Farmaceutici Italia, Milan, Italy, a corporation of Italy

No Drawing. Filed Feb. 11, 1965, Ser. No. 432,008

Claims priority, application Italy, Feb. 12, 1964, 3,105/64

2 Claims. (Cl. 260—112.5)

1. The protected undecapeptide of the structure L-pyroglutamyl - L-alanyl-L-aspartyl-L-prolyl-L-asparaginyl-L - lysyl-L-phenylalanyl-L-tyrosyl-glycyl-L-leucyl-L-methioninamide having the imino group of the pyroglutamyl radical and the ε-amino group of the lysyl radical blocked by a protecting group selected from the group consisting of trityl, tosyl, phthalyl, carbobenzoxy, carbo-t-butoxy, trifluoroacetyl, formyl and the β-carboxyl group of the aspartyl radical blocked by a protecting group selected from the group consisting of methyl, ethyl, t-butyl, benzyl, and p-nitrophenyl.

3,374,219

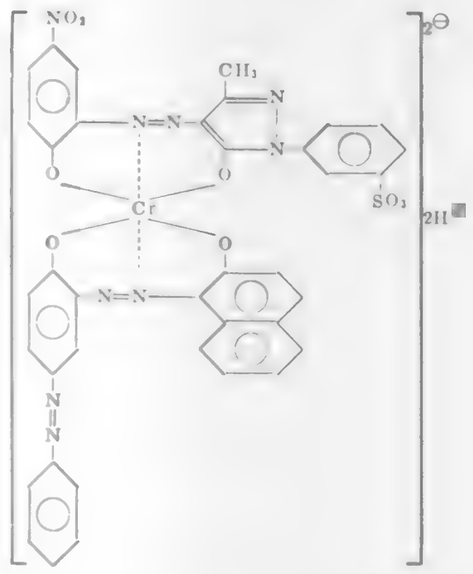
CHROMIUM - CONTAINING DYESTUFFS CONTAINING A MONOAZO AND A DIAZO DYESTUFF

Walter Biedermann and Eginhard Steiner, Basel, Switzerland, assignors to J. R. Geigy A.G., Basel, Switzerland

No Drawing. Filed Dec. 16, 1964, Ser. No. 418,867

1 Claim. (Cl. 260—145)

The chromium-containing azo dyestuff, which in its free acid form has the formula



and dyes natural and synthetic polyamide fibers in brown shades of very good fastness properties.

3,374,220

PYRIDAZINE MONOAZO DYESTUFFS

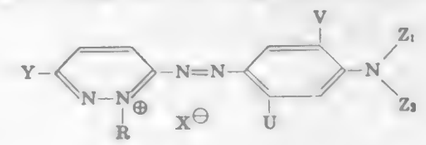
Gilbert Victor Henri Kremer, Ernont, and Robert Frederic Michel Sureau, Enghien-les-Bains, France, assignors to Etablissements Kuhlmann, Paris, France

No Drawing. Filed Feb. 24, 1965, Ser. No. 435,045

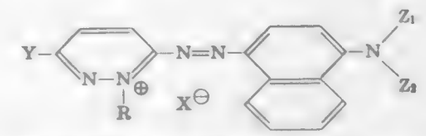
Claims priority, application France, Feb. 28, 1964, 965,493

3 Claims. (Cl. 260—154)

Dyestuffs having one of the general formulae:



and



in which Y represents a member selected from the group consisting of chlorine, and bromine atoms, the phenoxy group and alkoxy groups having up to 3 carbon atoms, R is a member selected from the group consisting of the methyl and ethyl groups, $X^{\ominus}$ represents a monovalent anion, Z_1 and Z_2 each represents a member selected from the group consisting of the hydrogen atom and the methyl and ethyl groups, U represents a member selected from the group consisting of the hydrogen atom and the methyl, methoxy, ethoxy and acetylamino groups, and V represents a member selected from the group consisting of the hydrogen atom and the methoxy and ethoxy groups.

3,374,221

BASIC DYES

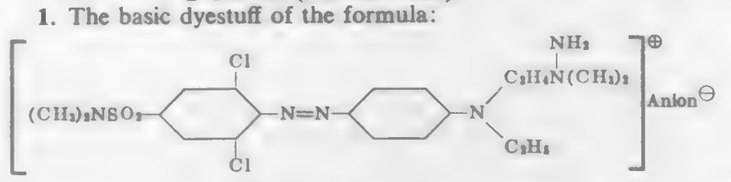
Roland Entschel and Curt Mueller, Basel, and Walter Wehrli, Riehen, Switzerland, assignors to Sandoz Ltd. (also known as Sandoz A.G.), Basel, Switzerland

No Drawing. Original application Feb. 13, 1964, Ser. No. 344,557. Divided and this application June 2, 1966, Ser. No. 554,695

Claims priority, application Switzerland, Apr. 21, 1961, 4,709/61; Jan. 12, 1962, 359/62; Apr. 24, 1962, 4,898/62

2 Claims. (Cl. 260—205)

1. The basic dyestuff of the formula:



3,374,222

SEPARATING LEVOGLUCOSAN AND CARBOHYDRATE DERIVED ACIDS FROM AQUEOUS MIXTURES CONTAINING THE SAME BY TREATMENT WITH METAL COMPOUNDS

Quintin P. Peniston, Bainbridge Island, Wash., assignor to Weyerhaeuser Company, Tacoma, Wash., a corporation of Washington

Continuation-in-part of application Ser. No. 325,658, Nov. 22, 1963. This application July 6, 1965, Ser. No. 471,502

14 Claims. (Cl. 260—209)

1. The process of separating aqueous mixtures containing dissolved levoglucosan and carbohydrate derived acids, the process comprising:

(a) adding to the mixture at least the equivalent amount with reference to the acid content thereof, of either an alkaline earth, aluminum, lead or zinc compound forming water insoluble salts of the acids,

(b) separating the resulting water insoluble carbohydrate derived acid salts from the resulting aqueous solution of levoglucosan,

(c) concentrating the aqueous solution of levoglucosan,

(d) and crystallizing from the concentrated solution a solid, crystalline, levoglucosan product.

3,374,223

CRYSTALLINE SODIUM 5'-GUANYLATE PENTAHYDRATE AND METHOD OF PRODUCING THE SAME

Saburo Senoo, Tokyo, Toshio Kato, Omiya-shi, and Kenji Sato, Tokyo, Japan, assignors to Asahi Kasei Kogyo Kabushiki Kaisha, Osaka, Japan, a corporation of Japan

No Drawing. Filed Oct. 19, 1964, Ser. No. 409,344

Claims priority, application Japan, Oct. 19, 1963, 38/55,684

4 Claims. (Cl. 260—211.5)

1. A method for producing crystalline barium 5'-guanylate pentahydrate comprising cooling a hot aqueous solution of barium 5'-guanylate to a temperature in a range from 50° C. to the freezing point of said solution to form a supersaturated solution of barium 5'-guanylate pentahydrate, adding seed crystals of barium 5'-guanylate pentahydrate to the thusly formed supersaturated solution, and maintaining the supersaturated solution at the said temperature range to separate crystalline barium 5'-guanylate pentahydrate.

3,374,224

NOVEL PREPARATION OF CARBOXYMETHYL CELLULOSE

Roy W. Sommers, Pennsville, N.J., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

Filed Dec. 28, 1964, Ser. No. 421,340

7 Claims. (Cl. 260—231)

An alkali metal salt of carboxymethyl cellulose which forms clear aqueous solutions containing gell particles which are insoluble in 5% sodium hydroxide at room temperature but soluble above about 80° C., having a degree of etherification between about 0.4 to 1.3 and being characterized by an infrared adsorption band between 5.7 and 5.9 microns. The alkali metal salt is prepared by reacting alkali cellulose with an etherifying agent containing 2 to 20 mole percent dichloroacetic acid and the balance being monochloroaectic acid. The etherification reaction can be conducted in a slurry medium or by a dry mix procedure.

3,374,225

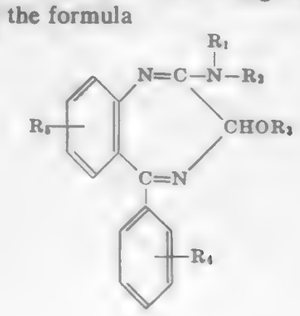
AMINOBENZODIAZEPINE COMPOUNDS AND METHODS

Earl Reeder, Nutley, Arthur Stempel, Teaneck, and Leo Henryk Sternbach, Upper Montclair, N.J., assignors to Hoffmann-La Roche Inc., Nutley, N.J., a corporation of New Jersey

No Drawing. Continuation-in-part of application Ser. No. 240,750, Nov. 28, 1962. This application Mar. 28, 1963, Ser. No. 268,553

8 Claims. (Cl. 260—239)

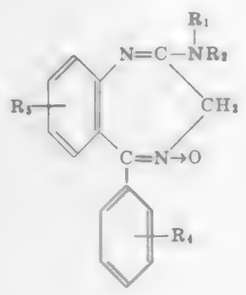
1. A compound selected from the group consisting of compounds of the formula



and their pharmaceutically acceptable salts,

wherein R_1 is selected from the group consisting of hydrogen and lower alkanoyl; R_2 is selected from the group consisting of hydrogen and lower alkyl; R_3 is selected from the group consisting of hydrogen, lower alkyl, lower alkanoyl, and benzoyl; R_4 is selected from the group consisting of hydrogen, halogen, lower alkoxy and trifluoromethyl; R_5 is selected from the group consisting of hydrogen, halogen, trifluoromethyl, nitro, lower alkylthio and lower alkyl.

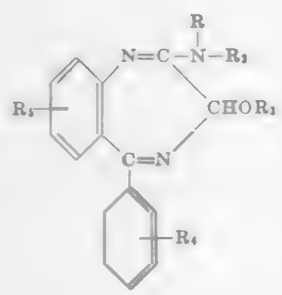
8. A method which comprises reacting a compound of the formula



wherein

R_1 is selected from the group consisting of hydrogen and lower alkanoyl, R_2 is selected from the group consisting of hydrogen and lower alkyl, R_4 is selected from the group consisting of hydrogen, chlorine, fluorine, methoxy and trifluoromethyl and R_5 is selected from the group consisting of hydrogen, chlorine, bromine, trifluoromethyl and nitro

with an acylating agent selected from the group consisting of lower alkanoyl anhydride, benzoyl anhydride, lower alkanoyl halide and benzoyl halide and recovering compounds having the formula



wherein

R_1 is selected from the group consisting of hydrogen and lower alkanoyl, R_3 is selected from the group consisting of lower alkanoyl and benzoyl and R_2, R_4 and R_5 have the same meaning as above.

3,374,226
17 - ETHERS OF 17α - HALOETHYNYL - 17β-HYDROXY - 19 - NOR - 4,9 - ANDROSTADIENE-3-ONES

John Fried, Palo Alto, Calif., and Thomas F. Bry, Linden, N.J., assignors to Merck & Co., Inc., Rahway, N.J., a corporation of New Jersey

No Drawing. Continuation-in-part of application Ser. No. 234,204, Oct. 30, 1962. This application Oct. 18, 1965, Ser. No. 497,463

15 Claims. (Cl. 260—239.5)

15. 17α - chloroethynyl-19-nor-4,9-androstadiene-17β-pyrrolidyl ethyl ether.

3,374,227
SULFONAMIDES

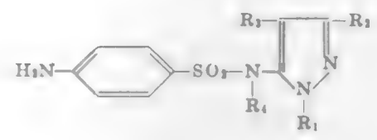
Paul Schmidt, Therwil, Ernst Schweizer and Kurt Eichenberger, Basel, and Max Wilhelm, Allschwil, Switzerland, assignors to Ciba Corporation, New York, N.Y., a corporation of Delaware

No Drawing. Filed Dec. 26, 1963, Ser. No. 333,678

Claims priority, application Switzerland, Jan. 10, 1963, 342/63; Nov. 5, 1963, 13,597/63

19 Claims. (Cl. 260—239.9)

1. A member selected from the group consisting of compounds of the formula



in which R_1 stands for a member selected from the group consisting of lower alkyl, lower alkoxy-lower alkyl, halogeno-lower alkyl, phenyl, lower alkyl-phenyl, lower alkoxy - phenyl, halogenophenyl, trifluoromethylphenyl, cyclo-lower alkyl and lower alkyl-cyclo-lower alkyl, R_2 for lower alkoxy-lower alkyl, R_3 for a member selected from the group consisting of hydrogen, lower alkyl and lower alkoxy and R_4 for a member selected from the group consisting of hydrogen, alkanoyl containing 1 to 16 carbon atoms, phenyl-lower alkanoyl, benzoyl, alkali metals, alkaline earth metals and earth metals and their formaldehyde condensation products obtained by reacting about 1 mol formaldehyde with about 1–2 mols sulfonamide.

3,374,228
14β-ESTRA-1,3,5(10)-TRIENES

John H. Fried, Palo Alto, Calif., assignor to Syntex Corporation, Panama, Panama, a corporation of Panama

No Drawing. Filed Oct. 25, 1965, Ser. No. 505,191

4 Claims. (Cl. 260—239.55)

3-tetrahydropyranyloxy- and/or 17α-tetrahydropyranyloxy-18-methyl-14β-estra-1,3,5(10)-trienes, optionally substituted at C-3 with hydroxy or alkoxy, or at C-17α with hydroxy or an ester thereof, and at C-17β with hydrogen, (lower)alkyl, (lower)alkenyl, (lower)alkynyl or halo (lower)alkylnyl, are estrogenic agents.

3,374,229
3-OXO-5α,10α-DIHYDROXYESTRANE COMPOUNDS

Kanzo Sasaki, Osaka-shi, Japan, assignor to Shionogi & Co., Ltd., Osaka, Japan

No Drawing. Filed Dec. 22, 1965, Ser. No. 515,758

Claims priority, application Japan, Dec. 29, 1964, 39/74,388

8 Claims. (Cl. 260—239.55)

Hypocholesteremic 3-oxo-5α,10α-dihydroxyestranes are prepared by the action of an agent which is generally used for α-cis-glycol formation from a double bond on 3-protected-oxo-estr-5(10)-enes, followed by hydrolysis of ketal group.

3,374,230
ACETYLATION OF STEROIDAL ALCOHOLS WITH KETENE

John N. Gardner, Wayne, and Hershel L. Herzog, Glen Ridge, N.J., assignors to Schering Corporation, Bloomfield, N.J., a corporation of New Jersey

No Drawing. Filed Apr. 26, 1966, Ser. No. 545,243

6 Claims. (Cl. 260—239.55)

1. The process for acetylating a tertiary steroidal alcohol which comprises contacting said tertiary steroidal alcohol with ketene in a basic medium comprising a member selected from the group consisting of alkali metal alkoxides, alkali metal amides and alkali metal hydrides in an inert organic solvent.

3,374,231
HYDRAZONES OF 1-AMINO-4-(XANTHENYL AND THIOXANTHENYL)PIPERAZINES

John W. Cusic, Skokie, and Peter Yonan, Chicago, Ill., assignors to G. D. Searle & Co., Chicago, Ill., a corporation of Delaware

No Drawing. Continuation-in-part of application Ser. No. 293,137, July 5, 1963. This application June 14, 1965, Ser. No. 463,929

Claims priority, application Great Britain, June 17, 1964, 25,131

15 Claims. (Cl. 260—240)

Hydrazones derived from 1-amino-4-(xanthenyl and thioxanthenyl)piperazines and a wide variety of aldehydes and ketones are described herein. These hydrazones are useful as anti-ulcer agents which do not possess anti-acetylcholine activity. They are usually prepared by the reaction of an aminopiperazine with an aldehyde or ketone.

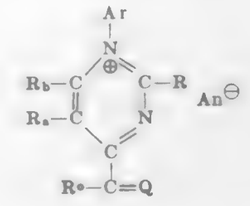
3,374,232
N-ARYL PYRIMIDINIUM COMPOUNDS

George de Stevens, Summit, Herbert Morton Blatter, Millburn, and Richard William James Carney, Murray Hill, N.J., assignors to Ciba Corporation, New York, N.Y., a corporation of Delaware

No Drawing. Filed Mar. 11, 1964, Ser. No. 351,230

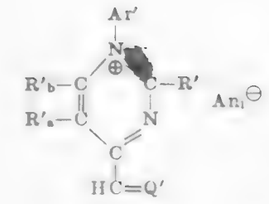
12 Claims. (Cl. 260—240.7)

6. A compound of the formula



in which Ar stands for a member selected from the group consisting of phenyl, (lower alkyl)-phenyl, (lower alkoxy)-phenyl, (halogen)-phenyl, (lower alkylmercapto)-phenyl, (trifluoromethyl)-phenyl, (nitro)-phenyl and (di-lower alkylamino)-phenyl, each of R and R_b for a member selected from the group consisting of lower alkyl, lower alkenyl, cycloalkyl and cycloalkyl-lower alkyl having from three to eight ring members, phenyl-lower alkyl, phenyl, (lower alkyl)-phenyl, (lower alkoxy)-phenyl, (halogeno)-phenyl, (lower alkylmercapto)-phenyl, (trifluoromethyl)-phenyl, (nitro)-phenyl and (di-lower alkylamino)-phenyl, R_o for a member selected from the group consisting of lower alkyl, lower alkenyl, cycloalkyl and cycloalkyl-lower alkyl having from three to eight ring members, and phenyl-lower alkyl, Q for a member selected from the group consisting of 1-R_1-2-pyridylidene, 1-R_1-4-pyridylidene, 1-R_1-2-quinolylidene, 1-R_1-4-quinolylidene, 2-R_1 - 1 - isoquinolylidene, 3-R_1-2-thiazolylidene, 3-R_1-2-benzothiazolylidene, 3-R_1-oxazolylidene, 3-R_1-2-benzoxazolylidene, 1,3,3-tri-R_1-2-indolylidene, in which R_1 stands for lower alkyl, and those radicals having a member selected from the group consisting of lower alkyl, lower alkoxy, halogeno, lower alkylmercapto, trifluoromethyl, nitro and di-lower alkylamino as substituent, R_a for a member selected from the group consisting of carboxy, carbo-lower alkoxy, cyano, carbamyl, lower alkylcarbamyl, di-lower alkylcarbamyl, lower alkanoyl and benzoyl and $An^{\ominus}$ for a member selected from the group consisting of the hydroxyl ion and the anion of a pharmaceutically acceptable acid.

7. A compound of the formula



in which Ar' is a member selected from the group consisting of phenyl, (lower alkyl)-phenyl, (lower alkoxy)-phenyl, (halogeno)-phenyl, (lower alkylmercapto)-phenyl and (nitro)-phenyl, R' is a member selected from the group consisting of the lower alkyl, phenyl, (lower alkyl)-phenyl, (lower alkoxy) - phenyl, (halogeno) - phenyl, (lower alkylmercapto)-phenyl and (nitro)-phenyl, Q' is a member selected from the group consisting of 1-R_1-2-pyridylidene, 1-R_1-4-pyridylidene, 1-R_1-2-quinolylidene, 1-R_1-4-quinolylidene, 2-R_1 - 1 - isoquinolylidene, 3-R_1-2-thiazolylidene, 3-R_1-2-benzothiazolylidene, 3-R_1-2-oxazolylidene, 3-R_1-2-benzoxazolylidene, 1,3,3-tri-R_1-2-indolylidene, in which R_1 stands for lower alkyl, and those radicals having a member selected from the group consisting of lower alkyl, lower alkoxy, halogeno, lower alkylmercapto, trifluoromethyl, nitro and di-lower alkylamino as substituent, R'_a is a member selected from the group consisting of carbo-lower alkoxy, cyano, lower alkanoyl and benzoyl, R'_b is a member selected from the group consisting of lower alkyl and phenyl, and $An_1^{\ominus}$ is the anion of a hydrohalic acid.

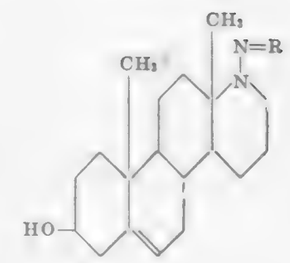
3,374,233
N-AMINO-17a-AZA-D-HOMOANDROST-5-EN-3β-OL AND HYDRAZONES THEREOF

Robert W. Hamilton, Wilmette, Ill., assignor to G. D. Searle & Co., Chicago, Ill., a corporation of Delaware

No Drawing. Filed Aug. 3, 1964, Ser. No. 387,229

7 Claims. (Cl. 260—240)

1. A compound of the formula



wherein R is selected from the group consisting of the following radicals: ethylidine, isopropylidene, cyclopentylidene, cyclohexylidene, benzylidene, chlorobenzylidene, 3,4-methylenedioxybenzylidene, naphthylmethylene, 3,4 - dihydro-2(1H) - naphthylidene, and pyridylmethylene.

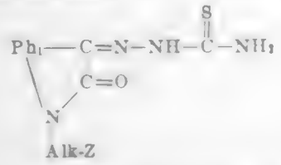
4. N - benzylideneamino - 17a - aza - D - homoandrost-5-en-3β-ol.

3,374,234
THIOSEMICARBAZONES AND PROCESS FOR THEIR MANUFACTURE

Vishwa Prakash Arya, Goregaon, Bombay, India, assignor to Ciba Limited, Basel, Switzerland, a Swiss company

No Drawing. Filed June 8, 1965, Ser. No. 462,418
Claims priority, application Switzerland, June 11, 1964, 7,607/64; Apr. 26, 1965, 5,859/65
37 Claims. (Cl. 260—247.1)

1. A member selected from the group consisting of a compound of the formula



(Ia)

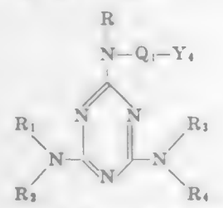
wherein Ph_1 is a member selected from the group consisting of phenylene-(1,2), (halogeno)-phenylene-(1,2) and (trifluoromethyl)-phenylene-(1,2), Alk is an alkylene radical with 1–5 carbon atoms, and Z is a member selected from the group consisting of di-lower alkylamino, N-lower alkyl-N-cycloalkyl-amino, dibenzylamino, alkyleneimino with 4 to 7 carbon atoms, a morpholino, a thiamorpholino and a piperazino group, and an acid addition salt thereof.

3,374,235
S-TRIAZINES

Denis Varsanyi, Basel, and Willy Roth, Strengelbach, Aargau, Switzerland, assignors to Geigy Chemical Corporation, Greenburgh, N.Y., a corporation of Delaware

No Drawing. Filed Dec. 28, 1964, Ser. No. 421,693
Claims priority, application Switzerland, Dec. 31, 1963, 16,070/63
1 Claim. (Cl. 260—249.6)

1. A compound of the formula



wherein each of R, R_1 and R_3 represents a member selected from the group consisting of hydrogen, alkyl, of from 1 to 20 carbon atoms, cycloalkyl of from 6 to 12 ring carbon atoms, alkenyl of from 3 to 20 carbon atoms, hydroxy-alkyl of from 2 to 20 carbon atoms, fluoro-alkyl of from 3 to 20 carbon atoms, and chloro-alkyl of from 3 to 20 carbon atoms,

R_2 represents a member selected from the group consisting of alkyl of from 1 to 20 carbon atoms, cycloalkyl of from 6 to 12 ring carbon atoms, alkenyl of from 3 to 20 carbon atoms, hydroxy-alkyl of from 2 to 20 carbon atoms, fluoro-alkyl of from 3 to 20 carbon atoms, and chloro-alkyl of from 3 to 20 carbon atoms,

R_4 represents a lipophilic radical selected from the group consisting of alkyl from 10 to 18 carbon atoms and alkenyl of from 10 to 18 carbon atoms,

Y_4 represents hydroxyl, and

Q_1 represents a divalent radical selected from the group consisting of alkylene of from 10 to 20 carbon atoms and alkylene of from 10 to 20 carbon atoms,

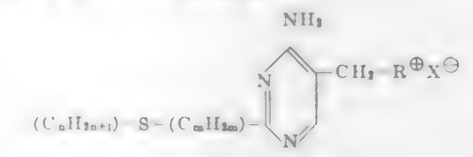
and wherein Y_4 is located at the Q_1 radical at least 4 carbon atoms remote from each of the two free bonds of Q_1.

3,374,236
QUATERNARY 5-AMMONIUMMETHYL-4-AMINO-2-ALKYLMERCAPTOALKYLENE PYRIMIDINE SALTS

Renat Herbert Mizzoni, Long Valley, and George de Stevens, Summit, N.J., assignors to Ciba Corporation, New York, N.Y., a corporation of Delaware

No Drawing. Filed Aug. 23, 1965, Ser. No. 481,897
9 Claims. (Cl. 260—256.5)

1. A member selected from the group consisting of a compound having the formula



in which each of n and m stands for an integer from 1 to 7, $R^{\oplus}$ stands for a member selected from the group consisting of pyridinium, quinolinium, isoquinolinium, pyridazinium, pyrimidinium, pyrazinium, thiazolinium and oxazolinium and such radical substituted by lower alkyl and $X^{\ominus}$ for the anion of a therapeutically useful acid, its sulfoxide and sulfone and a therapeutically useful acid addition salt of these compounds.

3,374,237
1-PHENYL-3-(4-PHENYL-1-PIPERAZINOALKYL)-IMIDAZOLIDINONES AND IMIDAZOLIDINETHIONES

William Blythe Wright, Jr., Woodcliff Lake, N.J., and Herbert Joseph Brabander, Nanuet, N.Y., assignors to American Cyanamid Company, Stamford, Conn., a corporation of Maine

No Drawing. Filed May 21, 1965, Ser. No. 457,862
19 Claims. (Cl. 260—268)

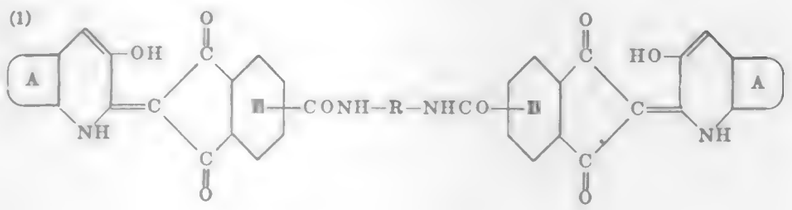
The preparation of imidazolidinones and imidazolidinethiones having a phenyl or substituted phenyl group in the 1-position and 4-phenyl or substituted phenyl-1-piperazinyl lower alkylene groups in the 3-position. The phenyl groups may have substituents such as halogen, lower alkyl, lower alkoxy or trifluoromethyl present. These compounds are useful as tranquilizers.

3,374,238
3-HYDROXYQUINOPHTHALONE DIAMIDO PIGMENTS

Arnold Wick, Therwil, and Christoph Frey, Basel, Switzerland, assignors to Ciba Limited, Basel, Switzerland, a Swiss company

No Drawing. Filed June 18, 1965, Ser. No. 465,157
Claims priority, application Switzerland, June 26, 1964, 8,416/64
8 Claims. (Cl. 260—287)

Pigments of the 3-hydroxyquinophthalone series of the formula



in which A represents an arylene residue, especially a benzene or naphthalene residue, R represents a direct bond or an organic residue and in which the benzene residue B may contain further substituents, for example, halogen atoms or alkoxy groups.

3,374,239
6-CHLORO-2-(5-NITRO-2-FURYL) CINCHONINIC ACID

Homer Albert Burch, Norwich, N.Y., assignor to The Norwich Pharmacal Company, a corporation of New York

No Drawing. Filed Nov. 25, 1966, Ser. No. 596,826
2 Claims. (Cl. 260—287)

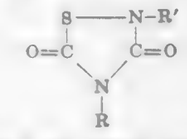
Antibacterially active 6-chloro-2-(5-nitro-2-furyl)cinchoninic acid and a method for its preparation.

3,374,240
SUBSTITUTED 1,2,4-THIADIAZOLIDIN-3,5-DIONES AND PROCESS THEREFOR

Gerhard F. Ottmann, Hamden, and Haywood Hooks, Jr., West Haven, Conn., assignors to Olin Mathieson Chemical Corporation, New Haven, Conn., a corporation of Virginia

No Drawing. Continuation-in-part of applications Ser. No. 411,638, Nov. 16, 1964, and Ser. No. 427,088, Jan. 21, 1965. This application June 29, 1965, Ser. No. 468,121
4 Claims. (Cl. 260—306.7)

1. A compound of the formula



wherein R is aryl of 6–10 carbon atoms and R′ is phenyl having a lower alkoxy substituent.

3. A process for preparing substituted 1,2,4-thiadiazolidin-3,5-diones which comprises reacting S-[N′-(chlorocarbonyl)-amino] isothiocarbamyl chlorides with water and isolating the substituted 1,2,4-thiadiazolidin-3,5-diones.

3,374,241
DIPHENYLCARBAMYL DERIVATIVES OF CERTAIN AZOLES

John W. Giberson, Woodstown, N.J., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application Apr. 22, 1963, Ser. No. 274,803, now Patent No. 3,274,132, dated Sept. 20. 1966, which is a continuation-in-part of application Ser. No. 211,898, July 23, 1962. Divided and this application Feb. 23, 1966, Ser. No. 565,663
1 Claim. (Cl. 260—308)

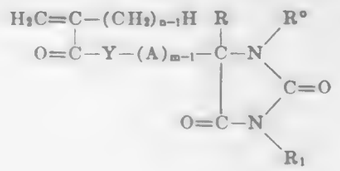
1. A compound selected from the group consisting of 1-diphenylcarbamylimidazole, 1-diphenylcarbamylbenzimidazole, and 1-diphenylcarbamyl-1,2,3-benzotriazole.

3,374,242
5-(4-ACRYLOXYALKYL)-HYDANTOINS

Everett J. Kelley, Moorestown, N.J., assignor to Rohm & Haas Company, Philadelphia, Pa., a corporation of Delaware

No Drawing. Filed June 8, 1964, Ser. No. 373,486
6 Claims. (Cl. 260—309.5)

1. As a composition of matter, a compound of the formula



wherein

m is an integer having a value of 1 to 2,

n is an integer having a value of 1 to 2,

Y is selected from the group consisting of O and NH,

A is an alkylene group having 1 to 8 carbon atoms,

R is selected from the group consisting of H, benzyl, cyclohexyl, phenyl, and alkyl groups having 1 to 6 carbon atoms,

R° is selected from the group consisting of H, methylol, and alkoxymethyl groups having 2 to 5 carbon atoms, and

R^1 is selected from the group consisting of H, methylol, and alkoxymethyl groups having 2 to 5 carbon atoms.

3,374,243
B-NORSTEROIDAL PYRAZOLES

Kenneth G. Holden, Stratford, N.J., and James F. Kerwin, Broomall, Pa., assignors to Smith Kline & French Laboratories, Philadelphia, Pa., a corporation of Pennsylvania

No Drawing. Filed Jan. 26, 1965, Ser. No. 428,190
8 Claims. (Cl. 260—310)

17β-hydroxy-B-norandrosteno and estreno[3,2-c]-pyrazoles, optionally substituted at the 17α-position with a methyl, ethyl, ethynyl, or methoxymethyl group, are prepared by condensation of the corresponding 2-hydroxymethylene-3-keto-Δ^4-B-norsteroid with hydrazine hydrate. The products possess antiandrogenic and cholesterol-lowering activities.

3,374,244
N-(DIALKYLAMINOALKYL)ADAMANTANECARBOXAMIDES AND RELATED COMPOUNDS

Carl Peter Krimmel, Wauconda, Ill., assignor to G. D. Searle & Co., Chicago, Ill., a corporation of Delaware

No Drawing. Continuation-in-part of application Ser. No. 466,832, June 24, 1965. This application June 30, 1966, Ser. No. 561,707
Claims priority, application Great Britain, June 13, 1966, 26,187/66
7 Claims. (Cl. 260—326.3)

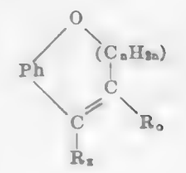
The present N-(dialkylaminoalkyl)adamantanecarboxamides and related compounds possess anti-inflammatory, anti-bacterial, anti-protozoal, anti-fungal, and anti-algal activity. The compounds are prepared by the reaction of adamantane-1-carbonyl chloride or the corresponding homoadamantane compound with a dialkylaminoalkylamine or similar compound.

3,374,245
UNSATURATED OXACYCLES

Richard William James Carney, Murray Hill, and William Laszlo Bencze, New Providence, N.J., assignors to Ciba Corporation, New York, N.Y., a corporation of Delaware

No Drawing. Filed Apr. 1, 1964, Ser. No. 356,664
9 Claims. (Cl. 260—345.2)

Compounds of the formula



in which pH stands for an optionally substituted ortho-phenylene radical, one of the radicals R_x and R_o is a monocyclic carbocyclic aryl group containing a tertiary amino-lower alkoxy group and the other an aryl radical, n is an integer from 0 to 4, the group $-(C_nH_{2n})$ separating the oxygen atom from the carbon atom of the double bond to which it is attached by at most 2 carbon atoms, their salts, their N-oxides, their salts of their N-oxides and their quaternary ammonium compounds. The compounds are useful as estrogenic, antifertility and antimicrobial agents.

3,374,246

PREPARATION OF 2,4,6-HEPTANETRIONE AND 2,6-DIMETHYL-4-PYRANONE

Erich Marcus and John K. Chan, Charleston, W. Va., assignors to Union Carbide Corporation, a corporation of New York

No Drawing. Filed Oct. 23, 1965, Ser. No. 504,161

6 Claims. (Cl. 260—345.9)

1. A process for the production of 2,4,6-heptanetrione and 2,6-dimethyl-4-pyranone which comprises reacting diketene with from about 0.3 to about 0.9 mole of water per mole of diketene in contact with a catalytically effective concentration of a tertiary amine.

3,374,247

PROCESS FOR THE CATALYZED REDISTRIBUTION OF SILICON-FLUORINE AND SILICON-HYDROCARBYLOXY BONDS

Enrico J. Pepe, Kenmore, and Bernard Kanner, Tonawanda, N.Y., assignors to Union Carbide Corporation, a corporation of New York

No Drawing. Filed Oct. 3, 1963, Ser. No. 313,442

7 Claims. (Cl. 260—348)

This invention is directed to a catalytic process for the redistribution of silicone-fluorine and silicon-hydrocarbyloxy bonds by heating a mixture of compounds containing at least one silicon-fluorine bond and at least one silicon-hydrocarbyloxy bond in the presence of a redistribution catalyst.

3,374,248

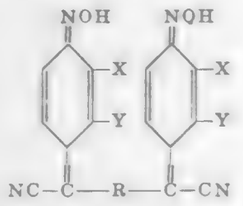
PHENYLACETONITRILE OXIMES

Charles D. Mitchell, Willow Street, Pa., assignor to Armstrong Cork Company, Lancaster, Pa.

No Drawing. Filed Aug. 3, 1965, Ser. No. 477,002

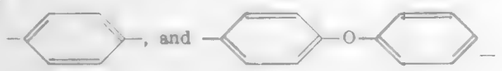
1 Claim. (Cl. 260—396)

1. Phenylacetonitrile oximes of the formula



wherein X and Y are selected from the group consisting of

provided at least one of X and Y on any cyclohexadiene group is —H, and R is selected from the group consisting of



3,374,249

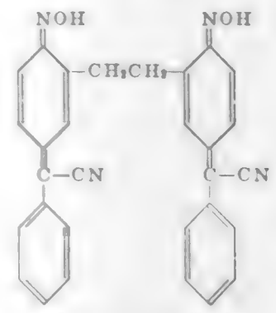
PHENYLACETONITRILE OXIMES

Charles D. Mitchell, Willow Street, Pa., assignor to Armstrong Cork Company, Lancaster, Pa., a corporation of Pennsylvania

No Drawing. Filed Aug. 3, 1965, Ser. No. 477,003

1 Claim. (Cl. 260—396)

1. A bis(phenylacetonitrile oxime) of the formula



3,374,250

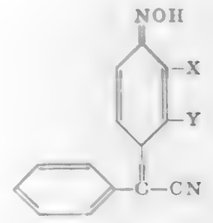
PHENYLACETONITRILE OXIMES

John S. Heckles, Lancaster, and Charles D. Mitchell, Willow Street, Pa., assignors to Armstrong Cork Company, Lancaster, Pa., a corporation of Pennsylvania

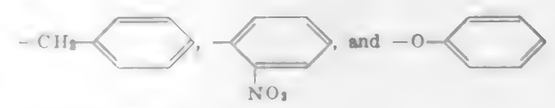
No Drawing. Filed Aug. 3, 1965, Ser. No. 477,023

1 Claim. (Cl. 260—396)

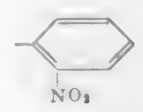
1. Phenylacetonitrile oximes of the formula



wherein X and Y are selected from the group consisting of —H,



provided that Y is not



and one and only one of X and Y is hydrogen.

3,374,251

17-(ALIPHATIC HYDROCARBONOXY) AND 17-(SUBSTITUTED ALIPHATIC HYDROCARBONOXY) ESTRANE DERIVATIVES

Alexander D. Cross, Mexico City, Mexico, assignor to Syntex Corporation, Panama, Panama, a corporation of Panama

No Drawing. Filed May 24, 1963, Ser. No. 282,844

17 Claims. (Cl. 260—397.1)

1. 17-(2′-fluoroethoxy)-3-methoxy-$\Delta^{1,3,5(10)}$-estratriene.

3,374,252

PHARMACEUTICAL PRODUCT OBTAINED FROM PLANTS OF THE GENUS HOLARRHENA (APOCYNACEAE)

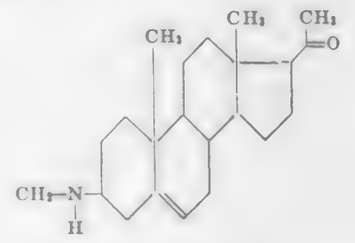
Jean Louis Paul Mainil, Boitsfort, Belgium, assignor to Société Anonyme Oletta, Luxembourg, Luxembourg

No Drawing. Continuation-in-part of application Ser. No. 8,486, Feb. 15, 1960. This application Oct. 17, 1962, Ser. No. 231,292

Claims priority, application Luxembourg, Aug. 19, 1958, Patent No. 36,360; application Germany Dec. 31, 1959, S 66,498

1 Claim. (Cl. 260—397.3)

An alkaloid derived from plants of the genus Holarrhena (Apocynaceae) and of the formula:



3,374,253

PROCESS FOR THE PREPARATION OF 17(20)-21-AL PREGNENES

John H. Fried, Palo Alto, Calif., assignor to Syntex Corporation, Panama, Panama, a corporation of Panama

No Drawing. Filed Apr. 25, 1966, Ser. No. 544,855

10 Claims. (Cl. 260—397.3)

1. A process for the preparation of $\Delta^{17(20)}$-21-al pregnanes which comprises reacting a 17-ketosteroid with at least one molar equivalent of $LiCH_2$—CH=N—R, wherein R is selected from the group consisting of a lower alkyl group containing from 1 to 6 carbon atoms and a cycloalkyl group containing from 3 to 7 carbon atoms, in an ether solvent medium and subjecting the thus-formed compound to acid hydrolysis.

3,374,254

6-KETO-ESTRONE AND PROCESS FOR THE PRODUCTION THEREOF

Luciano Re, South Orange, N.J., assignor to Merck & Co., Inc., Rahway, N.J., a corporation of New Jersey

No Drawing. Filed Aug. 18, 1965, Ser. No. 480,764

22 Claims. (Cl. 260—397.4)

The invention disclosed herein is concerned with a novel synthesis of optically active estrone lower alkyl ethers and intermediate compounds useful in the synthesis of optically active estrone lower alkyl ethers. More particularly, this invention relates to a total synthesis of optically active estrone lower alkyl ethers in which inexpensive starting materials are used and which has the advantage that resolution is accomplished in an early stage of the synthesis. In this synthesis, 3-(p-alkoxybenzoyl)-propionic acid is reacted with vinyl magnesium bromide to form 4-(p-alkoxyphenyl)-4-vinyl-4-hydroxybutyric acid, which is then condensed with 2-methylcyclopentane-1,3-dione thereby producing 3-alkoxy-14, 17-diketo-5(6),8(14) - diseco - 1,3,5(10),9(11) - estratetraene-6-oic acid. The latter compound is then reacted with p-toluene sulfonic acid and an optically active alcohol to form a mixture of diasteroisomeric esters of 3-alkoxy-17-keto-5(6)-seco-1,3,5(10),8,14 - estrapentaene-6-oic acid which are separated by fractional crystallization. The individual isomers are then separately reacted with a saponifying agent, and the resulting isomeric acids are reacted first with hydrogen thereby reducing the Δ^{14}-double bond and then with potassium in liquid ammonia thereby reducing the Δ^{8}-double bond, to form the 3-alkoxy-17-keto-5(6)-seco-1,3,5(10)-estratriene-6-oic acid isomers. The last named compound is then reacted with a strong acid thereby closing the B-ring, and the resulting l- and d-isomers of 6-keto-estrone 3-alkyl ether are reacted with hydrogen to produce the desired d- and l-isomers of estrone 3-alkyl ether.

3,374,255

PROCESS FOR THE HALOETHYNYLATION OF GONA-ENE-3,17-DIONES

Thomas B. Windholz, Westfield, and Arthur A. Patchett, Cranford, N.J., and John Fried, Palo Alto, Calif., assignors to Merck & Co., Inc., Rahway, N.J., a corporation of New Jersey

No Drawing. Continuation-in-part of application Ser. No. 227,582, Oct. 1, 1962. This application Apr. 8, 1966, Ser. No. 541,070

6 Claims. (Cl. 260—397.4)

1. A process for the haloethynylation of gona-4-ene-3,17-diones and B- and C- ring unsaturated derivatives thereof in which the double bonds are conjugated with the double bond at the 4-position, and in which the keto groups at C–3 and C–17 are both in free unprotected form, to produce the corresponding 17α-haloethynyl-17β-hydroxy-gona-4-ene-3-ones which comprises reacting the said 3,17-diones with a dihaloethylene in liquid ammonia in the presence of an alkali metal amide, said dihaloethylene being selected from the group consisting of dichloroethylene and dibromoethylene.

3,374,256

COMPLEX PHOSPHORUS SALTS

John S. Driscoll, Belmont, and Clifford N. Matthews, Winchester, Mass., assignors to Monsanto Research Corporation, St. Louis, Mo., a corporation of Delaware

No Drawing. Filed Aug. 16, 1963, Ser. No. 302,697

19 Claims. (Cl. 260—429.9)

1. A methylene phosphonium halide compound selected from the class consisting of phosphonium methylene phosphorane trihalides of the formula $R'C[P(R)_3]_2(X)_3$, methylene diphosphonium tetrahalides of the formula $(R')_2C[P(R)_3]_2(X)_4$, phosphonium methylene phosphorane metal halides of the formula

$$R'C[P(R)_3]_2M(X)_{(a+1)}$$

and methylene diphosphonium metal halides of the formula $(R')_2C[P(R)_3]_2M(X)_{(a+2)}$ where each R′ is a radical selected from the class consisting of hydrogen and hydrocarbon radicals, each R is a hydrocarbon radical, each X is a halogen atom, each M is a metal which forms halides having bonds of predominantly covalent character, and a is the valence of M, wherein each said hydrocarbon radical is free of aliphatic unsaturation and contains up to 18 carbon atoms.

17. Methods of forming a phosphonium methylene phosphorane metal halide, selected from the group consisting of

(1) contacting a metal halide with a phosphonium methylene phosphorane halide in an organic solvent;
(2) contacting an elemental metal with a methylene bis(phosphonium halide) in an organic solvent; and
(3) contacting an elemental metal with a tri-hydrocarbylphosphine and a hydrocarbyl polyhalide; wherein each said metal is metal forming halides having bonds of predominantly covalent character.

3,374,257

TERNARY ADDITION COMPOUNDS

David G. Walker, Baytown, Tex., assignor, by mesne assignments, to Esso Research and Engineering Company, Elizabeth, N.J., a corporation of Delaware

No Drawing. Filed Sept. 9, 1963, Ser. No. 307,325

9 Claims. (Cl. 260—448)

Ternary addition compounds of the formula: R:HX: $2AlX_3$, where R is selected from the group consisting

of C_8, C_9 and C_{10} methylbenzenes and X is either Cl or Br, are prepared in pure form by mixing the aromatic compound with a stoichiometric excess of anhydrous aluminum halide or hydrogen halide at a temperature between about −5° to about 30° C. The pure ternary addition compounds are heated to a temperature from about 30° to about 80° C. to allow isomerization to occur to pure ternary addition compounds whereby substantial pure meta-xylene, mesitylene, or isodurene ternary addition compounds are formed. The ternary addition compounds are hydrolyzed to produce meta-xylene, mesitylene and isodurene in substantial high purities.

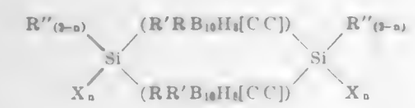
3,374,258

SILYLAMINE CARBORANES

Stelvio Papetti, Hamden, Conn., assignor to Olin Mathieson Chemical Corporation, a corporation of Virginia

Filed Sept. 20, 1963, Ser. No. 310,421
2 Claims. (Cl. 260—448.2)

Nitrogen-containing organoboron compounds are prepared by reacting a silicon-containing organoboron compound of the formula:



wherein R and R′ are each hydrogen or an alkyl, R″ is alkyl or an aryl radical, X is a halogen and n is the integer 1 or 2, with a compound of the formula:

$$NH_2R'''$$

wherein R‴ is hydrogen, phenyl, or an alkyl radical.

3,374,259

CYCLIC ORGANOSILYLAMINE CARBORANES AND PROCESS THEREFOR

Stelvio Papetti, Hamden, Conn., assignor to Olin Mathieson Chemical Corporation, a corporation of Virginia

Filed Sept. 20, 1963, Ser. No. 310,422
19 Claims. (Cl. 260—448.2)

Cyclic silicon and nitrogen-containing organoboron compounds are prepared by reacting a compound of the formula:

$$RR'B_{10}H_8[C(SiX_{(3-n)}R''_n)]_2$$

wherein R and R′ are each selected from a group consisting of hydrogen and an alkyl radical containing from 1 to 5 carbon atoms, R″ is selected from the group consisting of an alkyl radical containing from 1 to 5 carbon atoms or an aryl radical containing not more than 10 carbon atoms, X is a halogen selected from the group consisting of chlorine, bromine and iodine, and n is an integer of from 0 to 2 inclusive, with a nitrogen-containing compound of the formula:

$$NH_2R''$$

wherein R‴ is selected from the group consisting of hydrogen, alkyl of from 1 to 8 carbon atoms, or phenyl.

3,374,260

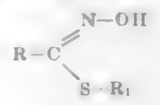
PREPARATION OF S-ALKYL THIOL-HYDROXAMATE ESTERS

James B. Buchanan, Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Filed Aug. 12, 1966, Ser. No. 571,963
10 Claims. (Cl. 260—453)

This application pertains to a process for preparing thiolhydroxamate esters. More particularly this application is directed to a process for preparing S-alkyl thiolhydroxamate esters of the formula

(I)



wherein

R is alkyl of 1 through 3 carbon atoms, methoxyalkyl of 2 through 4 carbon atoms, methylthioalkyl of 2 through 4 carbon atoms, ethoxyalkyl of 3 through 5 carbon atoms or ethylthioalkyl of 3 through 5 carbon atoms; and R_1 is alkyl of 1 through 3 carbon atoms;

by the reaction of an acid salt of the corresponding S-alkyl imidic thiolester with an anhydrous acid salt of hydroxylamine in the presence of an alkali metal alkoxide and an alkanol of 1 through 4 carbon atoms.

3,374,261

PREPARATION OF CYCLODODECYL HYDROGEN SULPHATE AND SALTS OF CYCLODODECYL HYDROGEN SULPHATE

Bonnie C. Lloyd, Pasadena, Tex., and Charles G. McAlister, Lake Charles, La., assignors to Columbian Carbon Company, New York, N.Y., a corporation of Delaware

No Drawing. Filed Jan. 29, 1965, Ser. No. 429,119
6 Claims. (Cl. 260—457)

Cyclododecyl hydrogen sulphate is prepared by reacting cyclododecene with cold concentrated sulphuric acid, diluting the reaction mixture with cold water, warming the aqueous mixture and adding a hydrocarbon solvent, separating the hydrocarbon phase and evaporating the hydrocarbon solvent to precipitate the acid sulphate. Salts of cyclododecyl hydrogen sulphate are precipitated from the separated hydrocarbon extract by neutralization with an alkali. These salts and the acid sulphate are separately converted to cyclododenol by dilute acid hydrolysis or to dodecane dioic acid by oxidation with concentrated nitric acid.

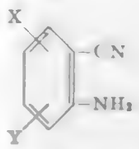
3,374,262

PRODUCTION OF O-AMINOBENZONITRILES BY THERMAL DECOMPOSITION OF ISATIN-β-OXIMES

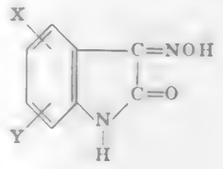
Matthias Seefelder, Ludwigshafen (Rhine), and Herbert Armbrust, Frankenthal, Pfalz, Germany, assignors to Badische Anilin- & Soda-Fabrik Aktiengesellschaft, Ludwigshafen (Rhine), Germany

No Drawing. Filed June 11, 1965, Ser. No. 463,347
Claims priority, application Germany, June 20, 1964, B 77,337
5 Claims. (Cl. 260—465)

1. Process for the production of o-aminobenzonitriles having the general formula



in which X and Y denote a member of the group consisting of a hydrogen atom, a halogen atom and an alkyl group having 1 to 4 carbon atoms which process comprises heating an isatin-β-oxime having the general formula



in which X and Y have the above meanings under subatmospheric pressure to at least 200° C. in the presence of an inert solvent having a boiling point higher than the boiling point of the aminobenzonitrile to be formed, under such conditions of temperature and pressure that the o-aminobenzonitrile distills off immediately after formation.

3,374,263

SEPARATING ACRYLONITRILE OR METHACRYLONITRILE FROM MIXTURES CONTAINING THE SAME

Hans-Martin Weitz and Hans Friz, Ludwigshafen (Rhine), and Rolf Platz, Mannheim, Germany, assignors to Badische Anilin- & Soda-Fabrik Aktiengesellschaft, Ludwigshafen (Rhine), Germany

Filed Feb. 5, 1965, Ser. No. 430,535
Claims priority, application Germany, Feb. 7, 1964, B 75,330
8 Claims. (Cl. 260—465.3)

Separation of unsaturated nitriles, especially acrylonitrile and/or methacrylonitrile, from gas mixtures such as are obtained in the ammonia oxidation of olefins, especially of propylene and/or butylene, by countercurrently contacting such gas mixtures with lactones, lactams, N-alkyllactams, N-hydroxyalkyllactams, sulfones, sulfoxides or propylenecarbonate and recovering the dissolved unsaturated nitriles from the resultant solution.

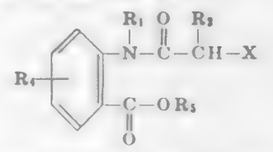
3,374,264

N-HALOACETYL-ANTHRANILIC ACIDS AND ESTERS

Milan Radoje Uskokovic, Montclair, and Wilhelm Wenner, Upper Montclair, N.J., assignors to Hoffmann-La Roche Inc., Nutley, N.J., a corporation of New Jersey

No Drawing. Original application Oct. 4, 1962, Ser. No. 228,256, now Patent No. 3,261,828, dated July 19, 1966. Divided and this application July 27, 1965, Ser. No. 475,267
10 Claims. (Cl. 260—471)

1. A compound of the formula:



wherein R_1 is selected from the group consisting of hydrogen, lower alkyl, phenyl-lower alkyl, nitrophenyl-lower alkyl and cyclo-lower alkyl-lower alkyl; R_2 is selected from the group consisting of hydrogen and lower alkyl; R_4 is selected from the group consisting of hydrogen and halogen; R_5 is selected from the group consisting of hydrogen and lower alkyl; and X is halogen.

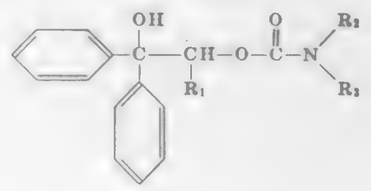
3,374,265

DIPHENYL HYDROXY CARBAMATE COMPOUNDS

Charles D. Bossinger, Olympia Fields, and Kelley G. Taylor, Decatur, Ill., assignors to Armour Pharmaceutical Company, Chicago, Ill., a corporation of Delaware

No Drawing. Original application Feb. 6, 1962, Ser. No. 171,354, now Patent No. 3,278,380, dated Oct. 11, 1966. Divided and this application Feb. 18, 1966, Ser. No. 528,383
3 Claims. (Cl. 260—482)

1. Diphenyl hydroxy carbamates having the formula



wherein R_1 is hydrogen and R_2 and R_3 are selected from the class consisting of hydrogen, methyl and ethyl.

3,374,266

PREPARATION OF ACRYLIC ACID ESTERS

Theodor Volker, Fribourg, Switzerland, assignor to Lonza Ltd., Basel, Switzerland

No Drawing. Continuation-in-part of application Ser. No. 481,072, Aug. 19, 1965. This application June 21, 1967, Ser. No. 647,634
Claims priority, application Switzerland, Mar. 6, 1963, 2,925/63; Sept. 1, 1964, 11,416/64
10 Claims. (Cl. 260—486)

Acrylic acid esters are prepared by decarboxylation of a mono copper salt of a 1,2-ethylenedicarboxylic acid in the presence of pyridine, quinoline, or acridines and preferably also of an acrylic acid ester and an alcohol.

3,374,267

PREPARATION OF LOWER ALKANOYLOXY-PROPIONALDEHYDES

Henry Harry Tan, Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Filed Aug. 10, 1965, Ser. No. 478,760
3 Claims. (Cl. 260—494)

1. A method for preparing lower alkanoyloxy-substituted propionaldehydes comprising reacting an aldehyde of the formula

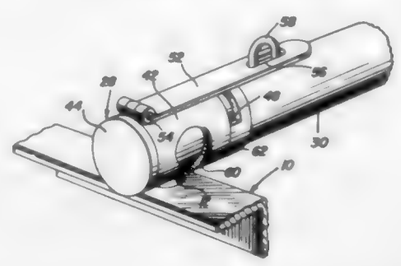
wherein R_1 and R_2, which may be the same, represent alkyl radicals of from 1 to about 6 carbon atoms, with a formaldehyde-yielding compound and a monobasic carboxylic acid, in the presence of a catalytic amount of a mineral acid at a temperature within the range of from about 50° to about 120° C.

3,374,268

HITCH CONSTRUCTION

James A. Groves, 1850 W. 9th St., Long Beach, Calif. 90813

Continuation of application Ser. No. 501,732, Oct. 22, 1965. This application July 5, 1967, Ser. No. 651,322
7 Claims. (Cl. 280—512)



A socket hitch element with a forward end of a trailer tongue including a cylindrical portion at the forward end of the tongue having a downwardly facing radial opening formed therein and with a cylindrical plug member snugly telescoped into the cylindrical portion, which plug member includes a radially outwardly opening recess whose outer end is registered with the opening and which is adapted to seatingly receive the ball portion of a ball hitch element inserted thereinto through said opening, and a sleeve telescoped over the cylindrical end portion and including a circumferential slot whose opposite ends are registrable with the opening and are of wide and narrow dimensions adapted to pass therethrough the aforementioned ball portion and to snugly receive the reduced di-

ameter shank portion of the ball hitch element, respectively.

3,374,269

PROCESS OF PRODUCING 3,5-DIIODOTHYRONINES

Franz Langer, Vienna, Austria., assignor, by mesne assignments, to Sandoz Ltd. (also known as Sandoz A.G.), Basel, Switzerland

No Drawing. Filed Jan. 2, 1964, Ser. No. 335,387

Claims priority, application Austria, Jan. 9, 1963, A 173/63

14 Claims. (Cl. 260—519)

A process of producing 3,5-diiodothyronines by converting 3,5-diiodotyrosine to a complex of divalent metal cations and reacting the complex in the presence of bases such as alkali metal hydroxides and alkoxides and organic nitrogen compounds, with 4,4'-dialkoxy-diphenyl-iodonium salts and then dealkylating to the corresponding 3,5-diiodothyronine.

3,374,270

PROCESS AND CATALYST FOR CATALYTIC DEHYDROGENATION OF CYCLODODECANOL

Manfred zur Hausen and Wilhelm Knepper, Marl, Germany, assignors to Chemische Werke Huls Aktiengesellschaft, Marl, Germany, a corporation of Germany

No Drawing. Filed June 2, 1965, Ser. No. 460,815

Claims priority, application Germany, June 4, 1964, C 33,046

8 Claims. (Cl. 260—586)

1. In a process for the catalytic dehydrogenation of cyclododecanol to cyclododecanone, the improvement comprising heating cyclododecanol in the liquid phase between 160 and 230° C. in the presence of a solid bed catalyst, said solid bed catalyst comprising 5 to 15% by weight of copper on an activated aluminum oxide carrier, said carrier having a surface area of 30–100 square meters per gram and a pore volume of more than 0.30 ml. per gram.

3,374,271

BENZOCYCLOHEPTEN-6-ONES AND METHODS OF PREPARING THE SAME

Andrew Steven Kende, Nanuet, N.Y., assignor to American Cyanamid Company, Stamford, Conn., a corporation of Maine

No Drawing. Filed Apr. 19, 1967, Ser. No. 631,918

7 Claims. (Cl. 260—590)

Novel bridged organic compounds, 5,9-dihydro-5,9-etheno-6H-benzocyclohepten-6-ones, prepared by the reaction of an aryne with tropone or substituted derivatives thereof. The novel compounds exhibit good activity against a broad spectrum of fungi and bacteria.

3,374,272

HYDROGENATION OF MESITYL OXIDE

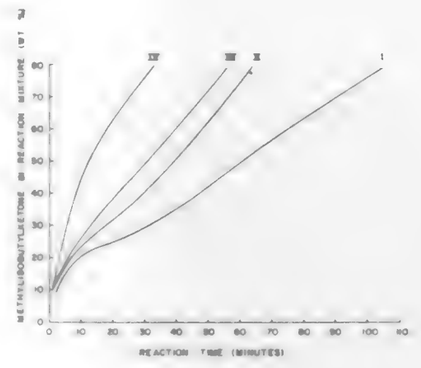
Adolf Heykoop and Franciscus A. van Dijk, Rotterdam, Netherlands, assignors to Shell Oil Company, New York, N.Y., a corporation of Delaware

Filed Mar. 9, 1966, Ser. No. 532,973

Claims priority, application Netherlands, Mar. 18, 1965, 65—3,470

8 Claims. (Cl. 260—593)

Crude mesityl oxide, obtained by dehydrogenating diacetone alcohol with sulfuric acid, is treated with hydrogen peroxide and caustic before liquid phase hydrogenation



in the presence of a nickel catalyst such as Raney nickel to methyl isobutyl ketone and/or methyl isobutyl carbinol.

3,374,273

FLUORO COMPOUNDS AND SYNTHESIS THEREOF

William J. Cunningham, Somerset, and Cyril Woolf, Morris Township, Morris County, N.J., assignors to Allied Chemical Corporation, New York, N.Y., a corporation of New York

No Drawing. Continuation-in-part of application Ser. No. 297,220, July 24, 1963. This application Oct. 31, 1966, Ser. No. 591,034

4 Claims. (Cl. 260—593)

1. The process for making a hydrate selected from the group consisting of $CF_3COCF_3 \cdot 3H_2O$ and

$$CF_3COCF_2Cl \cdot 3H_2O$$

comprising heating a corresponding compound selected from the group consisting of $CF_3COCF_3 \cdot H_2O$ and

$$CF_3COCF_2Cl \cdot H_2O$$

to volatilize therefrom volatile constituents which boil below about 105° C. at atmospheric pressure to thereby form a liquid hydrate selected from the group consisting of $CF_3COCF_3 \cdot 3H_2O$ and $CF_3COCF_2Cl \cdot 3H_2O$ boiling constantly at about 105° C. at atmospheric pressure, and thereafter recovering a hydrate selected from the group consisting of $CF_3COCF_3 \cdot 3H_2O$ and $CF_3COCF_2Cl \cdot 3H_2O$ of said heating operation.

3,374,274

PROCESS FOR THE PRODUCTION OF AROMATIC THIOLS AND AROMATIC SULFIDES

James D. Spainhour, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware

No Drawing. Filed Sept. 15, 1964, Ser. No. 396,739

10 Claims. (Cl. 260—609)

1. A process for the preparation of an aromatic thiol and an aromatic sulfide which comprises reacting a nuclear monohalo-substituted aromatic compound with an excess of an alkali metal monosulfide in a polar organic solvent selected from N-methyl-2-pyrrolidone, pyrrolidone caprolactam, N-ethyl-caprolactam, dimethylacetamide, tetramethylurea, hexamethylphosphoramide, and N,N'-ethylenedipyrrolidone at an elevated temperature for a time sufficient to carry out said reaction.

3,374,275

STABILIZATION OF POLYOXYALKYLENE COMPOUNDS

Charles R. Dickey, Covina, Calif., assignor to Union Carbide Corporation, a corporation of New York

No Drawing. Continuation-in-part of application Ser. No. 216,960, Aug. 15, 1962. This application May 24, 1966, Ser. No. 552,421

7 Claims. (Cl. 260—611.5)

1. A composition which comprises a polyoxyalkylene compound selected from the group consisting essentially of polyoxyethylene compounds, polyoxypropylene compounds and polyoxyalkylene compounds consisting essentially of oxyethylene and oxypropylene units having an average molecular weight between 200 and 50,000, from about 0.005 to about 1.0 weight percent, based on the weight of said polyoxyalkylene compound, of a boron-containing compound selected from the group consisting of alkali metal borohydrides and amine boranes, and from about 0.005 to about 1.0 weight percent, based on the weight of said polyoxyalkylene compound, of a compound selected from the group consisting of phenothiazine and alkylphenothiazine wherein the alkyl group contains from 1 to 8 carbon atoms.

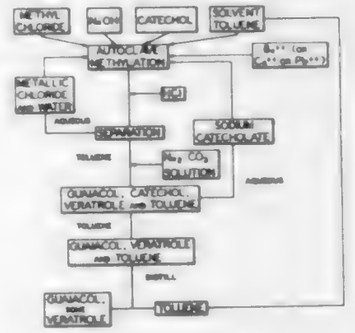
3,374,276

MANUFACTURE OF GUAIACOL

John Swidinsky, Newark, N.J., assignor to S. B. Penick & Company, New York, N.Y., a corporation of Delaware

Continuation-in-part of application Ser. No. 344,348, Feb. 12, 1964. This application Feb. 21, 1966, Ser. No. 529,158

9 Claims. (Cl. 260—613)



The invention relates to a process for converting catechol to guaiacol by treating catechol with a methyl halide in a closed reaction system at a temperature of between about 75–150° C. and at a pressure below about 300 pounds per square inch. The process is conducted in the presence of a water-soluble salt or hydroxide of a divalent metal, such as barium, calcium, lead or strontium, which divalent metal forms a water-insoluble sulfate and a catechol salt which are insoluble in water. The process is conducted in a solvent system made up of water and of a water-insoluble organic solvent which is not reactant with the catechol salt of the divalent metal and in which guaiacol is soluble. Desirably, when methyl chloride is employed, it is present in a mole ratio of 0.75 to 2.00 per mole of catechol.

3,374,277

DIOL OF POLY(ISOBUTYLENE OXIDE)

Edwin J. Vandenberg, Foulk Woods, Del., assignor to Hercules Incorporated, a corporation of Delaware

No Drawing. Continuation-in-part of application Ser. No. 298,434, July 29, 1963. This application Oct. 20, 1965, Ser. No. 499,035

2 Claims. (Cl. 260—615)

1. As a new composition of matter, a crystalline diol of poly(isobutylene oxide), wherein each of the hydroxyl groups is attached to a terminal carbon of the polymer chain, said diol having a number average molecular weight between about 500 and about 20,000 and a melting point of about 150° C. to about 175° C.

3,374,278

PREPARATION OF ALKYL IODIDES FROM ALKYL ALCOHOLS AND ORGANOTIN IODIDES

Harold Coates, Wombourn, and Peter Albert Theodore Hoye, Stourbridge, England, assignors to Albright & Wilson (Mfg.) Limited, Oldbury, near Birmingham, England, a British company

No Drawing. Filed Oct. 14, 1963, Ser. No. 316,131

Claims priority, application Great Britain, Oct. 15, 1962, 38,891/62

18 Claims. (Cl. 260—652)

Alkyl iodide is prepared by heating an organotin iodide in the presence of hydrogen chloride and an alkyl alcohol thereby forming alkyl iodide and organotin chloride; and the alkyl iodide is recovered from the reaction mixture.

3,374,279

ALKYLATION PROCESS

David G. Walker, Madison, N.J., assignor to Esso Research and Engineering Company

No Drawing. Filed Dec. 30, 1965, Ser. No. 517,857

9 Claims. (Cl. 260—671)

1. A method which comprises
contacting in the liquid phase an alkylatable aromatic hydrocarbon with an olefin
in a reaction zone which is substantially free of water and molecular oxygen,
and in the presence of an effective amount of a catalyst dissolved in said aromatic hydrocarbon,
said catalyst consisting of a crystalline complex having the empirical formula

$$1TiCl_3 : 1 \text{ aromatic hydrocarbon} : 2AlCl_3$$

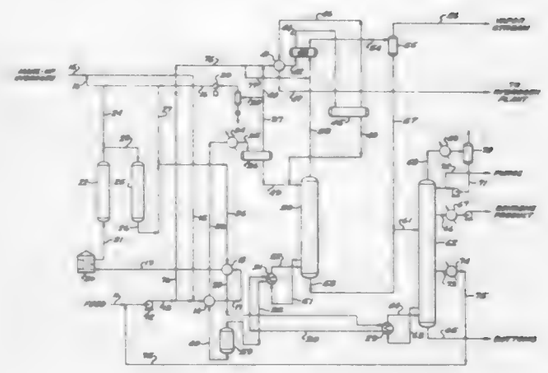
3,374,280

THERMAL HYDRODEALKYLATION PROCESS

Norman L. Carr, Allison Park, and Rodney E. Peterson, Oakmont, Pa., assignors to Gulf Research & Development Company, Pittsburgh, Pa., a corporation of Delaware

Filed June 20, 1966, Ser. No. 558,993

5 Claims. (Cl. 260—672)



Alkyl aromatic hydrocarbon feed stocks containing toluene are subjected to thermal hydrodealkylation in the presence of hydrogen and at least one alkyl benzene having at least 8 carbon atoms per molecule. The presence of C_8^+ alkyl benzenes increased selectivity and conver-

sion of toluene to benzene at lower reaction temperatures and shorter reaction times.

3,374,281

PRODUCTION OF ALKYLATED BENZENES FROM PARAFFINS

Sigmund M. Csicsery, Greenbrae, Calif., assignor to Chevron Research Company, San Francisco, Calif., a corporation of Delaware

No Drawing. Filed Sept. 28, 1965, Ser. No. 491,023

8 Claims. (Cl. 260—673)

A process for the production of alkylated benzene compounds in which a feed stream comprising at least one C_4–C_5 paraffin and hydrogen (in a hydrogen-to-hydrocarbon ratio of less than 1.0) is contacted with a catalyst comprising a Group V, VI or VII metal or oxide dehydrogenating component and an acidic component of specified acidity at a temperature of 800°–1200° F. and a pressure of 2–500 p.s.i.a., yielding alkylated benzene compounds as the principal aromatic reaction products. Acidity is measured by the mol ratio of isobutene to normal butenes in the product. Temperatures of 950°–1170° F. and pressures of 5–100 p.s.i.a. are preferred.

3,374,282

METHOD OF PREPARING AROMATIC HYDROCARBONS FROM PROPYLENE HYDROCARBONS

Frederick J. Soderquist, Essexville, Harold D. Boyce, Coleman, and Edward P. Duris, Midland, Mich., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Filed Feb. 1, 1967, Ser. No. 613,104

7 Claims. (Cl. 260—673.5)

A process for converting propylene to aromatic hydrocarbons by conducting a mixture of a gaseous diluent, such as, for example, steam, and polypropylene hydrocarbons through a reaction zone maintained at a temperature range of from about 700° to about 950° C., and separating the resultant aromatic hydrocarbons from the hydrocarbon product phase.

3,374,283

HYDROCARBON DEHYDROGENATION IN THE PRESENCE OF OXYGEN, IODINE AND COBALT

Laimonis Bajars, Princeton, N.J., assignor to Petro-Tex Chemical Corporation, Houston, Tex., a corporation of Delaware

No Drawing. Continuation-in-part of application Ser. No. 242,077, Dec. 4, 1962. This application Mar. 11, 1965, Ser. No. 439,079

3 Claims. (Cl. 260—680)

1. The method for preparing aliphatic diolefins which comprises heating in the vapor phase at a temperature in the range of about 400° C. to about 800° C. a mono-olefinic hydrocarbon containing 4 to 6 carbon atoms with oxygen in a molar ratio of about one-fourth to about two mols of oxygen per mol of mono-olefin, an iodine liberating material in amount greater than 0.001 mol of iodine per mol of mono-olefin, the partial pressure of said mono-olefin being less than about 20 inches mercury, in the presence of a material selected from the group consisting of cobalt metal, inorganic cobalt salts, cobalt oxide and mixtures thereof, the ratio of the amount of said oxygen being greater than 1 mol per atom of said iodine.

3,374,284

PRODUCTION OF CONJUGATED DIOLEFINES

John Lynn Barclay, Tadsworth, and David James Hadley and James Robert Bethell, Epsom Downs, England, assignors to The Distillers Company Limited, Edinburgh, Scotland, a British company

No Drawing. Continuation-in-part of application Ser. No. 490,127, Sept. 24, 1965. This application Sept. 12, 1966, Ser. No. 578,498

Claims priority, application Great Britain, Oct. 12, 1960, 34,878/60; Jan. 25, 1961, 2,856/61; May 19, 1961, 18,256/61; Aug. 18, 1961, 29,802/61

11 Claims. (Cl. 260—680)

Process for the conversion of mono-olefines containing a chain of not less than four carbon atoms such as butenes or 2-alkyl butenes to the corresponding conjugated diolefine by forming a vapor mixture of the mono-olefine with oxygen and passing the mixture over a heated catalyst which is either a mixture of oxides of any of the elemental pairs, cobalt-tin, cobalt-titanium, tin-titanium, tin-tungsten, tin-molybdenum, titanium-tungsten, titanium-molybdenum, or a compound of oxygen with the metals of one of these pairs.

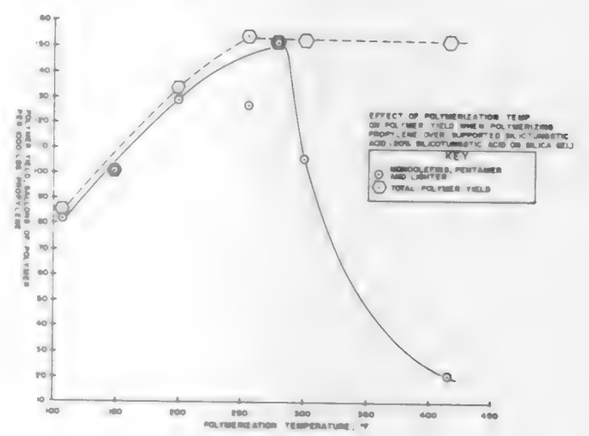
3,374,285

PROCESS FOR THE POLYMERIZATION OF PROPYLENE

Alfred M. Henke, Springdale, and Raynor T. Sebulsky, Verona, Pa., assignors to Gulf Research & Development Company, Pittsburgh, Pa., a corporation of Delaware

Filed Dec. 29, 1964, Ser. No. 421,805

14 Claims. (Cl. 260—683.15)



EFFECT OF POLYMERIZATION TEMP ON POLYMER YIELD WHEN POLYMERIZING PROPYLENE OVER SUPPORTED PHOSPHOTUNGSTIC ACID (30% SILICOTUNGSTIC ACID ON SILICA GEL)
KEY
BICYCLOETHER, PENTAMER AND LIGHTER
TOTAL POLYMER YIELD
POLYMERIZATION TEMPERATURE, °F

1. A process for the polymerization of propylene wherein no aromatics are formed which comprises:

contacting propylene at a temperature which is maintained between 100° F. and 300° F. with a catalyst comprising a tungsten containing heteropoly acid deposited on a support selected from the group consisting of the oxides of aluminum, silicon and magnesium and mixtures thereof for a time sufficient to produce substantially only polymers of propylene having a maximum of 15 carbon atoms per molecule.

3,374,286

POLYMERIC POLYHYDROXY - POLYETHER RESINS AND METHOD OF MAKING SAME

Darrell D. Hicks, Louisville, Ky., assignor to Celanese Coatings Company, New York, N.Y., a corporation of Delaware

No Drawing. Continuation-in-part of application Ser. No. 281,337, May 17, 1963. This application Feb. 1, 1967, Ser. No. 613,123

9 Claims. (Cl. 260—834)

A process for preparing fusible polymeric polyhydroxy polyether resins by reacting a diepoxide resin, a monohydric alcohol and a monoepoxide in the ratio of 1 mol of diepoxide resin with about one mol of alcohol and less than ten mols of monoepoxide.

3,374,287

POLYEPOXIDE PRODUCTS OF REDUCED ODOR CURED WITH SULFUR CONTAINING POLYACID COMPOUNDS AFTERTREATED WITH FORMALDEHYDE

Sylvan O. Greenlee, Lafayette, Ind., assignor, by mesne assignments, to Ciba Limited, Basel, Switzerland, a corporation of Switzerland

No Drawing. Original application Oct. 8, 1962, Ser. No. 229,217. Divided and this application Nov. 10, 1966, Ser. No. 607,096

3 Claims. (Cl. 260—836)

The odor associated with polyepoxide conversion products formed by reacting a polyepoxide having a functionality of greater than one vicinal epoxy group per molecule with a thioxyalkanoic acid containing at least one thioether group and at least two carboxylic acid groups, obtained by reaction of a mercapto acid and a diene polymer, is substantially reduced by treating the thioxyalkanoic acid after formation with formaldehyde in the presence of a mineral acid.

3,374,288

POLYCARBONAMIDE FILAMENTS CONTAINING POLYALKYLENE OXIDE, SODIUM PHENYL PHOSPHINATE AND SODIUM AMINOALKYL-PHOSPHINATE

Ronald F. Lange, Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Filed Sept. 3, 1965, Ser. No. 485,109

4 Claims. (Cl. 260—857)

Stabilized filaments may be prepared from synthetic linear polyamides by the addition of 0.5 to 1.0 mole percent of sodium aryl phosphinate and 0.5 to 1.0 percent of sodium aminoalkyl phosphinate, with the further addition of at least 2.0% of a polyalkylene oxide based on the weight of the polyamide. In an example a polymeric composition is prepared from 73 lbs. of hexamethylenediammonium adipate ammonium salt, 68.1 gms. sodium phenyl phosphinate, and 60.2 gms. of sodium 3 - aminopropyl phosphinate.

3,374,289

GRAFT POLYMERS FOR COATINGS, IMPREGNATIONS AND ADHESIVE FILMS FOR FIBRE SUBSTRATA

Karl-Heinz Ott, Harro Schlesmann, Karl Dinges, Oskar Glenz, Karl-Arnold Weber, and Fritz Kassack, Cologne-Stammheim, Germany, assignors to Farbenfabriken Bayer Aktiengesellschaft, Leverkusen, Germany, a German corporation

No Drawing. Filed Dec. 17, 1963, Ser. No. 331,116

Claims priority, application Germany, Dec. 22, 1962, F 38,632

5 Claims. (Cl. 260—885)

Grafting substrate of a saturated copolymer of p-isopropyl-α-methylstyrene and an ester of acrylic and/or methacrylic acid, the esterifying moiety thereof containing 1–10 carbon atoms and, as the grafting component, at least one ester of acrylic acid, the esterifying moiety thereof containing from 1–10 carbon atoms with permissible replacement of up to 50% by weight of said component with other mono-olefinically unsaturated compounds having a terminal $CH_2{=}C<$ group. A preferred embodiment embraces a grafting component wherein said olefinically unsaturated compound is an ether, ester or a Mannich base having groups which are capable of spontaneous cross-linking.

3,374,290

POLYETHYLENE CONTAINING HOMOPOLYMER OF C_{14-16} ALPHA-MONOOLEFIN

Norman W. Franke, Penn Hills Township, Allegheny County, and Joseph C. Martini, Export, Pa., assignors to Gulf Research & Development Company, Pittsburgh, Pa., a corporation of Delaware

No Drawing. Filed Nov. 2, 1965, Ser. No. 506,112

6 Claims. (Cl. 260—897)

A new polyethylene composition is claimed which has both improved environmental stress cracking resistance and melt index properties. The composition consists of between 80 and 98 weight percent polyethylene and between 2 and 20 weight percent of a n-1-monoolefin homopolymer wherein the monoolefin has between 14 and 16 carbon atoms.

3,374,291

TRITHIOPHOSPHITES OF MERCAPTO ACID ESTERS

Herbert Myers, Cherry Hill, N.J., assignor to Mobil Oil Corporation, a corporation of New York

No Drawing. Filed May 25, 1964, Ser. No. 370,112

6 Claims. (Cl. 260—942)

1. A mercapto acid ester trithiophosphite of the formula

$$[(R'\overset{O}{\overset{\|}{O}}C)_nRS]_3P$$

wherein R is selected from the class consisting of alkylene, alkenylene, arylene, alkarylene and aralkylene having from 1 to about 40 carbon atoms; R′ is selected from the class consisting of alkyl, cycloalkyl, alkenyl, aryl, alkaryl, aralkyl, and monochloroalkyl and having from 1 to about 18 carbon atoms; and n is an integer of from 1 to 3, and when R′ is alkyl, R is selected from the class consisting of alkenylene, arylene, alkarylene and aralkylene.

3,374,292

PHOSPHONO CARBOXAMIDES

Sheik Abdul-Cader Zahir, Great Shelford, Cambridge, England, assignor to Ciba Limited, Basel, Switzerland, a Swiss company

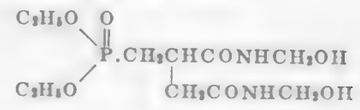
No Drawing. Continuation of application Ser. No. 362,998, Apr. 27, 1964. This application June 14, 1967, Ser. No. 646,119

Claims priority, application Great Britain, May 3, 1963, 17,563/63

9 Claims. (Cl. 260—943)

1. N-hydroxymethyl - 3 - (diethylphosphono)propionamide.

7. The compound of the formula:



3,374,293

PHOSPHORIC, PHOSPHONIC, PHOSPHINIC, THIONOPHOSPHORIC, -PHOSPHONIC, -PHOSPHINIC ACID ESTERS

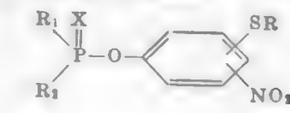
Rudolf Heiss and Karl Mannes, Cologne-Stammheim, Heinrich Pelster, Leverkusen, Günter Unterstenhöfer, Opladen, and Wolfgang Behrenz, Wuppertal-Elberfeld, Germany, assignors to Farbenfabriken Bayer Aktiengesellschaft, Leverkusen, Germany, a corporation of Germany

No Drawing. Continuation-in-part of application Ser. No. 331,121, Dec. 17, 1963. This application Jan. 5, 1965, Ser. No. 423,576

Claims priority, application Germany, Dec. 22, 1962, F 38,633

13 Claims. (Cl. 260—949)

1. A compound of the formula



wherein R_1 and R_2 stand independently for members selected from the group consisting of alkyl having up to 8 carbon atoms, phenyl, lower alkoxy having up to 4 carbon atoms and monochloro lower alkoxy having up to 4 carbon atoms, R stands for a member selected from the group consisting of alkyl having up to 12 carbon atoms, lower alkoxy-carbonyl substituted lower alkyl, said lower alkoxy and lower alkyl having up to 4 carbon atoms and hydroxy substituted lower alkyl having up to 4 carbon atoms, and X stands for oxygen or sulfur.

3,374,294

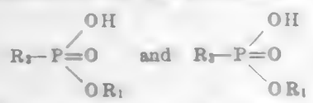
MONOESTERS OF PHOSPHONIC ACIDS

Emile Cherbuliez and Joseph Rabinowitz, Geneva, Switzerland, assignors to Hooker Chemical Corporation, Niagara Falls, N.Y., a corporation of New York

No Drawing. Continuation-in-part of application Ser. No. 230,315, Oct. 11, 1962. This application Nov. 24, 1965, Ser. No. 509,650

6 Claims. (Cl. 260—958)

1. A compound selected from the group consisting of compounds represented by the formulas



and

wherein R_2 is selected from the group consisting of halogeno-phenyl and nitro-phenyl, R_3 is selected from phenyl, halogeno-phenyl and nitrophenyl, R_1 is bicycloalkyl of 6 to 18 carbon atoms, and M is selected from the group consisting of alkali metals and alkaline earth metals.

3,374,295

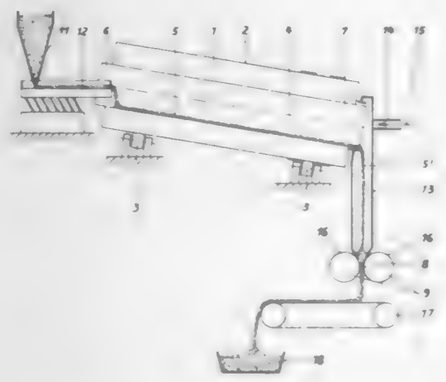
METHOD OF HEATING OF ROLLING MILL ROLLS FOR THE ROLLING OF HEATED METAL PARTICLES

Eckard Gehring, Dusseldorf-Kaiserswerth, and Oswald Kaiser, Lintorf, near Dusseldorf, Germany, assignors to Schloemann Aktiengesellschaft, Dusseldorf, Germany

Filed Jan. 24, 1966, Ser. No. 522,722

Claims priority, application Germany, Jan. 23, 1965, Sch 36,423

3 Claims. (Cl. 263—52)



A method of rolling strips and sections from heated metal particles by so adjusting the roll gap that the heated metal particles can pass through in contact with the rolls but without deformation, thereby heating the rolls, and then readjusting the roll gap and rolling the particles to the desired form and dimensions. The particles first passed through, being unchanged, may be immediately rolled in the second stage. Heated protective gas may be supplied to the furnace that heats the granules.

3,374,296

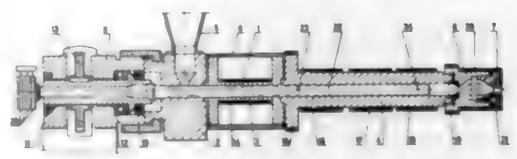
THERMOPLASTIC EXTRUSION PROCESS

Hermann R. K. N. Janeschitz-Kriegl, Delft, and Johannes Schijf and Johannes A. M. Telgenkamp, The Hague, Netherlands, assignors to Nederlandse Organisatie Voor Toegepast-Natuurwetenschappelijk Onderzoek ten Behoeve van Nijverheid, Handel en Verkeer, a corporation of the Netherlands

Filed Jan. 22, 1964, Ser. No. 340,116

Claims priority, application Netherlands, Feb. 6, 1963, 288,647

1 Claim. (Cl. 264—40)



1. A process for controlling the heat supply to the melting zone of a thermoplastic synthetic resin screw extruder comprising

(a) measuring the difference in temperature between two separately located sensing devices at both ends of a metering zone;

(b) maintaining the outer cylinder wall of the metering zone of said screw extruder at a constant temperature; and

(c) supplying heat to the melting zone of said extruder in response to a change in the difference in temperature between said sensing devices.

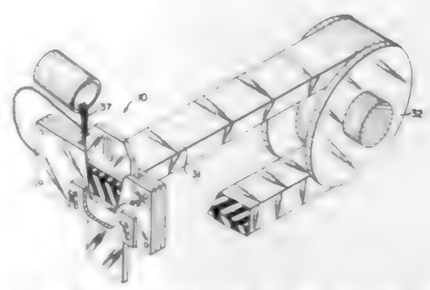
3,374,297

METHOD FOR MEASURING BELT SECTIONS

Dewey D. Henderson, Springfield, Mo., assignor to Dayco Corporation, a corporation of Delaware

Original application Sept. 28, 1962, Ser. No. 226,815, now Patent No. 3,240,465, dated Mar. 15, 1966. Divided and this application May 10, 1965, Ser. No. 470,278

1 Claim. (Cl. 264—40)



A method of measuring the cross section of a belt without the necessity of removing the belt from its drive. The method consists of placing a mold cavity around the belt and dispensing material to form an impression of the belt periphery, and placing a movable member on the upper surface of the belt to close the mold. After the material has hardened it is removed and provides an impression of the cross section of the belt.

3,374,298

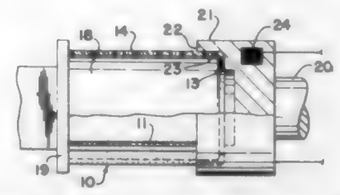
METHOD OF MAKING DRINKING UTENSIL JACKET

Charles E. Studen, R.R. 1, Pekin Road, Newbury, Ohio 44065

Filed Apr. 8, 1965, Ser. No. 446,530

2 Claims. (Cl. 264—41)

A method of making a collapsible polyethylene drinking utensil jacket having an inturned flange at one end thereof to support a utensil by extruding polyethylene foam through a die to form a tubular member having longitudinal indentations to facilitate collapse of the member, cutting the tubular member into predetermined lengths and fitting these lengths upon a mandril, said mandril being of a length to permit a pre-established amount of said cut tubular member to extend and overhang therefrom, displacing the mandril into a heatable female die shaping member to form an inturned flange, and applying heat to the female die to permanently set the inturned flange.



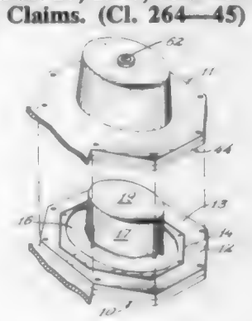
3,374,299

PLASTIC HAT

Engelbert J. Peham, St. Paul, Minn., assignor to Peham Plastics Company, St. Paul, Minn., a partnership

Original application Feb. 1, 1965, Ser. No. 429,231, now Patent No. 3,305,874, dated Feb. 28, 1967. Divided and this application Feb. 27, 1967, Ser. No. 618,631

5 Claims. (Cl. 264—45)



The method disclosed is for producing objects such as plastic hats having a resilient band embedded in the plastic at spaced areas and normally extending in straight lines between these areas, the resilient band serving to make the hat adaptable to various head sizes and shapes. The method is used in conjunction with a convex male mold and a concave relatively movable female mold defining a mold cavity therebetween. The male mold includes a series of spaced parallel pins extending into the mold cavity at points spaced outwardly of the convex surface thereof. The method employs the steps of stretching an endless resilient band around the convex portion of the male mold and outwardly of the pins. Intermediate portions of the band between the pins are drawn under tension against the male mold. The mold cavity is then filled with plastic. When the molded body is removed from the mold, the portions of the band which have been held under tension against the male mold are free to flex into straight lines between the embedded areas.

3,374,300

PROCESS AND APPARATUS FOR THE CONTINUOUS PRODUCHON OF POLYSTYRENIC FOAM MATERIALS

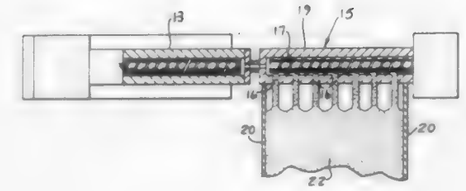
Kimikazu Azuma, 6703 Kugenuma Fujisawa-shi, Kanagawa-ken, Japan

Filed July 6, 1964, Ser. No. 380,581

Claims priority, application Japan, Oct. 12, 1963, 38/54,382; Oct. 14, 1963, 38/55,171

7 Claims. (Cl. 264—46)

A process and an apparatus for the continuous manufacture of a uniform foamed product in which a melted thermoplastic resin containing a foaming agent uniformly intermixed therein is fed into a screw extruder, the housing of which has a plurality of orifices uniformly axially spaced along one side thereof. A low pressure shaping chamber is positioned outside of the extruder housing and adjacent said one side thereof for receiving the material extruded through the plurality of orifices. Rotation of the screw of said extruder applies pressure to the melted resin mass whereby the melted material is forced through the plurality of orifices so as to form a plurality of individual strands. The strands pass into the shaping chamber which permits the strands to expand to form a foam material. The strands coalesce to form an integral foamed body.



3,374,301

METHOD OF THERMOFORMING ALKENYL AROMATIC RESINOUS SHEET

Earl F. Engles, William R. R. Park and Donald A. Shmidt, Midland, Mich., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

Continuation-in-part of application Ser. No. 204,123, June 21, 1962. This application June 1, 1965, Ser. No. 460,335

6 Claims. (Cl. 264—134)

1. In the thermoforming of oriented alkenyl aromatic resinous sheet wherein said sheet is heated to a thermoplastic temperature, conformed to a mold or form and subsequently cooled to provide a rigid shaped sheet, the improvement which comprises applying to said sheet prior to thermoforming a coating comprising a water dispersion of a salt selected from the group consisting of potassium or sodium oleate and mixtures thereof, evaporating the water from the surface of the alkenyl aromatic resinous sheet to deposit thereon a substantially continous coating of the salt, and subsequently thermoforming said sheet.

3,374,302

STRAND TREATMENT PROCESS

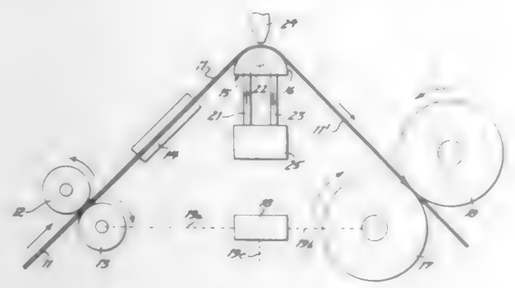
Robert K. Stanley, Media, Pa., assignor to Techniservice Corporation, Lester, Pa., a corporation of Pennsylvania

Continuation-in-part of application Ser. No. 476,933, Aug. 3, 1965. This application Dec. 6, 1965, Ser. No. 511,929

4 Claims. (Cl. 264—168)

A process of drawing and crimping textile strands is disclosed wherein the strand is pulled slidably over a snubbing surface, with cooling of the side of the strand in contact with the snubbing surface and simultaneous heating of the opposite side of the strand. The strand is withdrawn from the snubbing location and is subsequently relaxed, whereupon it obtains a bulky or crimped configuration. Optional features of the process include preheating the strand uniformly before reaching the snubbing location and withdrawing the strand from the snubbing location under reduced tension and heating it

substantially uniformly. A form of the product is characterized by concavity on the side of the strand



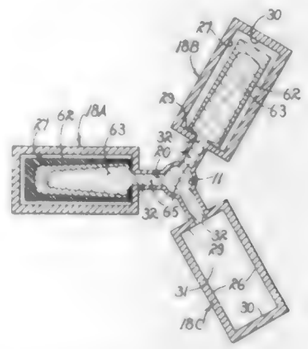
previously cooled in contact with the snubbing surface and by convexity on the opposite side previously heated.

3,374,303
METHOD FOR MANUFACTURING IMPRINTED PLASTIC FILM
Peter J. Metz, Jr., Castro Valley, Calif., assignor to Crown Zeilerbach Corporation, San Francisco, Calif., a corporation of Nevada
Filed Feb. 14, 1964, Ser. No. 344,857
10 Claims. (Cl. 264—216)

Polyolefin film is extruded in a viscous amorphous state onto a continuously moving chill roll. The film moves with one face in contact with the chill roll and, at a critical area where the polyolefin sets to a substantially solid semicrystalline state, known as the frost line, the film passes through a nip defined by the chill roll and a cooled rotary impression roll to effect impressions on the opposite face of the film.

3,374,304
METHOD FOR INJECTION MOLDING
Richard E. Ayres, Rte. 1, Box 326, Woodlake, Calif. 93286
Filed Aug. 20, 1965, Ser. No. 481,210
2 Claims. (Cl. 264—231)

1. Method of injection molding articles of a selected size and shape to form a plurality of articles of substantially homogeneous thermoplastic materials characteristically prone to shrinkage when cooled from a molten state comprising heating a source of said material to a molten state; injecting under pressure a first quantity of molten material from said source into a first cavity of a plurality of mold cavities, each cavity being formed by a wall having substantially the internal shape and size of the desired end product to be formed and providing an inlet, said injected material filling said first cavity to the wall thereof; cooling the material in said first cavity so that it forms a progressively hardening outer layer and a diminishing molten inner core communicating with the inlet, said material shrinking from the wall during hardening; injecting under pressure a second quantity of molten material from said source distributively into the core in the first cavity and into a second cavity substantially simultaneously to fill said second cavity to the wall thereof and to expand the hardening layer in the first cavity to the wall thereof; cooling the material in said cavities respectively to increase the hardening layer in the first cavity and to form a progressively hardening outer layer and a diminishing molten inner core in the

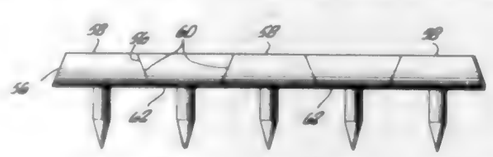


material of the second cavity, said core communicating with the inlet to said cavity, said material in the second cavity shrinking from the wall thereof during hardening; repeating the preceding steps until the material in the first cavity during cooling reaches a degree of substantial conformity with the internal shape of the wall and size of the cavity, each repetitive step including injection of similar molten material under pressure into an additional cavity substantially similar to the first and second cavities so that the total number of cavities utilized equals the number of injection steps necessary to bring the material in the first cavity to said degree of conformity; removing the substantially conforming material from the first cavity; and repeating the steps successively to complete said conformance of the material in the respective cavities and to remove the substantially conforming material in turn from said cavities, the cavities from which the material has been removed being utilized as the respective additional cavities for subsequent injection steps, the individual quantities of material removed from the respective cavities forming molded substantially homogeneous articles.

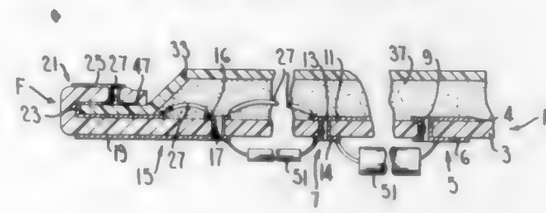
ELECTRICAL

3,374,305
ELECTRIC CIRCUIT
Richard R. Bower, 10012 Wilbur Ave., Northridge, Calif. 91324
Filed Mar. 21, 1966, Ser. No. 536,015
10 Claims. (Cl. 174—68.5)

A series of elongated electrical conductors is disposed in intersecting grooves in a sheet or a board. Each conductor includes a shank to form a T-shaped cross section providing outwardly-extending portions of the conductor on opposite sides of the shank and disposed in a respective groove. The shanks extend into the board or support to anchor the conductors in place. The ends of the conductors are in electrical contact with each other to form an electrical circuit.

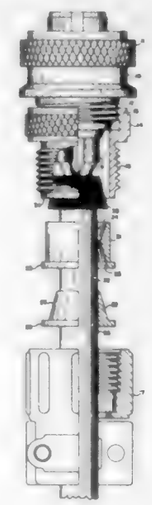


3,374,306
PRINTED CIRCUIT BOARD
Allen C. Bradham III, Houston, Tex., assignor to Texas Instruments Incorporated, Dallas, Tex., a corporation of Delaware
Filed Sept. 12, 1966, Ser. No. 578,647
2 Claims. (Cl. 174—68.5)



1. A circuit board comprising:
a dished back,
a substantially flat insulating sheet covering said back,
conductive elements disposed on the outside and inside surfaces of the sheet, at least some of which elements being interconnected through the sheet,
inside wiring connecting at least some of the inside conductive elements and a cured solid plastic containing said wiring and connecting the back and the sheet to form a rigid unit.

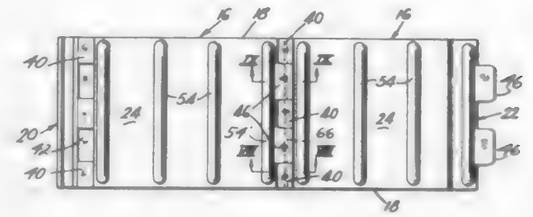
3,374,307
ELECTRICAL CONNECTOR
Theodore J. Rauen, Suitland, Edwin Clarence Myers, Jr., Temple Hills, and Arthur B. Cooke, Silver Spring, Md., assignors to the United States of America as represented by the Secretary of the Navy
Filed Feb. 28, 1966, Ser. No. 532,536
2 Claims. (Cl. 174—89)



An electrical connector for insuring a positive electrical contact between the shield of an electrical cable and a connector. Specially shaped concentric rings are so related to the shield that the shield is secured between the concentric rings. The concentric rings are then held in place by coupling nuts which secures the connector with a desired connection.

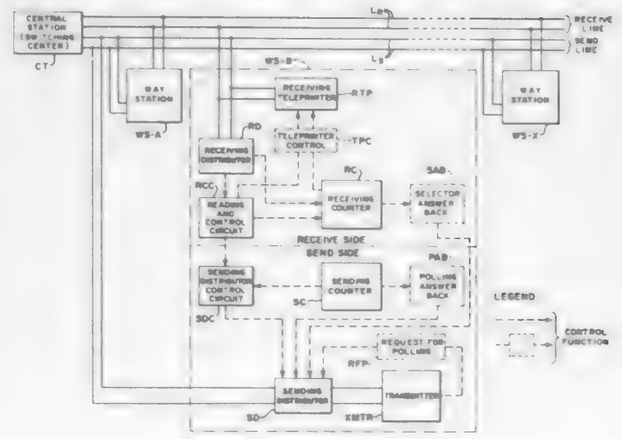
3,374,308
CONDUIT INSULATING SPACER
Carroll J. Haas, Mendon, Mich., assignor to Research Molding, Inc., Mendon, Mich., a corporation of Michigan
Filed Sept. 12, 1966, Ser. No. 578,703
12 Claims. (Cl. 174—138)

An electrically insulating spacer for conduits mounted within housings consisting of a plurality of dielectric segments interconnected to form an annular collar about the



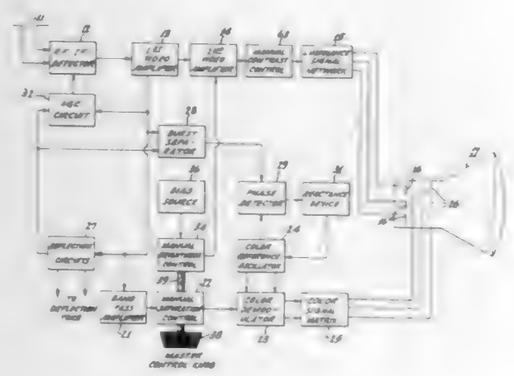
conduit, spacing projections being defined upon the segments from the material of the segments.

3,374,309
DUPLEX WAY STATION SELECTOR
John Elich, Staten Island, and Vincent C. Kempf, South Ozone Park, N.Y., assignors to The Western Union Telegraph Company, New York, N.Y., a corporation of New York
Filed Mar. 30, 1964, Ser. No. 355,541
15 Claims. (Cl. 178—2)



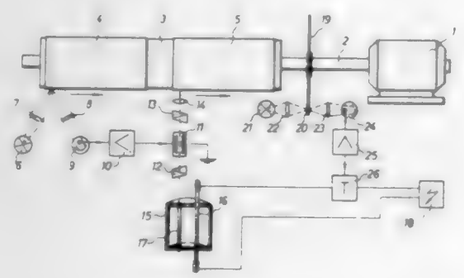
1. In a telegraph system, in combination:
(a) a central station;
(b) a plurality of way stations;
(c) a line circuit arranged for duplex operation interconnecting the central station and the way stations;
(d) a message recorder at each way station;
(e) a recorder control means at said recorder for blinding and unblinding said recorder to message and control signals;
(f) a receiving distributor connected to said line circuit for receiving signals from the central station;
(g) reading means connected to said receiving distributor for reading a sequence of way station selection characters sent from the central station;
(h) a receiving counter capable of assuming a predetermined number of counting states;
(i) signal transmission means at each way station connected to said line circuit for transmitting answer-back signals to the central station; and
(j) circuit means interconnecting said receiving counter with said receiving distributor, with said reading means, and with said signal transmission means, whereby control signals are received by said receiving distributor, messages are recorded by said recorder and answer-back signals are sent by said signal transmission means, only during counting states of said receiving counter in a receiving program determined and controlled by said counter.

3,374,310
COLOR TELEVISION RECEIVER WITH SIMULTANEOUS BRIGHTNESS AND COLOR SATURATION CONTROLS
George L. Beers, 410 Peyton, Ave., Haddonfield, N.J. 08033
Filed Aug. 23, 1965, Ser. No. 481,817
12 Claims. (Cl. 178—5.4)



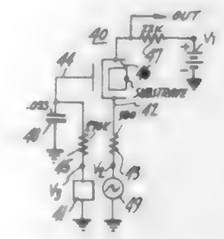
A color television reproducing system is provided with a master control which permits the average brightness of the reproduced color image to be varied as desired while maintaining the subjective saturation of the reproduced color image substantially unaltered. This is accomplished by causing the color saturation control of the color television reproducing system to vary simultaneously with the brightness control.

3,374,311
PRODUCING PRINTING BLOCKS, PREFERABLY INTAGLIO PRINTING BLOCKS
Rudolf Hell, Kiel, Germany, assignor to Dr.-Ing. Rudolf Hell Kommanditgesellschaft, Kiel-Dietrichsdorf, Germany, a German company
Filed Aug. 27, 1963, Ser. No. 304,995
Claims priority, application Germany, Sept. 1, 1962, S 46,818
7 Claims. (Cl. 178—6.6)



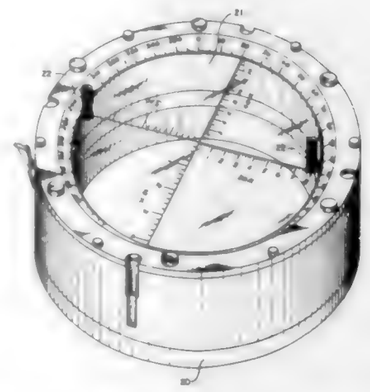
1. A system of producing printing blocks, preferably intaglio printing blocks, from single-colored or multicolored picture or text copies, by photoelectrically scanning such originals to be reproduced and removing continuously variable and controllable amounts of material from the surface of such blocks under the control of such scanning, comprising evaporating the material on the surface of such blocks in atmospheric pressure by a very highly bunched, monochromatic bundle of light rays of high power density being focused on to said surface of said blocks, and modulating said bundle of light rays by the photocell signals.

3,374,312
CLIPPING CIRCUIT UTILIZING AN INSULATED-GATE FIELD-EFFECT TRANSISTOR
Lucius P. Thomas, Indianapolis, Ind., assignor to Radio Corporation of America, a corporation of Delaware
Filed Feb. 12, 1964, Ser. No. 344,272
18 Claims. (Cl. 178—7.3)



A clipping circuit including an insulated-gate field-effect transistor biased so as to be rendered conductive only upon applied signals exceeding a predetermined voltage level. In a synchronizing signal separator arrangement for use in a television receiver environment, independent control of the aforementioned predetermined voltage enables design for optimum noise immunity and signal response.

3,374,313
CATHODE RAY TUBE OVERLAY INCLUDING A ROTATABLE DISC WITH A PLURALITY OF RANGE SCALES
Robert H. Mathes, Hillcrest Heights, and Lauro C. Ricalzone, Forest Heights, Md., assignors to the United States of America as represented by the Secretary of the Navy
Original application Apr. 12, 1962, Ser. No. 188,006. Divided and this application Mar. 30, 1964, Ser. No. 357,015
2 Claims. (Cl. 178—7.83)

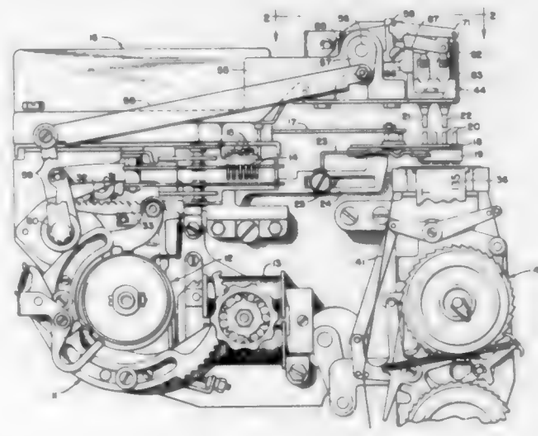


This invention is directed to an overlay for a cathode ray tube. The overlay includes a transparent rotatable disc which has a plurality of radially extending range scales which cooperate with the sweep on the scope to determine range of a target displayed by the scope.

3,374,314
STOCK QUOTATION PRINTER
Otto P. Geilich, Addison, Ill., assignor to Teletype Corporation, Skokie, Ill., a corporation of Delaware
Filed Mar. 17, 1964, Ser. No. 352,460
7 Claims. (Cl. 178—34)

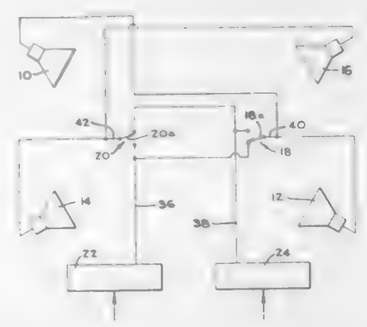
1. A print hammer selector and actuator for a stock quotation printer having code bar controlled means for aligning two rows of type in position for printing comprising,

a print hammer actuating shaft oscillated through a predetermined arc in each cycle of the printer;
a pair of print hammer actuators each having a cam surface;
an interposer member actuated by said shaft and shiftable with respect to said shaft into operative relation to one of said cam surfaces by one of said code bars to actuate said print hammer actuator upon oscillation by said shaft in one direction;
a print hammer lever individual to each hammer actuator and positively moved by its hammer actuator to a set position;



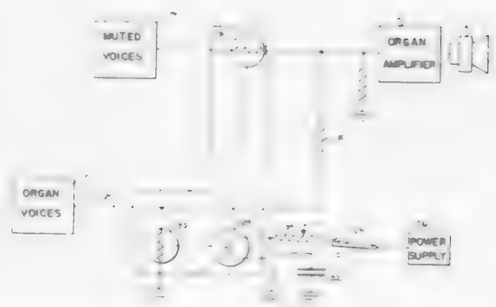
a print hammer attached to each print hammer lever for actuation thereby;
means for urging said hammer actuator to snap said hammer lever to printing position;
a latch for temporarily holding said actuator lever in said set position; and
means actuated by said shaft in its oscillation in the opposite direction for tripping said latch to render the urging means operative.

3,374,315
SOUND REPRODUCTION SYSTEM
Harold Sterling Gladwin, Jr., 19467 Los Gatos Road, Saratoga, Calif. 95070
Continuation of application Ser. No. 33,181, June 1, 1960. This application Feb. 21, 1964, Ser. No. 347,078
1 Claim. (Cl. 179—1)



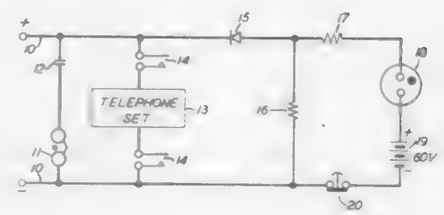
A sound reproduction system including a plurality of electro-acoustic transducers, such as loud-speakers, and a plurality of sources of sound current for energizing such transducers together with switching means for alternatively switching different sources of sound currents to different transducers.

3,374,316
CIRCUIT FOR ELECTRONIC ORGAN FOR PRODUCING MUTED VOICES BY THE USE OF PHOTOSENSITIVE CELLS
Mathew A. Slaats and Alan B. Welsh, Jasper, Ind., assignors to Jasper Electronic Mfg. Corp., Jasper, Ind., a corporation of Indiana
Filed Nov. 9, 1964, Ser. No. 409,675
7 Claims. (Cl. 179—1)



Two sources are selectively switched to a common input by placing a photocell in series with one source and another photocell in shunt across the second source. Both photocells are illuminated simultaneously by the same controllable light source.

3,374,317
TELEPHONE SIGNALING SYSTEM
Daryl M. Chapin, Basking Ridge, N.J., assignor to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York
Original application Mar. 12, 1964, Ser. No. 351,353, now Patent No. 3,322,903, dated May 30, 1967. Divided and this application Dec. 28, 1966, Ser. No. 623,153
5 Claims. (Cl. 179—84)

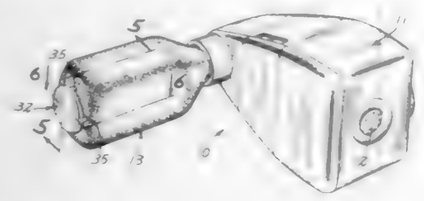


A "called-when-you-were-out" indicator for subscriber telephone is disclosed which detects the ringing signal by breaking down a gas tube in response to the increased peak voltage. The tube sustains conduction with the normal line voltage and can be made to flash or to hold a steady on signal until manually reset. Once it has been broken down, the indicator continues to give either a continuous or a flashing signal until it is manually reset by the subscriber.

3,374,318
WAX GUARD FOR HEARING AIDS
Richard T. Martin, Minneapolis, Minn., assignor to Dahlberg Electronics, Inc., Minneapolis, Minn., a corporation of Minnesota
Filed Apr. 1, 1965, Ser. No. 444,551
9 Claims. (Cl. 179—184)

5. In an in-the-ear hearing aid having an elongated boot with a sound-emitting aperture in one end thereof, said boot adapted for insertion in the ear canal of a user with the sound-emitting aperture adjacent the user's eardrum, the improvement comprising:

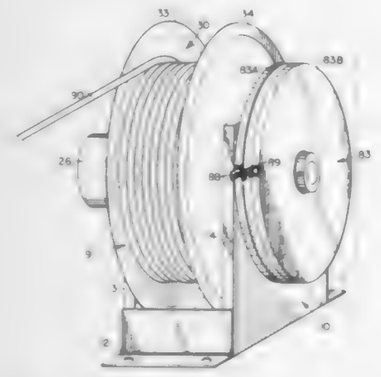
(a) a cover member mounted to overlie the sound-emitting aperture of said boot and spaced from the output end thereof;



(b) said cover member being movable toward and away from said boot; and

(c) said cover member having a surface area sufficient to close off said sound-emitting aperture when the cover member contacts said boot.

3,374,319
CABLE TAKE-UP REEL
Bernhardt Stahmer, 1509 Chicago St., Omaha, Nebr. 68102
Filed Apr. 25, 1966, Ser. No. 544,984
8 Claims. (Cl. 191—12.4)



1. A cable take-up reel for an output power cable comprising:

(A) a frame member including at least one side panel,

(B) an elongate shaft revolvably supported by the at least one side panel of the frame member, said elongate shaft being revolvable about the longitudinal central axis thereof, said shaft having a bore along the longitudinal axis commencing at the shaft first end, said shaft having a medial lateral slot intersecting said longitudinal bore,

(C) a spool member surrounding said elongate shaft and integrally joined thereto so as to be directly revolvable with said shaft, said spool having a fixed longitudinal relationship along said shaft, said spool member comprising a cylindrical drum band and a pair of opposed flanges integrally attached to the respective ends of the intervening drum band, said drum band having a lateral opening overlying the medial lateral slot of the elongate longitudinal shaft,

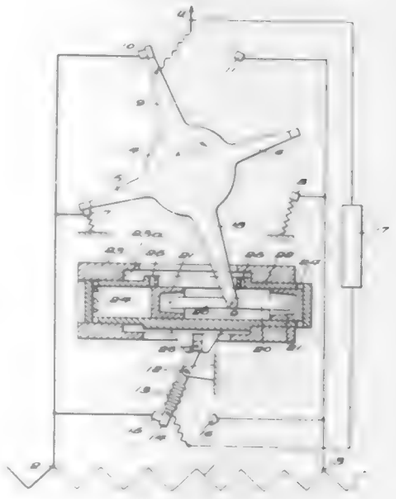
(D) a stationary housing attached to the frame member for protectably surrounding the elongate shaft first end, said housing including an entrance ring portion for passage of an input power cable to the shaft first end,

(E) revolvable joint means for conveying the power from the input power cable to the output power cable, said revolvable joint means including an intermediate power cable leading from the shaft medial lateral slot and having a terminal end at the drum band opening, the terminal end of the intermediatae cable at the drum band opening having a coupling device to engage the output power cable,

(F) a cover member removably attached to the spool drum band across the lateral opening thereof, said cover member including an opening for passage of the output power cable, the coupling device at the terminal end of the intermediate cable being attached to the interior side of the cover member, and

(G) a spring means removably attached to the exterior side of the frame member side panel adjacent to the elongate shaft second end, said spring means being connected between the frame member and the second end of the elongated shaft.

3,374,320
TAP-CHANGING DEVICE FOR TRANSFORMERS HAVING LOAD CURRENT DIVERTER MEANS AND IMPROVED HYDRAULIC FOLLOWER MECHANISM THEREFOR
Karl Bühler, Nussbaumen, and Heinz Trachsel, Ennet-Baden, Switzerland, assignors to Aktiengesellschaft Brown, Boveri & Cie, Baden, Switzerland, a joint-stock company
Filed Oct. 24, 1966, Ser. No. 588,824
Claims priority, application Switzerland, Nov. 2, 1965, 15,103/65
6 Claims. (Cl. 200—18)



A switching mechanism for diverting current when changing taps on a transformer comprises a multi-armed oscillatable diverter switch actuated when a tap change is made. One arm of the diverter switch controls a set of main contacts connected to the taps, two other arms control sets of quenching contacts in parallel with the main contacts and a fourth arm is articulated to piston elements of an oil-immersed hydraulic follower mechanism which includes a guide sleeve within which the pistons reciprocate, the guide sleeve itself also being reciprocated by the pistons within a stationary cylinder, and a contact arm articulated to the guide sleeve is oscillated by the latter to connect in a diverter resistance in the circuit of the main contacts.

3,374,321
DIRECTION SIGNAL AND DIMMER SWITCH ACTUATOR
Elmer F. Trarbach, St. Clair Shores, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Continuation of application Ser. No. 150,416, Nov. 6, 1961. This application Apr. 22, 1965, Ser. No. 450,156
7 Claims. (Cl. 200—61.27)

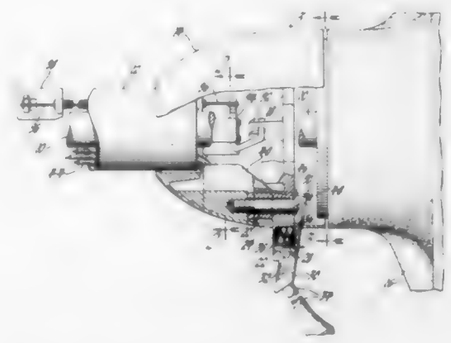
1. A combination direction signal and headlight dimmer switch actuator comprising a housing,

a direction signal actuator ring pivotally mounted on the housing for movement about a first axis,

a manually controlled operating lever mounted near one end of the ring moving the ring about the first axis and pivoted to the ring for movement about a second axis transverse to the first axis,

a direction signal switch connected with the ring for actuation upon pivoting the ring about the first axis,

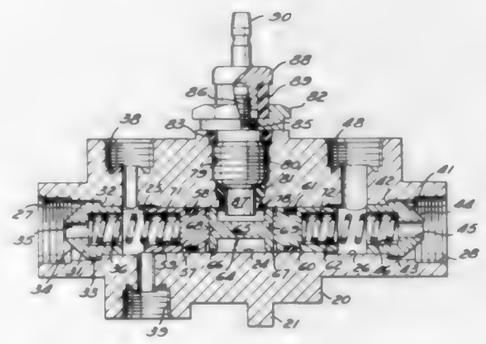
a dimmer switch secured to said housing,



a wire link connected between said one end of the lever and the dimmer switch for actuating the dimmer switch upon movement of the operating lever about the second axis,

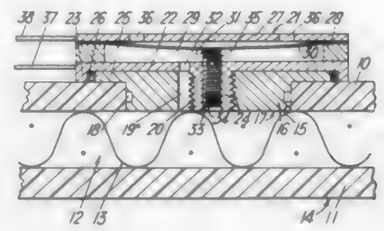
and a spring member acting between the ring and the lever for resiliently biasing the lever in one direction about the second axis.

3,374,322
DUAL BRAKE SYSTEM SAFETY DEVICE
Paul J. Miller, Maple Heights, Ohio, assignor to The Weatherhead Company, a corporation of Ohio
Filed Oct. 6, 1966, Ser. No. 584,780
3 Claims. (Cl. 200—82)



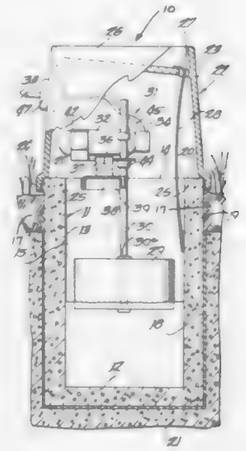
A dual brake system including a switch operable to produce a signal responsive to a pressure unbalance between the two fluid lines. The switch includes a bore containing a piston assembly exposed to the two pressures at opposite ends. The piston assembly has two sealing members spaced apart by a spacer having two end walls and a portion of reduced diameter between them. The piston assembly constitutes one switch element and is centered by means of springs so that upon a pressure unbalance the piston assembly moves from a centered position causing one of the end walls to engage a second switch contact in the form of a stud projecting into the bore to complete the electric circuit and produce the signal. The sealing members engage the spacer only near the axis so that cocking forces produced by contact between the spacer end walls and the stud are not transmitted to the sealing members.

3,374,323
PRESSURE RESPONSIVE DEVICE FOR ACTUATING AN ALARM
Cecil H. Peek and Kenneth R. Peek, both of 2 Russell Drive, Stanwell, Middlesex, England
Filed Apr. 7, 1966, Ser. No. 540,865
Claims priority, application Great Britain, Apr. 14, 1965, 16,123/65; Jan. 11, 1966, 1,333/66
7 Claims. (Cl. 200—83)



A pair of panels defining a hermetically sealed cavity placed under a controlled air pressure and having a switching means associated therewith which is responsive to a predetermined change in the air pressure to actuate an external circuit such as a relay alarm system.

3,374,324
MOISTURE CONTROL APPARATUS
James G. McGrann, R.R. 2, Bloomington, Ill. 61701
Filed June 24, 1964, Ser. No. 377,552
5 Claims. (Cl. 200—84)



1. An apparatus for alternately completing and interrupting an electrical circuit in response to a reduction in moisture in soil surrounding said apparatus and in response to a delivery of a predetermined quantity of water to the vicinity of the apparatus, said apparatus including a hollow concrete block having bottom and side walls and an open top leading to a cavity in said block, a waterproofing material covering the exterior surfaces of the bottom wall and lower portions of the side walls of said block to form the lower portion of the block into a watertight container, said block being insertable in soil with the top thereof positioned adjacent the top of the soil and having upper and non-waterproofed portions of said side walls in contact with upper layers of said soil to function as a wick to transfer water from said cavity to said upper layers of said soil, a mercury switch rigidly supported on a carriage mounted above said cavity for pivotal movement about a horizontal axis, said mercury switch having lead-in wires adapted to be connected to an electric circuit with the switch being adapted to alternately interrupt and complete said electric circuit upon pivotal movement about said horizontal axis, a float positioned in said cavity for vertical movement in response to changes in

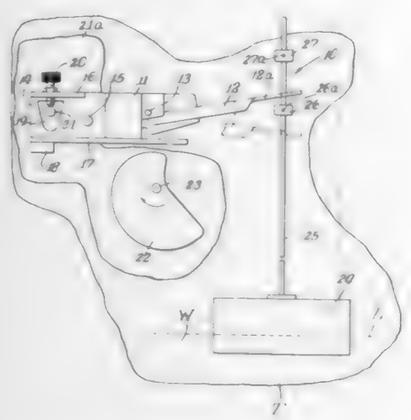
the water level in the cavity, an elongated rod rigid with and extending upwardly from said float and through an opening in said carriage for guided vertical movement relative thereto, stops spaced apart longitudinally along said rod and engageable with said carriage to transmit movement of the rod to the carriage, said stops being adjustable along the length of said rod to be engageable with said carriage when said float is moved to predetermined vertical positions in said cavity in response to changes in said water level, and means to collect a portion of water delivered to the vicinity of the apparatus and transfer it to said cavity.

3,374,325

PIVOTALLY MOUNTED SWITCH HAVING ACTUATING MEANS ENGAGEABLE WITH A JUXTAPOSED MANUALLY SETTABLE CAM FOR ADJUSTABLY OPERATING SAID SWITCH AS A FUNCTION OF DIFFERENCES IN A LIQUID LEVEL BEING SENSED

David C. Eisendrath, Chicago, Ill., assignor to Cory Corporation, a corporation of Delaware

Original application Oct. 21, 1965, Ser. No. 499,307, now Patent No. 3,297,844, dated Jan. 10, 1967. Divided and this application Aug. 18, 1966, Ser. No. 573,316
9 Claims. (Cl. 200—84)



A control for providing a signal responsive to a variation in a liquid level. The control includes a switch mounted on a substantially rigid member which is pivoted about a horizontal axis and which is swung about the axis by means of a float device responsive to a variation in a liquid level being sensed. A manually adjustable cam is disposed in the path of movement of the switch to be engaged by an operator thereof at different positions as a function of the setting of the cam. A second operator associated with the switch is engageable with an adjustable screw device for operating the switch at an upper limit of travel of the float.

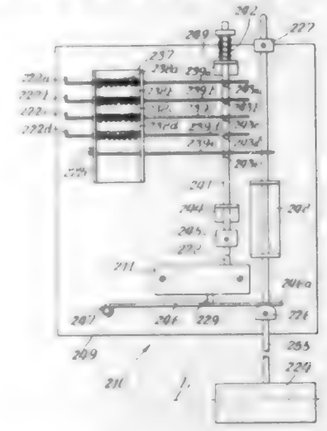
3,374,326

CONTROL RESPONSIVE TO VARIATIONS IN LIQUID LEVELS

David C. Eisendrath, Chicago, Ill., assignor to Cory Corporation, a corporation of Delaware

Original application Oct. 21, 1965, Ser. No. 499,307, now Patent No. 3,297,844. Divided and this application Aug. 18, 1966, Ser. No. 573,319
8 Claims. (Cl. 200—84)

A control for providing a signal corresponding to a variation in a liquid level wherein a plurality of vertically spaced adjustbly positionable actuators are arranged to be selectively movable from a retracted position to an operating position for engagement by a float operated structure to control a switch, whereby the switch is operated at any selected one of a plurality of different levels of the liquid corresponding to the selected one of the actuators. The control is useful in selecting different quantities



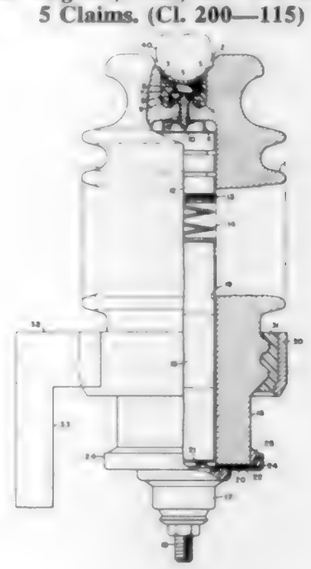
of water to be delivered to a coffee brewing apparatus as for making different numbers of cups of coffee.

3,374,327

LINE INSULATOR-LIGHTNING ARRESTER

Robert J. Lawrence and Charles H. Carothers, Bloomington, Ind., assignors to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania

Filed Aug. 31, 1965, Ser. No. 484,047
5 Claims. (Cl. 200—115)



The invention comprises a combination of a rugged power line insulator and lightning arrester, the lightning arrester being supported inside the insulator. The line connecting end of the insulator is provided with a recess and bore, the recess supporting a concave-shaped electrical terminal for seating the line conductor. The recess is filled with a sealing cement, the cement securing an electrical conductor in the bore, the conductor extending between the arrester inside the insulator and the concave-shaped terminal.

3,374,328

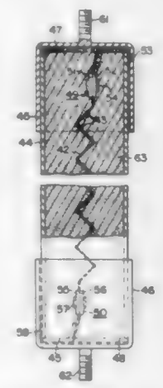
CARTRIDGE-TYPE FUSE WITH EXPLOSION POTS

Frank L. Cameron, North Huntingdon Township, Irwin, Pa., assignor to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania

Filed Sept. 15, 1965, Ser. No. 487,408
5 Claims. (Cl. 200—120)

1. A self-protecting fuse comprising a fuse tube, first and second ferrules at the ends of the fuse tube respectively, a fuse element disposed within the fuse tube, first and

second terminal rings disposed between the ends of the fuse tube and adjacent the first and second ferrules respectively, the terminal rings being composed of conductive material and making electrical contact with the ferrules respectively, each of the terminal rings having a tab extending therefrom with a bore therein, the adjacent end of the fuse element passing through the bore in the tab and thence passing around the outside of the adjacent end of the fuse tube and being forced against the outer wall of the fuse tube and the inner wall of the ferrule, a pin disposed within the bore of each tab and fastening the fuse element in place therein, a granular arc-ex-



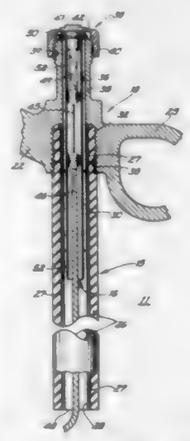
tinguishing material filling the space within the fuse tube, both the tabs being of sufficient length whereby, while the fuse is mounted with its longitudinal axis in a vertical position, the upper tab extends beneath the surface of the granular arc-extinguishing material and the bore thereof remains within the granular arc-extinguishing material, the fuse element upon melting due to a large overload current or a sustained small overload current starting an arc which burns back towards the ends of the fuse tube, the tab extending beneath the surface of the granular arc-extinguishing material preventing the arc from reaching the adjacent ferrule and damaging said last-named ferrule.

3,374,329

FUSE CUTOUT

Raymond J. Bronikowski, South Milwaukee, Wis., assignor to McGraw-Edison Company, Milwaukee, Wis., a corporation of Delaware

Filed Oct. 31, 1966, Ser. No. 590,840
5 Claims. (Cl. 200—127)



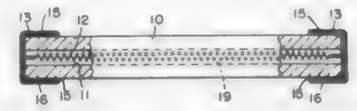
A fuse cutout comprising a fuse tube having a frangible cap at one end and being opened at its other end and a fusible element disposed within said tube wherein the fuse tube bore is composed of an arc extinguishing gas evolving material and a metallic insert as disposed within the bore and insulated from terminal means at the opposite ends of the fuse tube.

3,374,330

CURRENT LIMITING FUSE

Frank L. Cameron, North Huntingdon Township, Irwin, Pa., assignor to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania

Filed Apr. 19, 1966, Ser. No. 543,745
8 Claims. (Cl. 200—132)



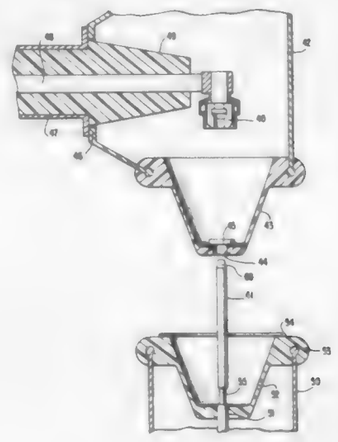
A fuse which may be easily and quickly assembled without the necessity of soldered connections includes a spirally wound fuse element passing through a fuse tube, the element having end portions of enlarged diameter formed by crimping copper straps to the ends of the fuse element, which are bent around the ends and outside wall of the fuse tube, the enlarged ends of the fuse element and the portions of the outside wall of the fuse tube adjacent the ends thereof being coated with an epoxy resin containing a large number of conductive particles, such as silver, to form a conductive cement. The ferrules are then forced down over the ends of the fuse tube and the enlarged ends of the fuse element including the crimped straps, the conductive cement resin cementing the ferrules to the fuse tube and cementing the fuse element ends to the ferrules while providing electrical connections between the ends of the fuse element and the ferrules. The enlarged diameters of the ends of the fuse element increases the surface area in contact with the conductive cement thereby forming a better electrical connection. The increased surface area in contact with the cement also insures a better bond. The cement quickly sets at room temperature. The crimped copper straps extend far enough into the bore in the fuse tube to prevent an arc burning back to the ferrules.

3,374,331

ELECTRICAL COUPLING IN WHICH MAKING AND BREAKING OF CONDUCTORS IS WITHIN CASING FILLED WITH AN INSULATING MEDIUM

Gerhard Brockhaus, Heiligenhaus, Bezirk Dusseldorf, and Günter Leonhardt and Heinz Weber, Ratingen, Germany, assignors to Calor-Emag Elektrizitats-Aktiengesellschaft, Ratingen, Germany

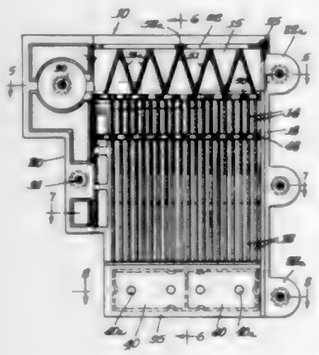
Filed May 26, 1965, Ser. No. 458,982
Claims priority, application Germany, May 27, 1964, C 32,984
10 Claims. (Cl. 200—144)



This invention relates to improvements in high tension conductors, the making and breaking of the electrical

contacts of the circuit of which takes place in a casing filled with an insulating medium. The principal advantage of this construction enables the disengagement of the electrical contacts within the insulated casing and withdrawal of one contact from the casing without appreciable loss of the insulating medium.

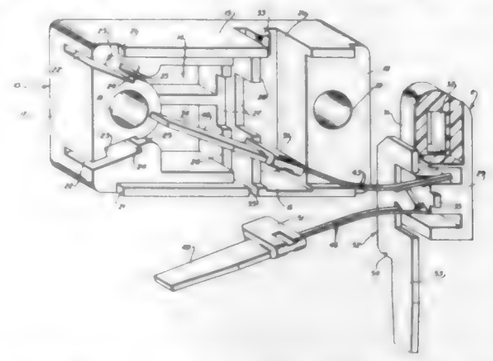
3,374,332
ARC CHUTE FOR A CIRCUIT BREAKER
Fred Bould, Pittsburgh, Pa., assignor to Square D Company, Park Ridge, Ill., a corporation of Michigan
Filed July 16, 1965, Ser. No. 472,427
6 Claims. (Cl. 200—144)



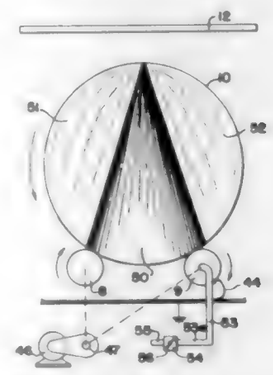
1. An arc chute for confining and extinguishing an arc formed between separable electric contacts, said arc chute comprising a wall structure having front and rear walls and a pair of side walls defining an arcing chamber, said side walls having respective inwardly-directed flange portions along their lower margins extending inwardly toward each other, a pair of recesses in said inwardly-directed flange portions, respectively, a pair of magnetizable plate means disposed in said recesses, respectively, a plurality of conductive magnetizable plates, each of said side walls having a plurality of horizontally-spaced grooves in its inner face extending upwardly from said inwardly-directed flange portion thereof toward the top edge thereof, said magnetizable plates respectively having their side edge portions received, respectively, in aligned pairs of said grooves at the lower portions thereof, a lower perforated baffle plate resting on the top of said magnetizable plates, a plurality of insulating plates, said insulating plates respectively having their side edge partions received respectively in aligned pairs of said grooves above said lower baffle plate and being supported by said lower baffle plate, an upper perforated baffle plate resting on the top of said insulating plates, a sinuous metal screen resting on said upper baffle plate, a retaining frame, a pair of horizontally disposed grooves in said side wall portions adjacent the upper edges thereof, respectively, and said retaining frame being slidably received in said horizontal grooves and overlying an edge portion of said metal screen.

3,374,333
PUSHBUTTON SWITCHES WITH AT LEAST ONE FLEXIBLE CANTILEVERED SPRING LEAF CONTACT CONTINUALLY PRESTRESSED BY A PUSHBUTTON
Fred A. Anderson, Collinsville, Conn., assignor to Royal Typewriter Company, Inc., Hartford, Conn., a corporation of Delaware
Filed Feb. 1, 1967, Ser. No. 613,225
6 Claims. (Cl. 200—164)

A pushbutton switch having at least one flexible cantilevered movable contact continually normally prestressed by a pushbutton and controlled thereby for movement toward encounter with but short of unstressed condition, a fixed contact having a contact surface angularly disposed relative to the path of movement of said movable contact to effect a bounceless high pressure wiping contact.



3,374,334
HIGH FREQUENCY HEATING SYSTEM
Boyd R. Hopkins, Louisville, Ky., assignor to Chemetron Corporation, Chicago, Ill., a corporation of Delaware
Filed Apr. 29, 1963, Ser. No. 276,576
1 Claim. (Cl. 219—10.69)

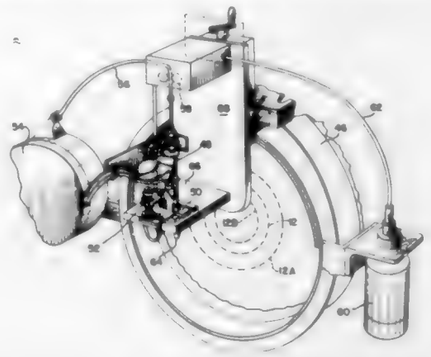


1. In a high frequency dielectric system for heating cylindrical dielectric material to a predetermined desired temperature between a pair of spaced electrodes in a high frequency dielectric heating system, the combination comprising a roller forming an electrode and an additional electrode defining spaced electrodes, an additional roller defining a pair of elongated rollers with said first roller for supporting said material in heating position between the electrodes with the axis of said material and of said rollers parallel to each other and to said additional electrodes; drive means for rotating at least one of said rollers to rotate said material continuously about its axis while maintaining said axis in place in heating position; and high frequency power means connected to said electrodes for heating said material to said predetermined desired temperature.

3,374,335
METHOD OF ARC WELDING A CIRCULAR JOINT
James W. Reesor, Richmond, Va., and George W. Frehafer, Valencia, Pa., assignors to Reynolds Metals Company, Richmond, Va., a corporation of Delaware
Filed Dec. 8, 1964, Ser. No. 416,848
14 Claims. (Cl. 219—60)

1. A method comprising: aligning two substantially equal diameter aluminous cylindrical pipes with contiguous ends and with their central axes substantially aligned, said contiguous ends having been shaped to form a circular fillet receiving groove, each contiguous end having an end land with substantially coaxial inner and outer cylindrical surfaces, the outer cylindrical surface of

said land joining an outwardly beveled pipe end edge extending outwardly from its respective land at an angle to a plane perpendicular to said outer cylindrical surface, the contiguous outer ends of said lands substantially butting each other to form a fillet receiving circular opening; and placing a fillet in said groove and circular opening by circularly passing a welding arc forming aluminum



alloy electrode wire having the characteristics of the group forming series No. 5000 aluminum alloys longitudinally directed toward said groove; discharging an inert gas around said electrode wire and into said groove; charging said electrode wire relatively to the charge on said pipes to form an arc with an arc forming intensity in the order of 200,000–250,000 amperes per square inch of electrode transverse area.

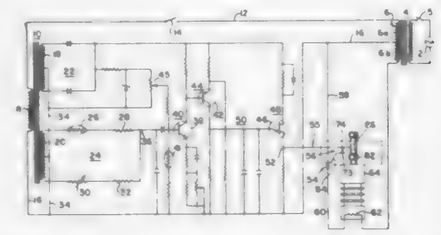
3,374,336
INFINITE HEAT SWITCH FOR AN INFRARED HEATING UNIT
James W. Jacobs, Dayton, Ohio, assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed May 3, 1965, Ser. No. 452,719
2 Claims. (Cl. 219—452)

In preferred form, an improved infinite controlled heat switch for an infrared surface unit wherein a thermally responsive pulser and voltage selector switch provide a low voltage circuit with relatively long "on-off" pulsing cycle periods for low preselected temperatures and a high voltage circuit with shorter "on-off" pulsing cycle periods for higher preselected temperatures.

3,374,337
THERMAL ACTUATOR AND CONTROL THEREFOR
Billy Burley, Dallas, Tex., assignor to Johnson Service Company, Milwaukee, Wis., a corporation of Wisconsin
Continuation-in-part of application Ser. No. 250,677, Jan. 10, 1963. This application Aug. 28, 1964, Ser. No. 393,496
9 Claims. (Cl. 219—501)

A thermal actuator control system includes a normally closed limit switch connecting the gate of a silicon controlled rectifier (SCR) to a signal supply. The power electrodes of the SCR are connected in series with a heating resistor of the actuator. A wax is disposed within a cylinder having a shaft journaled in one end as a piston. The heating resistor is embedded within the wax and produces a mechanical motion as a result of the volumetric change in the wax. The resistor is a spiral wound coil located within the chamber with a generally U-shaped configuration having the outer end secured as the connecting electrodes or terminals in the outer end of the cylinder and having a base extending around the inner portion of the movable shaft. The limit switch carries only very low gate current and voltage and is a floating contact type responsive to incremental movements of the order of micro inches of the actuator shaft.

A condition-responsive means produces an alternating current signal voltage the magnitude and phase of which are a function of the deviation of the condition from a predetermined value, and means including an R-C network and the limit switch applies the signal voltage to the gate of the SCR to vary the conduction angle thereof and the effective level of the D.C. current flowing through the heating resistor. The limit switch includes an insulating mounting base disposed within an end chamber of the thermal actuator cylinder with the actuating shaft passing

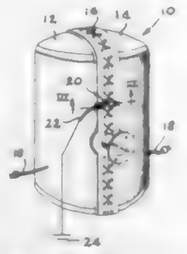


through a central opening. A leaf spring is resiliently mounted as a cantilevered member to the base plate with a breaker member encircling the shaft and clamped between the spring and plate. The breaker member has a diameter somewhat less than the opening in the base plate. A collar on the shaft will pass through the base plate opening into engagement with the breaker to transmit the final shaft motion to the spring. The free end of the spring is aligned with and is tensioned to engage a fixed contact on the base. The silicon controlled rectifier is secured to the back side of the base to form an integral subassembly with the gate terminal in series circuit with the switch contacts. A two-part seal seals about the shaft at the exit opening of the thermal cylinder and includes an encircling rubber member and a thin plastic wafer encircling the shaft and bearing on a planar surface of the cylinder. The rubber member is of a substantial axial length and includes an inner step face projecting inwardly into the expansion chamber and a thin sealing lip adjacent the shaft. The plastic wafer has a central opening through which the shaft projects and is formed with a central cone-shaped portion projecting outwardly of the expansible filled chamber. A thin disc is disposed between the rubber member and the adjacent planar surface and constitutes a seal backup.

3,374,338
GROUNDED HEATING MANTLE
Glen H. Morey, Terre Haute, Ind., assignor to Templeton Coal Company, Terre Haute, Ind., a corporation of Indiana
Filed Sept. 29, 1965, Ser. No. 491,301
4 Claims. (Cl. 219—529)

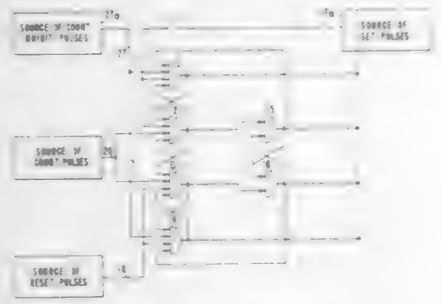
Flexible heating blanket made up of separable parts and having eyelets along the edges to receive lacing to fasten the parts together about an object to be heated

and with flexible electrically conductive coatings on the outer surfaces of said parts insulated from the resistance



heating means carried by the blanket parts but interconnected with each other and to ground.

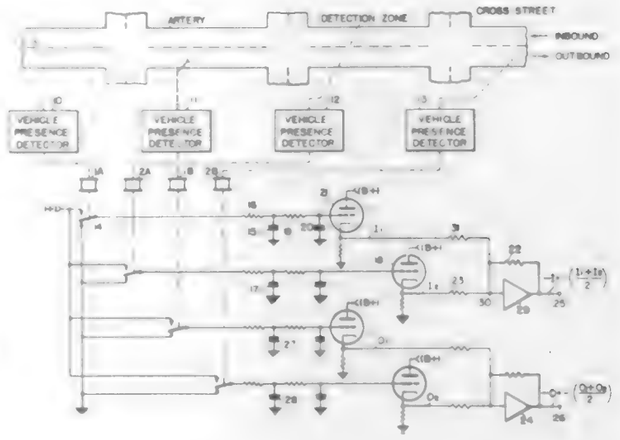
3,374,339
COUNTER AND SHIFT-REGISTER
James E. Webb, Administrator of the National Aeronautics and Space Administration, with respect to an invention of Christian Smith, Salisbury, Southern Rhodesia
Filed Dec. 17, 1964, Ser. No. 423,412
11 Claims. (Cl. 235—92)



1. A counting and shifting circuit comprising: a plurality of gating means, each gating means having an output terminal a plurality of input terminals and being characterized by providing an output of a first polarity on said output terminal whenever none of said input terminals is provided with an input signal of said first polarity, each of said gating means being characterized by providing an output signal of a second polarity whenever an input signal of said first polarity is provided to any one of the input terminals thereof; means for interconnecting said first plurality of gating means; count inhibiting means for inhibiting at least some of said gating means whenever said plurality of gating means is operable in a shifting mode; means for energizing some of said gating means with a plurality of shift pulses so as to control the outputs of said plurality of gating means; shift inhibiting means for inhibiting at least some of said gating means whenever said circuit is operable in a counting mode; and means for energizing some of said gating means with counting pulses to provide output pulses as a function of the number of said counting pulses supplied thereto.

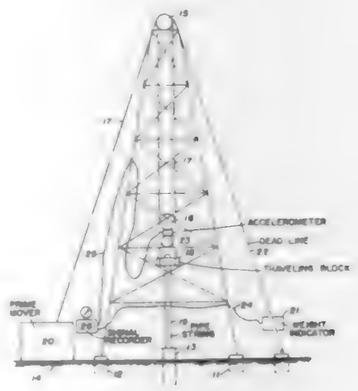
3,374,340
COMPUTATION OF PARAMETERS FOR TRAFFIC CONTROL SYSTEMS
John H. Auer, Jr., and Jerry P. Huffman, Rochester, N.Y., assignors to The General Signal Corporation, Rochester, N.Y., a corporation of New York
Filed July 3, 1963, Ser. No. 292,584
33 Claims. (Cl. 235—150.24)

1. In a traffic monitoring system, amplifier means having an input and an output, means responsive to traffic flow in a first predetermined direction for coupling a signal to said input having a magnitude related to the magnitude of traffic flow in said first direction, variable magnitude signal feedback means between said output and said input of said amplifier means, and means responsive to traffic flow in a second predetermined direc-



tion different from said first direction for varying the magnitude of signal feedback by said signal feedback means in relation to traffic flow in said second direction thereby to produce a resultant signal at said amplifier output jointly related to the traffic flows in both said first and second directions.

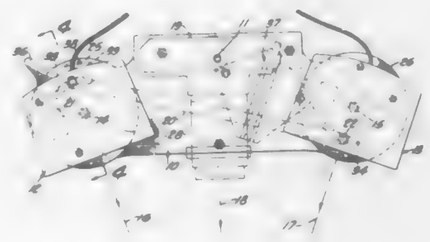
3,374,341
METHOD FOR CONTROLLING PRESSURE DIFFERENTIAL RESULTING FROM FLUID FRICTION FORCES IN WELL-DRILLING OPERATIONS
James A. Klotz, Crystal Lake, Ill., assignor, by mesne assignments, to Union Oil Company of California, Los Angeles, Calif., a corporation of California
Filed Nov. 26, 1963, Ser. No. 325,850
6 Claims. (Cl. 235—193)



The fluid friction forces resulting from the movement of a body vertically through a column of liquid cause a pressure differential above or below the corresponding hydrostatic pressure of the liquid column. In various applications, such as the drilling of well bores into subterranean earth formations, direct measurement of this pressure differential is difficult; yet, in many applications, the pressure differential must be controlled within relatively close limits. This invention provides a method for controlling the pressure differential caused by the passage

of a body through a vertical column of liquid below a predetermined value based on measurements external of the liquid column.

3,374,342
PHOTOGRAPHIC ILLUMINATING DEVICE
Ross E. Hutchins, Starkville, Miss.
(P.O. Drawer EH, State College, Miss. 39762)
Filed Oct. 13, 1965, Ser. No. 495,440
6 Claims. (Cl. 240—1.3)

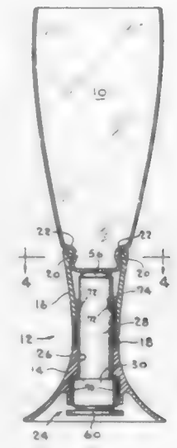


The invention provides a portable, unitary combination of a base which is adapted to hold a camera thereon, together with a pair of illuminators laterally disposed with respect to said camera and affixed to said base but rotatable about parallel axes at right angles to the base and with a linkage such that both illuminators illuminate the same point on the optical axis.

3,374,343
POST LIGHT
Mitchell Bobrick, 605 Erskine Drive, Pacific Palisades, Calif. 90272
Filed Oct. 3, 1966, Ser. No. 583,728
10 Claims. (Cl. 240—3)

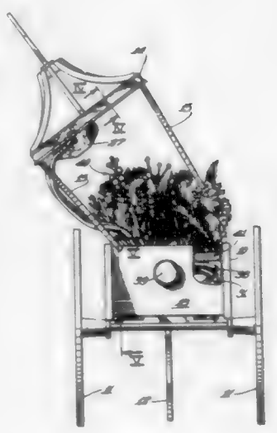
A tubular lamp is supported on a post and has a shade peripherally surrounding said lamp. The shade has a series of adjacent and separate segments around the lamp extending angularly outwardly and downwardly, with a supporting arm near a lower end of each segment inwardly supporting said segment lower end away from the lamp. The shade segments and supporting arms may be pivotal for a collapse thereof closely against the lamp and post.

3,374,344
LIGHTED BEVERAGE GLASS
Ralph H. Rudolph, Plymouth, and David Douglas, Manitowoc, Wis., assignors to Douglas Plymouth Corporation, Manitowoc, Wis., a corporation of Wisconsin
Filed Oct. 12, 1965, Ser. No. 495,139
5 Claims. (Cl. 240—6.4)



A lighted beverage glass comprising a hollow stem and a glass shell member removably mounted thereon. A unitary cartridge assembly slideably inserted into the stem through the base thereof, said assembly including a main body portion and a transparent tip member mounted at one end. A lamp holder member, a bulb, a compression spring and a battery are mounted inside the body portion with the bulb positioned adjacent the transparent tip member. A switch knob member is threaded into the base of the cartridge body and adapted for manual rotation to turn the light bulb on and off. The light passing through the transparent tip of the cartridge assembly passes upwardly through the bottom of the glass shell portion into the liquid thereon.

3,374,345
NOVELTY LAMP CONSTRUCTION
Francis A. Schafer, 2916 Riverside Drive, McHenry, Ill. 60050
Filed Sept. 13, 1965, Ser. No. 486,718
11 Claims. (Cl. 240—10)



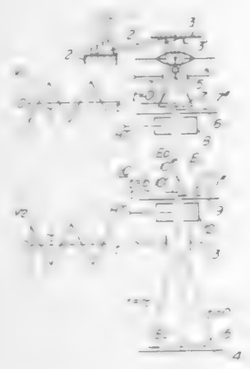
A supporting base provides an upwardly opening receptacle within which is electrical equipment upon which is supported a base panel of a fluorescent display which is

illuminated by a black light electrical lamp tube carried on the underside of a roof panel on a canopy which has a plurality of spaced posts the lower ends of which are notched to engage separably with upper edges of the receptacle walls, certain of the posts having upwardly opening hooks engaged by an elastic strand for hinged rocking to displace the canopy for access to the display and the lamp.

ERRATUM

For Class 240—52 see:
Patent No. 3,374,347

3,374,346
SPECTROSCOPIC ELECTRON MICROSCOPE WHEREIN A SPECIMEN IS IRRADIATED WITH X-RAYS AND THE ELECTRONS EMITTED ARE ENERGY ANALYZED
Hiroshi Watanabe, Kokubunji-shi, Japan, assignor to Hitachi, Ltd., Tokyo, Japan
Filed July 12, 1965, Ser. No. 470,991
Claims priority, application Japan, July 15, 1964, 39/40,591
3 Claims. (Cl. 250—49.5)

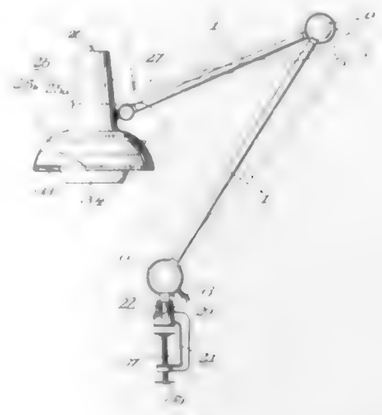


1. A spectroscopic electron microscope comprising means for irradiating the specimen under examination with X-rays of a predetermined wavelength, an objective lens, and an axial arrangement between the objective lens and the imaging plane of the microscope of components including:

a first deflecting device for deflecting the electron image of the specimen formed by the objective lens, a first aperture diaphragm having a small aperture or slit and disposed in the imaging plane of the objective lens, means for energy analysis of the electrons passing in time sequence through said first aperture diaphragm to form the respective points of said image of the specimen, a second aperture diaphragm adapted to allow passage of only those electrons having any desired energy value of all the electrons analyzed by said means for energy analysis, and a second deflecting device for deflecting the rays of monoenergetic electrons passing through said second aperture diaphragm toward their respective positions in the imaging plane of the microscope.

3,374,347
ELECTRIC LAMP STAND
You Hirose, 24–7 3-ban-cho, Chiyoda-ku, Tokyo, Japan
Filed Aug. 23, 1965, Ser. No. 481,480
2 Claims. (Cl. 240—52)

A swivel arrangement including a first member and a second member at least one of which is rotatable with reference to the other about a predetermined axis. Resilient means interposed between the members and connected therewith, such resilient means biasing the members against one another with a force which varies in response to relative angular displacement of said members.



The present invention relates to an electric lamp stand. An object of the present invention is to supply an electric lamp stand consisted of supporting rods in 2 legs or more and swivel joints in 2 legs or more jointing said supporting rods.

3,374,348
CORONA UNIT WITH A TAPERED PASSAGEWAY OF ELECTRICALLY NONCONDUCTIVE MATERIAL BETWEEN CONDUCTIVE HOUSINGS THAT ARE ELECTRICALLY INTERCONNECTED
Ralph G. Ostensen, Morton Grove, Ill., assignor to SCM Corporation, New York, N.Y., a corporation of New York
Continuation of application Ser. No. 473,110, July 19, 1965. This application May 9, 1966, Ser. No. 548,799
19 Claims. (Cl. 250—49.5)

1. A corona unit for electrostatically charging a carrier member having a layer of photoactive material serving as a chargeable layer in an electrostatic photocopying process comprising:

(a) a pair of U-shaped elongated housings of conductive material mounted generally parallel to each other and electrically connected together with open sides facing each other and having adjacent side walls, said side walls of the respective housings defining opposed openings and being spaced apart sufficiently to enable the carrier member to pass between said housings in a direction transverse to the longitudinal dimension of said housings;

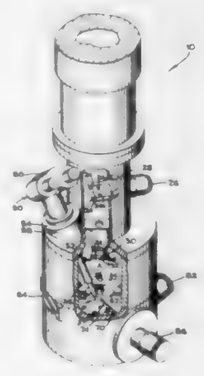
(b) a corona discharge member mounted in each of said housings and insulated therefrom;

(c) means for connecting a source of energizing potential between said corona discharge members, with said corona discharge members being effective to apply through said openings an electrostatic charge to a carrier member passing between said housings; and

(d) insulating means forming a tapered passageway between said housings convergent in the direction of movement of said carrier member providing a relatively wide entrance opening between said housings to permit easy ingress of said carrier member and a comparatively narrow exit opening between said housings for egress of said carrier member to improve uniformity of the electrostatic charge on said carrier member, said insulating means also serving to prevent the carrier member from contacting any conductive portion of said housings and said corona discharge members as the carrier member moves through the corona unit, said insulating means being discontinuous to provide for the substantially unblocked, uniform application of the electrostatic charge by said corona discharge members as the carrier member passes between said housings.

7. In an electrostatic printer, a charging unit comprising: a pair of corona discharge units each having a corona wire mounted within a housing unit, said corona wires being spaced and the housing units arranged to permit passage of a chargeable member therebetween; and a high voltage circuit connected to produce a current discharge between said corona wires including a transformer high voltage secondary winding and rectifier means connected to said secondary winding for producing a direct voltage, said high voltage circuit being free of galvanic connection to any point of reference potential on said printer.

3,374,349
ELECTRON PROBE HAVING A SPECIFIC SHORT-FOCAL LENGTH MAGNETIC LENS AND LIGHT MICROSCOPE
Victor G. Macres, 3385 Louis Road, Palo Alto, Calif. 94303
Continuation of applications Ser. No. 368,448, May 11, 1964, and Ser. No. 86,200, Jan. 31, 1961. This application Nov. 14, 1966, Ser. No. 594,275
4 Claims. (Cl. 250—49.5)

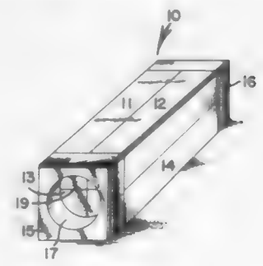


An electron probe including a support for a specimen to be probed, an electron beam directed at said specimen and focused thereon by an adjacent short-focal length lens, and a light microscope for observing the probed specimen.

ERRATUM

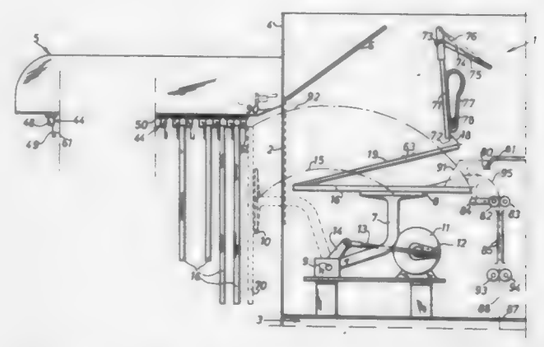
For Class 250—49.5 see:
Patent No. 3,374,346

3,374,350
ALIGNMENT CHECKING DEVICE FOR PENETRATING RADIATION PHOTOGRAPHY APPARATUS
William W. Mills, Jr., Huntsville, Ala., assignor to Thiokol Chemical Corporation, Bristol, Pa., a corporation of Delaware
Filed Dec. 21, 1964, Ser. No. 419,771
3 Claims. (Cl. 250—65)



In instrument for aligning a beam from a penetrating radiation source with a rocket motor to be analyzed and a recording device to determine what effects have been caused to the rocket motor by age, temperature ranges and other compatible conditions.

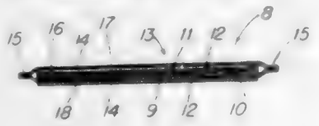
3,374,351
APPARATUS FOR AUTOMATICALLY HANDLING FILM SHEET CASSETTES
Karel Marcel Sano, Borsbeek, and Jan Alfons Stoop, Schilde, Belgium, assignors to Gevaert Photo-Producten N.V., Mortsel, Belgium, a Belgian company
Filed Oct. 14, 1964, Ser. No. 403,710
Claims priority, application Netherlands, Oct. 15, 1963, 299,222
8 Claims. (Cl. 250—66)



1. Apparatus for automatically handling film sheet cassettes, in particular cassettes containing exposed X-ray film sheets, comprising a plurality of hook means arranged to carry one cassette each, means for supporting and displacing the hook means over a rectilinear course in a substantially horizontal direction and for returning the hook means at the end of their course to the starting point of said course, means for gripping the cassettes at the end of said course, for lifting them from the hook means and for transferring them into a light-tight closed cabinet, and within the reach of means for opening and closing

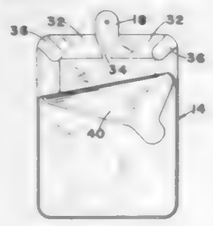
the cover of the cassette, means for thereupon removing the exposed film from the cassette and conveying it to a developing means, a plurality of storage means for different sized X-ray films, means for inserting the proper-sized X-ray film into the cassette, and means for moving the reloaded cassette out of the cabinet.

3,374,352
X-RAY FILM PACKAGE WITH WATER SOLUBLE SEPARATOR AND WATER SOLUBLE LIGHT OPAQUE ENVELOPE
Elihu L. Sachs, 2035 Benedict Ave., Bronx, N.Y. 10462
Continuation-in-part of application Ser. No. 424,728, Jan. 11, 1965. This application Nov. 2, 1966, Ser. No. 591,637
11 Claims. (Cl. 250—68)



An X-ray film package having an X-ray sensitive sheet enveloped by a light-opaque, radiolucent, water soluble plastic film and a radiolucent, water soluble separator between the emulsion of the X-ray sensitive sheet and the envelope to prevent adherence of the envelope to the emulsion.

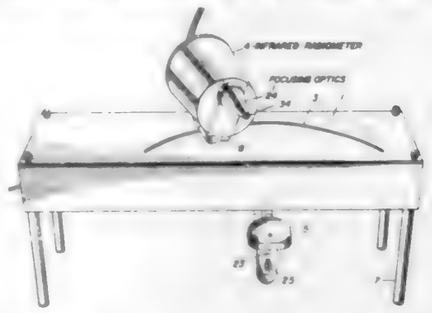
3,374,353
DENTAL X-RAY FILM PACKAGE WHEREIN A PROJECTION OF THE X-RAY FILM EXTENDS OUTSIDE THE WRAPPER
Jacob A. Saffir, Los Angeles, Calif., assignor to The Dentists' Supply Company of New York, York, Pa., a corporation of New York
Filed July 12, 1965, Ser. No. 471,267
9 Claims. (Cl. 250—69)



A dental X-ray film package comprising a sensitized X-ray film having a supporting member projecting from one edge thereof, a light-proof container enclosing said film in a manner to render said supporting member unobstructed for engagement by a clip of a film rack, and said container readily being separable from said film while said supporting member is clipped to said rack.

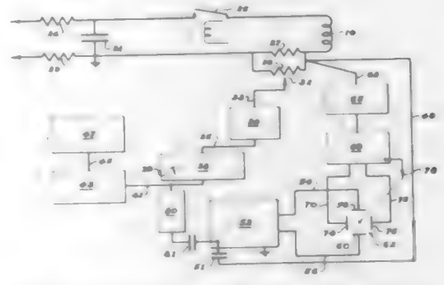
3,374,354
INFRARED RADIOMETER SCANNING DEVICE WITH PREDETERMINED SCAN PATH MEANS
Robert L. Hood, Byram, Conn., assignor to Barnes Engineering Company, Stamford, Conn., a corporation of Delaware
Filed Apr. 12, 1965, Ser. No. 447,358
12 Claims. (Cl. 250—83.3)

An infrared radiometer is mounted on a carriage which can be moved back and forth along a guiding wire or slot which may be straight or curved. This permits scanning across a portion of a patient's body, for example the forehead, while maintaining constant the distance to the patient. In some cases, where the surface is sharply curved, as where a scan across a woman's breasts is needed, a curved track also permits the radiometer to be aimed so that it is always at right angles to the surface of the skin. The radiometer is provided with focusing



means having a small field of view so that the scan will have the desired resolution.

3,374,355
MAGNETIC FOCUSING OF X-RAY TUBES AND SYSTEM FOR OPERATING
Lyman G. Parratt, Trevor R. Cuykendall, Kenneth I. Greisen, L. Taylor Finlayson and Frederick Reines, Santa Fe, N. Mex., assignors to the United States of America as represented by the United States Atomic Energy Commission
Filed Feb. 21, 1946, Ser. No. 649,413
1 Claim. (Cl. 250—9.9)

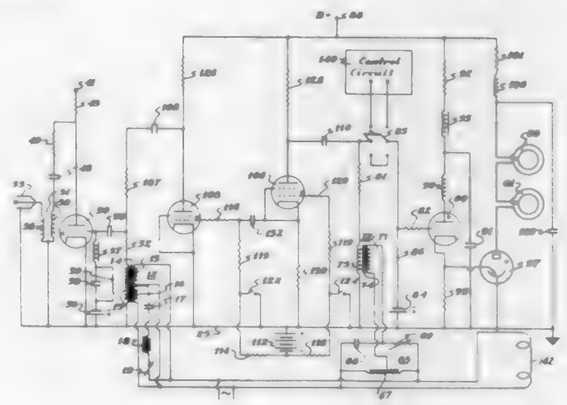


1. A system for operating an X-ray generator comprising in combination an X-ray tube having an axially spaced anode and electron emissive cathode, a coil surrounding said tube for producing a magnetic field in the direction of said axis; means for rapidly producing a pulsed intense magnetic flux comprising a source of surge current, and means for connecting said surge current to said coil, means responsive to a selected predetermined magnitude of said surge current for applying a source of surge voltage to said anode and said cathode, means for developing a potential having an amplitude variable in time in accordance with said flux, a cathode ray oscilloscope, means for applying said potential to one pair of deflecting plates of said oscillator, means for applying a sweep voltage to the other of said deflecting plates simultaneously with the application of said surge current to said coil, and means for applying the surge voltage discharge also to said first named deflection plates, whereby said predetermined magnitude may be selected so that said surge voltage is applied when the magnetic flux produced by said coil is maximum.

3,374,356
MAGNETIC INDUCTION ACCELERATOR WITH MEANS TO DEFLECT ACCELERATED ELECTRONS TO AN X-RAY TARGET
Donald W. Kerst, Urbana, Ill., assignor to the United States of America as represented by the United States Atomic Energy Commission
Filed Mar. 1, 1946, Ser. No. 651,280
8 Claims. (Cl. 250—99)

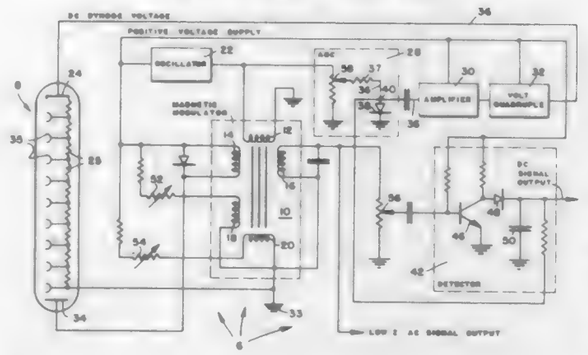
1. The combination with a magnetic induction accelerator having an alternating current source providing cyclic accelerating magnetic field energy and means

for periodically injecting electrons at a time appropriate for acceleration through an orbit defined by said accelerating field energy, means coupled to said current source for controlling the timing of one of said injections to permit electron capture and acceleration through said orbit by said accelerating energy, and means for introducing phase shift to effect all subsequent injections at times inappropriate for electron capture and orbit acceleration thereof, whereby to produce a single effective injection.



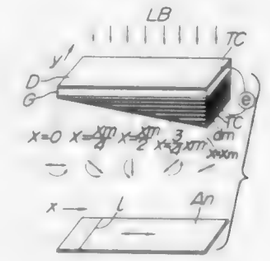
2. The combination with a magnetic induction accelerator of the type including cyclic energizing field for the establishment of a charged particle orbit, means associated with said field for the injection of electrons within said orbit and operative in response to an introduced pulse, and means for deflecting the injected electrons from said orbit after acceleration therein for the bombardment of a target and the production of an X-ray burst; of an electronic circuit associated therewith including electron discharge means responsive to one of a sequence of pulse signals introduced to said electron injection means for the initiation of said injection in proper phase with the cyclic energizing field to effect capture and acceleration within said orbit, said circuit being responsive to all other pulses of said sequence to effect phase shift between the resulting injections, energizing field, and the orbit expanding means, whereby one pulse of said sequence results in an X-ray burst and all other pulses of said sequence are ineffective to cause X-ray bursts.

3,374,357
SENSITIVITY REGULATOR FOR A PHOTOMULTIPLIER TUBE USING MAGNETIC MODULATOR MEANS
George T. Barlow, San Diego, Calif., assignor, by mesne assignments, to the United States of America as represented by the Secretary of the Navy
Filed Aug. 26, 1965, Ser. No. 482,951
6 Claims. (Cl. 250—207)



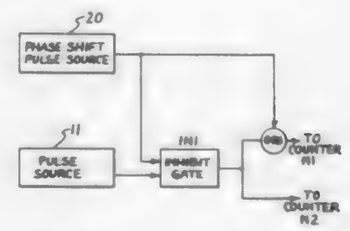
The description discloses a regulator for regulating the sensitivity of a photomultiplier tube so that the tube will be sensitive to light over a large range of intensity without damage to the tube. This may be accomplished by employing a magnetic modulator circuit which cooperates with a detector means and automatic gain control circuit to control an oscillator which drives the cathode and dynode string of the photomultiplier tube. The oscillator may have a constant frequency with a fixed output amplitude.

3,374,358
LIGHT DISPLAY DEVICE EMPLOYING ANGULARLY SELECTIVE POLARIZER
Hideyasu Majima, Hachioji-shi, Japan, assignor to Hitachi, Ltd., Tokyo, Japan, a corporation of Japan
Filed Oct. 20, 1965, Ser. No. 498,217
Claims priority, application Japan, Oct. 30, 1964, 39/61,258
8 Claims. (Cl. 250—213)



1. A light selection device comprising an electro-optically active element including an optical gyrator having along the direction of light transmission a thickness varying in a direction different to the direction of light transmission and an electro-optically active gyrator having an angle of optical rotation controllable under a voltage applied thereto, said electro-optically active gyrator being arranged to act upon the light transmitted through said optical gyrator and a light-analyzing element for detection of light having a predetermined direction of vibration including an analyzer arranged to receive the rotated light emerging from said electro-optically active element.

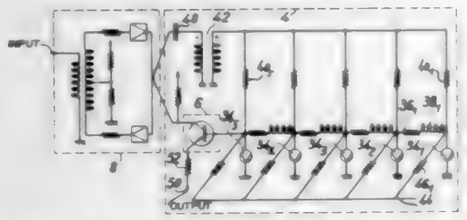
3,374,359
PHASE SHIFT DEVICE
Wilmer C. Anderson, Greenwich, Conn., assignor to General Time Corporation, New York, N.Y., a corporation of Delaware
Filed Oct. 25, 1963, Ser. No. 319,036
12 Claims. (Cl. 307—106)



7. In a phase shift device, the combination which comprises, first and second counters having the same capacity for independently counting the pulses applied thereto and for producing output signals when filled, a first pulse source, means operative to transmit pulses from the first source to both counters whereby the counters are filled at a desired rate, an auxiliary pulse source, means operative to transmit pulses from the auxiliary source to only one of the counters to the exclusion of pulses from said first source to either of the counters so that a desired differential count exists between the counters and output signals are produced thereby with a desired time interval therebetween, and a device independently associated with each

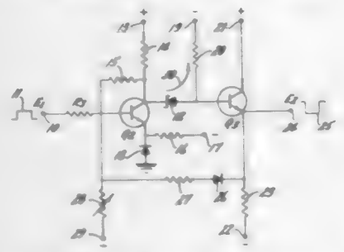
counter for producing an output pulse having a desired volt-second content in response to the production of an output signal by the associated counter.

3,374,360
PULSES TO PROVIDE CONTINUOUS SCALING NON-RESETTABLE COUNTER WITH MEANS FOR CYCLICALLY CHANGING POLARITY OF INPUT
Louis Ponthus, Lyon, and Jacques Lacour, Grenoble, France, assignors to Commissariat à l'Energie Atomique, Paris, France
Filed Mar. 4, 1965, Ser. No. 441,404
Claims priority, application France, Mar. 9, 1964, 966,687
8 Claims. (Cl. 307—225)



The present invention relates to a device for counting a repetitive series of pulses or a pulse train. Particularly the present invention concerns a counting device including a scaling unit comprised of a plurality of bistable elements arranged so that they may be sequentially switched by a positive pulse train and then by a negative pulse train without having to be reset.

3,374,361
ZENER COUPLED WIDE BAND LOGARITHMIC VIDEO AMPLIFIER
Carl R. Callis, Glen Burnie, Md., assignor, by mesne assignments, to the United States of America as represented by the Secretary of the Navy
Filed Sept. 4, 1964, Ser. No. 394,641
4 Claims. (Cl. 307—229)



A Zener coupled wide band logarithmic video amplifier having a transistor amplifier coupled to an emitter follower transistor amplifier by a Zener diode for direct current signal coupling with a first feedback through a resistor from the collector to the base of the first transistor and a second feedback from the emitter follower output to the base of the first transistor. Temperature compensating diodes are coupled to each transistor to produce good logarithmic characteristics over a wide band.

3,374,362
OPERATIONAL AMPLIFIER WITH MODE CONTROL SWITCHES
Monroe A. Miller, Coral Gables, Fla., assignor to Milgo Electronic Corporation, Miami, Fla., a corporation of Florida
Filed Dec. 10, 1965, Ser. No. 512,961
16 Claims. (Cl. 307—230)

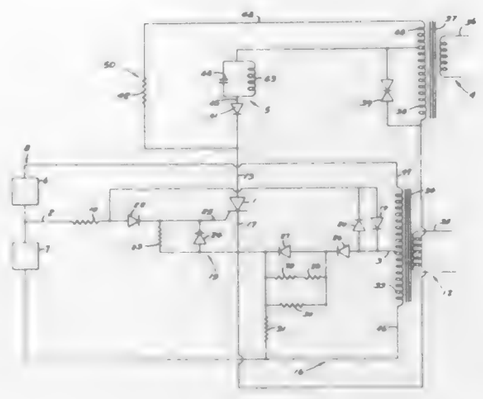
1. In an operational amplifier circuit the combination which comprises:
(a) an operational amplifier having an input circuit and an output circuit,
(b) first and second amplifier input terminals for receiving input signals to be selectively applied to the amplifier input circuit,
(c) a plurality of mode control switches
(d) each mode control switch having an input terminal, first and second output terminals and a control terminal and being arranged to selectively connect the input terminal thereof to the first and second output terminals in response to the application of first and second control signals, respectively, to the control terminal,
(e) the first output terminal of each switch being connected to the input circuit of the amplifier,
(f) the second output terminal of each switch being connected to ground potential,
(g) a separate feedback impedance connected between the amplifier output circuit and the input terminals of the first and second switches,

(h) an input impedance connected between the first amplifier input terminal and the input terminal of the first switch,
(i) an input impedance connected between the second amplifier input terminal and the input terminal of the second switch and
(j) means for applying the first control signal to the control terminal of a selected mode control switch and the second control signal to the control terminals of the other mode control switches and for simultaneously applying the first control signal to the control terminals of two of the switches during the transition time when the input terminals of said two switches are being disconnected from one of the output terminals and connected to the other output terminal so that the input circuit of the amplifier is always connected to at least one of the input terminals of the switches.

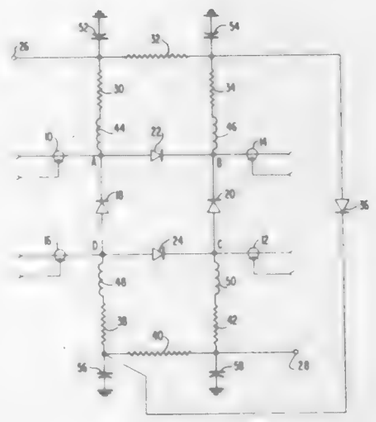
3,374,363
DETECTOR CONTROL CIRCUIT USING AN SCR IN A BALANCED BRIDGE
Gordon A. Roberts, Ann Arbor, Mich., assignor to Charles F. Warrick Company, Berkeley, Mich., a corporation of Michigan
Filed Aug. 30, 1963, Ser. No. 305,701
26 Claims. (Cl. 307—252)

1. A detector circuit responsive to a change in an input signal, comprising the combination:
a source of electrical energy of reversible polarity;
a trigger device having a first input electrode, a second input electrode, and at least a first output electrode;
a load and means connecting said load between said source of electrical energy and said first output electrode;
a pair of signal input terminals:
means for connecting said first input electrode of said trigger device to one of said signal terminals; and

diode means connected between said second input electrode of said trigger device and the other signal terminal for providing a potential on said second input electrode of said trigger device in excess of a predetermined potential with respect to the potential of said first input terminal of said trigger device when said source polarizes said first output electrode of said trigger device for nonconduction.



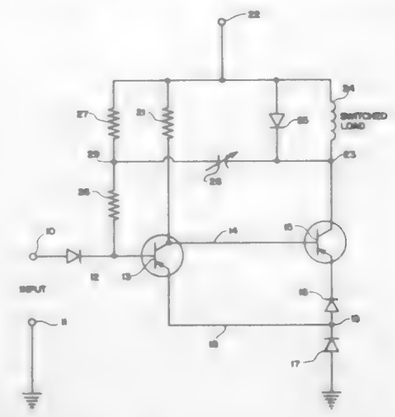
3,374,364
DIODE TRANSFER SWITCH
Carl W. Concelman, Danbury, Conn., assignor to Amphenol Corporation, Broadview, Ill., a corporation of Delaware
Filed Sept. 22, 1965, Ser. No. 489,345
8 Claims. (Cl. 307—257)



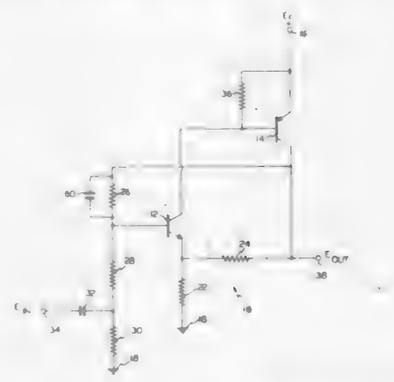
A high frequency, semi-conductor diode transfer switch utilizing a single voltage source for selectively switching two input radio frequency signal transmission lines between two output radio frequency signal transmission lines.

3,374,365
TRANSISTORIZED MONOSTABLE MULTIVIBRATOR WITH IMPROVED TIMING AND NOISE REJECTION
Marvin E. Lyles, Garden Grove, and Warren L. Childs, Ontario, Calif., assignors to Beckman Instruments, Inc., a corporation of California
Filed Apr. 20, 1965, Ser. No. 449,441
7 Claims. (Cl. 307—273)

A monostable multivibrator employing a voltage dividing network in conjunction with a capacitor for stabilizing the RC circuit timing and a pair of series connected diodes, one common to both transistors, for establishing the switching threshold of the circuit.

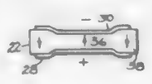


3,374,366
COMPLEMENTARY REGENERATIVE SWITCH
Leonard L. Kleinberg, Greenbelt, Md., assignor to the United States of America as represented by the Administrator of the National Aeronautics and Space Administration
Filed Sept. 28, 1965, Ser. No. 491,059
6 Claims. (Cl. 307—288)



A fast acting transistorized switch circuit incorporating a novel complementary PNP-NPN configuration employing both positive and negative feedback. Upon the application of a positive input pulse to the input terminal, the positive feedback overrides and regeneratively drives a transistor into saturation. Upon the removal of the positive input pulse, the negative feedback overrides and drives both transistors into the off condition in which state the circuit draws no power.

3,374,367
ELECTROACOUSTIC TRANSDUCERS
John V. Cowan, 210 S. King St., Danbury, Conn. 06810
Filed Jan. 21, 1966, Ser. No. 522,065
7 Claims. (Cl. 310—8.5)



1. An electroacoustic transducer comprising:
(A) a piezoelectric body having a first and a second major surface;

(B) A first and a second electrode adjacent to each major surface, and,

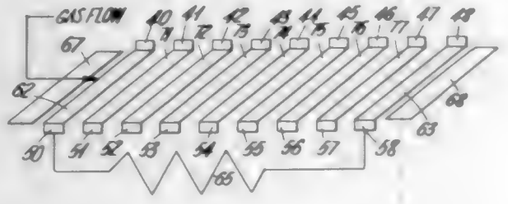
(C) at least two volumetric portions of said body between said electrodes being polarized such that upon the application of an electric field thereto, a first and a second potential energy quantity is stored in said portions of opposite kind and upon termination of said electric field the potential energy is changed to a first and a second kind of kinetic energy that is substantially mutually cancellable, thus creating a self-damping transducer.

3,374,368

MAGNETOHYDRODYNAMIC APPARATUS

Donald Thomas Swift-Hook, Dibden Purlieu, John Keith Wright, Ashtead, and John Maycock, Guildford, England, assignors to Central Electricity Generating Board, London, England, a British body corporate

Filed Mar. 18, 1965, Ser. No. 440,821
Claims priority, application Great Britain, Mar. 19, 1964, 11,629/64, 11,741/64; Mar. 20, 1964, 11,958/64
25 Claims. (Cl. 310—11)



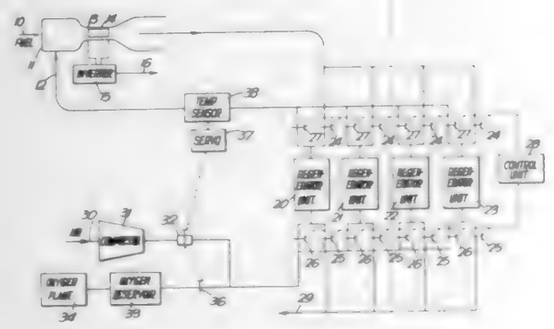
1. A duct for magnetohydrodynamic apparatus constructed of a number of metal tubes, each shaped to form a loop extending completely around the duct, the various loops being stacked together with electrical insulation between them to form a duct with each loop lying in a plane or other surface such that the planes or surfaces correspond with the desired equipotential surfaces and whereby the portions of the tube in contact with fluid passing through the duct may be utilised as electrodes.

3,374,369

MAGNETOHYDRODYNAMIC ELECTRICAL GENERATORS

Trevor Broom, Stoke D'Abernon, England, assignor to Central Electricity Generating Board, London, England, a British body corporate

Filed Mar. 22, 1965, Ser. No. 441,509
Claims priority, application Great Britain, Mar. 24, 1964, 12,458/64
12 Claims. (Cl. 310—11)



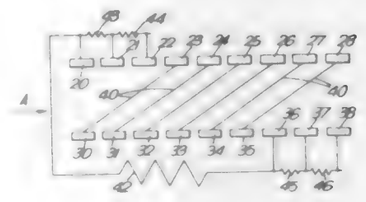
1. In an open cycle magnetohydrodynamic electrical power generator in which fuel is burnt with air the combination of cyclically switched regenerative pre-heaters for pre-heating the combustion air and means for periodic injection of oxygen into the air feed at the pre-heater switching frequency to increase or maintain the flame temperature as the temperature of the pre-heated air decreases.

3,374,370

MAGNETOHYDRODYNAMIC ELECTRICAL GENERATORS

Donald Thomas Swift-Hook, Dibden Purlieu, England, assignor to Central Electricity Generating Board, London, England, a British body corporate

Filed Mar. 22, 1965, Ser. No. 441,510
Claims priority, application Great Britain, Mar. 20, 1964, 11,873/64
7 Claims. (Cl. 310—11)



1. In a magnetohydrodynamic electrical generator, a duct through which conductive gas flows, two similar series of axially spaced electrodes on opposite surfaces of the duct, electrical connections between those electrodes of the two series which lie in the desired equipotential planes at an angle to the axis of the duct whereby there are some unconnected electrodes at one end of one series and at the other end of the other series a main load, first and second networks of subsidiary loads, means connecting one end of said main load through said first network of subsidiary loads to the unconnected electrodes at one end of one series, and means connecting the other end of said main load through said second network of subsidiary loads to the unconnected electrodes at the other end of the other series, the subsidiary loads in each network being proportioned in accordance with current flows to the various electrodes to which the network is connected to allow current to be drawn from or fed into these electrodes at the potentials appropriate to the required potential disribution along the duct.

3,374,371

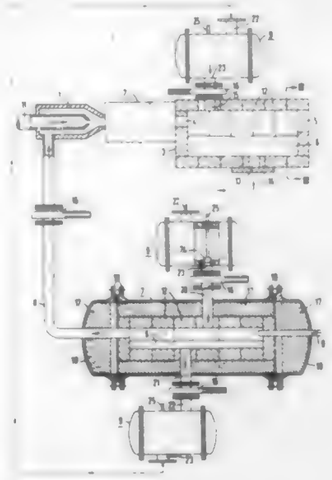
METHOD AND HEAT EXCHANGER FOR PREHEATING THE COMBUSTION AIR OF MAGNETOHYDRODYNAMIC GENERATORS

Walter Hanlein, Wilhelm Rieger and Max Maier, Erlangen, Germany, assignors to Siemens Aktiengesellschaft, Munich, Germany, a corporation of Germany

Filed May 3, 1965, Ser. No. 452,471
Claims priority, application Germany, May 2, 1964, S 90,903
8 Claims. (Cl. 310—11)

The combination in an MHD generator, having combustion-air supply means and a waste-gas outlet, of a heat exchanger plant including a first container and a second container, both containing molten liquid heat transfer material when in operation, the first container being connected to the waste gas outlet and forming a path for gas in heat-exchanging contact with the surface level of the molten material in the first container, the second container being connected in the combustion-air supply means and forming a supply path for air above and in heat-exchanging contact with the surface level of the molten material in the second container, the second container having a pressure-resistant jacket and, in operation,

having a higher internal pressure than the first container, both containers having material charging and discharging means for transferring material from the second container



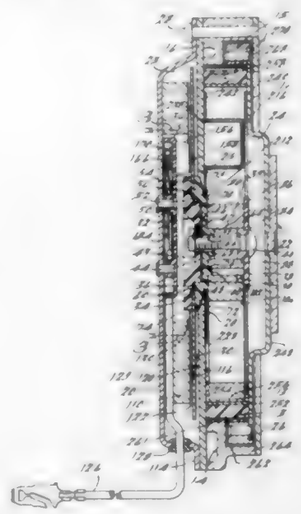
to the first container, the material charging and discharging means including in each of the two containers an outlet below the level and an inlet above the level.

3,374,372

ACTUATOR

David V. Tinder, Detroit, and Theodore F. Knapp and Donald R. Gaines, Farmington, Mich., assignors to Dura Corporation, a wholly owned subsidiary of Walter Kidde & Company, Inc., Oak Park, Mich., a corporation of New York

Filed Sept. 16, 1964, Ser. No. 396,978
51 Claims. (Cl. 310—80)



There is herein disclosed a power actuator for a vehicle window or the like comprising a disc motor and a harmonic transmission cooperably mounted in a pancake type housing.

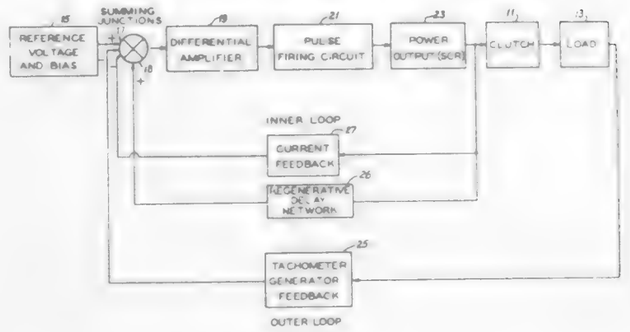
3,374,373

CONTROLLED-VELOCITY DRIVE

Frederick Hart Calvert, Kenosha, Wis., assignor to Eaton Yale & Towne, Inc., Cleveland, Ohio, a corporation of Ohio

Continuation of application Ser. No. 361,851, Apr. 22, 1964. This application Apr. 22, 1967, Ser. No. 642,619
11 Claims. (Cl. 310—94)

A solid-state speed control is disclosed in which the energization of the field winding of an eddy-current coupling is controlled in response to a tachometer feedback signal, which represents the coupling output speed, and a pair of signals which vary as functions of the field winding current. One of the pair of current responsive signals



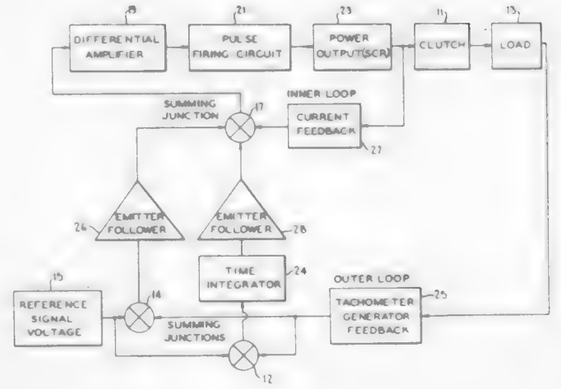
is applied substantially directly to effect degenerative feedback and the other is delayed and applied to effect regenerative feedback.

3,374,374

CONTROLLED-VELOCITY DRIVE

Aubrey H. Smith, Kenosha, Wis., assignor to Eaton Yale & Towne, Inc., Cleveland, Ohio, a corporation of Ohio

Continuation of application Ser. No. 365,413, May 6, 1964. This application Apr. 26, 1967, Ser. No. 642,622
13 Claims. (Cl. 310—94)



A solid-state speed control is disclosed in which the energization of the field winding of an eddy current coupling is varied in response to both a first error signal which is a function of the difference between the desired and actual speeds and a second error signal which is a function of the time integrated difference between the desired and actual speeds.

3,374,375

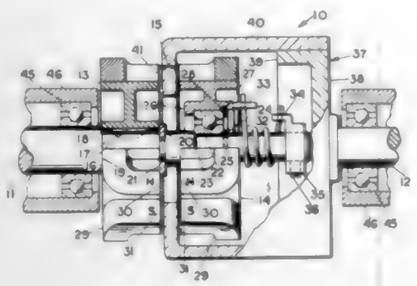
ACCELERATION SENSITIVE COUPLING

Jerome M. Cook, Plainview, N.Y., assignor to Grumman Aircraft Engineering Corporation, Bethpage, N.Y., a corporation of New York

Filed Aug. 3, 1964, Ser. No. 387,096
12 Claims. (Cl. 310—95)

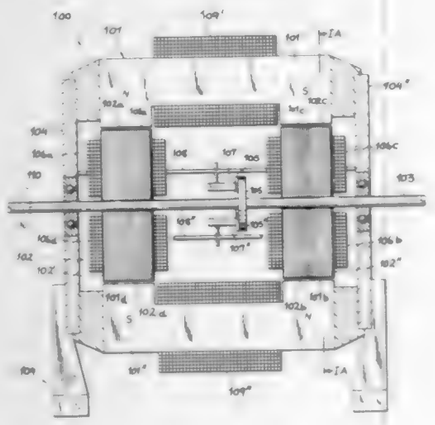
This invention is a magnetic eddy-current coupling in which the torque coupling between the drive and driven members is a function primarily of drive member acceleration. Maximum coupling effect is obtained in conditions of maximum drive member acceleration and the effect drops to zero when the drive member ceases to accelerate as, for instance, when it stabilizes at its rated

speed. Variations in the magnetic field to vary the coupling effect are obtained by a displacement in the relative positions of the field producing elements of the drive.



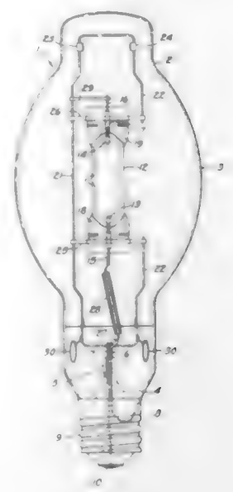
This displacement is produced by the inertia induced by acceleration. The operating principle is applicable in linear as well as rotary couplings.

3,374,376
ELECTRIC GENERATOR
Raymond Kromrey, 15 Rue du Mt. Blanc, Geneva, Switzerland
Filed Jan. 9, 1964, Ser. No. 336,769
1 Claim. (Cl. 310—112)



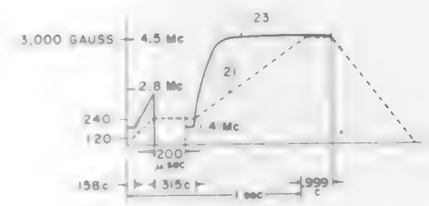
1. An electric generator comprising a fixed stator and a rotor coaxial with said stator; drive means for rotating said rotor about its axis, said stator being provided with a pair of elongated bar magnets extending parallel to said axis on opposite sides thereof and terminating in transverse extremities, oppositely poled extremities of said magnets confronting each other and defining magnet means having two axially spaced pole pairs disposed in a common axial plane and forming a pair of diametrically extending air gaps for establishing a magnetic-flux path including two axially spaced parallel magnetic fields across said air gaps traversing said axis substantially at right angles, said rotor being provided with two axially spaced parallel elongated ferromagnetic elements slightly shorter than the spacing of said confronting extremities and extending perpendicularly to said axis at locations coplanar with said pole pairs for concurrent periodic alignment of said elements with said fields in said air gaps upon rotation of said rotor; and an output circuit on said rotor including winding means on each of said elements and collector means in series with said winding means, each of said pole pairs and the corresponding elements having confronting arcuate faces centered on said axis, the sum of the arcs spanned by said faces being substantially equal to 90° in the plane of rotation.

3,374,377
METAL VAPOR LAMP COATING
Clarence G. Cook, Mayfield Heights, Ohio, assignor to General Electric Company, a corporation of New York
Filed Apr. 21, 1965, Ser. No. 449,745
4 Claims. (Cl. 313—17)



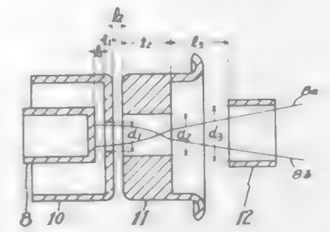
In a high pressure mercury metal halide (sodium iodide) lamp of the jacketed type, it is necessary to maintain the ends of the arc tube above 500° C. in order to prevent condensation of the metal halide. This is achieved by a heat and light-reflective coating on the ends of the quartz arc tube within the evacuated outer jacket. A material found suitable for this purpose is zirconium oxide ZrO_2; it does not react with the quartz at the operating temperature, nor vaporize, nor darken, nor release gases into the interenvelope space.

3,374,378
ACCELERATION OF HEAVY PARTICLES
Ernest D. Courant, Bayport, N.Y., assignor to the United States of America as represented by the United States Atomic Energy Commission
Continuation of application Ser. No. 324,593, Nov. 18, 1963. This application July 14, 1967, Ser. No. 654,039
6 Claims. (Cl. 313—63)



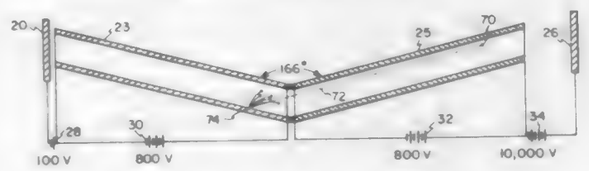
A method of increasing the revolution frequency and energy of heavy electrically charged particles that are magnetically held on a revolution orbit in a strong focusing synchrotron, wherein the particles are injected at a pre-selected low velocity from a linear accelerator and exposed to a high frequency electric field the frequency of which is successively made equal to different harmonics of the revolution frequency in the synchrotron with decreasing ordinal numbers of the harmonics whereby the revolution frequency and energy of the particles can be increased in the multiple bev. range in the synchrotron with a narrow band of electric field frequencies.

3,374,379
LOW SECOND GRID VOLTAGE ELECTRON GUN
Takaharu Maruyama, Hirofumi Suzuki, and Masaaki Yamauchi, Kawasaki-shi, Japan, assignors to Nippon Columbia Kabushikikaisha (Nippon Columbia Co., Ltd.), Kawasaki-shi, Japan, a corporation of Japan
Filed May 27, 1964, Ser. No. 370,516
Claims priority, application Japan, Mar. 2, 1964, 39/11,473
8 Claims. (Cl. 313—85)



A high transconductance electron gun type cathode ray tube with a low second grid voltage electron gun having multigrid electrodes successively in the advance direction of electron beams from the cathode of the electron gun. Each of the grid electrodes has a central aperture therein with the diameter of the central aperture of the second grid electrode being larger than the diameter of the central aperture of the first grid electrode and the axial length of the central aperture of the second grid electrode being greater than the diameter of the central aperture of the second grid electrode.

3,374,380
APPARATUS FOR SUPPRESSION OF ION FEEDBACK IN ELECTRON MULTIPLIERS
George W. Goodrich, Oak Park, Mich., assignor to The Bendix Corporation, Ann Arbor, Mich., a corporation of Delaware
Filed Nov. 10, 1965, Ser. No. 507,198
10 Claims. (Cl. 313—104)

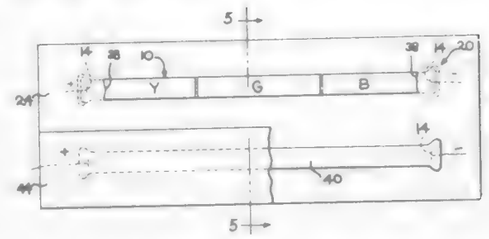


A pair of channel electron multipliers operating in series and disposed at an angle to minimize ion feedback.

3,374,381
MULTI-COLOR PHOTOLUMINESCENT GLASS SYSTEMS
Marvin J. Albinak and Warren H. Turner, Toledo, Ohio, assignors to Owens-Illinois, Inc., a corporation of Ohio
Filed May 3, 1965, Ser. No. 452,761
4 Claims. (Cl. 313—108)

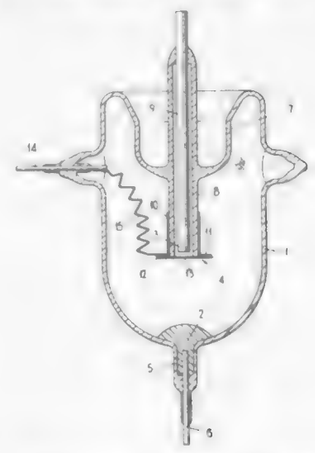
A multi-color photoluminescent glass system wherein separate segments of a common base glass, either rod or tube, and each segment having a different photoluminescent dopant, are joined together into a continuous length element. In the case of a tube, mercury vapor may be placed inside, with electrodes, and activated so that each of the segments will produce a different color, based upon its respective photoluminescent dopant. Within the broad scope of the invention, separate items can be so made and held on a support and activated to produce photoluminescent light output by a separate mercury vapor tube.

A substantial advancement to the art is provided in that multiple colors are produced in a novel and inexpensive manner, using a single excitation source to activate all of the different colored parts.



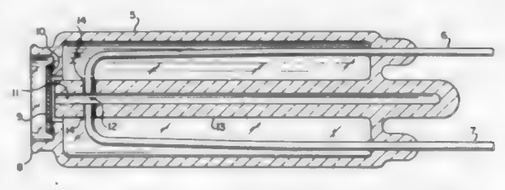
Since the doped segments are transparent, neon or similar gas can be enclosed in the tube for one color of light, and separately or simultaneously an external excitation source can be played upon the unit for a different set of colors.

3,374,382
CATHODE FOR USE IN GAS-FILLED ELECTRIC DISCHARGE DEVICES COMPRISING CADMIUM, ZINC, TIN AND ALLOYS THEREOF
Rodney William Young, Harrow, Middlesex, England, assignor to The M-O Valve Company Limited, London, England, a British company
Filed Nov. 18, 1965, Ser. No. 508,463
Claims priority, application Great Britain, Nov. 19, 1964, 47,157/64; June 29, 1965, 27,507/65
12 Claims. (Cl. 313—173)



1. A cold cathode, for use in a gas-filled electric discharge device, at least the emissive part of which consists of a solid material at least 30 atomic percent of which consists of metal having a latent heat of vapourization not greater than 50 kilocalories per mole and a vapour pressure at 1000° C. of not less than 0.1 torr.

3,374,383
ACCUMULATION MEANS FOR REDUCTION OF SPUTTER IN GAS-FILLED, LYMAN-ALPHA SOURCE TUBE
George J. Bergen, Oxon Hill, Md., and Arnold H. Singer, Washington, D.C., assignors to the United States of America as represented by the Secretary of the Navy
Filed Apr. 28, 1966, Ser. No. 546,491
5 Claims. (Cl. 313—207)



A miniature gas filled cold cathode Lyman-Alpha source tube including means to prevent deleterious effects due

to sputtering while providing a tube having stable operating characteristics throughout a long life span.

3,374,384
PROCESS FOR PRODUCING NEGATIVE HELIUM IONS

Bailey L. Donnally, Lake Forest, Ill., assignor to Lake Forest College, Lake Forest, Ill., a not for profit corporation of Illinois

No Drawing. Filed May 5, 1966, Ser. No. 547,800
10 Claims. (Cl. 313—230)

1. A process for producing negatively charged helium ions comprising the steps of:

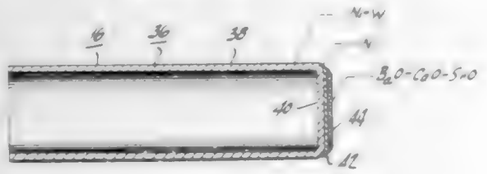
passing a beam of relatively low energy positively charged helium ions through the vapor of an alkali atom in order to produce metastable helium atoms; and

passing said metastable helium atoms through the vapor of an alkali atom in order to convert said metastable helium atoms into negatively charged helium ions.

3,374,385
ELECTRON TUBE CATHODE WITH NICKEL-TUNGSTEN ALLOY BASE AND THIN NICKEL COATING

Charles T. Lattimer, Marion, Ind., assignor to Radio Corporation of America, a corporation of Delaware

Filed July 10, 1963, Ser. No. 294,108
11 Claims. (Cl. 313—337)



1. An indirectly heated cathode for an electron tube comprising:

(a) a base element which exhibits desirable electron emissive properties superior to those of a nickel base element and to which electron emissive materials do not satisfactorily adhere, consisting of nickel-tungsten alloy,

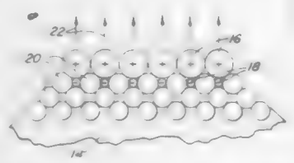
(b) a coating of nickel having a thickness not greater than 0.0006 inch on a portion of the surface of said base element, and

(c) a layer of electron emissive material on said nickel coating.

3,374,386
FIELD EMISSION CATHODE HAVING TUNGSTEN MILLER INDICES 100 PLANE COATED WITH ZIRCONIUM, HAFNIUM OR MAGNESIUM ON OXYGEN BINDER

Francis M. Charbonnier, Eugene E. Martin, and Lynwood W. Swanson, McMinnville, Oreg., assignors to Field Emission Corporation, McMinnville, Oreg., a corporation of Oregon

Filed Nov. 2, 1964, Ser. No. 408,035
9 Claims. (Cl. 313—34.6)



1. A field emission cathode comprising:

a substrate body of material taken from the group consisting of molybdenum and crystal lattice plane of Miller indices 100 oriented at the surface of a sharpened portion of said body having a small radius of curvature;

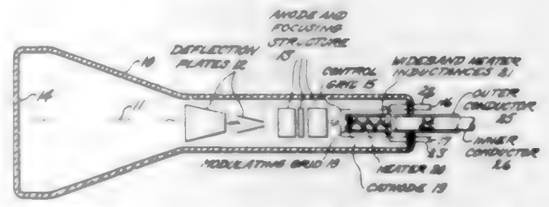
a layer containing electron emissive material taken from the group consisting of zirconium, hafnium and magnesium, coated only on said sharpened portion of said body and confined substantially entirely to said lattice plane to reduce the work function of said sharpened portion; and

said layer also containing bonding material, such as oxygen, to cause said emissive material to adhere only to said surface of said sharpened portion so that the field emission of electrons from said cathode forms an electron beam of high current density originating at a small source confined primarily to said coated 100 plane on said sharpened portion of said body.

3,374,387
COAXIAL LINE TERMINATING IN CATHODE AND CONTROL GRID OF CATHODE RAY TUBE

Hermann F. Schmid, San Francisco, Calif., assignor to the United States of America as represented by the Secretary of the Air Force

Filed Nov. 18, 1966, Ser. No. 595,537
2 Claims. (Cl. 315—3)

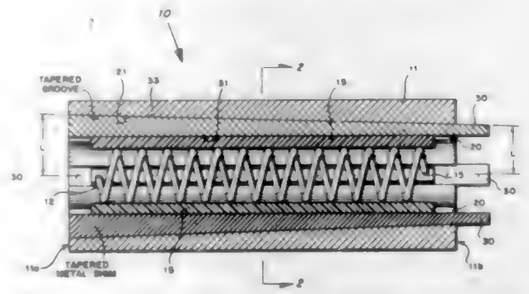


An electron gun structure for use in a cathode-ray tube having a cathode, control grid, an additional modulating grid, and anode. The modulating grid and cathode form part of the outer and center conductor of a coaxial line. The coaxial line is brought out through the base of the cathode ray tube. The modulating signal is applied between the cathode and modulating grid.

3,374,388
TRAVELING WAVE TUBE HAVING TAPERED GROOVES AND SHIMS FOR IMPROVED THERMAL CONTACT BETWEEN METAL ENVELOPE, SUPPORT RODS AND SLOW WAVE HELIX

Raymond E. Huber, Woodbine, Md., assignor, by mesne assignments, to the United States of America as represented by the Secretary of the Navy

Filed Nov. 13, 1964, Ser. No. 411,169
10 Claims. (Cl. 315—3.5)

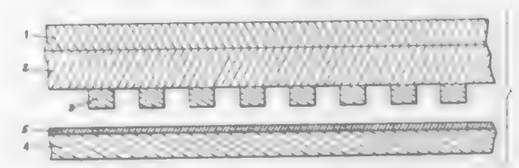


A traveling wave tube having a tubular envelope with longitudinally extending grooves of uniformly increasing depth between their ends spaced about the inner periphery, elongated tapered shims each contiguous with the radially outermost surface of a respective groove and forming an inner surface parallel to the longitudinal axis of the envelope, elongated dielectric support rods contiguous with a respective shim inner surface and forming an inner surface parallel to the longitudinal axis of the envelope, and a helical delay winding coaxially supported in the envelope by the rod inner surfaces whereby positioning of the shims along the length of the envelope obtains positive contact between interfaces of the winding, rods, shims and envelope and thereby affords high thermal conductivity therebetween.

3,374,389
SOLE ELECTRODE OF THE CROSSED-FIELD TYPE OF ELECTRON DISCHARGE DEVICE HAVING A COATING OF REFRACTORY MATERIAL THEREON

Pierre Cahour and Walter Sobotka, Paris, France, assignors to CSF—Compagnie Generale de Telegraphie Sans Fil, Paris, France

Filed July 20, 1964, Ser. No. 383,634
Claims priority, application France, Aug. 6, 1963, 943,878
12 Claims. (Cl. 315—3.5)

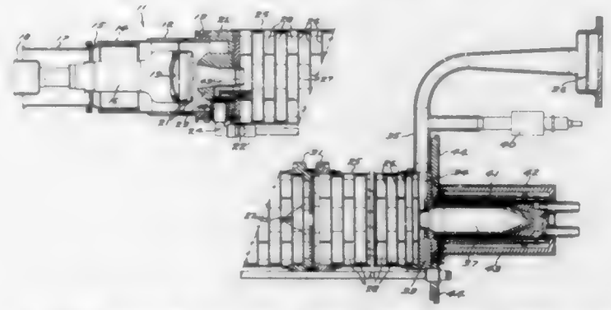


A crossed-field electron discharge device having a wave delay structure secured to an insulating base and a metallic sole electrode facing the delay structure, the surface of the sole electrode being coated with a refractory layer having a low electrical conductivity at least on the surface thereof.

3,374,390
TRAVELING-WAVE TUBE HAVING A SLOW-WAVE STRUCTURE OF THE CLOVERLEAF TYPE WHEREIN THE HEIGHT OF THE CLOVERLEAF SECTIONS ARE TAPERED

John A. Ruetz, Los Altos, Willis H. Yocom, Chatham, and René M. Rogers, Sunnyvale, Calif., assignors to Varian Associates, Palo Alto, Calif., a corporation of California

Continuation-in-part of application Ser. No. 56,415, Sept. 16, 1960. This application Mar. 29, 1965, Ser. No. 443,612
18 Claims. (Cl. 315—3.6)

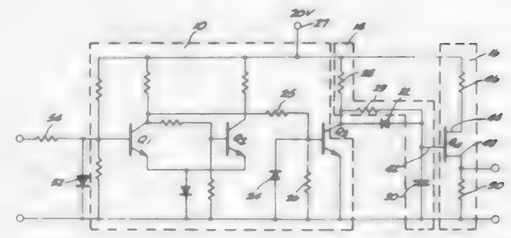


1. An electron discharge device comprising: a cathode for producing a beam of electrons, a collector for collecting said beam of electrons, a slow-wave structure positioned between the cathode and collector for supporting a traveling wave, input means coupled to the cathode end of said slow-wave structure for introducing the traveling wave onto the slow-wave structure, the traveling wave being amplified by interaction with the electron beam traveling through the slow-wave structure, said slow-wave structure comprising a plurality of inductively coupled cloverleaf sections aligned along the beam path, the heights of the last several cloverleaf sections in the slow-wave structure decreasing in value progressively, the last cloverleaf section being substantially shorter in height then the full height of the normal cloverleaf sections, said input means including a coaxial line extending into and across the first cloverleaf section in a direction parallel to the beam path, said first cloverleaf section having an annular tuning stub coaxially aligned with the beam path and extending into said first cloverleaf section for capacitive tuning of the input, and output means coupled to said last cloverleaf section for removing the wave energy from said slow-wave structure.

3,374,391
SWEEP PROTECTION CIRCUIT

Richard G. Friess, San Marcos, Calif., assignor to Hughes Aircraft Company, Culver City, Calif., a corporation of Delaware

Filed Mar. 3, 1966, Ser. No. 531,432
4 Claims. (Cl. 315—20)



1. In combination with an electron beam tube including a writing beam circuit and a sweep voltage generating circuit means having an output voltage of a preselected waveform, a protection circuit comprising:

a sensing circuit means connected to said sweep voltage generating circuit means for developing one output signal when the output voltage of said sweep voltage generating circuit means is of said preselected waveform and a second output signal when said output voltage is of a waveform other than said preselected waveform;

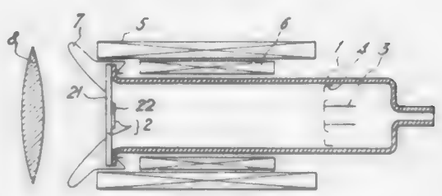
a pulse generating circuit means coupled to said writing beam circuit for disabling said writing beam circuit when said pulse generating circuit means develops an output pulse; and

a control circuit means coupled between said sensing circuit and said pulse generating means for causing said pulse generating means to develop an output pulse when said sensing circuit develops said second output signal.

3,374,392
CAMERA TUBE FOR INFRARED TELEVISION HAVING FERROELECTRIC STRIP FOR RECEIVING RADIATION

Armand Hadni, Paris, France, assignor to CSF—Compagnie Generale de Telegraphie Sans Fil, a corporation of France

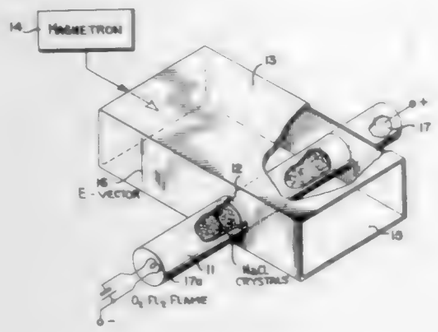
Filed Aug. 24, 1964, Ser. No. 391,631
Claims priority, application France, Aug. 27, 1963, 945,749, Patent 1,374,487
3 Claims. (Cl. 315—21)



The invention has for object a camera tube for infrared television of the charge storage type, including a ferro-

electric strip, having a dielectric constant particularly sensitive to the local temperature variations.

3,374,393
INTENSE INCOHERENT LIGHT SOURCE OBTAINED BY QUENCHING THE HIGHER EXCITED STATES AND CONCENTRATING THE ENERGY ON THE LOWER STATES
Jenny Bramley, Falls Church, Va., assignor to Melpar, Inc., Falls Church, Va., a corporation of Delaware
Filed Feb. 12, 1965, Ser. No. 432,149
14 Claims. (Cl. 315—39)

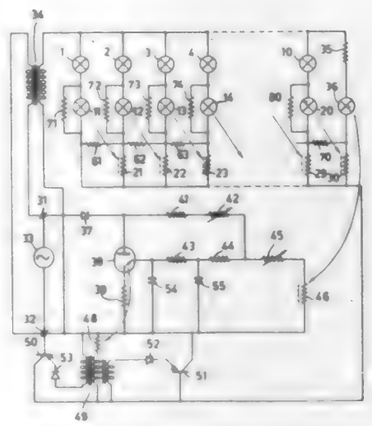


Emission of intense light in an appropriate region of the electromagnetic spectrum from a plasma containing a metal or compound thereof having first and further excited states is achieved by exciting the plasma using microwave energy, while quenching the higher excited states to concentrate energy in the lower excited state or states.

3,374,394
TIME DELAY CONTROL FOR LIGHTING CIRCUIT
Charles W. Miller, Anderson, Ind., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Aug. 20, 1965, Ser. No. 481,344
5 Claims. (Cl. 315—82)

A lighting circuit incorporating a relay, a transistor switch, and an RC timing network that together become operative when the light switch is moved to its "Off" position to provide a shunt connection between the headlamps and the power source. The RC network biases the transistor switch on and causes the relay to be energized to complete the shunt connection for a certain time interval determined by the time constant of the RC network.

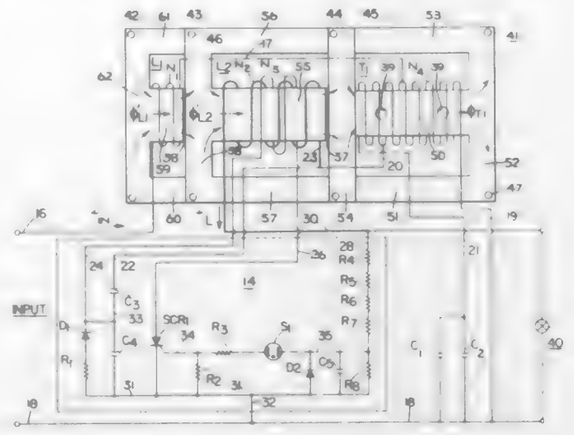
3,374,395
CIRCUIT ARRANGEMENT FOR LUMINOUS ADVERTISING IN WHICH THE LIGHT SOURCES FLASH UP CONSECUTIVELY AND ARE SIMULTANEOUSLY EXTINGUISHED
Mathias Donkers and Engbert Bernard Gerard Nijhof, Emmasingel, Eindhoven, Netherlands, assignors to North American Philips Company, Inc., New York, N.Y., a corporation of Delaware
Filed Mar. 4, 1965, Ser. No. 437,180
Claims priority, application Netherlands, Mar. 7, 1964, 64—2,377
14 Claims. (Cl. 315—151)



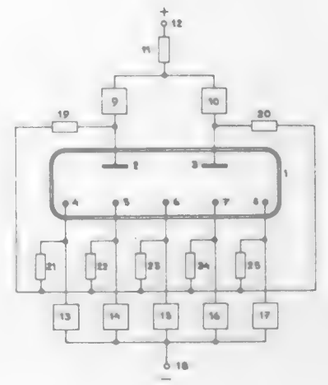
1. A circuit for sequentially energizing a plurality of electric light sources arranged in a given pattern comprising, a source of energizing voltage, electronic gate means, a plurality of light-sensitive elements, means connecting a first one, a second one, a third one, and so on, of said light sources in series with a first one, a second one, a third one, and so on of said light-sensitive elements, respectively, said light sources and said light-sensitive elements being arranged so that said light sources are individually optically coupled in sequence to adjacent light-sensitive elements, means connecting said electronic gate means in series between said voltage source and said plurality of series connected light sources and light-sensitive elements to control the energization thereof, means for exciting the first light-sensitive element in the sequence thereby to initiate a cycle wherein said light sources are sequentially energized as the respective series connected light-sensitive elements are sequentially illuminated by the respective light sources optically coupled therewith, a light-sensitive control element optically coupled to the last one of said light sources in the sequence and arranged to control the state of said electronic gate means so as to simultaneously de-energize said light sources at the end of a cycle, and a delay network coupled between said light-sensitive control element and said electronic gate means for providing a time delay between the activation of said control element and said control of said electronic gate means.

3,374,396
STARTING, CURRENT LIMITING AND VOLTAGE STABILIZING CIRCUIT FOR HIGH INTENSITY ARC DISCHARGE LAMPS
Gordon M. Bell and Alexander R. Hallay, Fort Wayne, Ind., assignors to General Electric Company, a corporation of New York
Filed Jan. 9, 1967, Ser. No. 608,030
11 Claims. (Cl. 315—277)

Starting and operating control apparatus including a current limiting reactor, a magnetic voltage stabilizer for supplying a constant voltage to the current limiting reactor and arc discharge lamp, and a starting circuit coupled on the current limiting reactor. The current limiting reactor and magnetic voltage stabilizer share a common section of the laminated core structure of the control apparatus. The magnetic flux produced by the current limiting reactor and magnetic voltage stabilizer are vectorially substractive with respect to each other in the common section of the laminated core and the common section does not become saturated with flux. A voltage divider is connected across the output of the control apparatus and responds to an open circuit voltage condition across the output to cause the starting circuit to supply a starting pulse in every other half cycle of the supply voltage. The starting circuit is essentially inoperative during normal operation of the lamp.

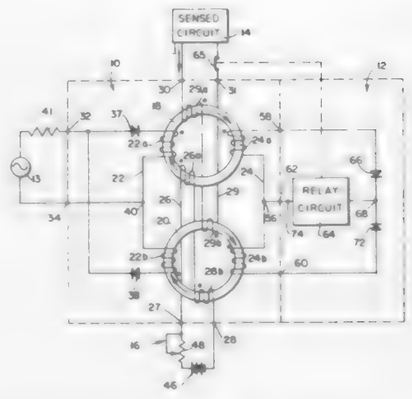


3,374,397
INDICATOR CIRCUIT WITH ALL ELECTRODES CONNECTED TO A COMMON POINT THROUGH INDIVIDUAL RESISTORS
Cornelis J. Krayenbrink, Zoetermeer, Netherlands, assignor to Indoheem N.V., The Hague, Netherlands, a Dutch limited-liability company
Filed Apr. 25, 1966, Ser. No. 544,757
Claims priority, application Netherlands, Sept. 8, 1965, 65—11,739
1 Claim. (Cl. 315—334)



1. An indicator circuit comprising a glow discharge tube having at least one anode and at least two cathodes, means for selectively connecting one anode and one cathode to a source of supply voltage thereby to establish a glow discharge between the anode and cathode concerned, a plurality of separate resistors, and means connecting all anodes and cathodes through separate ones of said resistors to a common star point which is not connected to anything else.

3,374,398
MAGNETIC CIRCUIT PROTECTIVE DEVICE
Richard A. Horn, Hudson, and Howard I. Cole, New Ipswich, N.H., assignors to Sanders Associates, Inc., Nashua, N.H., a corporation of Delaware
Filed Jan. 7, 1966, Ser. No. 519,281
20 Claims. (Cl. 317—9)



Apparatus is herein provided for sensing within a time limit measured in microseconds, both D.C. and A.C. currents and voltages which exceed predetermined limits. The protective circuit uses a magnetic amplifier for its high gain capabilities and low power consumption. The magnetic amplifier operates at a point in the saturation region on the flux vs. magnetomotive curve, the operating point being determined by the current in the primary or gate winding, and a bias winding. The current of the monitored circuit passes through a sense winding and generates a flux opposite in polarity to the flux produced by the gate winding and bias winding. When the current in the sense winding exceeds a predetermined limit the resulting flux will shift the operating point onto the linear portion of the flux vs. magnetomotive curve and, through transformer action, the varying primary flux will produce a voltage in the output winding which will activate the appropriate protective circuits.

3,374,399
DISTANCE PROTECTIVE RELAYING
Clyde G. Dewey, Drexel Hill, Pa., assignor to General Electric Company, a corporation of New York
Filed Feb. 1, 1966, Ser. No. 524,198
19 Claims. (Cl. 317—36)

1. A distance relay responsive to the conditions of a fault on an alternating current power transmission line, comprising:

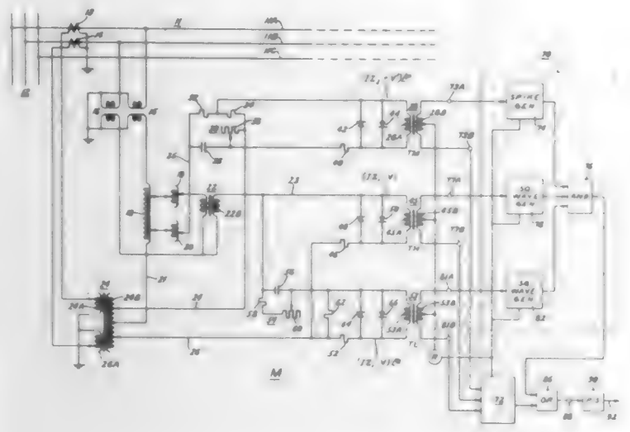
(a) first means for coupling to the line and responsive to line voltages for developing reference voltages representative of the line voltages and having a certain phase relation thereto;

(b) second means for coupling to a line and responsive to line currents for developing representative voltages related to the line currents by a predetermined constant impedance and by a predetermined phase displacement therefrom;

(c) third means connected to said first and second means for developing operating voltages related to the vector combination of said impedance and reference voltages; and

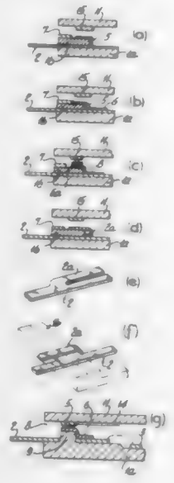
(d) fourth means for detecting, during intermittent periods of said operating voltages that are substan-

tially different from half cycles of the line voltages, the time relations of a certain instantaneous portion of successive cycles of said reference voltages, and



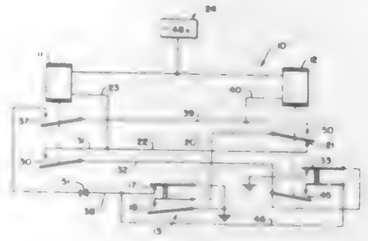
for producing output control signals indicative of fault conditions on the transmission line upon such detection.

3,374,400
COMPOUND ELECTRONIC UNIT
Seiichi Tabuchi, Hiroyuki Matsuzaki and Tatuo Tsuboi, Kawasaki-shi, Japan, assignors to Fujitsu Limited, Kawasaki-shi, Japan
Filed Sept. 1, 1965, Ser. No. 484,260
Claims priority, application Japan, Sept. 2, 1964, 39/50,143
6 Claims. (Cl. 317—101)



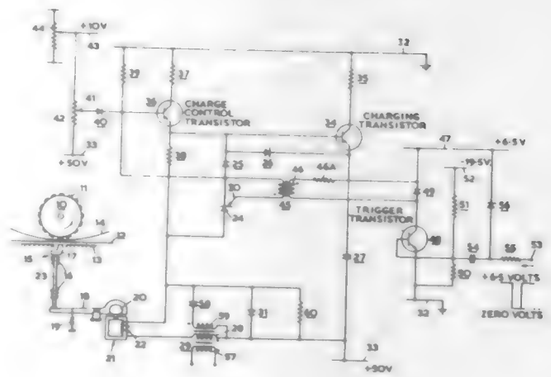
In a hybrid integrated electronic circuit, complete separation is achieved between the active and passive circuit elements by the use of a pair of planar insulating members forming the parts of a two-part housing, said members being hermetically connected with one another along registering wall-like mating surfaces thereof. The at least partly interconnected active circuit elements of the unit are supported by one of said members and the at least partly interconnected passive circuit elements of said unit are supported by the other of said members, while the elements of one member are electrically connected with the elements of the other member via registering surface contact elements disposed upon said mating surfaces and being in intimate conductive contact with one another in the closed and sealed position of the housing. Terminal conductors also in contact with said elements pass through and project outwardly from the housing.

3,374,401
RELAY FLIP-FLOP
Robert C. Swanson, Chicago, Ill., assignor to Teletype Corporation, Skokie, Ill., a corporation of Delaware
Filed May 13, 1965, Ser. No. 455,514
7 Claims. (Cl. 317—140)



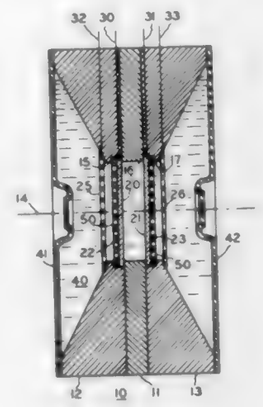
A relay flip-flop of the type wherein successive operations of an input switch cause a first relay to be operated, a second relay to be operated, the first relay to be disabled and the second relay to be disabled characterized in that operation of the relays establishes alternative holding paths for the relays through the contacts of the input switch so that later operations of the switch disable the relays by opening their holding paths.

3,374,402
DATA PRINTING APPARATUS
Roman Derc, Kidsgrove, Stoke-on-Trent, England, assignor to English Electro-Leo-Marconi Computers Limited, Kidsgrove, Stoke-on-Trent, England, a British company
Filed Oct. 7, 1964, Ser. No. 402,185
Claims priority, application Great Britain, Oct. 11, 1963, 40,191/63
17 Claims. (Cl. 317—148.5)



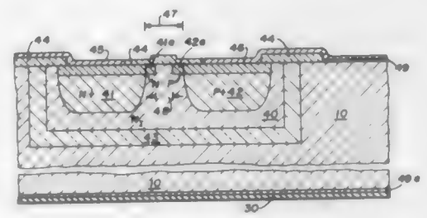
This invention relates to solenoid drive circuits for high speed printers and includes a capacitor which is connected on the one hand through a charging impedance to a power supply and on the other hand through an SCR to the solenoid. The present invention provides a charging transistor as the charging impedance. The charging transistor is controlled in cooperation with a variable bias supply whereby said charging transistor can be turned off when the voltage on the capacitor reaches an adjustable predetermined value; also said charging transistor is maintained in an off condition during discharge of the capacitor.

3,374,403
SOLION POLARIZED CATHODE ACOUSTIC LINEAR TRANSDUCER
Charles W. Larkam, Gayle E. English, Bert R. Hammer, Edwin H. Block, and Joseph L. Collins, Austin, Tex., assignors, by mesne assignments, to the United States of America as represented by the Secretary of the Navy
Filed June 30, 1965, Ser. No. 468,650
7 Claims. (Cl. 317—231)



An improved solion transducer is described having first and second spaced cathodes, first and second spaced anodes and individual flow distribution plates spaced between the cathode and anode. The entire set of plates being substantially parallel to each other and centered along a longitudinal axis of the solion housing.

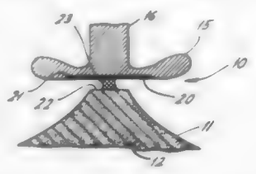
3,374,404
SURFACE-ORIENTED SEMICONDUCTOR DIODE
Gerald Luecke, Richardson, Tex., assignor to Texas Instruments Incorporated, Dallas, Tex., a corporation of Delaware
Filed Sept. 18, 1964, Ser. No. 397,479
13 Claims. (Cl. 317—234)



A surface-oriented device as a diode having anode and cathode regions formed at one surface of a high resistivity or intrinsic semiconductor substrate is included as one element of a mixer useful for microwave applications. Conductive striplines make ohmic contact with the anode and cathode regions and a ground plane is located on the back surface of the substrate.

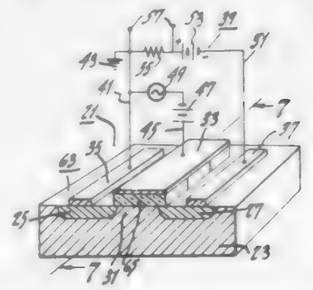
3,374,405
SEMICONDUCTIVE DEVICE AND METHOD OF FABRICATING THE SAME
Mitchell Davis, Conshohocken, and Minerva L. Sowers, West Point, Pa., assignors to Philco-Ford Corporation, a corporation of Delaware
Filed June 22, 1965, Ser. No. 466,008
13 Claims. (Cl. 317—234)

A semiconductive diode, and fabrication thereof. An etchant is applied to surface material of a semiconductor wafer, which material includes a body of semiconductor metal alloy. Thereafter, another etchant is applied which attacks only said alloy. The resultant product has a primary mesa projecting from surrounding surface portions of the wafer, and a smaller secondary mesa on the pri-



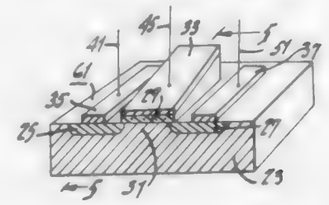
mary one. A rectifying junction is provided between the smaller mesa and the primary one.

3,374,406
INSULATED-GATE FIELD-EFFECT TRANSISTOR
John T. Wallmark, Princeton, N.J., assignor to Radio Corporation of America, a corporation of Delaware
Filed June 1, 1964, Ser. No. 371,454
10 Claims. (Cl. 317—235)



1. An insulated-gate field-effect transistor comprising a channel having a dielectric constant, a source and a drain connected to said channel and defining the ends of a plurality of current paths in said channel, a gate spaced from said channel by an insulator having a dielectric constant, one of said dielectric constants varying laterally along said gate.

3,374,407
FIELD-EFFECT TRANSISTOR WITH GATE-INSULATOR VARIATIONS TO ACHIEVE REMOTE CUTOFF CHARACTERISTIC
John A. Olmstead, Branchburg Township, Somerset County, N.J., assignor to Radio Corporation of America, a corporation of Delaware
Filed June 1, 1964, Ser. No. 371,674
11 Claims. (Cl. 317—235)



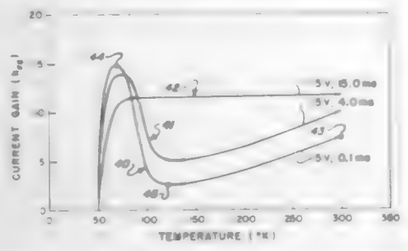
An insulated-gate field-effect transistor has a gate insulator which provides differing pinch-off voltages laterally along the gate. The transistor exhibits a remote cutoff gain characteristic.

3,374,408
TRANSISTOR HAVING CONSTANT GAIN OVER A BROAD TEMPERATURE RANGE
Howard H. Sander, Albuquerque, N. Mex., assignor, by mesne assignments, to the United States of America as represented by the United States Atomic Energy Commission
Filed May 21, 1965, Ser. No. 457,880
4 Claims. (Cl. 317—235)

1. In an amplifying circuit employing as its signal amplification means an n-p-n silicon transistor, the method of achieving substantially constant current gain over a

range of operating temperature from about 300° K. to about 76° K. consisting in the steps of:

(1) selecting as said signal amplification means a transistor of the type described whose current gain, in a non-irriadiated state, decreases with decreasing operating temperature from a high point at about 300° K. to a valley point at about 135° K., thereafter increases to a gain peak point at about 76° K. and thereafter decreases toward zero;



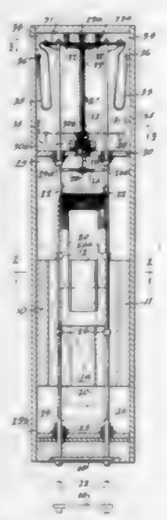
(2) irradiating said transistor to a predetermined level; and

(3) thereafter adjusting the operating collector current of said circuit until the values of current gain at said low temperature gain peak point, said valley point, and said high point are substantially equal.

3,374,409
FAST VERTICAL STROKE MOVING COIL TRANSDUCER

Andrew J. Gorka, Naperville, Ill., assignor to the United States of America as represented by the United States Atomic Energy Commission

Filed Sept. 28, 1965, Ser. No. 491,062
6 Claims. (Cl. 318—122)



6. Apparatus for periodically producing a fast vertical stroke comprising:

(a) a drive armature having a conducting wire wound into a number of rectangular loops cemented together to form a rigid structure;

(b) first and second rods supporting said drive armature on either side thereof, each rod having ball stops affixed thereto above and below said drive armature;

(c) means adapted to receive said rods for confining the motion of said rods and drive armature to a vertical plane and for engaging said ball stops to define the vertical stroke of said drive armature;

(d) a north and a south magnetic pole face located opposite one another and adapted to permit the upper and lower horizontal legs of said drive armature to move therebetween;

(e) a spiral spring resiliently holding said drive armature at the top of its stroke whereby said upper ball stops are seated against said ball-stop engaging means such that only the lower horizontal leg of said drive armature is between said magnetic pole faces;

(f) a soft iron armature;

(g) means for resiliently attaching said soft iron armature to said first and second supporting rods whereby said soft iron armature moves therewith;

(h) a fixed electromagnet located to cause a small air gap to exist between said electromagnet and a surface of said soft iron armature when said drive armature is at the bottom of its stroke;

(i) means for periodically supplying pulsed energizing current to said drive armature conducting wire; said energizing current flowing in the lower horizontal leg of said drive armature to force it downward thereby causing the upper portion of said drive armature conductor to move between said pole faces and the lower horizontal leg of said drive armature to move below said pole faces, said energizing current ending before said drive armature reaches the bottom of its stroke;

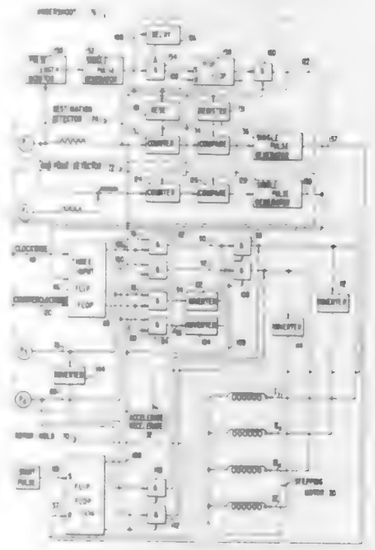
(j) current supply means for energizing said electromagnet, said electromagnet being energized before said drive armature reaches the bottom of its stroke whereby said drive armature is held at the bottom of its stroke by action of said electromagnet engaging and holding said soft iron armature thereby closing said air gap against the resilient force holding said soft iron armature, and for de-energizing said electromagnet after a predetermined time, whereby said drive armature is forced to the top of its stroke by said spiral spring; and

(k) means for supplying a second current pulse to said drive armature conducting wire responsive to the trailing edge of the pulse of said electromagnet current supply means to decelerate said drive armature before reaching the top of its stroke.

3,374,410
STEPPING MOTOR POSITIONING SYSTEM INCLUDING ACCELERATION AND DECELERATION CONTROL

Donald H. Cronquist and Joseph E. Shepard, Los Gatos, Calif., assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York

Filed Jan. 6, 1965, Ser. No. 423,671
7 Claims. (Cl. 318—138)



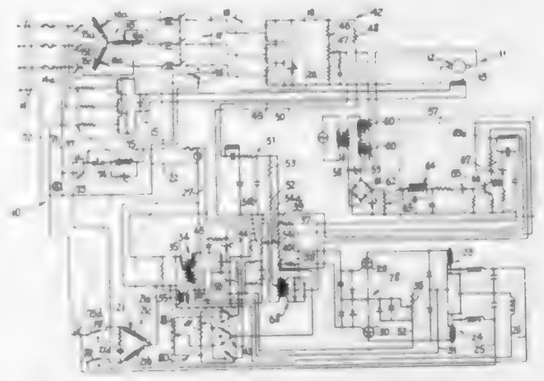
A self-regulating, high speed stepping motor where internally generated pulses, the repetition rate and duration

of which are a function of the location and velocity of the rotor, are amplified and applied to the windings so as to achieve essentially linear acceleration during a first fraction of the total distance and essentially linear deceleration during a second fraction of the total distance to be stepped.

3,374,411
DIRECT CURRENT MOTOR CONTROL

Allen R. Perrins, Cheshire, and William C. Bremner, Newington, Conn., assignors to The Superior Electric Company, Bristol, Conn., a corporation of Connecticut

Filed June 15, 1965, Ser. No. 464,008
10 Claims. (Cl. 318—331)

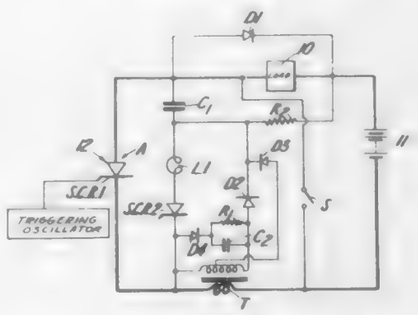


A control for adjusting and maintaining the speed of a D.C. motor by regulating the voltage to the armature by use of an adjusting means having a constant rate of adjustment and stopping said adjustment whenever the armature current exceeds a predetermined value.

3,374,412
CONTROL SYSTEM FOR REGULATING CURRENT PULSES TO BATTERY POWERED ELECTRIC MOTORS

Ivan Salisbury Payne, Basingstoke, England, assignor to Lansing Bagnall Limited, Basingstoke, England, a British company

Filed Apr. 16, 1965, Ser. No. 448,621
Claims priority, application Great Britain, Apr. 20, 1964, 16,217/64
1 Claim. (Cl. 318—341)

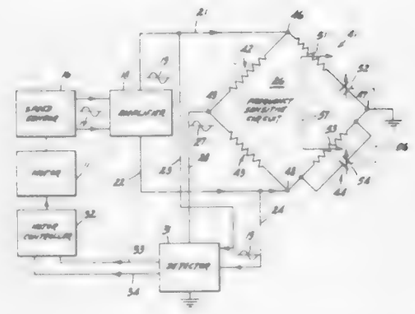


A control system for a battery powered electric motor, which system comprises a circuit containing in series the motor, a battery and a controlled rectifier, means for automatically periodically triggering the rectifier to control the supply of current to the motor in pulses, a capacitor arranged to act on the rectifier to terminate each pulse of current, a transformer having its primary connected in series in the said circuit, a subordinate rectifier circuit connecting the transformer secondary to the capacitor to charge the capacitor as the current of each pulse increases, a parallel circuit around the motor for partly charging the capacitor and containing said capacitor and a resistor and a parallel circuit shorting said controlled rectifier and said transformer primary and containing an on-off switch, the motor and the battery.

3,374,413
SYSTEM FOR MAINTAINING A MOTOR AT A PREDETERMINED SPEED

Georg Dornberger, Murray Hill, and William M. Smith, Jersey City, N.J., assignors to Western Electric Company, Incorporated, New York, N.Y., a corporation of New York

Filed May 6, 1965, Ser. No. 453,605
12 Claims. (Cl. 318—341)



The disclosure is a highly sensitive and linear operating control system for maintaining a motor constant at a prescribed speed, and involves a frequency sensitive bridge tuned to balance at a frequency indicative of the prescribed speed. An input reference signal has a frequency representing the actual motor speed and is fed to the bridge. The bridge provides an error signal representative of the difference between the actual speed and the prescribed speed. The error and reference signals are fed to a detector network. The detector converts the respective signals to digital pulses which are compared in a bistable trigger circuit. The latter provides digital correction pulses which are used to indicate the sense of the error signal deviation for regulating the motor. The detector is designed to feed correction control signals to a motor controller for returning the motor to its prescribed speed. A noise and harmonic check circuit shorts out operation of the detector in the region of bridge balance. This eliminates spurious correction control signals due to noise and harmonics.

3,374,414
POWER SUPPLY APPARATUS CONVERTING D.C. TO A STEPPED WAVE FOR APPROXIMATING A SINE WAVE

James R. Garnett, Philadelphia, Pa., assignor to the United States of America as represented by the Secretary of the Navy

Filed Mar. 25, 1964, Ser. No. 354,807
6 Claims. (Cl. 321—5)

1. A sine wave approximation power supply having a three-phase output comprising:

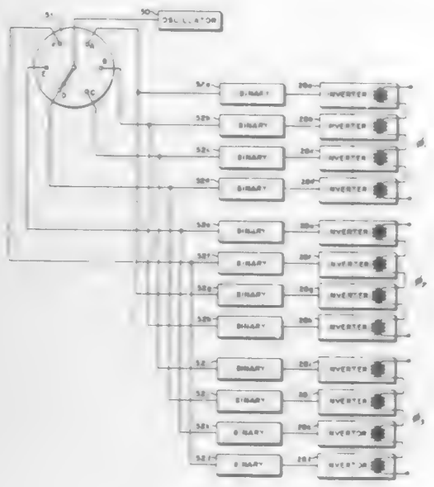
a plurality of output linked square wave power supplies divided in three groups each having a second plurality of output linked square wave power supplies, said square waves in each of said groups being successively out of phase with the other said waves in the same said group by a predetermined amount which is an integral division of 360°, each of said square wave power supplies comprising:

a pair of silicon controlled rectifiers each having a gate, an anode and a grounded cathode;

a first transformer having an input coil and an output coil, the input coil being connected across the anodes of said rectifiers;

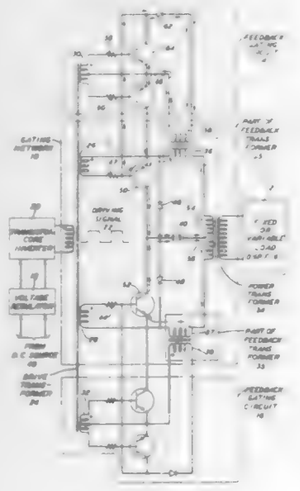
a voltage supply connected from ground to the center of said input coil; and

means to supply to the gates of said rectifiers a pair of input square waves 180° out of phase with each other of magnitude sufficient to cause conduction during one-half the cycle, each pair of input square waves being out of phase with the pairs of waves in successive square wave



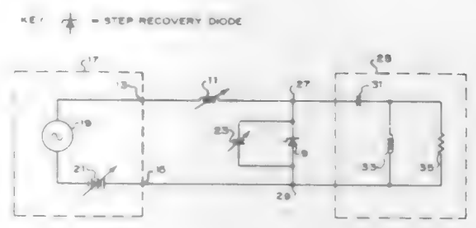
power supplies in the same said group by said predetermined amount which is an integral division of 360° and the first pair of input square waves of the first group being out of phase with the first pairs of input square waves of the second and third groups by 120° and 240°, respectively.

3,374,415
TRANSISTOR INVERTER UTILIZING POLARITY CONTROLLED CURRENT FEEDBACK
William E. Jewett, Basking Ridge, and Richard P. O'Connell, Ironia, N.J., assignors to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York
Filed Sept. 23, 1965, Ser. No. 489,485
4 Claims. (Cl. 321—18)



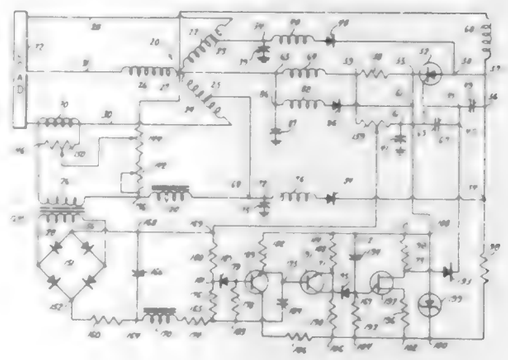
In a driven inverter which utilizes positive current feedback, a feedback gating circuit is associated with each of the switching transistors. The respective feedback gating circuits limit the application of the feedback signal to the switching transistors to that portion of the basic drive signal during which the feedback signal is in phase with the particular drive signal.

3,374,416
IMPULSE CIRCUIT INCLUDING A STEP-RECOVERY DIODE
Robert D. Hall, Los Altos, and Stewart M. Krakauer, Palo Alto, Calif., assignors to Hewlett-Packard Company, Palo Alto, Calif., a corporation of California
Filed Sept. 22, 1965, Ser. No. 489,311
4 Claims. (Cl. 321—69)



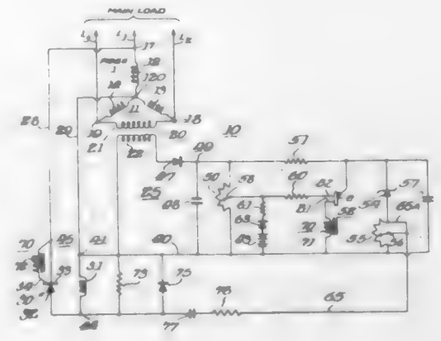
An impulse generating circuit includes a step recovery diode which produces impulses having rise and fall times which are adjustable over a wide range down to values of the order of 100 picoseconds or less. A circuit of this type in conjunction with external circuitry may be used as a harmonic generator having a conversion efficiency which closely approaches unity.

3,374,417
VOLTAGE CONTROLLING SYSTEM FOR ELECTRIC GENERATOR
David L. Trower, Affton, Mo., assignor to Century Electric Company, St. Louis, Mo., a corporation of Missouri
Filed Apr. 26, 1965, Ser. No. 450,772
18 Claims. (Cl. 322—28)



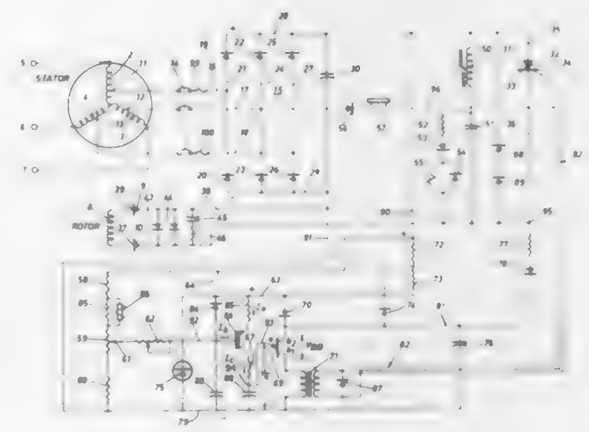
A combination exciter and regulator for an alternating current generator utilizes the residual magnetism of that generator to build up the excitation for that generator to the poin where that excitation can mainain the output voltage of that generator at the desired level; and, thereafter, that combination exciter and regulator will permit a drop in the speed of the prime mover for that generator to reduce the output voltage of that generator—and thus the load on that prime mover—so that prime mover can increase its speed to its normal value. In addition, that combination exciter and regulator has an amplifying subcircuit which enables small changes in the value of the output voltage of that generator to provide relatively large changes in the current flowing through the field winding of that generator, and thereby hold that output voltage close to its desired level.

3,374,418
ALTERNATING CURRENT VOLTAGE REGULATOR INCLUDING SYSTEM NO-LOAD TO FULL-LOAD COMPENSATING MEANS
Robert M. Henderson, Williams Bay, and Richard Zechlin, Beloit, Wis., assignors to Fairbanks Morse Inc., New York, N.Y., a corporation of Delaware
Filed May 13, 1965, Ser. No. 455,405
9 Claims. (Cl. 322—28)



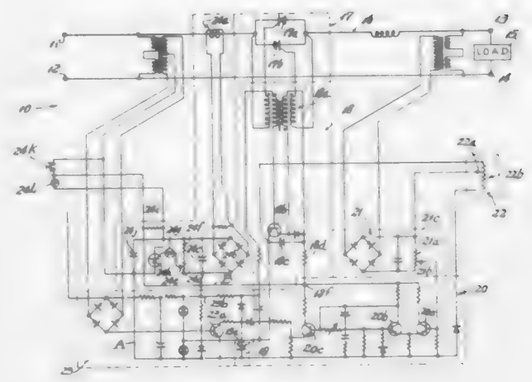
An alternating current voltage regulator is disclosed including means for adjusting for the change in output of the generating system as the system goes from no-load to a full-load condition.

3,374,419
STATIC EXCITER AND REGULATOR FOR ROTATING GENERATORS
Dennis F. Williamson, Peterborough, Ontario, Canada, assignor to Canadian General Electric Company, Limited, Toronto, County of York, Ontario, Canada, a corporation of Canada
Filed June 24, 1964, Ser. No. 377,624
3 Claims. (Cl. 322—72)



Alternating current is taken from a convenient source such as taps on the armature windings or auxiliary armature windings of an alternating-current generator. The alternating current is converted to direct current by means of rectifiers and excites the field of the generator. A controlled unidirectional current conducting device such as a silicon-controlled rectifier (SCR) having an anode, a cathode and a gating electrode is used to control the flow of direct current from the rectifier to the field coils of the generator, the anode and cathode being connected in series with the field coils. A voltage comparator compares the output voltage of the generator with a reference voltage to obtain a control signal which is inversely proportional to the deviation of the output voltage from the reference voltage. The device is rendered conductive by applying to the gating electrode firing pulses which have a frequency proportional to the magnitude of the control signal, and conduction is terminated at a fixed time after each initiation of conduction by a quenching pulse derived from a commutating circuit and applied to the anode and cathode of the device in opposition to the voltage causing the device to conduct. The firing and commutating circuits are designed such that each pulse from the firing circuit turns the device on and each successive pulse from the commutating circuit turns the device off. The current flowing from the rectifiers to the field coils will be a high-frequency unidirectional pulsating current which the time duration of the pulses will be fixed, but the frequency of the pulses will vary with fluctuations in output voltage of the generator, the variations being such as to restore the generator voltage to a level determined by the reference voltage. Since the field coils constitute an inductive load, a flywheel arrangement of rectifiers may be employed to utilize energy stored in the inductive load to smooth out the pulsating current into a steady state current of a value which will maintain the generator voltage substantially constant. The system incorporates a lockout circuit for synchronizing the firing pulses with the quenching pulses and a recovery circuit for restoring control over the generator by the control system should this control be lost due to abnormal conditions.

3,374,420
POWER CONTROL DEVICE HAVING AN OVERLOAD CURRENT CIRCUIT
John P. Weber, Jr., West Hartford, Conn., assignor to The Superior Electric Company, Bristol, Conn., a corporation of Connecticut
Filed Oct. 6, 1964, Ser. No. 401,841
8 Claims. (Cl. 323—9)

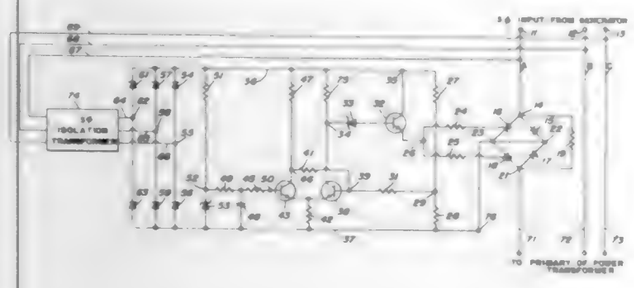


A power control unit for regulating power to a load by adjusting the conduction of SCR's including a circuit for sensing the occurrence of a relatively sustained overload value of current and preventing the application of triggering pulses to the SCR's until the circuit is reset.

3,374,421
TRANSIENT LIMITING CURRENT
John F. Ringelman, Glen Burnie, Md., assignor, by mesne assignments, to the United States of America as represented by the Secretary of the Navy
Filed Dec. 2, 1964, Ser. No. 415,520
11 Claims. (Cl. 323—22)

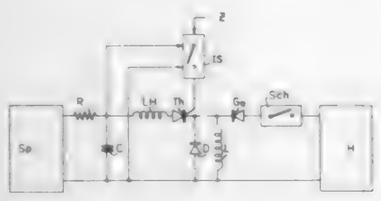
A circuit for protecting an A.C. power supply circuit from transients having a network containing SCR's and diodes and a transistor network coupled to the control electrodes of the SCR's. A Zener diode is coupled between the base of the transistor and a differential amplifier cir-

cuit which is responsive to a voltage control network which is coupled to a diode rectifier circuit which is responsive to the output of the A.C. circuit to enable the



differential amplifier circuit to control the Zener diode to activate the transistor to enable the SCR's to conduct under normal operating conditions and to impede current when excessive voltage appears on the A.C. circuit.

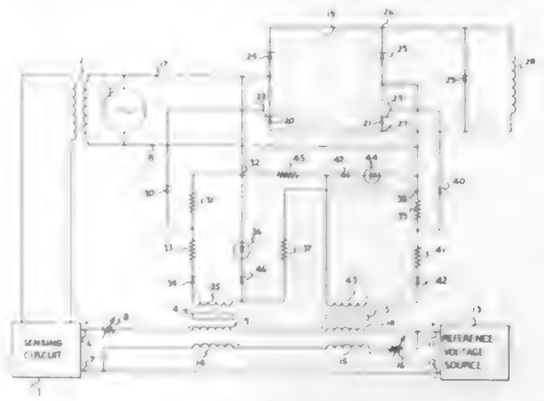
3,374,422
THYRISTOR SWITCHING AMPLIFIERS FOR RAPIDLY SWITCHING-ON INDUCTIVE LOADS
Peter Blume, Hamburg-Lurup, Germany, assignor to North American Philips Company, Inc., New York, N.Y., a corporation of Delaware
Filed Mar. 12, 1965, Ser. No. 439,362
Claims priority, application Germany, Mar. 14, 1964, P 33,840
3 Claims. (Cl. 323—22)



A switching circuit for an inductive load is provided with a voltage source having an RC circuit connected in series with an auxiliary inductor and a thyristor, and a diode connected in parallel with the inductive load. The gating circuit is responsive to the instantaneous voltage across the capactitive element of the RC circuit to gate a pulse triggering the thyristor into conduction, and the capacitor voltage of the RC circuit thereby controls the extinguishing of the thyristor through the action of the auxiliary inductor.

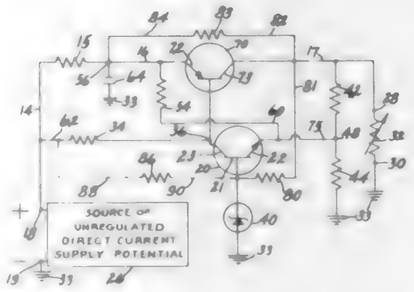
3,374,423
SCR POWER SUPPLY REGULATOR TRIGGERED BY MAGNETIC AMPLIFIERS
Stuart F. Hemmenway, Scotia, N.Y., assignor to General Electric Company, a corporation of New York
Filed May 3, 1965, Ser. No. 452,734
2 Claims. (Cl. 323—22)

A regulating circuit has a magnetic amplifier for each silicon-controlled rectifier and a regulated, half-wave voltage supply for each magnetic amplifier. The regulated voltage supply includes a zener diode having the anode thereof connected to the cathode of each silicon-controlled rectifier. Circuit means interconnect the gate winding of the magnetic amplifier and the regulated voltage supply with the gate circuit of the silicon-controlled rectifier to control the current flow through the silicon-controlled rectifier. Thus, when the silicon-controlled rectifier is forward-biased by the A-C supply and the magnetic amplifier saturates, gate current flows through the gate circuit of the silicon-controlled rectifier to fire it and energize the load. The use of the individual half-wave voltage sources with zener diodes obviates expensive



voltage isolation devices and by selecting the magnitude of voltage of the half-wave voltage source to be much less than the magnitude of average voltage of the A-C source, the gate circuit is made substantially independent of undesirable transient fluctuations in the magnitude of A-C source voltage.

3,374,424
SERIES TYPE POTENTIAL REGULATOR
Eldred H. Wiechmann, Kokomo, Ind., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed May 17, 1965, Ser. No. 456,190
2 Claims. (Cl. 323—22)



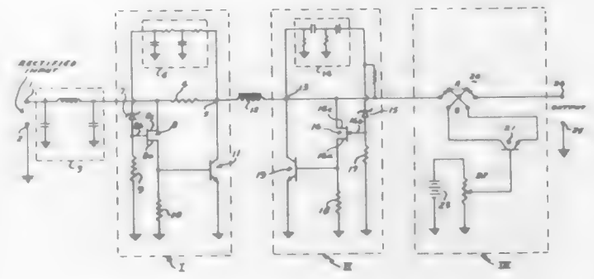
A series type potential regulator wherein the current carrying electrodes of a regulating transistor are connected in series with a source of unregulated direct current potential and an external electrical load. The magnitude of base bias potential for the regulating transistor is controlled by the degree of conduction of a control transistor connected in the circuit in such a manner that the conduction therethrough is determined by the magnitude of the regulated potential.

3,374,425
CASCADED POWER SUPPLY FOR PRODUCING A CLEAN D-C OUTPUT
Irving F. Barditch and Charles G. Brooks Baltimore, Md., assignors, by mesne assignments, to the United States of America as represented by the Secretary of the Air Force
Filed May 19, 1966, Ser. No. 551,866
3 Claims. (Cl. 323—22)

1. A voltage regulating circuit for connection between the output of an alternating current rectifier and a load, said circuit comprising:

(a) three cascaded sections with a series inductor connected between the first and second sections, counting from the rectifier end of the circuit;

(1) said first section comprising
  (a) a series fixed resistance element,
  (b) a shunt variable resistance element located at the load end of said series resistance element, and
  (c) means sensing the voltage across said shunt resistance element and responsive to changes in said voltage at the ripple frequency of said rectifier and below for producing conversely related changes in the resistance of said shunt element;

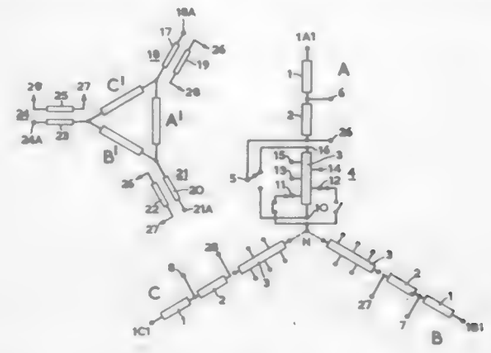


(2) said second section comprising
  (a) a second shunt variable resistance element, and
  (b) means sensing the voltage across said second shunt resistance element and responsive to changes in said voltage at frequencies above said ripple frequency for producing inversely related changes in the resistance of said second shunt element; and

(3) said third section comprising
  (a) a transistor,
  (b) a two-position switching means operative in one position to connect the collector-emitter path of said transistor serially in said circuit for load current conduction in the forward direction of the emitter-base junction and in the other position for conduction in the back direction of the emitter-base junction, and
  (c) means for applying an adjustable direct reference voltage to the base of said transistor.

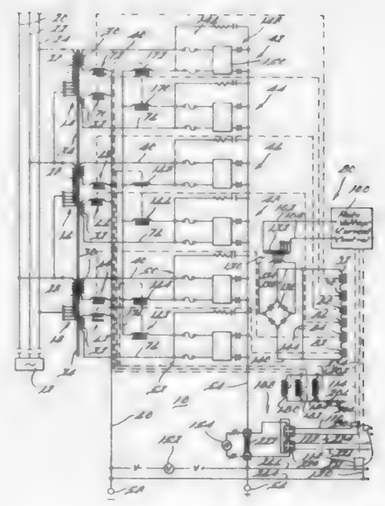
3,374,426
VOLTAGE REGULATED POLYPHASE AUTO TRANSFORMER
Fahir Bedil, Stafford, England, assignor to The English Electric Company Limited, London, England, a British company
Filed Dec. 8, 1965, Ser. No. 512,409
Claims priority, application Great Britain, Dec. 23, 1964, 52,291/64
5 Claims. (Cl. 323—45)

1. In a three phase electrical auto-transformer, three main windings and an auxiliary three phase delta connected winding, each main winding comprising first, second and third winding portions with the second and third portions connected in series, each first winding portion having tapping points thereon, a first terminal connection connected to the outermost end of each third winding portion, a second terminal connection connected between the junction of each second and third winding portion, a third terminal connection connected to the innermost end of each second winding portion, tapchanging means associated with the tapping points of each first winding portion and each third terminal connection and serving to connect the three main windings to a common star point and to raise or lower the output voltage from those terminal connections serving as output terminals of the transformer, additional transformer means having first, second and third primary windings and associated first, second and third secondary windings, one end of each such secondary winding being connected to a respective junction point of the windings of said delta winding, the primary windings of the additional transformer means being connected across respective pairs of said third terminal connections so that the secondary windings of the



additional transformer means inject onto the output of the delta connected winding voltages which are of a magnitude and sense dependent upon the settings of the tapchanging means and which are 180° out of phase with the voltages delivered by the delta winding proper when the tapchanging means are operated in a sense to lower the output voltage at those terminal connections serving as output terminals of the transformer, and which are in phase with the voltages delivered by the delta winding proper when the tapchanging means are operated in a sense to raise the said output voltages.

3,374,427
MAGNETIC AMPLIFIER VOLTAGE REGULATOR WITH PRELOAD SYSTEM
Charles E. Fenoglio, Detroit, and Michael A. Koltuniak, Warren, Mich., assignors to The Udylite Corporation, Warren, Mich., a corporation of Delaware
Filed Mar. 4, 1966, Ser. No. 531,857
10 Claims. (Cl. 323—89)



1. In a reactor controlled power supply circuit having output terminals and a load, a source of alternating current, a power transformer having a primary winding connected to the source of alternating current and a secondary winding, a control saturable reactor including a controlled winding connected to said secondary winding, and a shunt saturable reactor for loading said control saturable reactor when the load across said output ter-

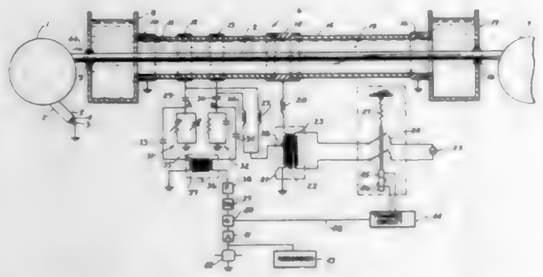
minals is minimized, said shunt reactor having a controlled winding shunting said output terminals and a controlling winding responsive to electrical condition in the controlled winding of said control saturable reactor to preload said control reactor upon the occurrence of a relatively small load across said terminals.

3,374,428

APPARATUS FOR DETECTING AND RECORDING CORONA DISCHARGE IN A MOVING INSULATED POWER CABLE HAVING A SEMICONDUCTING INSULATION SHIELD

George S. Eager, Jr., Upper Montclair, and George Bader, Metuchen, N.J., assignors to General Cable Corporation, New York, N.Y., a corporation of New Jersey

Filed Sept. 20, 1966, Ser. No. 580,799
5 Claims. (Cl. 324—54)



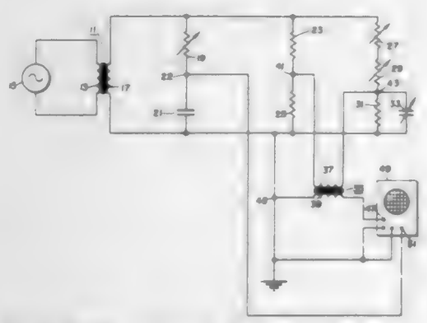
Apparatus for detecting and recording corona discharges generated within the insulation of an insulated power cable having a semiconducting insulation shield as the cable moves continuously through a liquid-filled test bushing having a plurality of spaced electrodes in contact with the liquid. This is an extension of the invention disclosed in applicants' Patent No. 3,346,809, which discloses apparatus for continuously measuring ionization inception voltage and ionization extinction voltage in an unshielded insulated conductor. In the present invention the high voltage source is applied to the cable under test for a short time, followed by a longer interval during which no voltage is applied, in order to permit dissipation of heat developed by current flow in the insulation shield. False indications which might result from switching surges are prevented by synchronously gating the passage of the detector signal to the recorder with the opening and closing of the switch which controls application of the high voltage.

3,374,429

BRIDGE CIRCUIT FOR DETERMINING THE THERMAL PARAMETERS OF BRIDGEWIRES USED IN ELECTRO-EXPLOSIVE DEVICES

Louis A. Rosenthal, Highland Park, N.J., assignor to the United States of America as represented by the Secretary of the Navy

Filed May 15, 1964, Ser. No. 367,903
6 Claims. (Cl. 324—57)



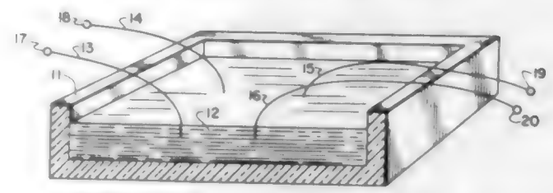
An A.C. bridge circuit for determining the thermal parameters of bridgewires used in electro-explosive devices. When an A.C. supply voltage is applied to the bridge network in which a bridgewire of an electro-explosive device is connected as a leg thereof, an A.C. voltage having three times the supply voltage will appear across the bridgewire which has an amplitude and phase relationship which are indicative of the thermal parameters of the bridgewire.

3,374,430

ELECTRICAL RESISTANCE STANDARD HAVING AN OUTPUT VOLTAGE REPRESENTATIVE OF APPLIED FREQUENCY, AND OF RESISTIVITY AND PERMEABILITY OF A CONDUCTING MEDIUM

Tenny D. Lode, Madison, Wis., assignor to Rosemount Engineering Company, Minneapolis, Minn., a corporation of Minnesota

Filed Jan. 14, 1965, Ser. No. 425,420
7 Claims. (Cl. 324—64)



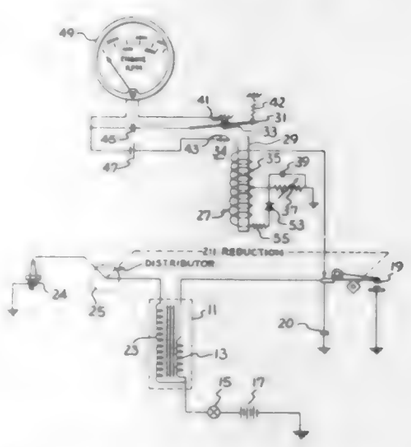
1. The method of establishing a voltage representative of a standard value of frequency and representative of the resistivity and permeability of a conducting body comprising the steps of: making four spaced electrical connections, each connection being made directly to a surface of a conducting body having a known value of the product of resistivity and permeability and each connection being made to the surface at a location spaced from the other connections in a known surface spacing relation; applying an alternating current through two of said spaced connections, said alternating current having a precisely known frequency of sufficiently high rate such that the electromagnetic skin depth in said conducting body is small compared to the spacing between any two of said connections; and connecting the other two spaced electrical connections to voltage measurement means; whereby said voltage is substantially proportional to the square root of the product of resistivity, permeability, and frequency.

3,374,431

RELAY TYPE IGNITION ENGINE TACHOMETER WITH CIRCUITRY FOR CANCELLING TRANSIENT COIL CURRENTS

Vernon C. Westberg, Arlington Heights, Ill.
(22 S. State St., Elgin, Ill. 60120)

Filed Aug. 27, 1965, Ser. No. 483,065
3 Claims. (Cl. 324—70)



A relay type ignition tachometer having, in addition to a first relay winding used to commutate a storage ca-

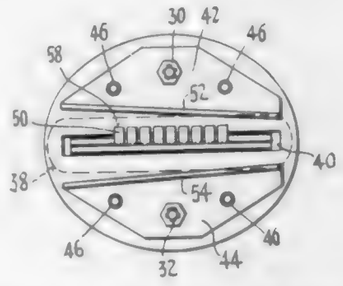
pacitor between a meter and a charging source (or a discharging path), an auxiliary winding for suppressing the effect of spark induced current in the first winding upon relay operation.

3,374,432

ELECTRIC FREQUENCY RESPONSIVE DEVICE

William J. Fitzgerald, West Haven, and Raoul A. Forest, Jr., and Carl J. Iaccarino, New Haven, Conn., assignors to J-B-T Instruments, Inc., New Haven, Conn., a corporation of Connecticut

Filed Jan. 24, 1966, Ser. No. 522,501
7 Claims. (Cl. 324—80)



1. An electric frequency responsive device comprising, in combination:

(a) a plurality of juxtaposed magnetic members having different resonant frequencies,

(b) a winding disposed adjacent said members, to influence the same with a common magnetic flux when the winding carries current, and

(c) means including a magnetic field structure having pole pieces adjacent said members, for influencing the members with magnetic flux,

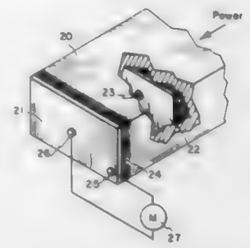
(d) said means providing a lesser flux density at a member having a lower resonant frequency than at a member of higher resonant frequency, thereby to render more uniform the response of the members to flux from said winding.

3,374,433

MICROWAVE POWER DETECTOR UTILIZING DIFFUSION OF HOT CARRIERS IN A SEMICONDUCTOR

Richard I. Harrison, Jericho, and Joseph Zucker, Queens, N.Y., assignors to General Telephone and Electronic Laboratories, Inc., a corporation of Delaware

Filed May 20, 1964, Ser. No. 368,879
9 Claims. (Cl. 324—106)



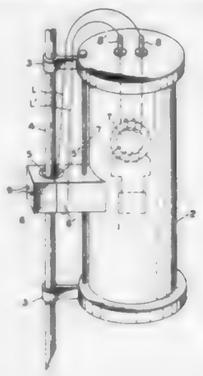
A microwave cavity power detector is described in which one wall of the cavity is formed of semiconductor material having a low carrier concentration. The currents induced in the semiconductor wall form a standing wave pattern having maximum and minimum values. By locating contacts at the locations of both the maxima and minima, the diffusion of hot carriers in the wall results in a voltage between contacts which is a function of the power in the cavity.

3,374,434

INDUCTIVE COUPLING APPARATUS FOR USE IN COUPLING TO UNDERWATER ELECTRIC SYSTEMS AND THE LIKE

Kenneth E. Perry, Wayland, Mass., assignor to Geodyne Corporation, Waltham, Mass., a corporation of Massachusetts

Filed Sept. 9, 1965, Ser. No. 486,112
6 Claims. (Cl. 324—127)



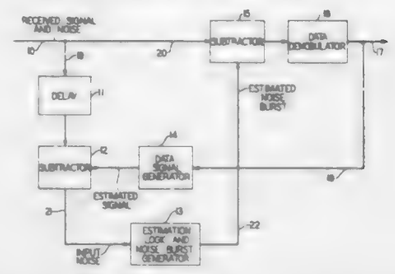
In an apparatus for inductively coupling a multiterminal electric system, disposed in a water-tight housing, to an underwater conductive-cable transmission line for the electric system, from which cable the housing is mechanically supported in the water, electrical connection between the electric system and the cable is established by means of a conductive loop that is connected between two terminals of the electric system, the cable and the loop being supported in an annulus that is formed by a two-part magnetic core one of the parts of which is mechanically supported by the housing and the other part of which is detachably secured to the said one part for the purpose of facilitating detachably mounting the cable and the loop in the annulus, the cable and the loop, however, being out of electrical contact with the core.

3,374,435

REDUCTION OF THE EFFECT OF IMPULSE NOISE BURSTS

Joel S. Engel, Bethesda, Md., assignor to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York

Filed July 29, 1965, Ser. No. 475,703
11 Claims. (Cl. 325—324)



8. In combination with a data transmission system subject to impulse noise, means for reducing the effect of such impulse noise on a received data signal comprising

means for regenerating the transmitted data signal waveshape for each individual demodulated data bit,

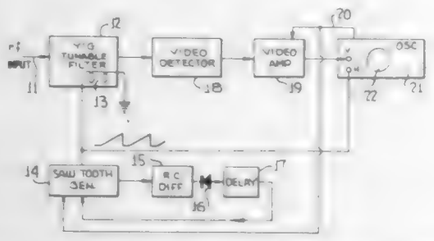
means subtracting each regenerated data bit from the total received signal to obtain an estimate of the noise added by said transmission system,

means responsive to the noise from said subtracting means exceeding a predetermined minimum level for generating an estimated noise burst locked in phase and time of occurrence with the onset only of a true noise burst, and

means taking the difference between said estimated noise

burst and the total received signal to obtain a received data signal substantially free of impulse noise.

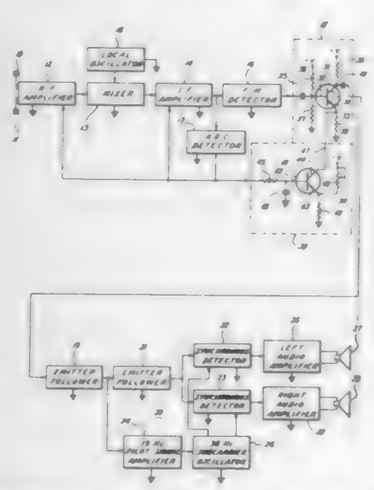
3,374,436
SPECTRUM ANALYZER INCLUDING A TUNED BAND-PASS FILTER
George H. Thiess, Dallas, Tex., assignor, by mesne assignments, to Melpar, Inc., Falls Church, Va., a corporation of Delaware
Filed Mar. 9, 1965, Ser. No. 438,340
14 Claims. (Cl. 325—336)



1. A scanning spectrum analyzer for deriving information indicative of the frequency components of an R.F. signal over a predetermined relatively wide frequency band, a tunable band-pass filter responsive to said R.F. signal, said filter including a crystal having molecules with magnetic moments precessed at a rate determined by a magnetic field applied thereto, means for applying a time variable magnetic field to said crystal to scan the center frequency of said filter through said frequency band, and detector means responsive to the R.F. signal deriving from said filter for providing a D.C. signal level indicative of the R.F. components passed through said filter.

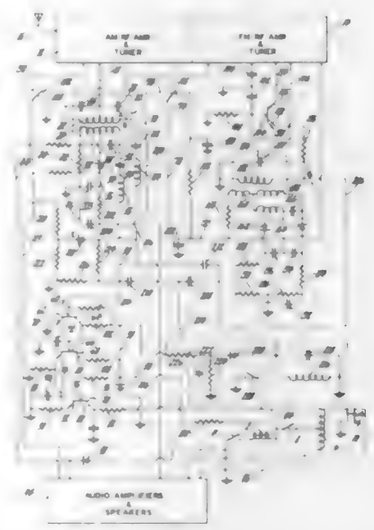
12. A filter comprising a ferrimagnetic crystal having molecules with magnetic moments precessed at a rate determined by a magnetic field applied thereto, a permanent magnet having an air gap for providing said magnetic field, said crystal being disposed in said air gap, a pair of loops disposed in orthogonal planes to each other being coupled about said crystal and having associated magnetic fields extending in a plane orthogonal to the plane of said magnetic field of said permanent magnet.

3,374,437
SQUELCH SYSTEM FOR RADIO RECEIVERS
Carl F. Heald, St. Joseph, Mich., assignor to Heath Company, St. Joseph, Mich., a corporation of Delaware
Filed Aug. 26, 1964, Ser. No. 392,159
3 Claims. (Cl. 325—478)



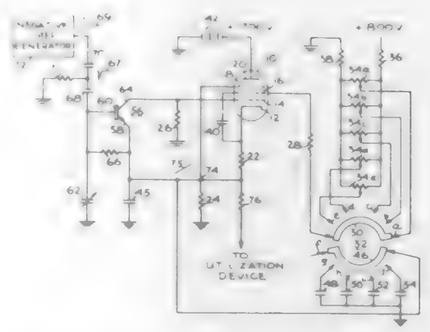
A squelch system for use in radio receivers. A squelch control transistor 41 is responsive to the receiver AGC voltage and acts to cut off a signal amplifier transistor 31 whenever the received radio signal carrier level falls below a preset value.

3,374,438
STOP-ON SIGNAL TUNER FOR COMBINED AM-FM RECEIVERS
Ervin R. Buehler, Galveston, Ind., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Sept. 17, 1964, Ser. No. 397,147
7 Claims. (Cl. 325—470)



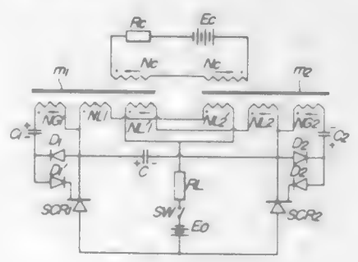
A stop-on station system for combined AM-FM receivers having signal seeking tuners. Signal to stop indexing is modified by a delay signal to continue indexing to middle of incoming signal band. Signal transfer circuit of system is detuned by a capacitive diode during standby to prevent distortion.

3,374,439
POSITIVE RAMP VOLTAGE GENERATOR
John J. Hickey, Hawthorne, Calif., assignor to TRW Inc., a corporation of Ohio
Continuation of application Ser. No. 316,909, Oct. 17, 1963. This application Apr. 22, 1966, Ser. No. 544,630
8 Claims. (Cl. 328—183)



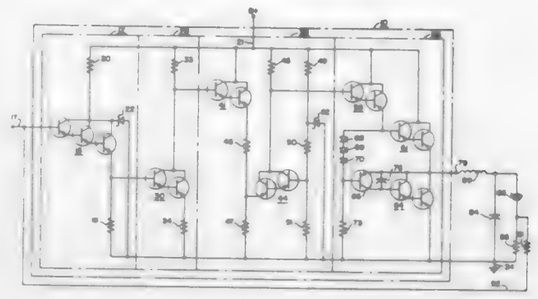
1. A ramp voltage generator circuit, comprising:
a vacuum tube including cathode, control grid and anode electrodes and having a constant current characteristic over a wide range of changing anode to cathode voltage;
means for establishing initial operating potentials on said electrodes such that said control grid is negatively biased a first amount relative to said cathode and said anode is positive relative to said cathode;
load capacitance means connected in series with said tube;
means in circuit between said control grid and said cathode for abruptly reducing by external trigger the negative bias below said first amount to establish a second potential difference between said control grid and said cathode so as to increase the current flow through said tube and charge said load capacitance means;
means for maintaining constant said second potential difference between said control grid and said cathode for the duration of the desired ramp voltage, thereby to establish constant current flow through said tube and produce a linear ramp voltage across said load capacitance means;
and means for terminating the operation of said generator circuit after generation of a single ramp voltage to cause the generator circuit to reset itself for the reception of the next trigger.

3,374,440
MAGNETIC AMPLIFIER CONTROLLED POWER CIRCUIT OPERATIVE WITH D.C. ELECTRIC SOURCE
Yoshinori Kawai, Katsuta-shi, Hisakatsu Kiwaki, Mitoshi, and Hiroshi Sato, Katsuta-shi, Japan, assignors to Hitachi, Ltd., Tokyo, Japan, a corporation of Japan
Filed Nov. 25, 1963, Ser. No. 325,827
Claims priority, application Japan, Nov. 24, 1962, 37/52,932
10 Claims. (Cl. 330—8)



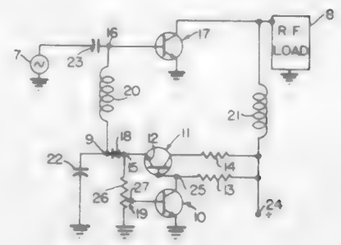
A magnetic amplifier controlled power circuit operable from a D.C. source for feeding a load with proportionally controlled current. The power circuit is comprised by a pair of saturable magnetic cores having a control winding wound on and extending over the pair of cores and a pair of output windings each respectively wound on one of the pair of cores. A pair of semiconductor switching elements are provided each having two load electrodes and a control electrode, respectively. The load electrodes of each of the semiconductor switching elements are connected in series with respective output windings, and a direct current electrical source and a load are connected in common with each of the series connected semiconductor switching elements and its series connected output winding. Turn on circuits are connected to the control electrodes of each of the switching semiconductor devices and to respective ones of the saturable cores for turning on the semiconductor switching elements in response to the saturation condition of the cores. As a consequence of this arrangement, the semiconductor switching elements are rendered conductive and non-conductive alternately in accordance with the saturation and non-saturation of the pair of magnetizable cores. The circuit is completed by means for applying a variable magnitude direct current control signal to the control winding to control the frequency of turn-on and turn-off of the circuit to thereby proportionally control the pulsating power output from the amplifier.

3,374,441
DIRECT COUPLED, TEMPERATURE STABILIZED AUDIO AMPLIFIER
Edmund A. Karcher, Severna Park, Md., assignor to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Nov. 2, 1964, Ser. No. 408,052
5 Claims. (Cl. 330—30)



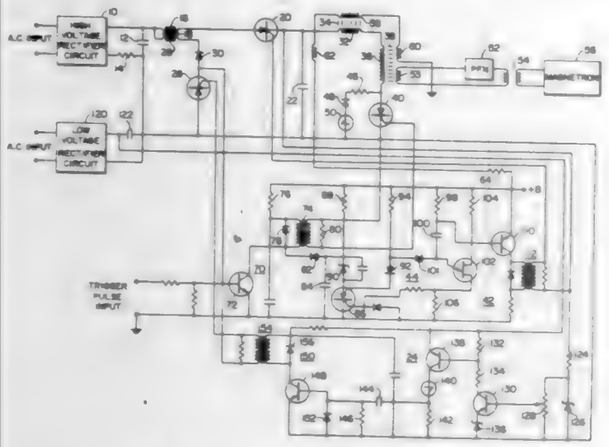
An amplifier circuit having a plurality of direct coupled transistor stages including an output stage having an output terminal. A speaker has one end connected to the output terminal and another end connected to a capacitor, the other end of which is connected to ground. In parallel with the capacitor is the serial connection of a Zener diode and resistor. The signal appearing at the output terminal is comprised of an AC component and a DC component. The DC component of the output signal appears across the capacitor and any changes in the DC level shows up entirely across the resistor of the Zener diode-resistor combination. This change in voltage is fed back to the input stage thus providing a stabilized amplifier system.

3,374,442
BIAS CONTROL CIRCUIT
Noel J. Griffin, Cincinnati, Ohio, assignor to Avco Corporation, Cincinnati, Ohio, a corporation of Delaware
Filed Sept. 30, 1965, Ser. No. 491,651
2 Claims. (Cl. 330—40)



Linear operation of a common emitter transistorized radio frequency power amplifier is provided by this invention. An R.F. source is capacitively coupled to the base of the amplifier. The forward bias network for that base comprises a series combination of choke, diode and a resistor having a variable tap output. A constant voltage regulator device comprising a pair of transistors is coupled to this variable tap output and to the anode of the diode in such a manner as to provide a stable positive voltage at the reference point established by that anode. The apparent input D.C. resistance of the power transistor decreases as its collector current is increased by R.F. excitation. Changes in voltage across the diode are opposite to the changes across the input base-emitter junction of the power transistor and the constant voltage available at the reference point is distributed between the diode and this junction.

3,374,443
PULSE GENERATOR FOR MODULATING A MAGNETRON
Reinhold Braun and John B. Porter, San Diego, Calif., assignors to General Dynamics Corporation, a corporation of Delaware
Continuation of application Ser. No. 490,289, Sept. 27, 1965. This application Aug. 24, 1967, Ser. No. 663,166
4 Claims. (Cl. 331—87)

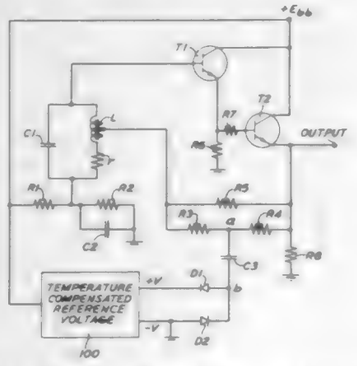


A system for developing pulses of a controlled energy content including a charge storage capacitor and means for controlling the charge applied on the capacitor and a discharge circuit which when coupled to the capacitor by means of an electronic switch develops an output pulse of a controlled energy content.

3,374,444
VACANCY COMPENSATED CALCIUM NEODYMIUM VANADATE PHOSPHORS
Lothar H. Brixner, Brandywine Hills, Pa., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Filed Oct. 21, 1964, Ser. No. 405,521
6 Claims. (Cl. 331—94.5)

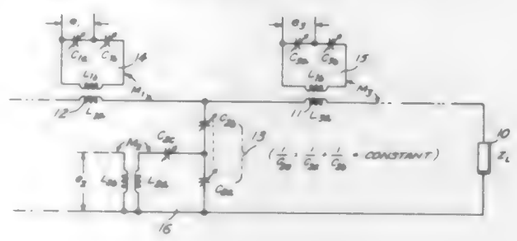
Luminescent compositions, useful as laser components, are crystalline, single-phase solid solutions of neodymium-substituted, vacancy-compensated calcium vanadates of the formula $Ca_{3-3x}Nd_{2x}\Phi_x(VO_4)_2$ where Φ represents the vacancy in the crystal lattice and x has a value of 0.01 to 0.3.

3,374,445
LOW DISTORTION OSCILLATOR USING DUAL FEEDBACK PATHS AND SYMMETRICAL CLIPPING
Wilmer B. Gaunt, Jr., New Shrewsbury, N.J., assignor to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York
Filed Apr. 28, 1966, Ser. No. 545,911
10 Claims. (Cl. 331—109)



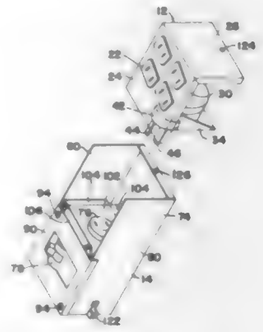
An oscillator is disclosed which achieves low harmonic distortion and improved amplitude and frequency stability by use of two positive-feedback paths and a symmetrical clipping network carefully connected to a selected point on one of the feedback paths.

3,374,446
MULTICOUPLING SYSTEM WITH A DISTRIBUTION LINE
Sam E. Parker, San Diego, Calif., assignor to the United States of America as represented by the Secretary of the Navy
Filed Dec. 29, 1964, Ser. No. 422,093
3 Claims. (Cl. 333—8)



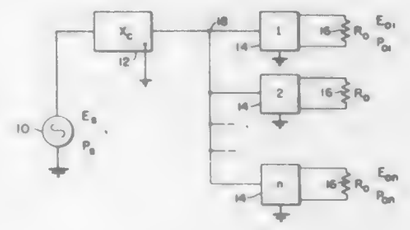
Many transmitters and receivers must be coupled to a single antenna as, for example, aboard a battleship where space is limited. The classic ladder network with parallel and shunt arms are connected at one end to the antenna. The impedances of the L and C elements of the ladder are selected so that the characteristic impedance of the ladder matches the impedance of the load. The transmitters and receivers are then coupled into the impedances elements in either the parallel or shunt arms without upsetting the match and with zero on minimum coupling between the transmitters and receivers.

3,374,447
PLUGGABLE FILTER ASSEMBLY FOR USE IN ELECTRONIC DISTRIBUTION SYSTEM
James Stilwell, Maple Glen, Pa., assignor to Telesystems Corporation, Glenside, Pa., a corporation of Pennsylvania
Filed Aug. 12, 1964, Ser. No. 389,105
8 Claims. (Cl. 333—70)



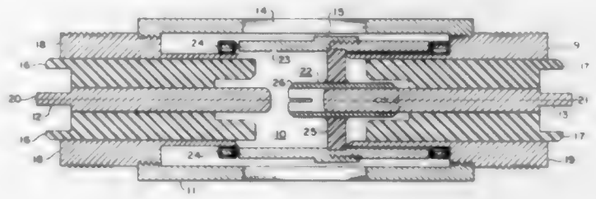
1. A pluggable filter assembly for use in electronic distribution systems in connection with antennae signals comprising an upper pluggable filter component contained in a filter housing and a lower receptacle circuit breaker component contained in a receptacle housing, said filter component including a filter assembly and a male plug depending therefrom, said circuit breaker component having a main receptacle associated therewith and adapted to receive said plug said filter housing having a front wall, said receptacle housing having elongated panels defining a space for removably receiving said filter component when said male plug is received in said main receptacle whereby when said filter component is rendered inoperative, it may be replaced by simply unplugging from said circuit breaker component and plugging in of a new filter component.

3,374,448
HIGH EFFICIENCY CONTIGUOUS COMB FILTER
Carl R. Hurtig, Greenbush, Mass., assignor to Damon Engineering, Inc., Needham Heights, Mass., a corporation of Delaware
Filed May 25, 1964, Ser. No. 369,772
8 Claims. (Cl. 333—72)



A comb filter employing a number of individual filters connected in parallel, the pass band of each of the filters being for contiguous portions of the frequency spectrum. The filters are singly terminated and are connected directly to the voltage source.

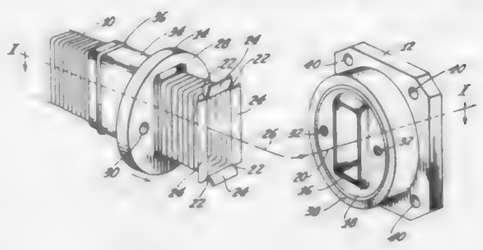
3,374,449
COAXIAL SWITCH
Robert E. Moore and Harold A. Brown, San Diego, Calif., assignors to General Dynamics Corporation, San Diego, Calif., a corporation of Delaware
Filed Mar. 21, 1966, Ser. No. 536,095
9 Claims. (Cl. 333—97)



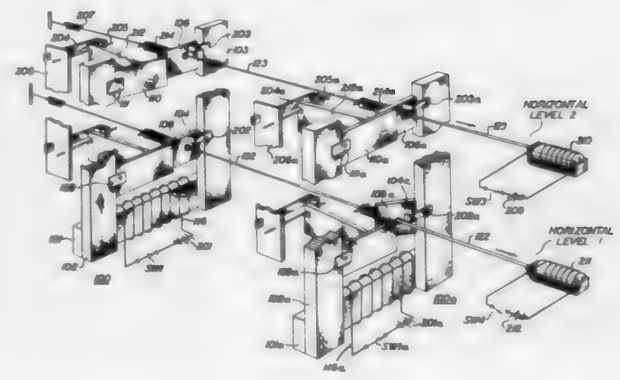
1. A switch comprising:
(a) two coaxial transmission lines having outer conductors joined in a continuous connection and having inner conductors terminated in spaced relationship,
(b) a connector means having an outer conductor slidably arranged on said joined outer conductors and a hollow inner conductor,
(c) said hollow inner conductor attached to said slidable outer conductor by a non-conducting means, and
(d) said hollow inner conductor slidable positioned on one of said inner conductors and adapted to contact said other inner conductor by actuating said connector means.

3,374,450
WAVEGUIDE FLANGE AND COUPLING ASSEMBLY
Robert F. Stewart, Convent Station, N.J., assignor to Litton Precision Products, Inc., Morris Plains, N.J., a corporation of Delaware
Filed Nov. 17, 1965, Ser. No. 509,682
8 Claims. (Cl. 333—98)

1. A waveguide assembly comprising, in combination, a section of rectangular waveguide; a flange member; and a collar member for securing said waveguide to said flange member, said flange member including a first substantially rectangular opening having predetermined dimensions relative to the internal dimensions of said waveguide and also including a shoulder member surrounding said first rectangular opening, said shoulder member having a male clamping surface which makes a predetermined acute angle with the axis of said first rectangular opening; said rectangular waveguide having its corners cut a predetermined distance at one end thereof and having its side walls folded back at said cut to said predetermined acute angle with respect to the axis of said rectangular waveguide; said collar member including a second substantially rectangular opening having predetermined dimensions relative to the external dimensions of said waveguide and also including a female clamping surface being at said predetermined acute angle with respect to the axis of said second rectangular opening; said flange member, rectangular waveguide and collar member being assembled such that their axes are aligned, said collar member is positioned around said rectangular waveguide and the folded portion of said side walls of said rectangular waveguide are positioned between said male and female clamping surfaces; and means securing said collar member to said flange member whereby the folded portion of said walls are clamped between said male and female clamping surfaces.



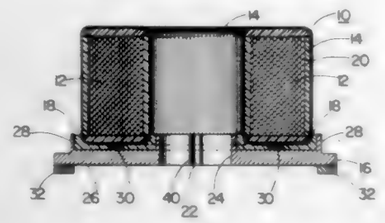
3,374,451
COORDINATE TYPE CROSSBAR SWITCH UTILIZING VARIABLE RELUCTANCE
John W. Barker, Jr., Blacklick, Ohio, assignor to Bell Telephone Laboratories, Incorporated, Berkeley Heights, N.J., a corporation of New York
Filed Oct. 5, 1966, Ser. No. 584,476
12 Claims. (Cl. 335—112)



1. A coordinate switch system comprising, in combination, a plurality of crosspoints each including respective first and second armatures, first means responsive to a horizontal selector current for pivoting a selected group of said first armatures into a closed position, thereby reducing the magnetic reluctance in the airgaps at corresponding ones of said crosspoints, second means responsive to a vertical selector current for applying magnetic flux across a selected group of said crosspoints including one of said corresponding crosspoints, whereupon that

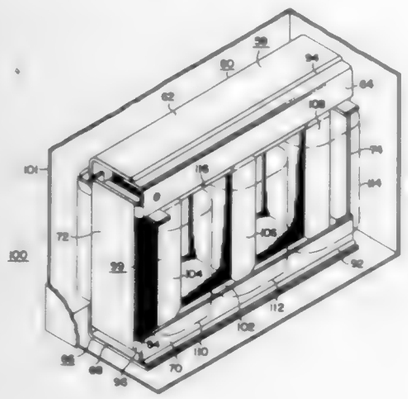
one of said second armatures corresponding to said last named crosspoint is pivoted to operate current carrying contacts associated therewith, provided that said horizontal selector current and said vertical selector current are applied to said system in coincidence.

3,374,452
TOROIDAL TRANSFORMER CONSTRUCTION AND METHOD OF CONSTRUCTING SAME
Winston R. Judd, Pittsfield, Mass., assignor to General Electric Company, a corporation of New York
Continuation-in-part of application Ser. No. 386,838, Aug. 3, 1964. This application Sept. 26, 1966, Ser. No. 582,024
8 Claims. (Cl. 336—60)



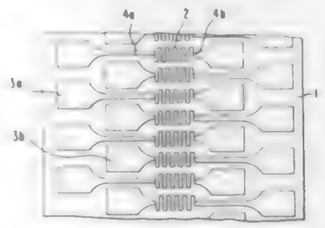
1. A toroidal transformer construction comprising a core and coil unit formed of a magnetic core member having a coil wound thereon and a cooling channel therethrough; a base member, said base member having an opening therein communicating with said cooling channel to provide a path for convective air currents that cool said transformer; and means comprising a cured resinous material for securing said core and coil unit to said base member, said means for securing providing a path for the conductive transfer of thermal energy from the core and coil unit to the base member.

3,374,453
ELECTRICAL INDUCTIVE APPARATUS
Alvin Y. Broverman and Garlington C. Wilburn, Sharpsville, and Quentin T. Jones, Sharon, Pa., and Donald A. Regar, Brookfield, Ohio, assignors to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Dec. 27, 1966, Ser. No. 604,968
5 Claims. (Cl. 336—197)



A transformer of the core-form type, and methods for constructing same, having concentric high and low voltage coils disposed on the leg portions of a stacked type magnetic core assembly. The yoke portions of the magnetic core assembly are compressed uniformly across their longitudinal length by metallic end frame members which are in continuous fixed engagement with one another across the complete longitudinal length of the yoke portions. Metallic plate members connect adjacent ends of the end frame members to brace the transformer during short circuit conditions, and to allow the transformer to be lifted without stressing the magnetic core assembly.

3,374,454
MEASURING TAPE FOR STRAIN GAUGE
Gerhard Holland, Stuttgart-Riedenberg, and German Kienle, Stuttgart-Unterturkheim, Germany, assignors to Daimler-Benz Aktiengesellschaft, Stuttgart-Unterturkheim, Germany
Filed Oct. 28, 1966, Ser. No. 590,337
Claims priority, application Germany, Oct. 28, 1965, D 48,537
10 Claims. (Cl. 338—2)

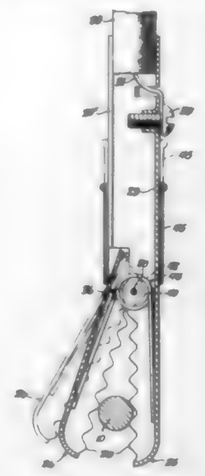


A compact strain gauge measuring tape is described which makes possible the placement of individual strain measuring resistive elements more closely adjacent to one another along the length of a backing tape without having to reduce the rather large connecting surfaces required for a completely satisfactory electrical connection to each of the individual strain sensive resistive elements. This closely spaced parallel arrangement of measuring resistance elements is the result of an arrangement of long and short connecting web portions between each resistive element and its lamellae-like, large surface contact soldering tabs formed on each end of the resistive elements. By this arrangement the individual strain sensing resistive elements can be arrayed parallel to each other along the longitudinal axis of a backing tape in a manner such that the shorter connecting web portions are located and nest between the longer web portions. The arrangement assures the greatest possible number of securely connected measuring elements arrayed within a unit length of the tape so as to allow for a maximum number of reliable measuring points over the surface of a work piece to which a section of the measuring tape is applied.

3,374,455
ELECTRICAL CONNECTOR
Dennis J. Sullivan, Chapel Hill Road, Allegany, N.Y. 14706, and John W. Bryan, Rte. 2, Olean, N.Y. 14760
Filed Oct. 21, 1965, Ser. No. 500,091
2 Claims. (Cl. 339—31)

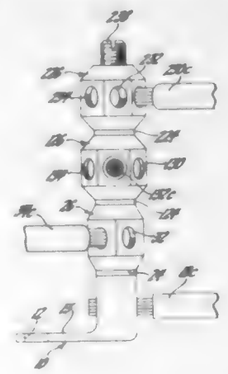
The test connector is adapted for both male and female electrical parts and has a tubular metal body adapted to be connected to an electrical test line and with one end extended along one side of its axis to provide an integral channel-shaped fixed jaw with its concavity facing this axis and its edges provided with teeth to engage a male electrical part. A movable channel-shaped jaw has its inner end pivoted to the base of the fixed jaw to swing on an axis perpendicular to the said first axis and has teeth mating with the teeth of the fixed jaw. The jaws, when closed, jointly are of cylindrical form to fit into the female part. The jaws are biased to their open position

and manually operable means are provided for moving them toward each other. These manually operable means



can be in the form of a sleeve slidable on the body portion over the exterior movable jaw or can be an extended finger piece at the base of the movable jaw.

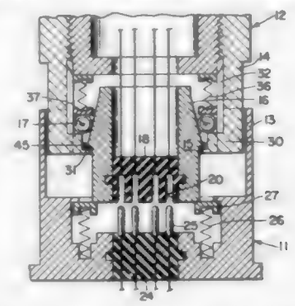
3,374,456
MULTIPLE TERMINAL CONNECTOR
Wronsford B. Evans, 1106 Belle View Blvd., Alexandria, Va. 22307
Filed Oct. 22, 1965, Ser. No. 502,257
3 Claims. (Cl. 339—32)



A multiple connector for a plurality of electrical wires and the like wherein a connector body has aligned upper and lower threaded bores and a plurality of openings transversely disposed to and intersecting the upper threaded bore, a set screw in the upper threaded bore engages a wire extending through one of such openings and retains it in the connector body; the set screw bash portion extending out of the upper threaded bore whereby the lower threaded bore of a second connector body may be stacked thereon.

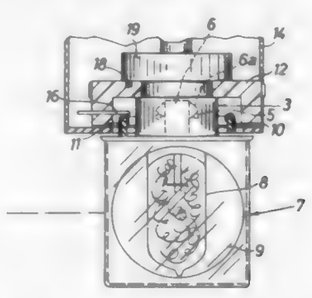
3,374,457
MISSILE SEPARATION CONNECTOR
Roger A. Herrick, Sunnyvale, Calif., assignor, by mesne assignments, to the United States of America as represented by the Secretary of the Navy
Filed Apr. 26, 1966, Ser. No. 546,155
6 Claims. (Cl. 339—45)

1. A disconnect device for separating missile components in adjacent missile stages without imparting thrust or causing imbalance comprising:
aligning means partially disposed in each of two adjacent stages of a composite missile assembly;
the portion of the aligning means in the forward stage including surfaces tapering inwardly from an intermediate portion of the aligning means into said forward stage;
axially movable means releasably restraining said aligning means in position in relation to the aft stage when said components are connected and during initial movement apart of said adjacent stages;



means connected to said forward stage for axially displacing said movable means in response to further movement apart of the adjacent stages; and
means in said aft stage urging said aligning means into said forward stage upon said further movement apart of said adjacent stages
whereby said aligning means is urged out of the one stage at a rate controlled by the rate of separation of the stages thereby eliminating thrust during separation of the stages.

3,374,458
FLASH UNIT
Helmut Dürr, Munich, Germany, assignor to Agfa-Gevaert Aktiengesellschaft, Leverkusen, Germany
Filed Nov. 23, 1966, Ser. No. 596,553
Claims priority, application Germany, Dec. 2, 1965, A 24,810
18 Claims. (Cl. 339—147)

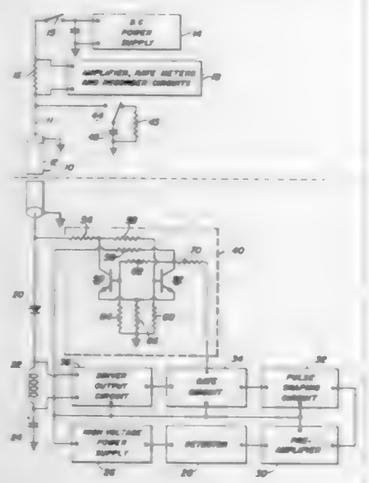


1. A flash unit for use with multiple flash bulb holders of the type having a plurality of electric contact means and a flash bulb electrically connected with each such contact means, comprising a support; a coupling member movably mounted in said support and having means for engaging and holding a multiple flash bulb holder so that the holder shares movements of said coupling member; and electric terminal means mounted on and movable with reference to said support into and from current-conducting engagement with selected contact means of a holder which is held by said coupling member.

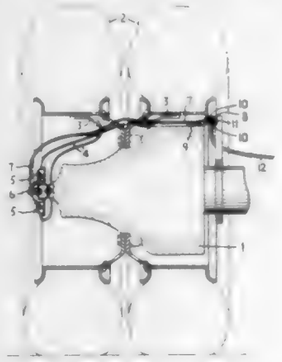
3,374,459
LOGGING CHANNEL DISABLING CIRCUIT
William R. Rabson, Homer M. Wilson, and Leroy C. De la Torre, Houston, Tex., assignors, by mesne assignments, to PGAC Development Company, Houston, Tex., a corporation of Delaware
Filed Apr. 16, 1965, Ser. No. 448,802
7 Claims. (Cl. 340—18)

1. In a well logging system, the combination of, a subsurface unit, a cable for moving said unit through a bore hole, a unidirectional power source at the earth's surface

and connected to the upper end of said cable, a measuring device in said unit and arranged to provide an electrical signal, proportional to a measured variable, means for connecting said electrical signal to the lower end of said cable for transmission to the earth's surface, means in said unit utilizing power transmitted over said cable from said source to energize said measuring device, means at the earth's surface for developing a control pulse, means for applying said control pulse to the upper end of said cable for transmission to said unit, means in said unit for receiving said control pulse and developing a blocking signal in response thereto, means responsive to said blocking signal for preventing said electrical signal from being impressed upon the lower end of said cable, means at the earth's surface for disconnecting said source from said cable, and means in said unit and responsive to said disconnection of said source by said last named means for disabling said blocking signal developing means, thereby to restore connection of said electrical signal to the lower end of said cable when said source is again connected to said cable.

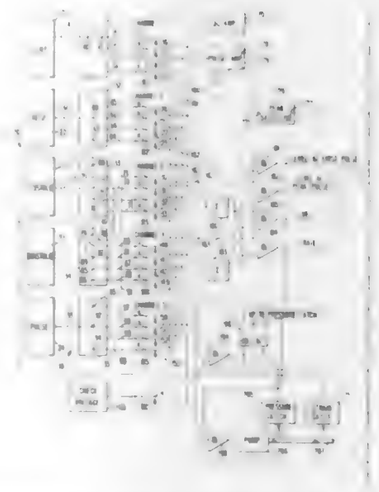


3,374,460
SYSTEM FOR SIGNALING CONDITIONS ON RELATIVELY MOVING MEMBERS OF A VEHICLE
Jean-Marie Massoubre, Clermont-Ferrand, France, assignor to Compagnie Generale des Establissments Michelin, raison sociale Michelin & Cie., Clermont-Ferrand, Puy-de-Dome, France
Filed Apr. 5, 1965, Ser. No. 445,402
14 Claims. (Cl. 340—58)



A system for signaling a condition on a first member rotatable with respect to a second member, including a pair of spaced apart, magnetically coupled stationary coils on the second member and a coil movable with the first member for passage between the pair of coils during each revolution of the rotating member. One of the coils of the pair is excited with an oscillator which produces a periodic electrical signal when the pair of coils is magnetically coupled. The oscillations of the signal are interrupted when the moving coil is short-circuited by a detector device responsive to the condition and passes between the coil pair to alter the magnetic coupling.

3,374,461
PHYSIOLOGICAL MONITORING SYSTEM
Ferd R. Anderholm, Donald J. Farris, and Lester J. Fiegel, Jr., Rochester, Minn., assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed Feb. 25, 1964, Ser. No. 347,212
20 Claims. (Cl. 340—147)



A data acquisition system is provided where the data inputs can be signals representing rates, levels, levels occurring at a first pulse, or levels occurring at a peak pulse. Data input modifiers identify the type of inputs to the system. The identification signals are used to develop control signals for gating the input data to proper data conversion and accumulating devices.

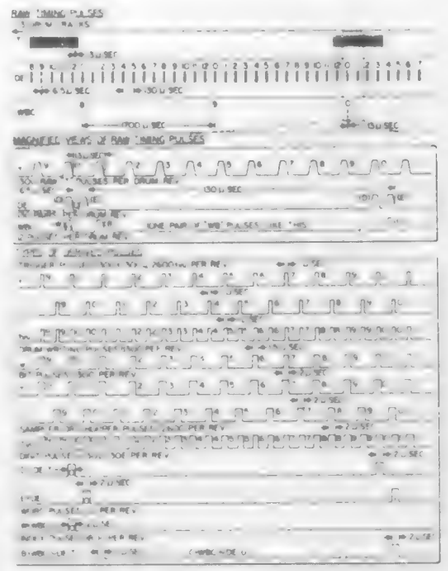
ERRATUM

For Class 340—172.5 see:
Patent No. 3,374,486

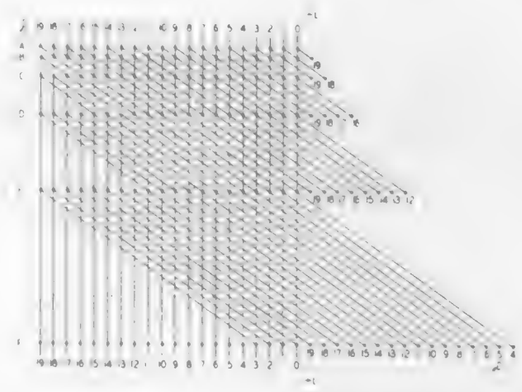
3,374,462
TIMING CIRCUITRY IN A DRUM STORAGE COMPUTER SYSTEM
Donald T. Best, Plymouth Meeting, Pa., and John R. Van Andel, Dearborn, Mich., assignors to Burroughs Corporation, Detroit, Mich., a corporation of Michigan
Original application Aug. 15, 1956, Ser. No. 604,153, now Patent No. 3,144,549, dated Aug. 11, 1964. Divided and this application July 24, 1963, Ser. No. 297,348
Claims priority, application Great Britain, Mar. 2, 1956, 6,693/56
18 Claims. (Cl. 340—172.5)

2. In an electronic digital computer system, a source of cyclically presented synchronizing signals having a plurality of channels, at least one means in the source for presenting at a single signal channel a plurality of intermixed sets of synchronizing signals for control of different computer circuits, at least one other means in the signal source for presenting a further set of synchronizing signals at another channel for use in the computer circuits and having a synchronously timed relationship with one of the intermixed sets of signals, a circuit coupled to said single channel for amplifying and shaping the

intermixed sets of signals, a circuit coupled to the other means for amplifying and shaping the further set of synchronizing signals, and coincidence gating means coupled to said circuits for comparing the two sets of amplified signals to produce output signals representative of of only said one of the intermixed sets of synchronizing signals, whereby said single channel of the signal source may be used for a plurality of sets of control signals.

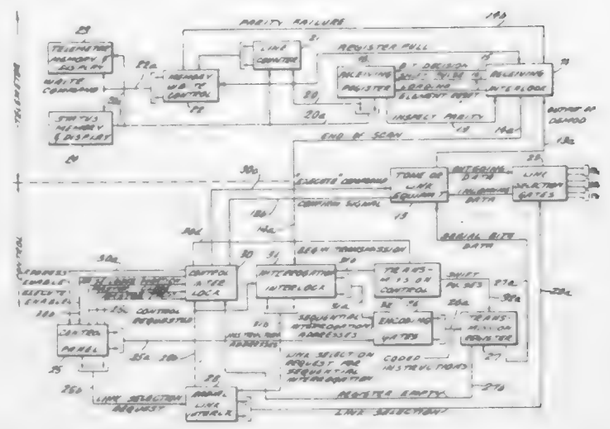


3,374,463
SHIFT AND ROTATE CIRCUIT FOR A DATA PROCESSOR
David Muir III, Minerva Park, Ohio, assignor to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York
Filed Dec. 23, 1964, Ser. No. 420,566
23 Claims. (Cl. 340—172.5)



A shift and rotate arrangement including a group of serially connected unidirectionally oriented rotate circuits connected between input and output terminals and a control circuit which simultaneously operates all the rotate circuits. Rotate and shift operations of any specified magnitude in either direction are performed by additive rotate operations during a single transmission of a data word from the input terminals through the series of rotate circuits to the output terminals by selective control of individual gating elements within the respective rotate circuits.

3,374,464
SUPERVISORY CONTROL SYSTEM
Abraham Brothman, Dumont, Lee Horowitz, Cedar Grove, Michael Gomery, Saddle River, and Conrad Yanis, Glen Rock, N.J., assignors, by mesne assignments, to Sangamo Electric Company, Springfield, Ill., a corporation of Delaware
Filed Jan. 8, 1965, Ser. No. 424,348
23 Claims. (Cl. 340—172.5)



This invention teaches a supervisory control system for gathering a variety of different types of information at a central data gathering point from a plurality of remote points within a system. The system is comprised of a central data gathering point and at least one remote location. Each remote location has concentrated thereat a plurality of data points for which it is desired to transmit telemetry, On, Off, Open or Closed and other varieties of information to the central data gathering point.

Quiescent operation of the system is such that the central data gathering point selects a particular remote location and transmits a transmit request signal. The remote location, upon receipt and recognition of the transmit request signal, first transmits an acknowledge signal confirming the receipt and/or authentication of a transmit request signal, which is followed by the information desired as to the status of each data point in the data bank for that remote location. After all data points at that particular remote location have been scanned and their status reported to the central data gathering point, an off-line signal is transmitted indicating to the central processing center that all points have been scanned, enabling the central location to scan data points of the next remote location. Scanning in this nature continues until all remote locations have been scanned, at which time the cycle begins anew.

If it is desired to reach a particular data point at any given remote location, control of the system may be seized by manually operable means wherein the particular remote location and the particular point at the selected remote location is selected at the central location. Operation of these controls causes the quiescent state to be interrupted upon completion of the scan at the remote location transmitting at that time and the system is then placed under control of the manually operable controls which have been enabled.

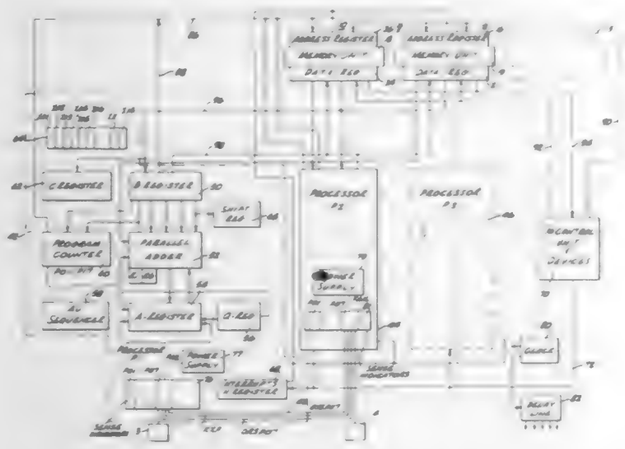
In order to reach a particular data point contained within a bank of points at the selected remote location, the central location transmits a binary word to the selected remote location. This binary word is fed into a shift register at the selected remote location. As soon as the word is loaded into this shift register, the shift register is divided into two parts each of which is then coupled to form a closed loop. Operation at the selected remote location to determine the data point whose status is desired begins by shifting the loaded data word received from the central location through the two shift registers

one bit position at a time. Gating means coupled to selected outputs of both the first and second shift registers are employed to sense the order of the data bits in the first and second shift registers. Recirculation of the code word within the two registers continues until the gating means acknowledges the fact that valid code word identifying one particular data point (i.e., the selected data point) is appropriately arranged in the first and second registers. At this point the gating means terminates the circulation of the code word in the registers.

Counting means are provided for counting the total number of shift operations performed. The total count is employed for the purpose of addressing the particular data point to be selected. The code word transmitted by the central location to the remote location sets up only one valid code word for the data point selected regardless of how many shifts may be performed and no other valid code words will be set up as a result of receipt and circulation of this code word.

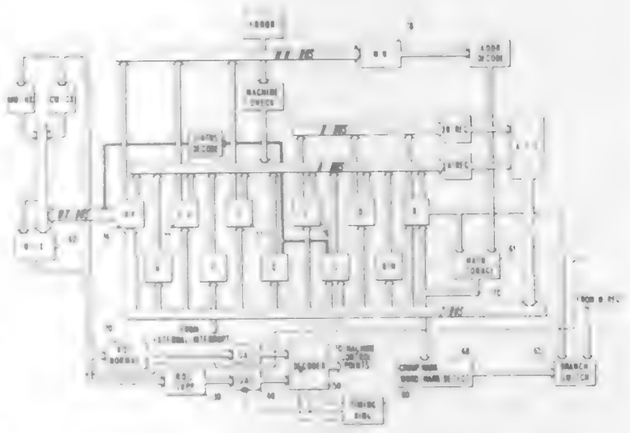
In the case where the status of the addressed data point is desired, as soon as the validity of the code word is established, this information will be transmitted to the central location. The transmitted code word may contain further information identified by the remote location requesting control over the particular data point addressed. For example, if the data point contains status as to the liquid level in a tank and upon receipt of that status, it is desired to raise or lower the level, the code word will further identify the fact that control over the data point is desired and manual control may be exerted at the central location to raise or lower the level to a desired value. Control may be relinquished by a suitable signal transmitted from the central location to the remote location. As soon as the status and/or control over the selected data point is completed the system returns to its quiescent state of operation.

3,374,465
MULTIPROCESSOR SYSTEM HAVING FLOATING EXECUTIVE CONTROL
Richard C. Richmond and Jack J. Pariser, Orange, and Thomas A. Connolly, Hacienda Heights, Calif., assignors to Hughes Aircraft Company, Culver City, Calif., a corporation of Delaware
Filed Mar. 19, 1965, Ser. No. 441,189
20 Claims. (Cl. 340—172.5)



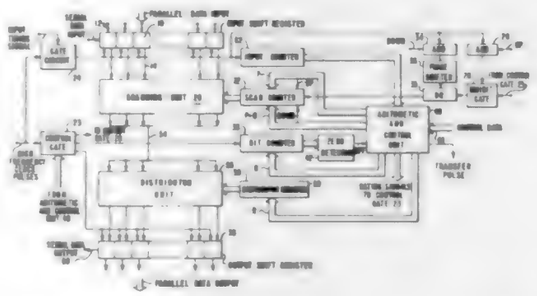
A multiprocessor computer system comprising an executive control logic circuit and an executive function logic circuit in each processor with the executive control logic circuits functioning as program indicators. Any of the executive control logic circuits may be set as a result of the processor's set instruction or of any processor's reset instruction. The executive function logic circuit is maintained in a set state during an executive routine or an interrupt routine. The system provides an executive "or" type of control circuit so that the computer's operation may be continued in event of a failure of a portion of the processors and to ensure that one and only one processor has executive control during any given time period.

3,374,466
DATA PROCESSING SYSTEM
William P. Hanf, Endicott, and Karl K. Womack, Endwell, N.Y., assignors to International Business Machines Corporation, Armonk, N.Y., a corporation of New York
Filed May 10, 1965, Ser. No. 454,325
8 Claims. (Cl. 340—172.5)



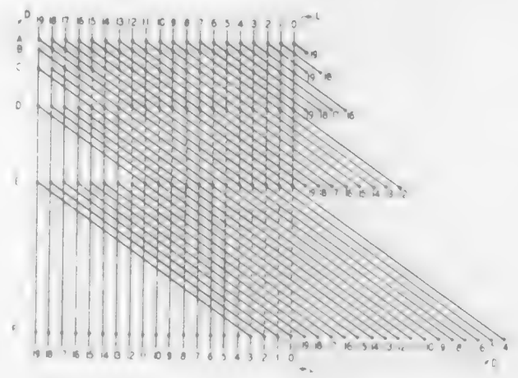
The present invention encompasses a data processing system universally designed so as to operate in response to first programs in a natural mode of operation and to second programs in a substituted mode of operation. Control word groups are stored in a first storage means to cause the data processing system to emulate an entirely different second processing system. An unnatural program designed for said second data processing system is executed by said universally designed data processing system by compatibility in character manipulation, hardware availability, address translation and operation code recognition.

3,374,467
DIGITAL DATA PROCESSOR
James N. Cast, Santa Ana, William H. Horning, Garden Grove, and Frank Twiss, Huntington Beach, Calif., assignors, by mesne assignments, to Lear Siegler, Inc., Santa Monica, Calif., a corporation of Delaware
Filed May 27, 1965, Ser. No. 459,360
11 Claims. (Cl. 340—172.5)



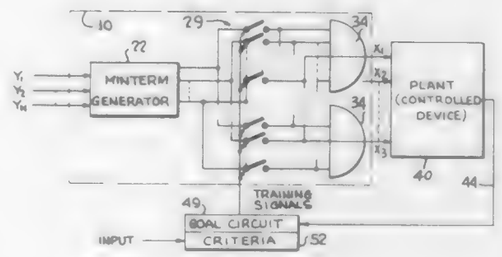
A processor for data words having a predetermined bit sequence is disclosed. Data is received in a storage device at the processor. A control signal generator emits a variable control signal which continually identifies the location of the bits making up data words delivered to the storage device. The bit sequence of the data words are extracted in accordance with the variable control signal in any predetermined sequence and at any predetermined output rate; and thus, the input and output bit sequences need not be the same.

3,374,468
SHIFT AND ROTATE CIRCUIT FOR A DATA PROCESSOR
David Muir III, Minerva Park, Ohio, assignor to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York
Continuation-in-part of application Ser. No. 420,566, Dec. 23, 1964. This application Aug. 10, 1965, Ser. No. 478,536
16 Claims. (Cl. 340—172.5)



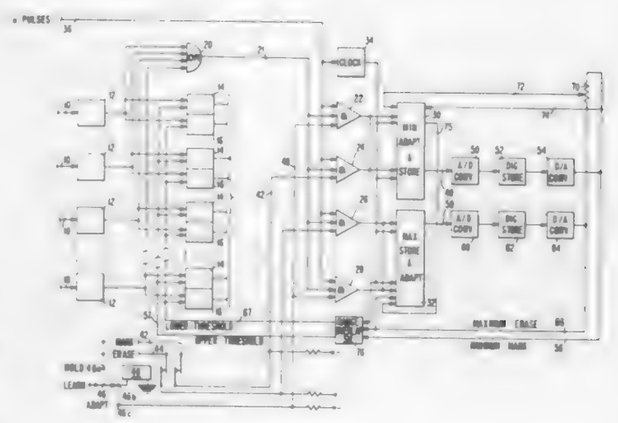
An arrangement which performs shift and rotate operations in either direction on data stored in a register. A plurality of multi-element rotate circuits are connected in parallel between the input and output terminals of the register. Each rotate circuit is oriented to rotate the bits contained in the register stages by a predetermined different number of stages in the same one direction. Specified shift and rotate operations are performed in accordance with specified magnitudes and directions by controlling selected elements of the rotate circuits during additive sequential energization thereof to inhibit transmission of bits through the selected rotate elements.

3,374,469
MULTI-OUTPUT STATISTICAL SWITCH
Edward M. Connelly, Springfield, Va., assignor to Melpar, Inc., Falls Church, Va., a corporation of Delaware
Filed Aug. 30, 1965, Ser. No. 483,608
16 Claims. (Cl. 340—172.5)



A statistical switch for variably controlling the probability that a completed circuit will be provided between a single input channel and any one of a plurality of output channels, in which input signal is fed to the single input channel for application in parallel to a plurality of gating circuits each connected to a distinct and different one of the output channels. Each of the gating circuits is energized in sequence to pass input signal therethrough, and the entire energizing sequence repeated during a substantially constant period of time. The probability of obtaining an output signal at a particular output channel at any given instant during this period is increased by increasing the time interval over which the gating circuit connected to that channel is energized, as compared with the time intervals over which the other gates are energized, such that the probability of obtaining an output signal from the switch remains at unity although the likelihood that it will appear at a specific output channel may be controllably varied.

3,374,470
ADAPTIVE THRESHOLD CIRCUITS
William S. Rohland, Rochester, Minn., assignor to International Business Machines Corporation, Armonk, N.Y., a corporation of New York
Filed Oct. 19, 1965, Ser. No. 497,660
15 Claims. (Cl. 340—172.5)

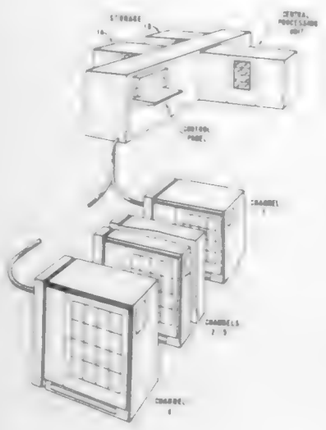


1. In an adaptive threshold circuit,
a multi-channel read head,
upper and lower threshold circuits connected to each channel,
circuit means common to all of said read head channels for producing a read signal,
additional circuit means connected to said circuit means for establishing minimum mark and maximum erasure signal levels,
and means connecting said additional circuit means to control the upper and lower threshold circuits.

3,374,471
INSTRUCTION FETCHING APPARATUS
Gordon L. Smith, 9F Dutchess Apts. Van Wagner Road, Poughkeepsie, N.Y. 12603
Continuation-in-part of application Ser. No. 455,323, Apr. 5, 1965. This application Jan. 13, 1967, Ser. No. 609,249
15 Claims. (Cl. 340—172.5)

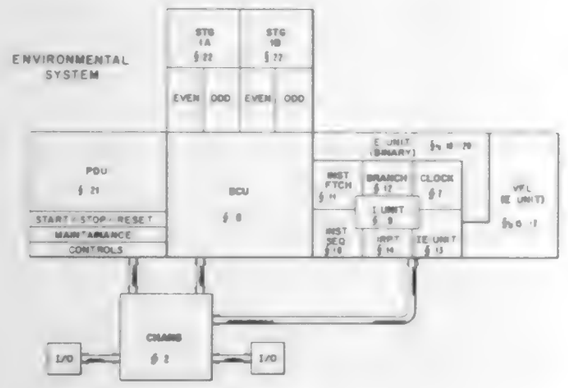
The specification discloses an illustrative embodiment for the invention comprising a large scale data processing system of the type which is composed of a plurality of quasi-independent units. The environmental data processing system includes a central processing unit or portion, which is herein referred to as a CPU, a plurality of storage units, a plurality of input/output control devices referred to herein as channels, as well as control and maintenance facilities which are found in a power distribution unit, herein referred to as a PDU. The CPU of the environmental system includes a control or instruction unit hereinafter referred to as an I unit, and an arithmetic and logic or execution unit, hereinafter referred to as an E unit. The I unit includes controls for instruction fetch-

ing, branching, interruption handling, communication with the input/output channels, and other related functions.



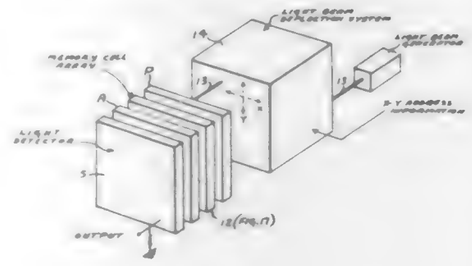
The E unit of the environmental system can perform algebraic and logical operations, moving, shifting, and other functions.

3,374,471
STORAGE CANCELLATION AND PANEL DATA KEY FETCHING IN A DATA PROCESSING SYSTEM
William P. Wissick, Sunnyvale, Calif., Leo J. Hasbrouck, Poughkeepsie, N.Y., Charles Richard Holleran, Saratoga, Calif., and Gordon L. Smith, Poughkeepsie, N.Y., assignors to International Business Machine Corporation, Armonk, N.Y., a corporation of New York
Continuation-in-part of application Ser. No. 445,311, Apr. 5, 1965. This application Jan. 13, 1967, Ser. No. 609,252
11 Claims. (Cl. 340—172.5)



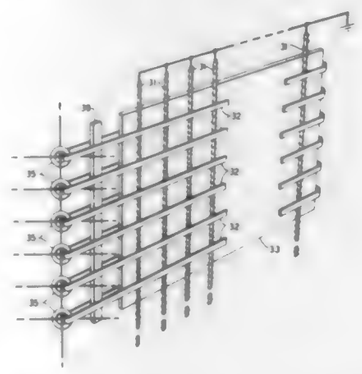
The specification discloses an illustrative embodiment for the invention comprising a large scale data processing system of the type which is composed of a plurality of quasi-independent units. The environmental data processing system includes a central processing unit or portion, which is herein referred to as a CPU, a plurality of storage units, a plurality of input/output control devices referred to herein as channels, as well as control and maintenance facilities which are found in a power distribution unit, herein referred to as a PDU. The CPU of the environmental system includes a control or instruction unit hereinafter referred to as an I unit, and an arithmetic and logic or execution unit, hereinafter referred to as an E unit. The I unit includes controls for instruction fetching, branching, interruption handling, communication with the input/output channels, and other related functions. The E unit of the environmental system can perform algebraic and logical operations, moving, shifting, and other functions.

3,374,473
BISTABLE OPTICALLY READ FERROELECTRIC MEMORY DEVICE
Stewart E. Cummins, 405 Funston Ave., New Carlisle, Ohio 45344
Filed Apr. 12, 1967, Ser. No. 630,469
12 Claims. (Cl. 340—173.2)



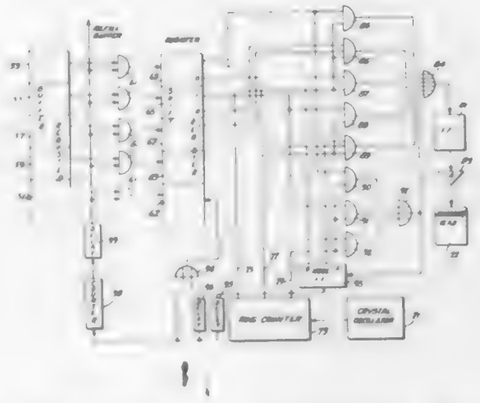
A bistable optically read memory device comprising a crystal of ferroelectric bismuth titanate ($Bi_4Ti_3O_{12}$) between crossed polarizers. The spontaneous polarization vector of this monoclinic crystal can be switched between two stable directions about 10° apart, with an accompanying switching of the optical indicatrix between two stable angular positions about the crystallographic *b* axis, by the momentary application of an electric field normal to the *a-b* plane. Nondestructive optical read-out is accomplished between crossed polarizers with the crystal oriented for extinction in one of the two stable positions of the indicatrix. Applications are shown to multicell memories with optical access and sensing for read-out and with either coincident pulse or optical access for write-in, to display panels, and to logic circuits.

3,374,474
NOISE SUPPRESSION CIRCUIT FOR MAGNETIC CORE MATRIX
Jules R. Cunrath, Salisbury Township, Lehigh County, Pa., assignor to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York
Filed Sept. 24, 1963, Ser. No. 310,999
4 Claims. (Cl. 340—174)



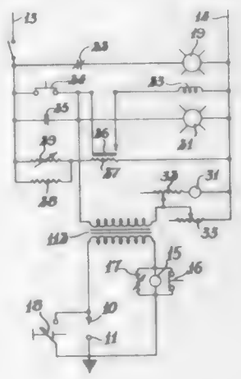
A biased core access matrix for a magnetic memory is provided with nonlinear inductive devices coupled to matrix output circuits to memory word addresses. Each device saturates at a drive signal level greater than matrix shuttle noise level but less than an access information signal level from the matrix so that device high impedance to shuttle noises suppresses such noises. Suppressor devices are shown as individual cores for each output circuit and as a flat strip common to a group of output circuits. A memory employing magnetic wire memory elements is illustrated.

3,374,475
HIGH DENSITY RECORDING SYSTEM
Andrew Gabor, Huntington, N.Y., assignor to Potter Instrument Company, Inc., Plainview, N.Y., a corporation of New York
Filed May 24, 1965, Ser. No. 458,110
15 Claims. (Cl. 340—174.1)



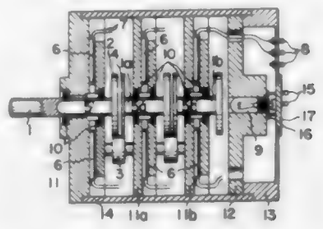
This specification discloses a high density recording and reproducing system in which binary information is divided into pairs of bits and different flux transition patterns are recorded to represent each pair of digits. Each pattern is made of three flux transition positions and the patterns are selected so that at least one transition is present in every adjacent pair of transition positions. The pattern selected to represent one particular pair of digits is made dependent upon an adjacent pattern recorded to represent another pair of digits.

3,374,476
METHOD OF AND APPARATUS FOR DETECTING MOISTURE IN NON-CONDUCTING LIQUIDS
Norbert K. Koebel, Maywood, and Kenneth A. Freutel, Franklin Park, Ill., assignors to Basic Products Corporation, a corporation of Wisconsin
Filed Jan. 18, 1965, Ser. No. 426,173
12 Claims. (Cl. 340—235)



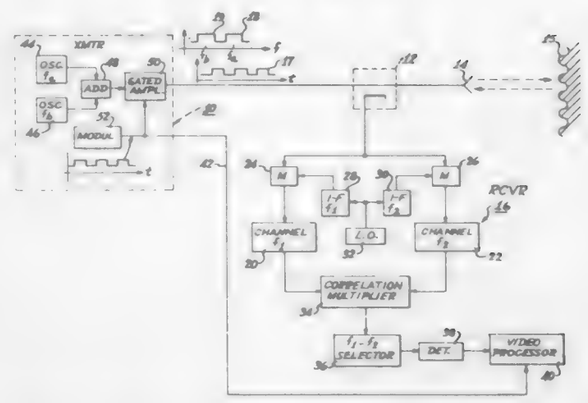
A detector for moisture in oil having spaced electrodes immersed in the oil and a time delay device started by current discharge between the electrodes and which actuates a signal when it times out. The electrode current controls a radiant energy emitter which when energized, initiates operation of the time delay device.

3,374,477
SHAFT POSITION DIGITIZER
Masakazu Ejiri, Hachioji-shi, and Akira Kamoi, Musashino-shi, Japan, assignors to Kabushiki Kaisha Hitachi Seisakusho, Tokyo-to, Japan, a joint-stock company of Japan
Filed July 7, 1964, Ser. No. 380,863
Claims priority, application Japan, July 10, 1963, 38/35,358
8 Claims. (Cl. 340—347)



A shaft position digitizer wherein a plurality of hollow shafts is disposed along the same center line; each of these shafts is hollow and connected continuously or intermittently by reduction gears; light from a single stationary source is conducted through the interior of the shaft which is in correct position; and a number of photosensitive elements is disposed around the shaft at given distances; a rotational angle corresponding to a mechanical displacement to be digitized is imparted to one shaft. The device is suited for miniaturization.

3,374,478
RADAR SIGNALING SYSTEM WITH REDUCED CLUTTER EFFECT
William Blau, Haddonfield, N.J., assignor of one-half to Spectronics, Inc., a corporation of New Jersey
Filed Dec. 7, 1966, Ser. No. 599,754
17 Claims. (Cl. 343—5)

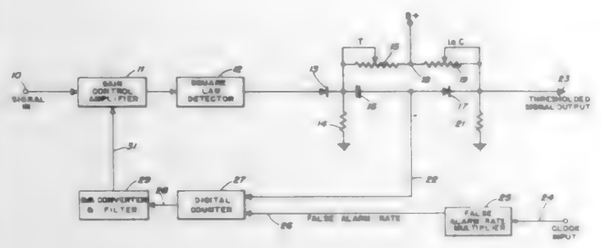


A radar system is provided having improved characteristics with respect to clutter effects. The radar transmitter supplies spaced frequency bands of substantially identical signals. The radar receiver spectrally correlates the returned signals to provide auto-correlation of true target signals and substantial cross-correlation of clutter signals. By means of spaced sub-bands a wide transmission bandwidth may be provided as well as a narrow correlated band that is suitable for processing.

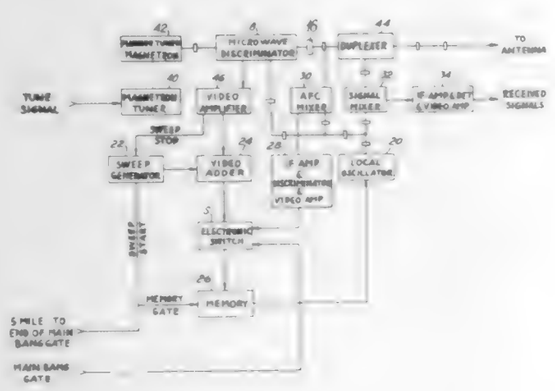
3,374,479
AUTOMATIC FALSE ALARM CONTROL
Thomas M. Moore, Severna Park, Md., assignor, by mesne assignments, to the United States of America as represented by the Secretary of the Navy
Filed Mar. 25, 1966, Ser. No. 538,484
6 Claims. (Cl. 343—7)

There is disclosed a system for preventing false alarm overloading of radar systems which are equipped with

automatic detection circuitry for processing false alarm signals, utilizing an arrangement whereby a double threshold is used in order to more closely approximate the probability of false alarms.



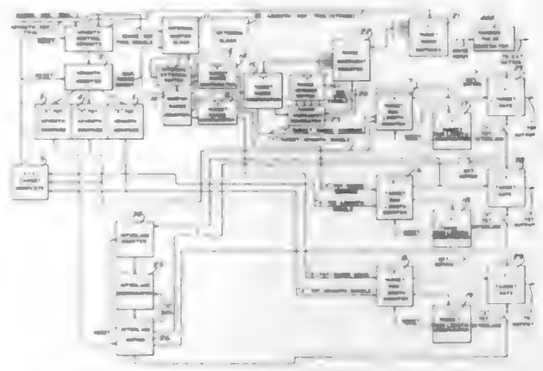
3,374,480
RECEIVER TUNING FOR RADAR AND THE LIKE
Charles W. Russell, Tonawanda, and Theodore Lerner, Buffalo, N.Y., assignors, by mesne assignments, to Bell Aerospace Corporation, Wheatfield, N.Y., a corporation of Delaware
Filed Aug. 20, 1958, Ser. No. 754,699
5 Claims. (Cl. 343—17.2)



1. A system of the character described comprising, a pulse generator of the cavity resonator type, a pulse echo receiver having a voltage tunable local oscillator, a first automatic frequency control circuit for said oscillator comprising the cavity of said generator and means including a microwave discriminator translating the resonant frequency of said cavity into a tuning control voltage for said local oscillator, a second automatic frequency control circuit for said local oscillator comprising means including a mixer receiving a sample of the transmitted pulse and the output of said local oscillator for developing a tuning control voltage for said local oscillator, and switch means for switching said local oscillator from said first automatic frequency control circuit to said second automatic frequency control circuit when a pulse is transmitted.

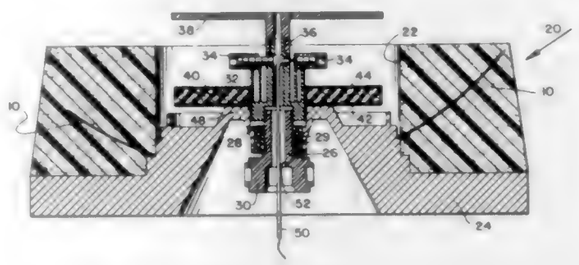
3,374,481
DIGITAL TARGET GENERATOR TEST SET
Albert A. Lupinetti, Northfield, N.J., assignor to the United States of America as represented by the Secretary of the Army and/or the Administrator of the Federal Aviation Agency
Filed Nov. 9, 1966, Ser. No. 593,608
10 Claims. (Cl. 343—17.7)

This invention relates to a device for the generation of signals which simulate radar returns initiated by radar or beacon interrogations. By simulating targets, process-



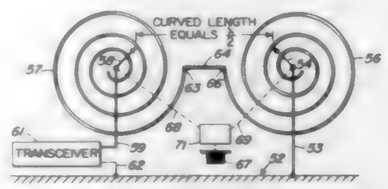
ing equipment designed to handle actual reply information, may be tested under precise calculated conditions.

3,374,482
RADAR DISH IN PLASTIC CASEMENT
Leo L. Kielman, China Lake, Calif., assignor to the United States of America as represented by the Secretary of the Navy
Filed Sept. 30, 1958, Ser. No. 764,456
5 Claims. (Cl. 343—761)



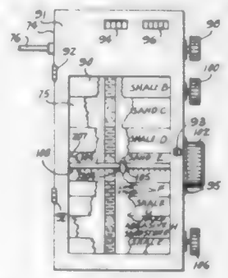
1. In a gyro mounted radar antenna, a gimbal-mounted support, a gyro rotor mounted on said support, said rotor operable to be rotated at high-speeds, an antenna-dish assembly having a large central aperture mounted on said gyro rotor, said antenna-dish assembly comprising a metallized spherical reflective surface imbedded at a cant within a concentric plastic casement, and operable to eliminate air pumping action due to cant of the spherical reflective surface and reduce mass unbalance, said antenna-dish assembly and rotor operable to rotate together about the gyro rotor spin axis, said gimbal-mounted support supporting a dipole type antenna and a flat radar energy reflector concentric with the aperture in said antenna-dish assembly.

3,374,483
TUNABLE ELECTRICALLY SMALL ANTENNA
Richard C. Fenwick, Richardson, Tex., assignor to Collins Radio Company, Cedar Rapids, Iowa, a corporation of Iowa
Filed May 6, 1965, Ser. No. 453,801
6 Claims. (Cl. 343—895)



A space saving implementation of an electrically small antenna of the type comprising a conductor arranged parallel to a ground plane with one end of the conductor shorted to the ground plane through a vertical conductor and with a feed point connected between a selected point at or near the other end of the conductor and the ground point. The half wavelength conductor is formed into a spiral arrangement permitting a space saving arrangement with which a novel slidable feed point contact may be incorporated for tuning purposes.

3,374,484
APPARATUS FOR INDICATING AND RECORDING BOREHOLE DRILLING
Zbigniew S. Wyszynski, 501 Earnest St., New Iberia, La. 70560
Filed Oct. 26, 1964, Ser. No. 406,262
4 Claims. (Cl. 346—14)



1. An indicating and programming apparatus for operation of a drill rig for boreholed drilling comprising means for advancing a programmed log tape means at a speed relative to the travel of a drilling bit in a borehole; clock means, shiftable apparatus having a stylus and indicator pointer adapted to be driven by said clock means to contact and uniformly travel across and along the log tape registering the units of time consumed by selective drilling operations for a borehole on an indicating scale overlying said log tape means, indicator counter means driven by the log tape means and adapted to record the number of feet of earth strata drilled in a given period of time; and coupling means operatively connecting the counter means to said means for advancing said log tape with an instrument line operatively connected to a swivel of a drill string.

3,374,485
CALIBRATION APPARATUS FOR PHYSIOLOGICAL AND BIOLOGICAL MEASURING AND RECORDING DEVICES
Alfred Gemmer, Berlin-Frohnau, Germany, assignor to Fritz Hellige & Co. G.m.b.H., Freiburg im Breisgau, Germany
Filed Nov. 4, 1966, Ser. No. 592,037
Claims priority, application Germany, Nov. 5, 1965, H 57,599
10 Claims. (Cl. 346—23)

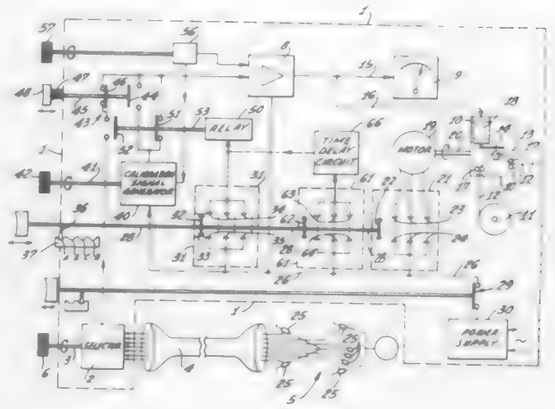
1. A system for monitoring and recording electrical signals comprising:

a selector receiving a first plurality of electrical signals for producing an output signal corresponding to preselected ones of said electrical signals;

a monitoring instrument for indicating the value of applied signals, said monitoring instrument including a recording medium and a drive mechanism for moving said recording medium at a second plurality of distinct speeds;

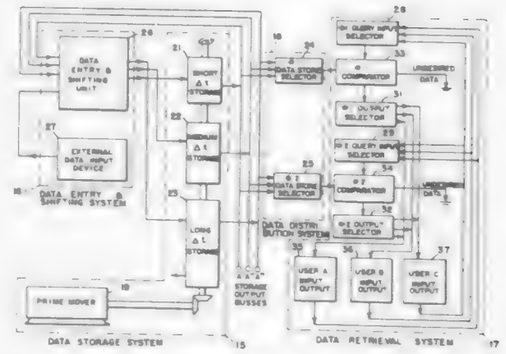
a signal generator for producing a calibration signal distinguishable from said output signal of said selector;

control means for energizing said monitoring instrument, said signal generator, and said drive mechanism and for changing the speed at which said drive mechanism moves said recording medium; and



shifting means having input terminals respectively coupled to said control means and to the output terminals of said selector and said signal generator for normally applying said output signal of said selector to said monitoring instrument and, in response to the energization of said drive mechanism or a change in the operating speed thereof, automatically interrupting the application of said output signal to said monitoring instrument and applying said calibration signal to said monitoring instrument for a predetermined interval of time.

3,374,486
INFORMATION RETRIEVAL SYSTEM
Vance R. Wanner, 1921 Tenley Drive, Collingwood, Alexandria, Va. 22308
Filed Jan. 15, 1965, Ser. No. 425,975
2 Claims. (Cl. 340—172.5)

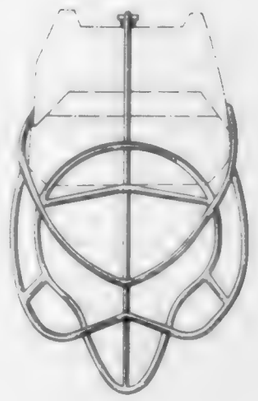


An information retrieval system wherein data is stored by both broad category and desired retrieval time. Stored data is continually read out and simultaneously made available to many users. Users identify and receive desired data by category and characteristic, combination of characteristics or permutations of characteristics.

DESIGNS

MARCH 19, 1968

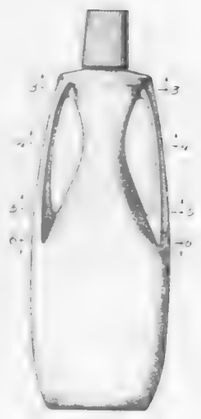
210,510
FACE GUARD FOR A HELMET
Dennis L. Burns, 4512 6th Ave. NW., Seattle, Wash. 98107
Filed Mar. 9, 1966, Ser. No. 1,365
Term of patent 14 years
(Cl. D2—213)



210,511
BOOT
William J. Dorsey, Newark, N.J., assignor to Kaysam Corporation of America, Paterson, N.J., a corporation of New Jersey
Filed Nov. 16, 1966, Ser. No. 4,700
Term of patent 14 years
(Cl. D2—272)

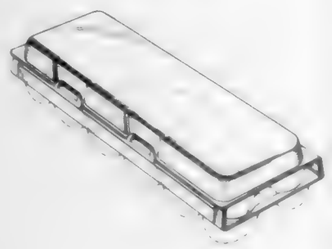
210,512
NECKTIE KNOT SUPPORT
Harry Kanter, 535 E. 86th St., New York, N.Y. 10028, and Robert Kallman, 612 Forest Hills Drive, Wilmington, N.C. 28401
Filed Jan. 6, 1967, Ser. No. 5,325
Term of patent 14 years
(Cl. D2—401)

210,513
JUG
Clayton A. Laughlin, Minneapolis, Minn., assignor to Minnesota Plastics Corporation, St. Paul, Minn., a corporation of Minnesota
Filed Oct. 10, 1966, Ser. No. 4,218
Term of patent 14 years
(Cl. D9—41)



210,514
BOTTLE
Herbert Brammer, London, England, assignor to Charles Mackinlay & Company Limited, Edinburgh, Scotland
Filed Apr. 26, 1966, Ser. No. 2,038
Claims priority, application Great Britain Dec. 22, 1965
Term of patent 14 years
(Cl. D9—72)

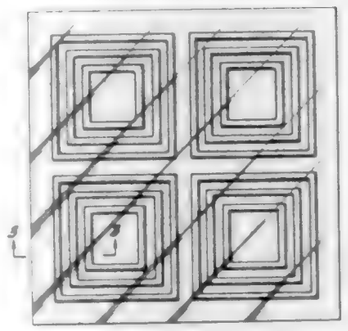
210,515
EGG CARTON
Richard T. Walter, Norristown, Pa., assignor to Container Corporation of America, Chicago, Ill., a corporation of Delaware
Continuation-in-part of design application Ser. No. 903, Feb. 3, 1966. This application July 25, 1967, Ser. No. 8,266
Term of patent 14 years
(Cl. D9—190)



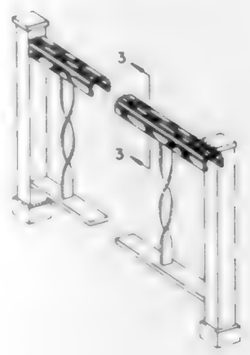
210,516
DISPENSER CAP FOR CONTAINERS
Carmen T. Mascia, Westchester, and Harry A. Peyser, Olympia Fields, Ill., assignors to Continental Can Company, Inc., New York, N.Y., a corporation of New York
Filed Jan. 16, 1967, Ser. No. 5,417
Term of patent 14 years
(Cl. D9—276)

210,517
HOLDER FOR A SQUEEZE TUBE
Paul Baratte, 18 Rue Volney, Paris, France
Filed Mar. 24, 1966, Ser. No. 1,616
Claims priority, application France Sept. 24, 1965
Term of patent 14 years
(Cl. D9—294)

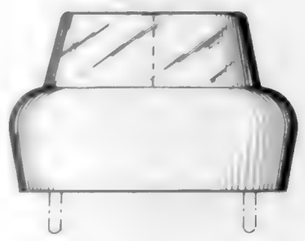
210,518
THREE-DIMENSIONAL PLASTIC PANEL
Gerald A. Woodman, 2216 Daxbury Circle, Los Angeles, Calif. 90034
Filed Aug. 22, 1966, Ser. No. 3,556
Term of patent 14 years
(Cl. D13—1)



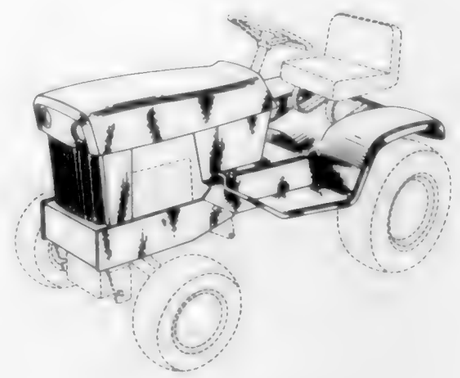
210,519
RAILING
Edward J. Kusel, 2343 Ridgewood Road, and Robert S. Mankin, 1954 Stockbridge Road, both of Akron, Ohio 44319
Continuation of design applications Ser. No. 849 and Ser. No. 858, Feb. 1, 1966. This application Feb. 13, 1967, Ser. No. 8,195
Term of patent 14 years
(Cl. D13—7)



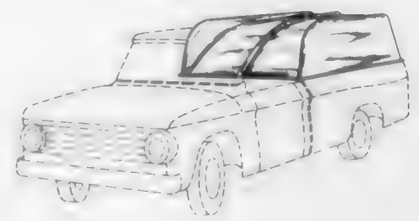
210,520
AUTOMOBILE
Robert R. Aronson, Ferndale, Mich., assignor to Electric Fuel Propulsion, Incorporated, Ferndale, Mich., a corporation of Delaware
Filed Mar. 3, 1967, Ser. No. 6,048
Term of patent 14 years
(Cl. D14—3)



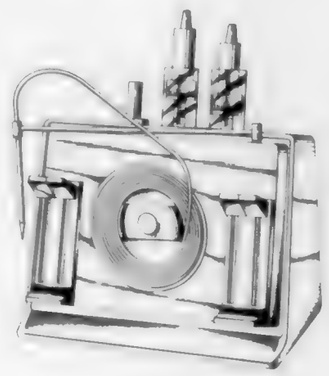
210,521
TRACTOR
Henry Dreyfuss, South Pasadena, and James Mervyn Conner, Glendale, Calif., assignors to Deere & Company, Moline, Ill., a corporation of Delaware
Filed Sept. 1, 1967, Ser. No. 8,469
Term of patent 14 years
(Cl. D14—3)



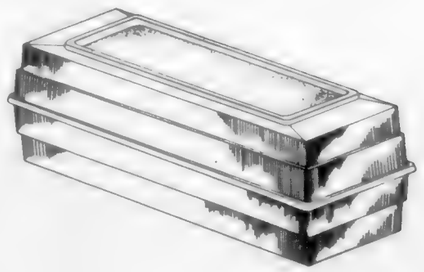
210,522
COMBINATION BOAT AND CANOPY FOR THE BED OF A PICK-UP VEHICLE AND THE LIKE
Elmer A. Ward, 3029 Aspen Drive, Casper, Wyo. 82601
Filed July 5, 1966, Ser. No. 2,913
Term of patent 14 years
(Cl. D14—27)



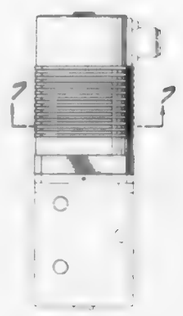
210,523
AUTOMATIC PIPETING UNIT
Leonard N. Albrecht, Mill Valley, Calif., assignor to Warner-Lambert Pharmaceutical Company, Morris Plains, N.J., a corporation of Delaware
Continuation-in-part of design application Ser. No. 2,952, July 6, 1966. This application Apr. 14, 1967, Ser. No. 7,137
Term of patent 14 years
(Cl. D16—2)



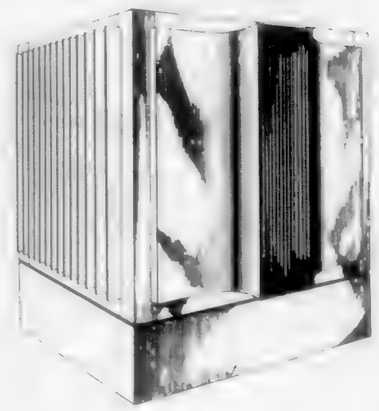
210,524
BURIAL VAULT
Guy Smith, 217 Patricia Drive, Forest Park, Ga. 30050
Filed May 4, 1966, Ser. No. 2,154
Term of patent 14 years
(Cl. D19—1)



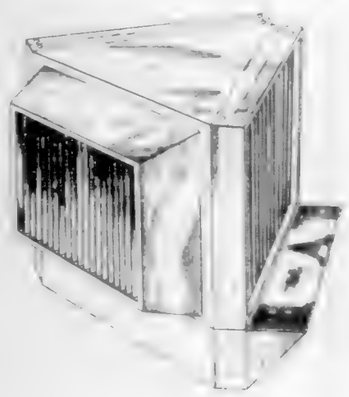
210,525
HIGH-PRESSURE, ELECTRICALLY ACTUATED, FLUID VALVE
Robert S. Keane, Placentia, Calif., assignor to International Research Corp., Anaheim, Calif., a corporation of California
Filed Mar. 25, 1966, Ser. No. 1,632
Term of patent 14 years
(Cl. D23—19)



210,526
FLUID HEAT EXCHANGER FOR AIR CONDITIONING AND REFRIGERATION SYSTEMS AND THE LIKE
Raymond A. Lo Turco, Wexford, Pa., assignor to Frick Company, Waynesboro, Pa., a corporation of Pennsylvania
Filed Sept. 1, 1967, Ser. No. 8,454
Term of patent 14 years
(Cl. D23—153)



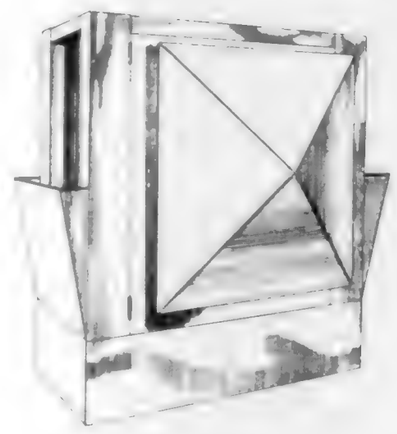
210,527
FLUID HEAT EXCHANGER FOR AIR CONDITIONING AND REFRIGERATION SYSTEMS AND THE LIKE
Raymond A. Lo Turco, Wexford, Pa., assignor to Frick Company, Waynesboro, Pa., a corporation of Pennsylvania
Filed Sept. 1, 1967, Ser. No. 8,455
Term of patent 14 years
(Cl. D23—153)



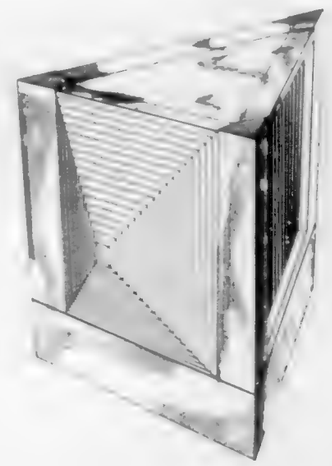
210,528
FLUID HEAT EXCHANGER FOR AIR CONDITIONING AND REFRIGERATION SYSTEMS AND THE LIKE
Raymond A. Lo Turco, Wexford, Pa., assignor to Frick Company, Waynesboro, Pa., a corporation of Pennsylvania
Filed Sept. 1, 1967, Ser. No. 8,456
Term of patent 14 years
(Cl. D23—153)

210,529
FLUID HEAT EXCHANGER FOR AIR CONDITIONING AND REFRIGERATION SYSTEMS AND THE LIKE
Raymond A. Lo Turco, Wexford, Pa., assignor to Frick Company, Waynesboro, Pa., a corporation of Pennsylvania
Filed Sept. 1, 1967, Ser. No. 8,458
Term of patent 14 years
(Cl. D23—153)

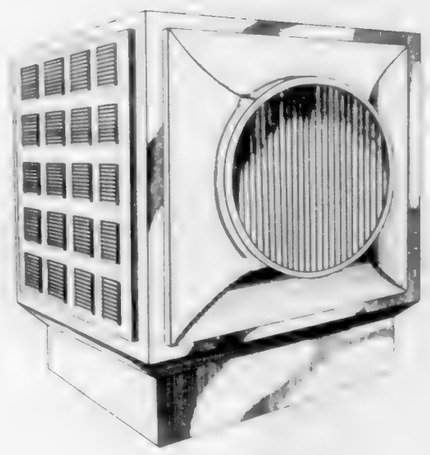
210,530
FLUID HEAT EXCHANGER FOR AIR CONDITIONING AND REFRIGERATION SYSTEMS AND THE LIKE
Raymond A. Lo Turco, Wexford, Pa., assignor to Frick Company, Waynesboro, Pa., a corporation of Pennsylvania
Filed Sept. 1, 1967, Ser. No. 8,457
Term of patent 14 years
(Cl. D23—153)



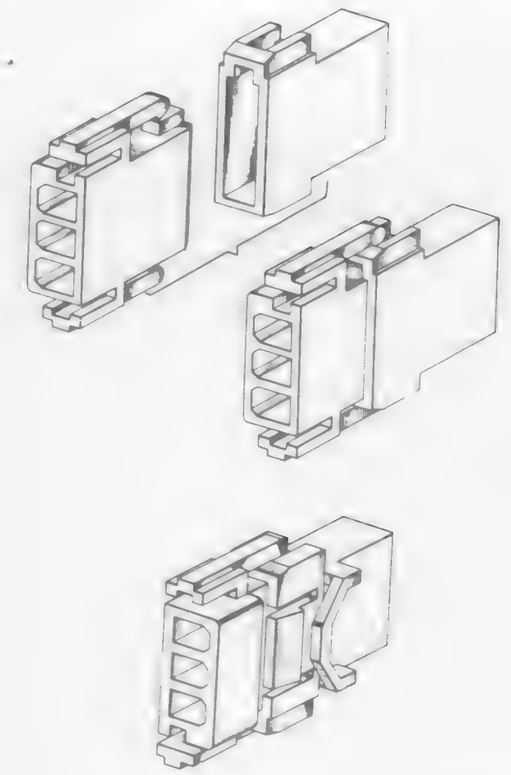
210,531
FLUID HEAT EXCHANGER FOR AIR CONDITIONING AND REFRIGERATION SYSTEMS AND THE LIKE
Raymond A. Lo Turco, Wexford, Pa., assignor to Frick Company, Waynesboro, Pa., a corporation of Pennsylvania
Filed Sept. 1, 1967, Ser. No. 8,460
Term of patent 14 years
(Cl. D23—153)



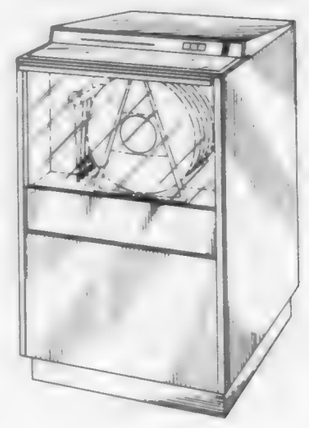
210,532
FLUID HEAT EXCHANGER FOR AIR CONDITIONING AND REFRIGERATION SYSTEMS AND THE LIKE
Raymond A. Lo Turco, Wexford, Pa., assignor to Frick Company, Waynesboro, Pa., a corporation of Pennsylvania
Filed Sept. 1, 1967, Ser. No. 8,461
Term of patent 14 years
(Cl. D23—153)



210,533
ELECTRICAL CONNECTOR HOUSING
William Vito Pauza, Harrisburg, Pa., assignor to AMP Incorporated, Harrisburg, Pa.
Filed Sept. 30, 1966, Ser. No. 4,113
Term of patent 14 years
(Cl. D26—1)

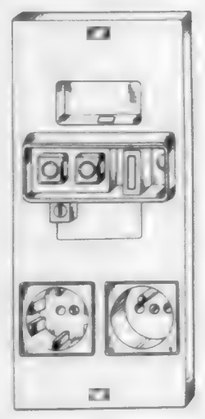


210,534
MAGNETIC DATA STORAGE UNIT
Harold L. Dean Wellesley, Mass., George H. Kress, East Orange, N.J., and Robert T. Pearson, Beverly, and David F. Sweeney, Wellesley, Mass., assignors, by mesne assignments, to Mohawk Data Science Corporation, Herkimer, N.Y., a corporation of New York
Filed Apr. 14, 1966, Ser. No. 1,900
Term of patent 14 years
(Cl. D26—5)

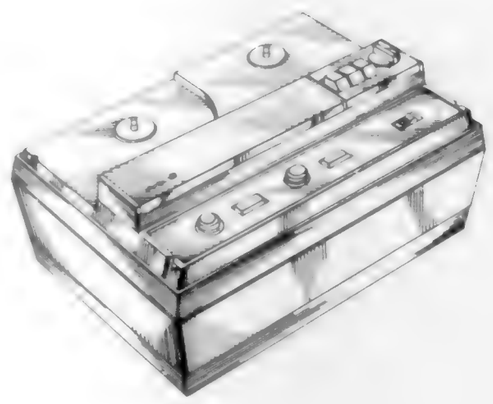


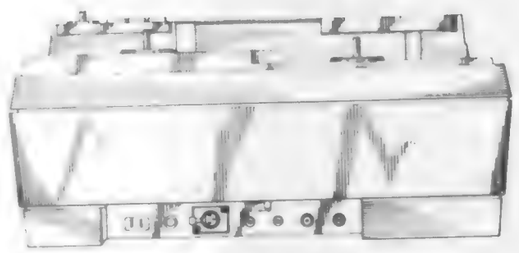
210,535
MAGNETIC TAPE TRANSPORT
Leon C. Sanderson, Los Angeles, Calif., assignor to Ampex Corporation, Redwood City, Calif., a corporation of California
Filed Feb. 24, 1967, Ser. No. 5,937
Term of patent 14 years
(Cl. D26—5)

210,536
COVER PLATE FOR ELECTRICAL RECEPTACLES
Mario Paganelli, Varese, Italy, assignor to Bassani S.p.A., Milan, Italy
Filed Dec. 20, 1966, Ser. No. 5,254
Claims priority, application Italy June 30, 1966
Term of patent 14 years
(Cl. D26—13)

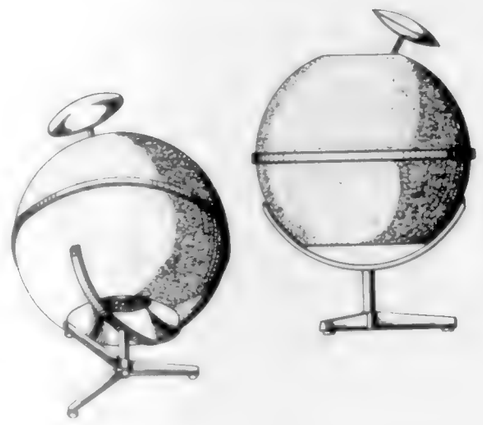


210,537
TAPE RECORDER
Richard S. Hart, Wheaton, Ill., assignor to Minnesota Mining and Manufacturing Company, St. Paul, Minn., a corporation of Delaware
Filed Apr. 22, 1966, Ser. No. 1,978
Term of patent 14 years
(Cl. D26—14)

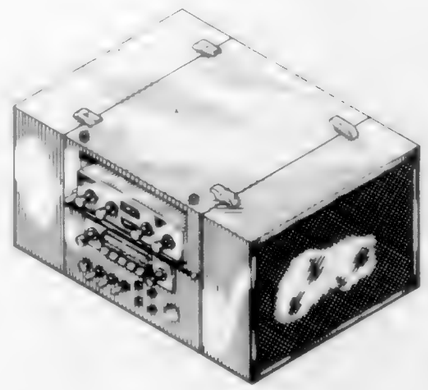




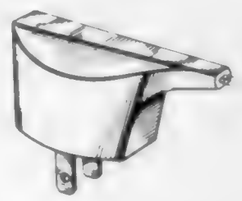
210,538
LOUDSPEAKER
Uolevi L. Lahti, 516 E. Liberty, Ann Arbor, Mich. 48108
Filed Dec. 22, 1966, Ser. No. 5,153
Term of patent 14 years
(Cl. D26—14)



210,539
PORTABLE STEREO TAPE RECORDER OR SIMILAR ARTICLE
Rex O. Wright, P.O. Box 16111, Salt Lake City, Utah 84116; Robert Haycraft, 1171 Hudson Ave., Salt Lake City, Utah 84106; and Raymond L. Gerard, 951 East 5650 South, Salt Lake City, Utah 84121
Filed July 24, 1967, Ser. No. 7,987
Term of patent 14 years
(Cl. D26—14)

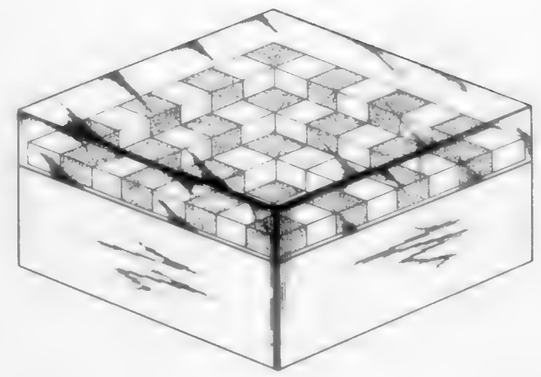


210,540
PLUG-IN POWER SUPPLY
Joseph A. Mas, 3 Maple Way Drive, Woodbury, N.Y. 11797
Filed Mar. 13, 1967, Ser. No. 6,191
Term of patent 14 years
(Cl. D26—15)

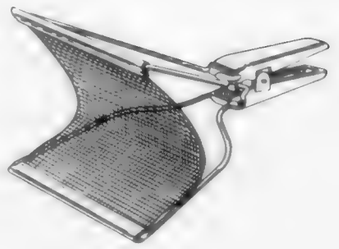


210,541
TOOTHPASTE TUBE DISPENSER
Donald E. McCombs, 3203 Chancer, St. Ann, Mo. 63074
Filed Jan. 30, 1967, Ser. No. 5,596
Term of patent 14 years
(Cl. D33—22)

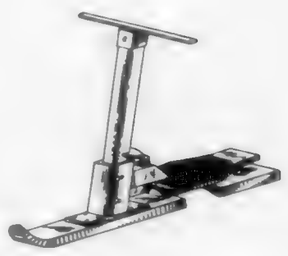
210,542
GAME BOARD
Noel Paul Stookey, 70 Bedford St., New York, N.Y. 10014
Filed Feb. 14, 1966, Ser. No. 1,022
Term of patent 14 years
(Cl. D34—5)



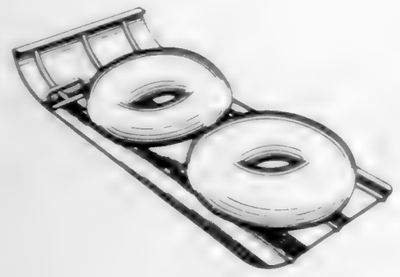
210,543
BALL PROJECTOR OR THE LIKE
Torao Nakayama, 38, 2-chome Hatsune-cho, Naka-ku, Yokohama, Japan
Filed Mar. 16, 1966, Ser. No. 1,495
Term of patent 14 years
(Cl. D34—5)



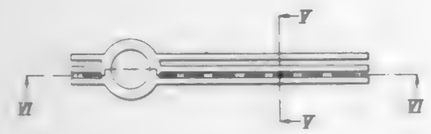
210,544
SKI SCOOTER
Samuel Fleisher, 2812 Ardmore, Royal Oak, Mich. 48073
Filed Nov. 21, 1966, Ser. No. 4,758
Term of patent 14 years
(Cl. D34—15)



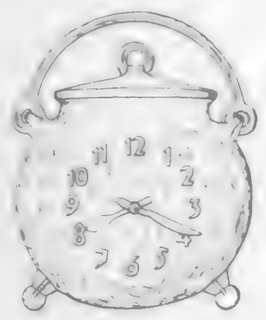
210,545
TOBOGGAN
Ray N. Thompson, 4096 West 5010 South, Kearns, Utah 84118
Filed Feb. 9, 1967, Ser. No. 5,750
Term of patent 14 years
(Cl. D34—15)



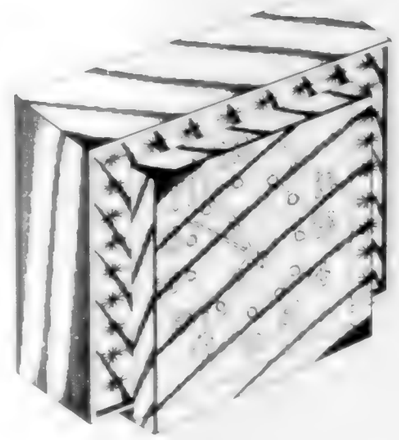
210,546
WATCH HAND OR SIMILAR ARTICLE
Hans-Ulrich Klingenberg, Merzligen, Switzerland, assignor to Vacuum Chronometer Corporation, Biel, Switzerland
Filed June 23, 1966, Ser. No. 2,793
Claims priority, application Switzerland Jan. 21, 1966
Term of patent 14 years
(Cl. D42—1)



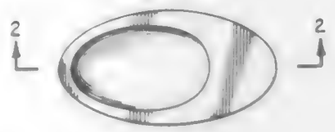
210,547
CLOCK
Harry L. Laylon, Syracuse, N.Y., assignor to Sunbeam Corporation, Chicago, Ill., a corporation of Illinois
Filed Jan. 27, 1966, Ser. No. 789
Term of patent 14 years
(Cl. D42—7)



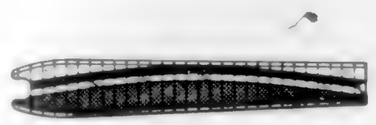
210,548
CLOCK CASING
Giacinto C. D'Ercoli, Park Forest, Roger L. Kelly, Arlington Heights, and Ellworth R. Danz and Roman J. Szalek, La Salle, Ill., assignors to General Time Corporation, Stamford, Conn., a corporation of Delaware
Filed July 19, 1967, Ser. No. 7,885
Term of patent 14 years
(Cl. D42—7)



210,549
SPOON
Donald Q. O'Brien, Bedminster, N.J., assignor to Warner-Lambert Pharmaceutical Company, Morris Plains, N.J., a corporation of Delaware
Filed Jan. 23, 1967, Ser. No. 5,521
Term of patent 14 years
(Cl. D44—29)



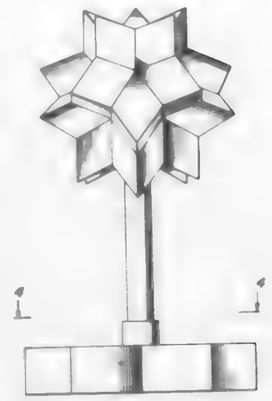
210,550
LINK CHAIN FOR A BRACELET OR THE LIKE
Morris D. Gandelman, Fort Lee, N.J., assignor to Jacoby-Bender, Inc., Woodside, N.Y., a corporation of New York
Filed July 26, 1967, Ser. No. 7,995
Term of patent 7 years
(Cl. D45—4)



210,551
FINGER RING
George A. Flynn, Warwick, R.I., assignor to Drexel Institute of Technology, Philadelphia, Pa., a corporation of Pennsylvania
Filed Nov. 28, 1966, Ser. No. 4,831
Term of patent 14 years
(Cl. D45—10)

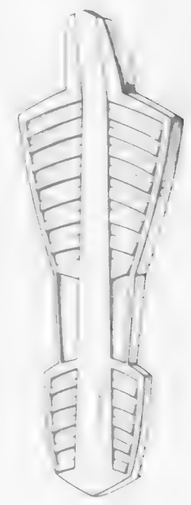
210,552
NECKLACE OR SIMILAR ARTICLE
Lee H. Pelzman, New York, N.Y., assignor to Pelton & Leru, Inc., New York, N.Y., a corporation of New York
Filed Oct. 23, 1967, Ser. No. 9,108
Term of patent 14 years
(Cl. D45—16)

210,553
LAMP
Henry J. Wilkerson, 211 S. McCrary St., Asheboro, N.C. 27203
Filed Dec. 28, 1966, Ser. No. 5,200
Term of patent 14 years
(Cl. D48—20)

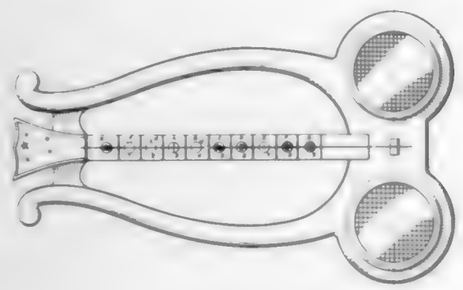


210,554
PITON OR THE LIKE
William A. Feuerer, 2009½ Oak St., Santa Monica, Calif. 90405
Filed Aug. 14, 1967, Ser. No. 8,261
Term of patent 14 years
(Cl. D54—11)

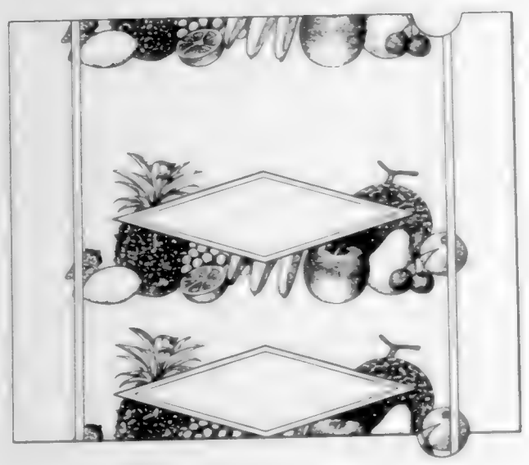
210,555
BASE DRUM BEATER FOOTPLATE COVER OR SIMILAR ARTICLE
Clifford A. Della-Porta, Evington, England, assignor to The Premier Drum Company Limited, London, England, a British company
Filed July 5, 1966, Ser. No. 2,914
Term of patent 14 years
(Cl. D56—1)



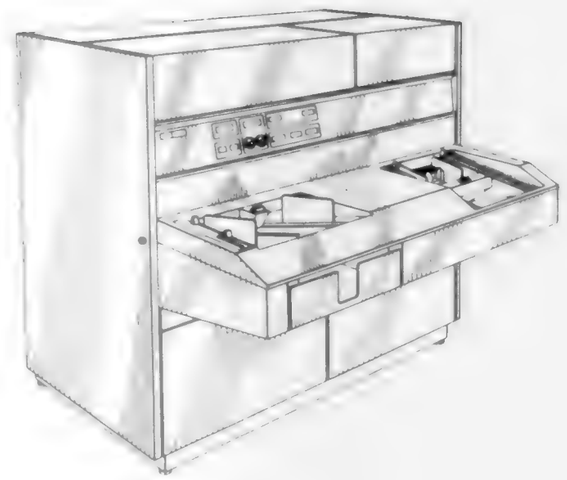
210,556
STRINGED MUSICAL INSTRUMENT
Clair Omar Musser, 12997 Blairwood Drive, Studio City, Calif. 91604
Filed Feb. 8, 1967, Ser. No. 5,724
Term of patent 14 years
(Cl. D56—1)



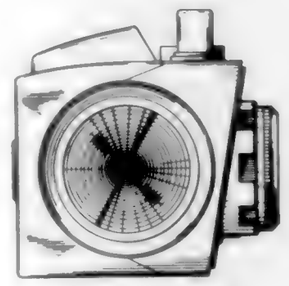
210,557
WRAPPING PAPER FOR CHEWING GUM
Akira Morita, Neyagawa-shi, Japan, assignor to Kanegafuchi Spinning Co., Ltd., Osaka, Japan
Filed Feb. 1, 1967, Ser. No. 5,648
Term of patent 14 years
(Cl. D59—2)



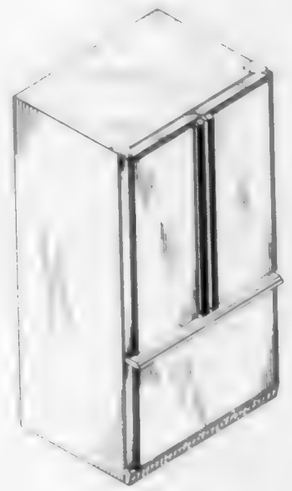
210,558
DOCUMENT REPRODUCING MACHINE
Robert G. Plantholt, Rochester, Mich., and Karl E. Kober, Rush, N.Y., assignors to Xerox Corporation, Rochester, N.Y., a corporation of New York
Filed Apr. 21, 1967, Ser. No. 6,780
Term of patent 14 years
(Cl. D61—1)



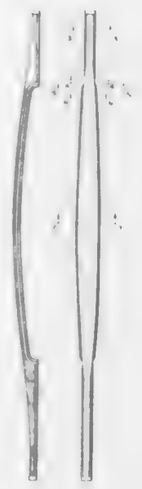
210,559
BOX CAMERA
Pasquale A. Mercorelli, 37 Halleck St., Newark, N.J. 07104
Filed May 24, 1967, Ser. No. 7,257
Term of patent 14 years
(Cl. D61—1)



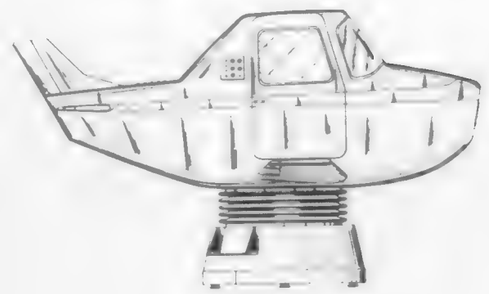
210,560
REFRIGERATOR-FREEZER CABINET
Robert W. Kennedy, Hilliard, and Wallace H. Appel, Columbus, Ohio, assignors to Westinghouse Electric Corporation, a corporation of Pennsylvania
Filed June 30, 1966, Ser. No. 2,873
Term of patent 14 years
(Cl. D67—3)



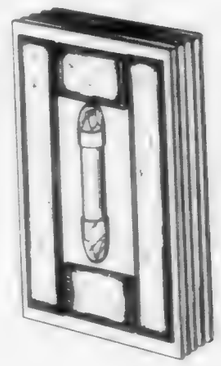
210,561
CABINET DOOR HANDLE
Edward H. Roberts, Jeffersontown, and Lawrence R. Collins, Louisville, Ky., assignors to General Electric Company, a corporation of New York
Filed June 14, 1967, Ser. No. 7,478
Term of patent 14 years
(Cl. D67—3)



210,562
FIXED-BASE AVIATION TRAINER
Laimons E. Drupa and Richard L. Strong, Binghamton, N.Y., assignors to General Precision Systems Inc., a corporation of Delaware
Filed Mar. 3, 1967, Ser. No. 6,044
Term of patent 14 years
(Cl. D71—1)

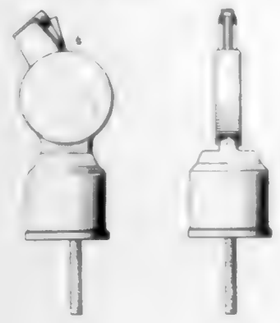


210,563
CONTAINER INSERT FOR A COSMETIC PACKAGE
Georges Kocens, 235 Camino Descanso, Palm Springs, Calif. 92262
Filed Apr. 6, 1967, Ser. No. 6,553
Term of patent 14 years
(Cl. D86—10)

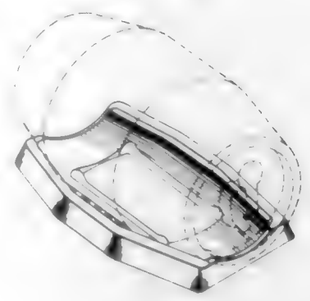


210,564
COMBINATION GUARD AND SPROCKET ASSEMBLY FOR BICYCLES EQUIPPED WITH DERAILLEUR MECHANISM
Frank P. Brilando, Niles, and Anton J. Panzica, Hinsdale, Ill., assignors to Schwinn Bicycle Company, a corporation of Illinois
Filed Nov. 7, 1966, Ser. No. 4,569
Term of patent 14 years
(Cl. D90—17)

210,565
LIQUOR POURER
Patrick Kearney, 38—11 217th St., Bayside, N.Y. 11360
Filed Nov. 15, 1965, Ser. No. 88,081
Term of patent 14 years
(Cl. D94—3)



210,566
KEG CRADLE
Frederic C. Jay, Richmond, Va., assignor to Richmond Cedar Works Manufacturing Corporation, Richmond, Va., a corporation of Virginia
Filed Apr. 17, 1967, Ser. No. 6,729
Term of patent 14 years
(Cl. D94—3)



LIST OF DESIGN PATENTEES

TO WHOM

PATENTS WERE ISSUED ON THE 19TH DAY OF MARCH, 1968

NOTE.—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice).

AMP Inc.: *See*—
Pauza, William V. 210,533.
Albrecht, Leonard N., to Warner-Lambert Pharmaceutical Co. Automatic pipeting unit. 210,523, 3–19–68, Cl. D16—2.
Ampex Corp.: *See*—
Sanderson, Leon C. 210,535.
Appel, Wallace H.: *See*—
Kennedy, Robert W., and Appel. 210,560.
Aronson, Robert R., to Electric Fuel Propulsion, Inc. Automobile. 210,520, 3–19–68 Cl. D14—3.
Baratte, Paul. Holder for a squeeze tube. 210,517, 3–19–68, Cl. D9—294.
Bassani S.p.A.: *See*—
Paganelli, Mario. 210,536.
Brammer, Herbert, to Charles Mackinlay & Co. Ltd. Bottle. 210,514, 3–19–68, Cl. D9—72.
Briando, Frank P., and A. J. Panzica, to Schwinn Bicycle Co. Combination guard and sprocket assembly for bicycles equipped with derailleur mechanism. 210,564, 3–19–68, Cl. D90—17.
Burns, Dennis L. Face guard for a helmet. 210,510, 3–19–68, Cl. D2—233.
Collins, Lawrence R.: *See*—
Roberts, Edward H., and Collins. 210,561.
Conner, James M.: *See*—
Dreyfuss, Henry, and Conner. 210,521.
Container Corp. of America: *See*—
Walter, Richard T. 210,515.
Continental Can Co., Inc.: *See*—
Mascia, Carmen T., and Peyser. 210,516.
Danz, Ellworth R.: *See*—
D'Ercoli, Giacinto C., Kelly, Danz, and Szalek. 210,548.
Dean, Harold L., G. H. Kress, R. T. Pearson, and D. F. Sweeney, to Mohawk Data Science Corp. Magnetic data storage unit. 210,534, 3–19–68, Cl. D26—5.
Deere & Co.: *See*—
Dreyfuss, Henry, and Conner. 210,521.
Della-Porta, Clifford A., to The Premier Drum Co. Ltd. Base drum beater footplate cover or similar article. 210,555, 3–19–68, Cl. D56—1.
D'Ercoli, Giacinto C., R. L. Kelly, E. R. Danz, and R. J. Szalek, to General Time Corp. Clock casing design. 210,548, 3–19–68, Cl. D42—7.
Dorsey, William J., to Kaysam Corp. of America. Boot. 210,511, 3–19–68, Cl. D2—272.
Drexel Institute of Technology: *See*—
Flynn, George A. 210,551.
Dreyfuss, Henry, and J. M. Conner, to Deere & Co. Tractor. 210,521, 3–19–68, Cl. D14—3.
Drupa, Laimons E., and R. L. Strong, to General Precision Systems Inc. Fixed-base aviation trainers. 210,562, 3–19–68, Cl. D71—1.
Electric Fuel Propulsion, Inc.: *See*—
Aronson, Robert R. 210,520.
Feuerer, William A. Piton or the like. 210,554, 3–19–68. Cl. D54—11.
Fleisher, Samuel. Ski scooter. 210,544, 3–19–68, Cl. D34—15.
Flynn, George A., to Drexel Institute of Technology. Finger ring. 210,551, 3–19–68, Cl. D45—10.
Frick Co.: *See*—
Lo Turco, Raymond A. 210,526.
Lo Turco, Raymond A. 210,527.
Lo Turco, Raymond A. 210,528.
Lo Turco, Raymond A. 210,529.
Lo Turco, Raymond A. 210,530.
Lo Turco, Raymond A. 210,531.
Lo Turco, Raymond A. 210,532.
Gandelman, Morris D., to Jacoby-Bender, Inc. Link chain for a bracelet or the like. 210,550, 3–19–68, Cl. D45—4.
General Electric Co.: *See*—
Roberts, Edward H., and Collins. 210,561.
General Precision Systems Inc.: *See*—
Drupa, Laimons E., and Strong. 210,562.
General Time Corp.: *See*—
D'Ercoli, Giacinto C., Kelly, Danz, and Szalek. 210,548.
Gerard, Raymond L.: *See*—
Wright, Rex O., Haycraft, and Gerard. 210,539.
Hart, Richard S., to Minnesota Mining and Mfg. Co. Tape recorder. 210,537, 3–19–68, Cl. D26—14.
Haycraft, Robert: *See*—
Wright, Rex O., Haycraft, and Gerard. 210,539.
International Research Corp.: *See*—
Keane, Robert S. 210,525.
Jacoby-Bender, Inc.: *See*—
Gandelman, Morris D. 210,550.
Jay, Frederic C., to Richmond Cedar Works Mfg. Corp. Keg cradle. 210,566, 3–19–68, Cl. D94—3.
Kallman, Robert: *See*—
Kanter, Harry, and Kallman. 210,512.
Kanegafuchi Spinning Co., Ltd.: *See*—
Morita, Akira. 210,557.
Kanter, Harry, and R. Kallman. Necktie knot support. 210,512, 3–19–68, Cl. D2—401.
Kaysam Corp. of America: *See*—
Dorsey, William J. 210,511.
Keane, Robert S., to International Research Corp. High-pressure, electrically actuated, fluid valve. 210,525, 3–19–68, Cl. D23—19.
Kearney, Patrick. Liquor pourer. 210,565, 3–19–68, Cl. D94—3.
Kelly, Roger L.: *See*—
D'Ercoli, Giacinto C., Kelly, Danz, and Szalek. 210,548.
Kennedy, Robert W., and W. H. Appel, to Westinghouse Electric Corp. Refrigerator-freezer cabinet. 210,560, 3–19–68, Cl. D67—3.
Klingenberg, Hans-Ulrich, to Vacuum Chronometer Corp. Watch hand or similar article. 210,546, 3–19–68, Cl. D42—1.
Kober, Karl E.: *See*—
Plantholt, Robert G., and Kober. 210,558.
Kocens, Georges. Container insert for a cosmetic package. 210,563, 3–19–68, Cl. D86—10.
Kress, George H.: *See*—
Dean, Harold L., Kress, Pearson, and Sweeney. 210,534.
Kusel, Edward J., and R. S. Mankin. Railing. 210,519, 3–19–68, Cl. D13—7.
Lahti, Uolevi L. Loudspeaker. 210,538, 3–19–68, Cl. D26—14.
Laughlin, Clayton A., to Minnesota Plastics Corp. Jug. 210,513, 3–19–68, Cl. D9—41.
Laylon, Harry L., to Sunbeam Corp. Clock. 210,547, 3–19–68, Cl. D42—7.
Lo Turco, Raymond A., to Frick Co. Fluid heat exchanger for air conditioning and refrigeration systems and the like. 210,526, 3–19–68, Cl. D23—153.
Lo Turco, Raymond A., to Frick Co. Fluid heat exchanger for air conditioning and refrigeration systems and the like. 210,527, 3–19–68, Cl. D23—153.
Lo Turco, Raymond A., to Frick Co. Fluid heat exchanger for air conditioning and refrigeration systems and the like. 210,528, 3–19–68, Cl. D23—153.
Lo Turco, Raymond A., to Frick Co. Fluid heat exchanger for air conditioning and refrigeration systems and the like. 210,529, 3–19–68, Cl. D23—153.
Lo Turco, Raymond A., to Frick Co. Fluid heat exchanger for air conditioning and refrigeration systems and the like. 210,530, 3–19–68, Cl. D23—153.
Lo Turco, Raymond A., to Frick Co. Fluid heat exchanger for air conditioning and refrigeration systems and the like. 210,531, 3–19–68, Cl. D23—153.
Lo Turco, Raymond A., to Frick Co. Fluid heat exchanger for air conditioning and refrigeration systems and the like. 210,532, 3–19–68, Cl. D23—153.
Mackinlay, Charles, & Co. Ltd.: *See*—
Brammer, Herbert. 210,514.
Mankin, Robert S.: *See*—
Kusel, Edward J., and Mankin. 210,519.
Mas, Joseph A. Plug-in power supply. 210,540, 3–19–68, Cl. D26—15.
Mascia, Carmen T., and H. A. Peyser, to Continental Can Co., Inc. Dispenser cap for containers. 210,516, 3–19–68, Cl. D9—276.
McCombs, Donald E. Toothpaste tube dispenser. 210,541, 3–19–68, Cl. D33—22.
Mercorelli, Pasquale A. Box camera. 210,559, 3–19–68, Cl. D61—1.
Minnesota Mining and Mfg. Co.: *See*—
Hart, Richard S. 210,537.
Laughlin, Clayton A. 210,513.
Mohawk Data Science Corp.: *See*—
Dean, Harold L., Kress, Pearson, and Sweeney. 210,534.
Morita, Akira, to Kanegafuchi Spinning Co., Ltd. Wrapping paper for chewing gum. 210,557, 3–19–68, Cl. D59—2.
Musser, Clair O. Stringed musical instrument. 210,556, 3–19–68, Cl. D56—1.
Nakayama, Torao. Ball projector or the like. 210,543, 3–19–68. Cl. D34—5.
O'Brien, Donald Q., to Warner-Lambert Pharmaceutical Co. Spoon. 210,549, 3–19–68, Cl. D44—29.
Paganelli, Mario, to Bassani S.p.A. Cover plate for electrical receptacles. 210,536, 3–19–68, Cl. D26—13.
Panzica, Anton J.: *See*—
Brilando, Frank P., and Panzica. 210,564.
Pauza, William V., to AMP Inc. Electrical connector housing. 210,533, 3–19–68, Cl. D26—1.
Pearson, Robert T.: *See*—
Dean, Harold L., Kress, Pearson, and Sweeney. 210,534.
Pelton & Leru, Inc.: *See*—
Pelzman, Lee H. 210,552.
Pelzman, Lee H., to Pelton & Leru, Inc. Necklace or similar article. 210,552, 3–19–68, Cl. D45—16.
Peyser, Harry A.: *See*—
Mascia, Carmen T., and Peyser. 210,516.
Plantholt, Robert G., and K. E. Kober, to Xerox Corp. Document reproducing machine. 210,558, 3–19–68, Cl. D61—1.
Premier Drum Co. Ltd., The: *See*—
Della-Porta, Clifford A. 210,555.

Richmond Cedar Works Mfg. Corp. : *See*—
Jay, Frederic C. 210,566.
Roberts, Edward H., and L. R. Collins, to General Electric Co. Cabinet door handle. 210,561, 3–19–68, Cl. D67—3.
Sanderson, Leon C., to Ampex Corp. Magnetic tape transport. 210,535, 3–19–68, Cl. D26—5.
Schwinn Bicycle Co. : *See*—
Brilando, Frank P., and Panzica. 210,564.
Smith, Guy. Burial vault. 210,524, 3–19–68, Cl. D19—1.
Stookey, Noel P. Game board. 210,542, 3–19–68, Cl. D34—5.
Strong, Richard L. : *See*—
Drupa, Laimons E., and Strong. 210,562.
Sunbeam Corp. : *See*—
Laylon, Harry L. 210,547.
Sweeney, David F. : *See*—
Dean, Harold L., Kress, Pearson, and Sweeney. 210,534.
Szalek, Roman J. : *See*—
D'Ercoli, Giacinto C., Kelly, Danz, and Szalek. 210,548.
Thompson, Ray N. Toboggan. 210,545, 3–19–68, Cl. D34—15.
Vacuum Chronometer Corp. : *See*—
Klingenberg, Hans-Ulrich. 210,546.
Walter, Richard T., to Container Corp. of America. Egg carton. 210,515, 3–19–68, Cl. D9—190.
Ward, Elmer A. Combination boat and canopy for the bed of a pick-up vehicle and the like. 210,522, 3–19–68, Cl. D14—27.
Warner-Lambert Pharmaceutical Co. : *See*—
Albrecht, Leonard N. 210,523.
O'Brien, Donald Q. 210,549.
Westinghouse Electric Corp. : *See*—
Kennedy, Robert W., and Appel. 210,560.
Wilkerson, Henry J. Lamp. 210,553, 3–19–68, Cl. D48—20.
Woodman, Gerald A. Three-dimensional plastic panel. 210,518, 3–19–68, Cl. D13—1.
Wright, Rex O., R. Haycraft, and R. L. Gerard. Portable stereo tape recorder or similar article. 210,539, 3–19–68, Cl. D26—14.
Xerox Corp. : *See*—
Plantholt, Robert G., and Kober. 210,558.

LIST OF PATENTEES

TO WHOM

PATENTS WERE ISSUED ON THE 19TH DAY OF MARCH, 1968

NOTE.—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice).

Abbott, Frank R. : *See*—
Burbank, Cecil J., and Abbott. 3,373,842.
Abbott Laboratories : *See*—
Kolsto, Orville L. 3,374,064.
ACF Industries : *See*—
Lane, Thomas. 3,373,594.
Adams, Richard C., to Friden, Inc. Control means in mail separating cancelling and stacking machines. 3,373,685, 3–19–68, Cl. 101—235.
Adams, Robert B., to Moore Products Co. Flow control apparatus. 3,373,759, 3–19–68, Cl. 137—81.5.
Adams, Robert B., and T. J. Huslin, to Moore Products, Co. Fluid control apparatus. 3,373,760, 3–19–68, Cl. 137—81.5.
Adamski, Joseph : *See*—
Tinder, David V., Ollman, and Adamski. 3,373,528.
Adamson, Arthur P. : *See*—
Erwin, John R., and Adamson. 3,373,928.
Admiral Corp. : *See*—
Bohman, Raymond H. 3,373,577.
Squire, Herbert D. 3,373,754.
Aerojet-General Corp. : *See*—
Lawson, Herbert E. 3,374,120.
Aerospace Systems Co. : *See*—
Kriesel, Marshall S. 3,373,656.
Afton, Leonard. Combined holder and utensil for a fever thermometer. 3,373,863, 3–19–68, Cl. 206—16.5.
AGFA Aktiengesellschaft : *See*—
Dieterich, Dieter, Bayer, Himmelmann, and Ulrich. 3,374,095.
Agfa-Gevaert Aktiengesellschaft : *See*—
Dürr, Helmut. 3,374,458.
Jakob, Franz. 3,373,671.
Air Products and Chemicals, Inc. : *See*—
Craig, Robert G., Friedman, and Schwartz. 3,374,167.
Jepsen, Robert E. 3,373,999.
McEvoy, James, and Shallit. 3,374,184.
Air Reduction Co., Inc. : *See*—
Edwards, Bernard, and Kimak. 3,374,133.
Air-Tech Industries, Inc. : *See*—
Meyer, Hans and K. 3,373,531.
Aishima, Itsuho, and Y. Takashi, to Asahi Kasei Kogyo Kabushiki Kaisha. Process for polymerizing propylene using a solid ternary catalyst of titanium, antimony and aluminum. 3,374,214, 3–19–68, Cl. 260—93.7.
Ajem Laboratories, Inc. : *See*—
Stewart, James M., Pashaian, Romack, and Arnold. 3,373,877.
Akai Electric Co., Ltd. : *See*—
Atsumi, Katsuya. 3,373,913.
Aktiebolaget Bofors : *See*—
Simmons, Bjorn H. O. 3,373,687.
Aktiebolaget Tabougnar : *See*—
Borgkvist, Tage A. 3,373,980.
Aktiengesellschaft Brown, Boveri & Cie : *See*—
Bühler, Karl, and Trachsel. 3,374,320.
Alberto, Pietro : *See*—
Gillono, Matteo, and Alberto. 3,373,551.
Albinak, Marvin J., and W. H. Turner, to Owens-Illinois, Inc. Multi-color photoluminescent glass systems. 3,374,381, 3–19–68, Cl. 313—108.
Albrecht, Walter A. Fuel vaporizer for internal combustion engines. 3373,726, 3–19–68, Cl. 123—122.
Albright & Wilson (Mfg.) Ltd. : *See*—
Coates, Harold, and Hoye. 3,374,278.
Alfa-Laval AB : *See*—
Kompert, Paul. 3,373,874.
Algieri Salvatore : *See*—
Cappuccio, Vittorio, and Algieri. 3,374,215.
Allen, Donald L. : *See*—
Blaiklock, William M., and Allen. 3,373,962.
Allen, John H., Sr., and O. A. Wobig, to United States of America, National Aeronautics and Space Administration. Apparatus for machining geometric cones. 3,373,640, 3–19–68, Cl. 82—14.
Allen, Miner D. : *See*—
De Hart, Edward G., and Allen. 3,373,906.
Allen, Roe C., Jr. : *See*—
Boberg, Thomas C., and Allen. 3,373,805.
Allied Chemical Corp. : *See*—
Boggs, Beryl Aaron. 3,373,469.
Cunningham, William J., and Woolf. 3,374,273.
Schmidt, Lawrence D. 3,374,151.
Wholf, Robert H. 3,374,194.
Allied Plastics Co. : *See*—
Crane, Walton B. 3,373,921.
Allison, Virgil E. Loading attachment. 3,373,885. 3–19–68, Cl. 214—131.
Alloy Engineering Co., The : *See*—
Johnson, Carl G. A., and Whitten. 3,373,983.
Alter, Henry W., to General Electric Co. Visual imaging of track-etched patterns. 3,373,683, 3–19–68, Cl. 101—129.
Aluminum Co. of America : *See*—
Blayden, James H. 3,373,537.
Watt, William E. R., and Willis. 3,373,479.
Amchem Products, Inc. : *See*—
Schieffman, Louis, and Machu. 3,374,156.
American Allsafe Co. : *See*—
Militello, James V. 3,373,444.
American Brake Shoe Co. : *See*—
Smilges, Robert, and Caslow. 3,373,763.
American Cyanamid Co. : *See*—
Blichars, Mitchell S., and Jackson. 3,374,146.
Deichert, William G. 3,374,200.
Kende, Andrew S. 3,374,271.
Naumann, Herbert O. 3,373,553.
Wright, William B., Jr., and Brabander. 3,374,237.
American Maize-Products Co. : *See*—
Frank, Ernest Yui, and Silvasi. 3,374,115.
American Metal Climax, Inc. : *See*—
Berridge, Jack A. 3,373,534.
American Seating Co. : *See*—
Barecki, Chester J. 3,373,703.
American Tobacco Co., The : *See*—
Black, James H., Coleman, and Stant. 3,373,870.
Amphenol Corp. : *See*—
Concelman, Carl W. 3,374,364.
Anchor Chemical Co., The : *See*—
Roberts, Kenneth C., and White. 3,374,172.
Anderholm, Ferd R., D. J. Farris, and L. J. Fiegel, Jr., to International Business Machines Corp. Physiological monitoring system. 3,374,461, 3–19–68, Cl. 340—147.
Anderson, Alfred J. : *See*—
Hardman, Kenneth V., and Anderson. 3,373,903.
Anderson, Fred A., to Royal Typewriter Co., Inc. Pushbutton switches with at least one flexible cantilevered spring leaf contact continually prestressed by a pushbutton. 3,374,333, 3–19–68, Cl. 200—164.
Anderson, Gerald R., to FMC Corp. Fruit processing battery. 3,373,785. 3–19–68, Cl. 146—43.
Anderson, Gerald R., S. H. Creed, and J. T. Parker, to FMC Corp. Fruit seed-celling machine having automatic depth control means for cutter. 3,373,786, 3–19–68, Cl. 146—52.
Anderson, Warren C., Jr. : *See*—
Shears, Stuart T., and Anderson. 3,373,742.
Anderson, William E., and G. P. Wiederecht, to Riegel Paper Corp. Moldable pouch material. 3,373,915, 3–19–68, Cl. 229—3.5.
Anderson, Wilmer C., to General Time Corp. Phase shift device. 3,374,359, 3–19–68, Cl. 307—106.
Andrews, Sydney A. : *See*—
Parkin, Leslie, and Andrews. 3,373,789.
Angel, Arthur M. Transaction recorder for printing on pressure-sensitive journal tape. 3,373,682, 3–19–68, Cl. 101—45.
Annis, Max R. : *See*—
Robinson, Leon H., Jr., Friedman, and Annis. 3,373,820.
Anschuts & Co., G.m.b.H. : *See*—
Lassig, Martin. 3,373,617.
Arburg Maschinenfabrik Hehl & Sohne : *See*—
Hehl, Karl. 3,373,459.
Arentzen, Einar M., to Lee-Norse Co. Cutter head having fluid supply means. 3,374,033, 3–19–68, Cl. 299—81.
Arfert, Horst F. W., to Reynolds Metals Co. Pull tab opening means and method of making same. 3,373,895, 3–19–68, Cl. 220—54.
Armbrust, Herbert : *See*—
Seefelder, Matthias, and Armbrust. 3,374,282.
Armour Pharmaceutical Co. : *See*—
Bossinger, Charles D., and Taylor. 3,374,265.
Enkoji, Takashi, and Bossinger. 3,374,145.
Armstead, George B., Jr., to The Menow Machine Co. Stitch formation. 3,373,706, 3–19–68, Cl. 112—162.
Armstrong Cork Co. : *See*—
Heckles, John, and Mitchell. 3,374,250.
Herweh, John E., and Poshkus. 3,374,189.
Herweh, John E., and Poshkus. 3,374,190.
Mitchell, Charles D. 3,374,248.
Mitchell, Charles D. 3,374,249.
Armstrong Whitworth (Marine) Ltd. : *See*—
Stokes, Edward H. G. 3,373,712.
Arpaia, Miachel A. Fuel supply system, carburetor and method. 3,373,725, 3–19–68, Cl. 123—119.
Arya, Vishwa P., to Ciba Ltd. Thiosemicarbazones and process for their manufacture. 3,374,234, 3–19–68, Cl. 260—247.1.
Asahi Kasei Kogyo Kabushiki Kaisha : *See*—

Muir, David III. 3,374,463.
Muir, David, III. 3,374,468.

Bell, Thomas A., J. L. Etchells, and W. W. G. Smart, Jr., to United States of America, Agriculture. Enzyme inhibitor for preventing softening in brined foods. 3,374,099, 3–19–68. Cl. 99—156.

Belock Instrument Corp.: *See*—
Rothe, Wilhelm E., and Loughead. 3,373,499.

Beloit Eastern Corp.: *See*—
Klaczkiewicz, Edward J. 3,373,952.

Bencze, William L.: *See*—
Carney, Richard W. J., and Bencze. 3,374,245.

Bendix Corp., The: *See*—
Goodrich, George W. 3,374,380.
Taplin, Lael B. 3,373,600.
Wesstrom, Alfred. 3,373,627.

Benfield, John R., and G. W. Barnhart, Medical device such as for ileostomy and colostomy. 3,373,745, 3–19–68, Cl. 128—283.

Benner, Jon E.: *See*—
Fullerton, Hal B., Jr., Webb, and Benner. 3,373,823.

Benner, Stanley G.: *See*—
Maddox, Robert E., Hengstler, and Benner. 3,374,075.

Bennett, Frank P., to General Aniline & Film Corp. Slide changing device. 3,373,518, 3–19–68, Cl. 40—79.

Benson, Howard F., to General Dynamics Corp. Filtered wave-energy corner-reflector. 3,374,044, 3–19–68, Cl. 350—102.

Berg, Robert D. W. Latch mechanism. 3,374,020, 3–19–68, Cl. 292—175.

Bergen, George J., and A. H. Singer, to United States of America, Navy. Accumulation means for reduction of sputter in gas-filled, Lyman-Alpha source tube. 3,374,383, 3–19–68, Cl. 313—207.

Bernardi, Luigi, G. Bosisio, R. de Castiglione, and O. Goffredo, to Societa Farmaceutici Italia. Protected derivatives of physalaemin. 3,374,218, 3–19–68, Cl. 260—112.5.

Berndt, Walter, and H. Redlich, to Telefunken Aktiengesellschaft, Record. 3,373,997, 3–19–68, Cl. 274—42.

Berridge, Jack A., to American Metal Climax, Inc. Attachment clip for metal shingles. 3,373,534, 3–19–68, Cl. 52—90.

Bertin & Cie: *See*—
Guienne, Paul. 3,373,837.

Besler Corp.: *See*—
Boyen, John L. 3,373,771.

Bessette, Joseph U., J. A. Priestley, and H. O. Kennette, to Johnson & Johnson. Method for carding fibers. 3,373,461, 3–19–68, Cl. 19—98.

Best, Albert M.: *See*—
Kline, Charles M., and Best. 3,373,503.

Best, Donald T., and J. R. Van Andel, to Burroughs Corp. Timing circuitry in a drum storage computer system. 3,374,462, 3–19–68, Cl. 340—172.5.

Best, Stanley G., to United Aircraft Corp. Electronic schedule generator tracking circuit and rate limiter. 3,373,675, 3–19–68, Cl. 98—1.5.

Bethell, James R.: *See*—
Barclay, John L., Hadley, and Bethell. 3,374,284.

Bethlehem Steel Corp.: *See*—
Epstein, Henry, and Neubaum. 3,374,088.
Regan, Lloyd V., Jr., and Emond. 3,373,944.
Poole, William D. 3,374,159.

Bialkowski, Ludwik S., to The B. F. Goodrich Co. Diaphragm seal with a tubular extension carrying the sealing edge. 3,373,998, 3–19–68, Cl. 277—110.

Bianco, Thomas S., and E. M. Kratz, to Mono-Sol Division. Polyvinyl alcohol compositions containing a plasticizer mixture. 3,374,195, 3–19–68, Cl. 260—29.6.

Bick, David E., and C. R. Little, to Dowty Mining Equipment Ltd. Hydraulic devices for controlling the speed of wheeled vehicles. 3,373,699, 3–19–68, Cl. 104—162.

Biedermann, Walter, and E. Steiner, to J. R. Geigy, A.G. Chromium-containing dyestuffs containing a monoazo and a diazo dyestuff. 3,374,219, 3–19–68, Cl. 260—145.

Bien, Alfred A., and R. M. Gerweck, to Chrysler Corp. Releasable steering column clamp. 3,373,965, 3–19–68, Cl. 248—226.

Binsley, Glen E.: *See*—
Heiss, John F., and Binsley. 3,374,098.

Biron, Jules N., D. B. Jones, and D. L. Sims, to United States of America, National Science Foundation. Apparatus for coring subterranean formations under a body of water. 3,373,827, 3–19–68, Cl. 175—6.

Bishop, Leonard J., to Mechanical Handling Systems, Inc. Signal setting mechanism for tow truck conveyor systems. 3,373,698, 3–19–68, Cl. 104—88.

Bivans Corp.: *See*—
Bivans, Elbert L. 3,373,665.

Bivans, Elbert L., to Bivans Corp. Cartoning machine for vertical carton flats. 3,373,665, 3–19–68, Cl. 93—53.

Bjelland, John L., to Powers Chemco, Inc. Magazine for dispensing photographic film. 3,373,644, 3–19–68, Cl. 83—650.

Black, James E., Jr.: *See*—
Blunden, Donald J., Black, De Shetler, and Gotcher. 3,374,008.

Black, James H., C. E. Coleman, and V. C. Stant, to The American Tobacco Co. Cigar classification apparatus. 3,373,870, 3–19–68, Cl. 209—111.6.

Blaiklock, William M., and D. L. Allen, to General Steel Wares Ltd. Washing machine support structure. 3,373,962, 3–19–68, Cl. 248—18.

Blain, Jim W., and A. B. Leaman, to Lockheed Aircraft Corp. Explosive actuator. 3,373,686, 3–19–68, Cl. 102—22.

Blatter, Herbert M.: *See*—
De Stevens, George, Blatter, and Carney. 3,374,232.

Blau, William, ½ to Spectronics, Inc. Radar signaling system with reduced clutter effect. 3,374,478, 3–19–68, Cl. 343—5.

Blayden, James H., to Aluminum Co. of America. Joint structures and elements thereof. 3,373,537, 3–19–68, Cl. 52—288.

Blicharz, Mitchell S., and G. J. Jackson, to American Cyanamid Co. Sustained release encapsulation. 3,374,140, 3–19–68, Cl. 167—83.

Block, Edwin H.: *See*—
Larkam, Charles W., English, Hammer, Block, and Collins. 3,374,403.

Blosser, Donald N. Internal combustion engine. 3,373,723, 3–19–68, Cl. 123—17.

Blume, Peter, to North American Philips Co., Inc. Thyristor switching amplifiers for rapidly switching-on inductive loads. 3,374,422, 3–19–68, Cl. 323—22.

Blunden, Donald J., J. E. Black, Jr., L. K. De Shetler, and E. D. Gotcher, to Whitehead & Kales Co. Vehicle tie-down structure. 3,374,008, 3–19–68, Cl. 280—179.

Boberg, Thomas C., and R. C. Allen, Jr., to Esso Production Research Co. Steam lifting of heavy crudes. 3,373,805, 3–19–68, Cl. 166—2.

Bobrick, Mitchell. Post light. 3,374,343, 3–19–68, Cl. 240—3.

Boderke, Hubert: *See*—
Taubmann, Harro, and Boderke. 3,373,981.

Boggs, Beryl A., to Allied Chemical Corp. Apparatus for crimping textile fibers. 3,373,469, 3–19–68, Cl. 28—1.

Boggs, Le Roy A., to Koppers Co., Inc. Method and apparatus for making fiber reinforced articles of cross sectional shape other than cylindrical. 3,374,132, 3–19–68, Cl. 156—171.

Bohman, Raymond H., to Admiral Corp. Air conditioner control. 3,373,577, 3–19–68, Cl. 62—180.

Bohme, Alexander, to Nassovia Werkzeugmaschinenfabrik G.m.b.H. Tracing mechanism for duplicating machine. 3,373,659, 3–19–68, Cl. 90—62.

Bolomey, Rene A., to The Mearl Corp. Particulate reflective elements and method for forming the same. 3,374,105, 3–19–68, Cl. 106—291.

Borg-Warner Corp.: *See*—
Ericson, Roger K. 3,373,855.
Haas, Ronald H. 3,373,660.
Hendry, James W. 3,373,502.
Nelson, James K. 3,373,575.
Newton, Alwin B. 3,373,799.

Borgkvist, Tage A., to Aktiebolaget Tabougnar. Walking beam furnace for effecting different feed speeds of the charge. 3,373,980, 3–19–68, Cl. 263—6.

Borgman, Arthur C.: *See*—
Nesslinger, Fritz J., and Borgman. 3,373,887.

Bosisio, Germano: *See*—
Bernardi, Luigi, Bosisio, De Castiglione, and Goffredo. 3,374,218.

Bossinger, Charles D.: *See*—
Enkoji, Takashi, and Bossinger. 3,374,145.

Bossinger, Charles D., and K. G. Taylor, to Armour Pharmaceutical Co. Diphenyl hydroxy carbamate compounds. 3,374,265, 3–19–68, Cl. 260—482.

Botalam: *See*—
Missioux, Jean, Soubrier, and Vennat. 3,373,868.

Boucher, Gerald, to Sanders Associates, Inc. Method of producing printed circuits. 3,374,129, 3–19–68, Cl. 156—3.

Bould, Fred, to Square D Co. Arc chute for a circuit breaker. 3,374,332, 3–19–68, Cl. 200—144.

Boutwell, Frederick K., A. B. Wenzel, and A. C. Charters, to General Motors Corp. High speed gate valve. 3,373,758, 3–19–68, Cl. 137—68.

Bowdish, Frank W. Process for refining sands. 3,374,062, 3–19–68, Cl. 23—182.

Bower, Richard R. Electric circuit. 3,374,305, 3–19–68, Cl. 174—68.5.

Box, Willard D., to United States of America, Atomic Energy Commission. Electrolyte for the electrodeposition of technetium. 3,374,157, 3–19–68, Cl. 204—45.

Boyce, Donald A.: *See*—
Jeromson, James R., Jr., and Boyce. 3,373,632.

Boyce, Harold D.: *See*—
Soderquist, Frederick J., Boyce, and Duris. 3,374,282.

Boyen, John L., to Besler Corp. Gas flow modulator valve. 3,373,771, 3–19–68, Cl. 137—625.46.

Brabander, Herbert J.: *See*—
Wright, William B., Jr., and Brabander. 3,374,237.

Bradham, Allen C., to Texas Instruments Inc. Printed circuit board. 3,374,306, 3–19–68, Cl. 174—68.5.

Bramley, Jenny, to Melpar, Inc. Intense incoherent light source obtained by quenching the higher excited states and concentrating the energy on the lower states. 3,374,393, 3–19–68, Cl. 315—39.

Brass, William C. Handicapped children writing aid. 3,373,509, 3–19–68, Cl. 35—36.

Braun, Reinhold, and J. B. Porter, to General Dynamics Corp. Pulse generator for modulating a magnetron. 3,374,443, 3–19–68, Cl. 331—87.

Bremner, William C.: *See*—
Perrins, Allen R., and Bremner. 3,374,411.

Brennemann, Andrew E., to International Business Machines Corp. Method for depositing thin dielectric polymer films. 3,374,111, 3–19–68, Cl. 117—212.

Brisebois, Romeo. Detachable connection of a vehicle body to a chassis. 3,374,030, 3–19–68, Cl. 296—35.

British Nylon Spinners Ltd.: *See*—
Johnson, Bryan K. 3,373,945.
Swallow, Ian H. 3,373,949.

Brixner, Lothar H., to E. I. du Pont de Nemours and Co. Vacancy compensated calcium neodymium vanadate phosphors. 3,374,444, 3–19–68, Cl. 331—94.5.

Brockhaus, Gerhard, G. Leonhardt, and H. Weber, to Calor-Emag Elektrizitats-Aktiengesellschaft. Electrical coupling in which making and breaking of conductors is within casing filled with an insulating medium. 3,374,331, 3–19–68, Cl. 200—144.

Brockman, Heinz, to Daimler-Benz Aktiengensellschaft. Gas turbine blade. 3,373,970, 3–19–68, Cl. 253—39.15.

Brockmuller, Friedrich F., to Windmoller & Holscher. Apparatus for producing cross-bottom valve bags. 3,373,664, 3–19–68, Cl. 93—8.

Bronikowski, Raymond J., to McGraw-Edison Co. Fuse cutout. 3,374,329, 3–19–68, Cl. 200—127.

Brooks, Charles G.: *See*—
Barditch, Irving F., and Brooks. 3,374,425.

Brooks, William J. Swimming instruction pool. 3,373,450, 3–19–68, Cl. 4—172.

Broom, Trevor, to Central Electricity Generating Board. Magnetohydrodynamic electrical generators. 3,374,369, 3–19–68, Cl. 310—11.

Brothman, Abraham, L. Horowitz, M. Gomery, and C. Yanis, to Sangamo Electric Co. Supervisory control system. 3,374,464, 3–19–68, Cl. 340—172.5.

Brouwer, Charles W., and R. V. Tata, to Leesona Corp. Constant pressure, solid wax-applicator. 3,373,718, 3–19–68, Cl. 118—78.

Broverman, Alvin Y., G. C. Wilburn, Q. T. Jones, and D. A. Regar, to Westinghouse Electric Corp. Electrical inductive apparatus. 3,374,453, 3–19–68, Cl. 336—197.

Brummett, Earl R., to General Motors Corp. Regenerator matrix. 3,373,798, 3–19–68, Cl. 165—10.

Brunson, Virgil A., to Dover Corp. Positive displacement pump. 3,373,689. 3–19–68, Cl. 103—42.

Bry, Thomas F.: *See*—
Fried, John, and Bry. 3,374,226.

Bryan, John W.: *See*—
Sullivan, Dennis J., and Bryan. 3,374,455.

Buchanan, James B., to E. I. du Pont de Nemours and Co. Preparation of S-alkyl thiolhydroxamate esters. 3,374,260, 3–19–68, Cl. 260—453.

Buckbee-Mears Co.: *See*—
Toensing, James W. 3,373,912.

Budd Co., The: *See*—
Witzgall, Herbert J. 3,373,898.
Witzgall, Herbert J. 3,373,899.

Budde, Wolfgang. Remote vehicle control. 3,373,957, 3–19–68, Cl. 244—75.

Buechner, Werner W. Photographic wash vessel. 3,373,674, 3,19–68, Cl. 95—97.

Buehler, Ervin R., to General Motors Corp. Stop-on signal tuner for combined AM-FM receivers. 3,374,436, 3–19–68, Cl. 325—470.

Bühler, Karl, and H. Trachsel, to Aktiengesellschaft Brown, Boveri & Cie. Tap-changing device for transformers having load current diverter means and improved hydraulic follower mechanism therefor. 3,374,320, 3–19–68, Cl. 200—18.

Bunders, Gary A. Lamp construction. 3,373,964, 3–19–68, Cl. 248—158.

Burbank, Cecil J., and F. R. Abbott, to United States of America, Navy. Underwater anechoic chamber with screen of rubberlike tubes. 3,373,842, 3–19–68, Cl. 181—33.

Burch, Homer A., to The Norwich Pharmacal Co. 6-chloro-2-(5-nitro-2-furyl)cinchoninic acid. 3,374,239, 3–19–68, Cl. 260—287.

Burley, Billy, to Johnson Service Co. Thermal actuator and control therefor. 3,374,337, 3–19–68, Cl. 219—501.

Burlington Industries, Inc.: *See*—
Wilson, Thomas W., Fahringer, and Hiser.

Burnham, John W., to The French Oil Mill Machinery Co. Spacers for cage presses. 3,373,680, 3–19–68, Cl. 100—129.

Burroughs Corp.: *See*—
Best, Donald T., and Van Andel.

Burson, Bernard J., to Burson Electronics, Inc. Towel sorter having an infrared detector. 3,373,869, 3–19–68, Cl. 209—111.5.

Burson Electronics, Inc.: *See*—
Burson, Bernard, Jr.

Burtch, Fred W., to Gulf Research & Development Co. Process and apparatus for heating fluids in a well bore. 3,373,811, 3–19–68, Cl. 166—25.

Butler, Otto D. Shower-shaver. 3,373,448, 3–19–68, Cl. 4—1.

CSF-Compagnie Generale de Telegraphie Sans Fil: *See*
Cahour, Pierre, and Sobotka.
Hadni, Armand.

Cahour, Pierre, and W. Sobotka, to CSF-Compagnie Generale de Telegraphie Sans Fil. Sole electrode of the crossed-field type of electron discharge device having a coating of refractory material thereon. 3,374,389, 3–19–68, Cl. 315—3.5.

Caldwell, John P.: *See*—
Roberts, Russell R., and Caldwell.

Callis, Carl R., to United States of America, Navy. Zener coupled wide band logarithmic video amplifier. 3,374,361, 3–19–68, Cl. 307—229.

Calor-Emag Elektrizitats-Aktiengesellschaft: *See*—
Brockhaus, Gerhard, Leonhardt, and Weber.

Calvert, Frederick H., to Eaton Yale & Towne, Inc. Controlled-velocity drive. 3,374,373, 3–19–68, Cl. 310—94.

Cameron, Frank L., to Westinghouse Electric Corp. Cartridge-type fuse with explosion pots. 3,374,328, 3–19–68, Cl. 200—120.

Cameron, Frank L., to Westinghouse Electric Corp. Current limiting fuse. 3,374,330, 3–19–68, Cl. 200—132.

Camilleri, Charles F.: *See*—
Knapp, Robert S., and Camilleri.

Campagnolo, Tullio. High performance friction disc brake. 3,373,845, 3–19–68, Cl. 188—26.

Campbell, John R.: *See*—
Loprete, Joseph F., Flanzenbaum, and Campbell.

Canadian General Electric Co., Ltd.: *See*—
Williamson, Dennis F.

Canadian Patents and Development Ltd.: *See*—
Kusters, Norbert L., and MacMartin.

Cappuccio, Vittorio, and S. Algieri, to Montecatini Edison S.p.A. Synthetic polymer compositions having a particular receptivity to dyestuffs and a process for preparing them. 3,374,215, 3–19–68, Cl. 260—93.7.

Carney, Richard W. J.: *See*—
De Stevens, George, Blatter, and Carney.

Carney, Richard W. J., and W. L. Beneze, to Ciba Corp. Unsaturated oxacycles. 3,374,245, 3–19–68, Cl. 260—345.2.

Carolan, Ann J. and W. J. Display viewing apparatus. 3,373,654, 3–19–68, Cl. 88—24.

Carolan, William J.: *See*—
Carolan, Ann J. and W. J.

Carothers, Charles H.: *See*—
Lawrence, Robert J., and Carothers.

Carr, Norman L., and R. E. Peterson, to Gulf Research & Development Co. Thermal hydrodealkylation process. 3,374,280, 3–19–68, Cl. 260—672.

Carrier Corp.: *See*—
Miller, Kenneth H.

Caslow, Joseph H.: *See*—
Smilges, Robert, and Caslow.

Cast, James N., W. H. Horning, and F. Twiss, to Lear Siegler, Inc. Digital data processor. 3,374,467, 3–19–68, Cl. 340—172.5.

Catlin, Everett A., and A. Cort, Jr., to The Babcock & Wilcox Co. Thermal steam scrubber. 3,373,544, 3–19–68, Cl. 55—183.

Cavataio, Dolores B. Plant plastic cap. 3,373,525, 3–19–68, Cl. 47—27.

Celanese Coatings Co.: *See*—
Hicks, Darrell D.
Masters, John E., and Price.

Central Electricity Generating Board: *See*—
Broom, Trevor.

Chabal, Joseph: *See*—
Junge, Albert E., and Chabal.
Junge, Albert E., and Chabal.

Chabbert, Henri. Magnetic compass. 3,373,498, 3–19–68, Cl. 33—223.

Challis, Michael D.: *See*—
Ostberg, Werner, and Challis.

Chambers, Henry B., and C. W. Tellefson, to Hydranautics. Hydraulic gripper for derrick jack. 3,373,971, 3–19–68, Cl. 254—107.

Chan, John K.: *See*—
Marcus, Erich, and Chan.

Chang, James T. H., U. F. Gianola, and M. W. Sagal, to Bell Telephone Laboratories, Inc. Method for controlled aging of thin magnetic films by means of an easy axis annealing treatment. 3,374,113, 3–19–68, Cl. 117—227.

Chaplin, Daryl M., to Bell Telephone Laboratories, Inc. Telephone signalling system. 3,374,317, 3–19–68, Cl. 179—84.

Chaplin, John B., to Bell Aerospace Corp. Air cushion vehicle stabilizing means. 3,373,836, 3–19–68, Cl. 180—118.

Chapman, Roy A., to United Aircraft of Canada Ltd. Torquemeter with positive and negative reading. 3,373,603, 3–19–68, Cl. 73—136.

Charbonnier, Francis M., E. E. Martin, and L. W. Swanson, to Field Emission Corp. Field emission cathode having tungsten Miller indices 100 plane coated with zirconium, hafnium or magnesium on oxygen binder. 3,374,386, 3–19–68, Cl. 313—346.

Charters, Alexander C.: *See*—
Boutwell, Frederick K., Wenzel, and Charters.

Chaves, Aurellus, Jr., W. J. Thayer, and R. F. Bailey, to Moog, Inc. Valve for controlling simultaneously the flow of two separate fluids. 3,373,769, 3–19–68, Cl. 137—595.

Chemetron Corp.: *See*—
Hopkins, Boyd R.

Chemische Werke Huls Aktiengesellschaft: *See*—
Zur Hausen, Manfred, and Knepper.

Cherbuliez, Emile, and J. Rabinowitz, to Hooker Chemical Corp. Monoesters of phosphonic acids. 3,374,294, 3–19–68, Cl. 260—958.

Chevron Research Co.: *See*—
Csicsery, Sigmund M.
Fischer, William, and Postlewaite.

Childs, Warren L.: *See*—
Lyles, Marvin E., and Childs.

Christianson, Lynn M. Dust collecting system. 3,373,545, 3–19–68, Cl. 55—273.

Chrysler Corp.: *See*—
Bien, Alfred A., and Gerweck.
Wells, John R.

Ciba Corp.: *See*—
Carney, Richard W. J., and Bencze.
De Stevens, George, Blatter, and Carney.
Mizzoni, Renat H., and De Stevens.
Schmidt, Paul, Schweizer, Eichenberger, and Wilhelm.

Ciba Ltd.: *See*—
Arya, Vishwa P.
Greenlee, Sylvan O.
Meier, Edwin, and Schweizer.
Wick, Arnold, and Frey.
Zahir, Sheik A.-C.

Cities Service Oil Co.: *See*—
Glass, Eugene D., and Russell.

Clark, Oran: *See*—
McIntire, Daryl C., and Clark.

Claxton, Gerald L.: *See*—
Johnson, Wallace J. S., and Claxton.

Clay, Albert L., and A. W. Fidrych, to The Kellems Co., Inc. Hose containment device.

Cleary, James M., to Atlantic Richfield Co. Method and apparatus for drilling.

Coates, Harold, and P. A. T. Hoye, to Albright & Wilson (Mfg.) Ltd. Preparation of alkyl iodides from alkyl alcohols and organotin iodides.

Cochran, Chudleigh B., to C. C. Brown. Method for injector tubing gas lift.

Cole, Douglas I., to General Electric Co. Expendable immersion thermocouple including weight.

Cole, Howard I.: *See*—
Horn, Richard A., and Cole.

Coleman, Charles E.: *See*—
Black, James H., Coleman, and Stant.

Coleman, Lawrence J. Meat tongs.

Collins, Dennis I. Method and apparatus for heating stalled engines.

Collins, Joseph L.: *See*—
Larkam, Charles W., English, Hammer, Block, and Collins.

Collins Machinery Corp.: *See*—
Behnke, Howard N.

Collins Radio Co.: *See*—
Fenwick, Richard C.

Columbian Carbon Co.: *See*—
Lloyd, Bonnie C., and McAlister.

Columbus McKinnon Corp.: *See*—
Manney, Charles J., Robinson, and Molnar.

Colville, Francis J., and G. S. Kitson, to Rolls-Royce Ltd. Gas turbine jet engine power plant having a jet nozzle with a plurality of nozzle members.

Commissariat a l'Energie Atomique: *See*—
Costes, Didier.
Ponthus, Louis, and Lacour.

Compagnie des Gelatines Francaises: *See*—
Villalon, Ernest M.

Compagnie Generale des Etablissements Michelin, raison sociale Michelin & Cie: *See*—
Massoubre, Jean-Marie.

Concelman, Carl W., to Amphenol Corp. Diode transfer switch.

Congdon, George L., to Scovill Mfg. Co. Blender and built-in spatula.

Connelly, Edward M., to Melpar, Inc. Multi-output statistical switch.

Conner, Guy O., to Rolls-Royce of Canada, Ltd. Adjustable apparatus for pulverizing solid materials. 3,374,034, 3–19–68, Cl. 299—86.

Connolly, Thomas A.: *See*—
Richmond, Richard C., Pariser, and Connolly.

Connors, John D.: *See*—
Moore, William C., and Connors.

Conrath, Jules R., to Bell Telephone Laboratories, Inc. Noise suppression circuit for magnetic core matrix. 3,374,474, 3–19–68, Cl. 340—174.

Continental Can Co., Inc.: *See*—
Voigtman, Walter S., Sr., and Long.

Continental Transport Appliances Ltd.: *See*—
Dorey, George B.

Controls Co. of America: *See*—
McCarty, Lourdes V.

Cook, Clarence G., to General Electric Co. Metal vapor lamp coating.

Cook, Jerome M., to Grumman Aircraft Engineering Corp. Acceleration sensitive coupling.

Cooke, Arthur B.: *See*—
Rauen, Theodore J., Myers, and Cooke.

Cooke, Claude E., Jr., to Esso Production Research Co. Microemulsion oil recovery process.

Cooper, Douglas E., to Ethyl Corp. Copper oxide-alumina catalyst composition.

Cooper, Ralph F.: *See*—
Porter, Donald K., Eckenwiler, Barns, Cooper, and Head.

Cooprider, Clyde E. Sharpening fixture for twist drills.

Copeland, John W. Time, speed and distance computer.

Cornell Aeronautical Laboratory, Inc.: *See*—
Bellman, John L.

Corning Glass Works: *See*—
Smith, Terry P.
Wisner, William R.

Cornish, Judson E. Mnemonic teaching system.

Corriher, Henry A., Jr., and L. M. Mason. Fire kindling devices.

Cort, Ambrose, Jr.: *See*—
Catlin, Everett A., and Cort.

Cory Corp.: *See*—
Eisendrath, David C.
Eisendrath, David C.

Costes, Didier, to Commissariat a l'Energie Atomique. Safety system for pressure tube reactors.

Cotton, James F., to West Point-Pepperell, Inc. Process for the treatment of textiles with aminoplasts.

Courant, Ernsest D., to United States of America, Atomic Energy Commission. Acceleration of heavy particles.

Covey, William C.: *See*—
Harrington, Robert W., Covey, and McArthur.

Cowan, John V. Electroacoustic transducers.

Cowdery, James R.: *See*—
Lindgren, George C., and Cowdery.

Cox, Robert C. Foldable container.

Cox, Shaun M., to National Research Development Corp. Method of making film resistors.

Cox, Thomas L.: *See*—
Balentine, George H., Jr., Johnson, and Cox.

Crago, Richard A., to Union Carbide Corp. Ferroalloy casting process.

Craig, Carroll C. Film holder.

Craig, Robert G., L. Friedman, and W. A. Schwartz, to Air Products and Chemicals, Inc. Preparation of motor fuels having an octane number above 100.

Crampton, Charles P., to The Hamilton Tool Co. Batch delivery mechanism.

Crane, Walton B., to Allied Plastics Co. Shipping container.

Creed, Sherman H.: *See*—
Anderson, Gerald R., Creed, and Parker.

Critchley, Stuart W., and F. Lamb, to Geigy Chemical Corp. Lubricant compositions containing 2,4,6-tri-amino-substituted pyrimidines.

Crockett, Joseph G., and R. C. Belcer, ½ to XTRA, Inc., and ½ to Dorsey Trailers, Inc. Coupleable chassis.

Cronquist, Donald H., and J. E. Shepard, to International Business Machines Corp. Stepping motor positioning system including acceleration and deceleration control.

Cross, Alexander D., to Syntex Corp. 17-(aliphatic hydrocarbonoxy) and 17-(substituted aliphatic hydrocarbonoxy) estrane derivatives.

Crow, Lawrence J.: *See*—
White, Courtney W., and Crow.

Crowell, Philip L., to S. C. Johnson & Son, Inc. Actuator cap with frangible guard.

Crown Zellerbach Corp.: *See*—
Metz, Peter J., Jr.

Cruz, Calvin J., to E. I. du Pont de Nemours and Co. Crepe fabric of polyester yarns.

Csicsery, Sigmund M., to Chevron Research Co. Production of alkylated benzenes from paraffins.

Cubberly, Walter E., Jr., and D. F. Saurenman, to Schlumberger Technology Corp. Apparatus for selectively releasing cable-suspended well tools.

Cummins, Stewart E. Bistable optically read ferroelectric memory device.

Cunningham, William J., and C. Woolf, to Allied Chemical Corp. Fluoro compounds and synthesis thereof.

Curtis, David T. Device for moving injured persons.

Curtiss-Wright Corp.: *See*—
Loprete, Joseph F., Flanzenbaum, and Campbell.

Cusic, John W., and P. Yonan, to G. D. Searle & Co. Hydrazones of 1-amino-4-(xanthenyl and thioxanthenyl)piperazines.

Cuykendall, Trevor R.: *See*—
Parratt, Lyman G., Cuykendall, Greisen, Finlayson, and Reines.

Cypher, James H., to Pittsburgh Plate Glass Co. Method of press bending glass sheets between cold opposed shaping molds.

DBA: *See*—
Dugay, Pierre H.

Dadian, Lazarus H.: *See*—
Klessig, Ernst F., and Dadian.

Dahl, Walter L., and J. S. Martin, to Remington Arms Co., Inc. Carrier latch retainer for autoloading firearms.

Dahlberg Electronics, Inc.: *See*—
Martin, Richard T.

Daimler-Benz Aktiengesellschaft: *See*—
Brockmann, Heinz.
Helmer, Josef A.
Holland, Gerhard, and Kienle.

Daitch, Maurice L. Coat hanger coupler and assembly.

Dalto-Electronics Corp.: *See*—
Davidoff, Dorsey.

Dalton, Gerald, 50% to R. F. Wilson. Paint roller cleaning apparatus.

Daly, Donald H., to Maul Bros., Inc. Apparatus for molding glass.

Damon Engineering, Inc.: *See*—
Hurtig, Carl R.

Danon, David, to Yeda Research and Development Co. Ltd. Method and apparatus for controlled deposition of a thin conductive layer.

Davidoff, Dorsey, to Dalto-Electronics Corp. Aircraft landing lights simulator.

Davis, Claude E., 10% to C. Mason, and 10% to W. R. Graham. Method of producing a prepared quick-igniting charcoal fuel.

Davis, Golden C. Carrier for disk records.

Davis, Mitchell, and M. L. Sowers, to Philco Ford Corp. Semiconductive device and method of fabricating the same.

Davis, Orvis A., Sr., to Gulf Research & Development Co. Nozzle.

Davis, Paul, to Sweetheart Plastics, Inc. Container lid.

Davis, Robert H., to Mobil Oil Corp. Aqueous lubricant compositions containing an alkanolamine, a saturated organic acid and a polyoxyalkylene glycol.

Dayco Corp.: *See*—
Henderson, Dewey D.

De Castiglione, Roberto: *See*—
Bernardi, Luigi, Bosisio, de Castiglione, and Goffredo.

Deere & Co.: *See*—
Hansen, Harold V., and McCumber.
Hubbard, Arthur L.
Myers, Glenn L., and Lawrence.

Deffner, John F., to Gulf Research & Development Co. Gasoline composition.

De Haart, Inc.: *See*—
De Hart, Edward G., and Allen.

De Hart, Edward G., and M. D. Allen, to De Haart, Inc. Syringe with stirrer.

Deichert, William G., to American Cyanamid Co. Flame retardant polyacrylate resins.

De La Torre, Leroy C.: *See*—
Rabson, William R., Wilson, and De La Torre.

Del Giudice, Frank J., to Hardman Tool and Engineering Co. Aircraft seat.

Dentists' Supply Co., The: *See*—
Saffir, Jacob A.
Saffir, Jacob A.

Derc, Roman, to English Electro-Leo-Marconi Computers Ltd. Data printing apparatus.

De Ridder, Ernst J., to Reynolds Metals Co. Railway car door operating mechanism.

De Shetler, Louis K.: *See*—
Blunden, Donald J., Black, De Shetler, and Gotcher.

Design, Inc.: *See*—
Mack, Julian E., McNutt, and Roesler.

Desmond, Charles F., and R. D. Rumsey, to Houdaille Industries, Inc. Viscous torsional vibration dampers.

De Stevens, George: *See*—
Mizzoni, Renat H., and De Stevens.

De Stevens, George, H. M. Blatter, and R. W. J. Carney, to Ciba Corp. N-aryl pyrimidinium compounds. 3,374,232, 3–18–68, Cl. 260—240.7.

De Wald, Carl : *See*—
Taylor, Craig V. 3,374,049.

Dewey, Clyde G., to General Electric Co. Distance protective relaying. 3,374,399, 3–19–68, Cl. 317—36.

Diamond Crystal Salt Co. : *See*—
Heiss, John F., and Binsley. 3,374,098.

Dickey, Charles R., to Union Carbide Corp. Stabilization of polyoxyalkylene compounds. 3,374,275, 3–19–68, Cl. 260—611.5.

Didier-Werke A.G. : *See*—
Taubmann, Harro, and Boderke. 3,373,981.

Dieterich, Dieter, O. Bayer, W. Himmelmann, and H. Ulrich, to AGFA Aktiengesellschaft. Gelatin-containing photographic layers plasticized with polyurethane. 3,374,095, 3–19–68, Cl. 96—111.

Dietert, Harry W., Co. : *See*—
Dietert, Harry W. 3,373,977.

Dietert, Harry W., to Harry W. Dietert Co. Granular material conditioning apparatus. 3,373,977, 3–19–68, Cl. 259—154.

Dinges, Karl : *See*—
Ott, Karl-Heinz, Schlesmann, Dinges, Glenz, Weber, and Kassack. 3,374,289.

Distillers Co. Ltd., The : *See*—
Barclay, John L., Hadley, and Bethell. 3,374,284.

Dodge, Gerald F., III, and H. D. F. True, Jr., to General Electric Co. Single evaporator, single fan refrigerator including control means. 3,373,576, 3–19–68, Cl. 62—180.

Doerer, Richard P., to Van Dresser Corp. Swaging machine. 3,373,474, 3–19–68, Cl. 29—200.

Doerfler, Roger E., to Hydrasearch Co., Inc. Brake proportioning valves. 3,373,766, 3–19–68, Cl. 137—494.

Dollinger, Robert E. : *See*—
Joy, David S., and Dollinger. 3,374,181.

Domino Sugar Co. : *See*—
Shaw, Hugh H. 3,374,036.

Donges, Ernst : *See*—
Krettler, Albert, and Donges. 3,374,053.

Donkers, Mathias, and E. B. G. Nijhof, to North American Philips Co., Inc. Circuit arrangement for luminous advertising in which the light sources flash up consecutively and are simultaneously extinguished. 3,374,395, 3–19–68, Cl. 315—151.

Donlon, Richard H., and H. Sinko, to General Motors Corp. Independent wheel suspension. 3,374,005, 3–19–68, Cl. 280—124.

Donnally, Bailey L., to Lake Forest College. Process for producing negative helium ions. 3,374,384, 3–19–68, Cl. 313—230.

Dorey, George B., to Continental Transport Appliances Ltd. Selective pneumatic and gravity unloading hopper car. 3,373,884, 3–19–68, Cl. 214—83.18.

Dornberger, Georg, and W. M. Smith, to Western Electric Co. Inc. System for maintaining a motor at a predetermined speed. 3,374,413, 3–19–68, Cl. 318—341.

Dorsey Trailers, Inc. : *See*—
Crockett, Joseph G., and Belcer. 3,374,010.

Martini, Joseph C.: *See*—
Franke, Norman W., and Martini. 3,374,290.

Maruyama, Takaharu, H. Suzuki, and M. Yamauchi, to Nippon Columbia Kabushikaisha (Nippon Columbia Co., Ltd.). Low second grid voltage electron gun. 3,374,379, 3–19–68, Cl. 313—85.

Marwil, Stanley J., and R. G. Wallace, to Phillips Petroleum Co. Solids recovery from a flowing stream. 3,374,211, 3–19–68, Cl. 260—88.2.

Masalskis, Etienne F., to Ford Motor Co. Friction clutch operator having a linkage system with a variable mechanical advantage. 3,373,854, 3–19–68, Cl. 192—99.

Mason, Collins: *See*—
Davis, Claude E., and Mason. 3,374,070.

Mason, Lawrence M.: *See*—
Corriher, Henry A., Jr., and Mason. 3,374,071.

Massoubre, Jean-Marie, to Compagnie Generale des Etablissements Michelin, raison sociale Michelin & Cie. System for signaling conditions on relatively moving members of a vehicle. 3,374,460, 3–19–68, Cl. 340—58.

Masters, John E., and H. P. Price, to Celanese Coatings Co. Process for preparing high molecular weight polyhydroxypolyether resins. 3,374,204, 3–19–68, Cl. 260—47.

Masumoto, Hakaru, and T. Kobayashi, to The Research Institute of Electric and Magnetic Alloys Foundation. Method of manufacturing non-magnetic, elastic articles having a small change of vibration and deflection for temperature change. 3,374,123, 3–19–68, Cl. 148—11.5.

Mathes, Robert H., and L. C. Ricalzone, to United States of America, Navy. Cathode ray tube overlay including a rotatable disc with a plurality of range scale. 3,374,313, 3–19–68, Cl. 178—7.83.

Matsushita Electric Industrial Co., Ltd.: *See*—
Nitta, Tsuneharu, H. Taki, and K. Nagase. 3,374,185.

Matsuzak, Hiroyuki: *See*—
Tabuchi, Seiichi, Matsuzak, and Tsuboi. 3,374,400.

Matthews, Clifford N.: *See*—
Driscoll, John S., and Matthews. 3,374,256.

Maul Brothers, Inc.: *See*—
Daly, Donald H. 3,374,079.

Maurer, George P., and A. E. Phillips, to The Falk Corp. Mounting assembly for shaft mounted gear drive unit. 3,373,626, 3–19–68, Cl. 74—421.

May, John E., and R. L. Stoute, to Atomic Energy of Canada Ltd. Doped hypostoichiometric dioxide nuclear fuel composition and method of preparation. 3,374,178, 3–19–68, Cl. 252—301.1.

Maybin, Joseph F., to Hayes International Corp. Process and apparatus for controlling rocket engines and the like. 3,373,504, 3–19–68, Cl. 60—204.

Maycock, John: *See*—
Swift-Hook, Donald T., Wright, and Maycock. 3,374,368.

Mazoyer, Jean. Drive means for miniature tape recorders. 3,373,951, 3–19–68, Cl. 242—55.13.

McAlister, Charles G.: *See*—
Lloyd, Bonnie C., and McAlister. 3,374,261.

McArthur, George, Jr.: *See*—
Harrington, Robert W., Covey, and McArthur. 3,373,783.

McCabe, James A., to General Dynamics Corp. Radioisotope subliming solid propulsion system. 3,373,563, 3–19–68, Cl. 60—203.

McCarty, Lourdes V., to Controls Co. of America. Electric reset for pneumatic sensor control. 3,373,765, 3–19–68, Cl. 137—489.

McCumber, Virgil R.: *See*—
Hansen, Harold V., and McCumber. 3,373,705.

McCutchen, Hugh L., to The International Nickel Co. Electroforming and electrodeposition of stress free nickel from the sulfamate bath. 3,374,154, 3–19–68, Cl. 204—3.

McDaniel, Carl V.: *See*—
Maher, Philip K., and McDaniel. 3,374,056.

McDaniel, Carl V., and P. K. Maher, to W. R. Grace & Co. Process for ion exchanging crystalline zeolites with nitrogenous bases. 3,374,057, 3–19–68, Cl. 23—112.

McDaniel, Carl V., P. K. Maher, and W. E. Waxter, to W. R. Grace & Co. Process for preparing a crystalline zeolite. 3,374,058, 3–19–68, Cl. 23—113.

McDonald, Hugh C., to Melvin E. Lind. Navigational device. 3,373,493, 3–19–68, Cl. 33—1.

McDowell-Wellman Engineering Co.: *See*—
Ban, Thomas E., and Nelson. 3,374,101.

McElroy, James, and H. Shalit, to Air Products and Chemicals, Inc. Copper chromite-alkali metal oxide high surface area hydrogenation catalyst. 3,374,184, 3–19–68, Cl. 252—467.

McGrann, James G. Moisture control apparatus. 3,374,324, 3–19–68, Cl. 200—84.

McGraw-Edison Co.: *See*—
Bronikowski, Raymond J. 3,374,329.

McIntire, Daryl C., and O. Clark. Air driven grain circulating means. 3,373,504, 3–19–68, Cl. 34—57.

McKelvey, Michael J. Removable beam seat. 3,373,988, 3–19–68, Cl. 269—309.

McKittrick, Gordon D., to Tractor Supply Co. Pumps. 3,373,693, 3–19–68, Cl. 103—136.

McManama, Charles E. Sawmill capable of high production and lumber quality control operable by one man. 3,373,778, 3–19–68, Cl. 143—19.

McNutt, Douglas P.: *See*—
Mack, Julian E., McNutt, and Roesler. 3,373,651.

Mead Corp., The: *See*—
Wood, Prentice J. 3,373,867.

Mead Johnson & Co.: *See*—
Barton, Raymond W., and Neely. 3,373,864.

Mearl Corp., The: *See*—
Bolomey, Rene A. 3,374,105.

Meat Packers Equipment Co.: *See*—
Hawley, Richard A. 3,373,777.

Mechanical Handling Systems, Inc.: *See*—
Bishop, Leonard J. 3,373,698.

Meier, Edwin, and E. Schweizer, to Ciba Ltd. Cell for electrolysis with molten salt electrolyte. 3,374,163, 3–19–68, Cl. 204—246.

Meigs, Frederick M.: *See*—
Garber, John D., Ide and Meigs. 3,374,051.

Meipar, Inc.: *See*—
Bramley, Jenny. 3,374,393.
Connelly, Edward M. 3,374,469.
Thiess, George H. 3,374,436.

Melton, James O., T. B. Wilkinson, and J. H. Jackson, to Jamco, Inc. Ball joint. 3,374,016. 3–19–68, Cl. 287—87.

Memole, Ralph, J. S. Liebmann, H. Barkowitz, and D. Meszaros. Decorative shoe cover. 3,373,510, 3–19–68, Cl. 36—2.5.

Menow Machine Co., The: *See*—
Armstead, George B., Jr. 3,373,706.

Merck & Co.: *See*—
Fried, John, and Bry. 3,374,226.
Garber, John D., Ide and Meigs. 3,374,051.
Re, Luciano. 3,374,254.
Windholz, Thomas B., Patchett, and Fried. 3,374,255.

Meszaros, Daniel: *See*—
Memole, Ralph, Liebmann, Barkowitz, and Meszaros. 3,373,510.

Metcalfe, Paul V., and J. D. Ford. Tie lug. 3,374,012, 3–19–68, Cl. 285—114.

Metrailer, William J., to Esso Research and Engineering Co. Coking process and apparatus. 3,374,168, 3–19–68, Cl. 208—127.

Metz, Peter J., Jr., to Crown Zellerbach Corp. Method for manufacturing imprinted plastic film. 3,374,303, 3–19–68, Cl. 264—216.

Meurer, Hans., to Mannesmann-Meer Aktiengesellschaft. Drive mechanism for two rolling frames of a tube reducing rolling mill. 3,373,635, 3–19–68, Cl. 74—665.

Meyer, Engelbert A., to Warren Fastener Corp. Trim fastener. 3,373,530, 3–19–68, Cl. 52—718.

Meyer, Engelbert A., to Warren Fastener Corp. Retainer assembly. 3,374,017, 3–19–68, Cl. 287—189.36.

Meyer, Hans, and K. Meyer., to Air-Tech Industries, Inc. Wide span inflated structure. 3,373,531, 3–19–68, Cl. 52—2.

Meyer, Kurt: *See*—
Meyer, Hans and Kurt. 3,373,531.

Milani, Franco, to Milani Resine S.p.A. Flexible curtain for movable partitions or walls and process and device relative thereto. 3,373,791, 3–19–68, Cl. 160—181.

Milani Resine S.p.A.: *See*—
Milani, Franco. 3,373,791.

Miles Laboratories, Inc.: *See*—
Stolar, Morris E. 3,374,144.

Milgo Electronic Corp.: *See*—
Miller, Monroe A. 3,374,362.

Militello, James V., to American Allsafe Co. Safety attachment for hard headgear. 3,373,444, 3–19–68, Cl. 2—10.

Mill Equipment, Inc.: *See*—
Pease, Lionel. 3,373,782.

Miller, Charles W., to General Motors Corp. Time delay control for lighting circuit. 3,374,394, 3–19–68, Cl. 315—82.

Miller, Clarence J., to General Electric Co. Fluxless aluminum brazing. 3,373,482, 3–19–68, Cl. 29—501.

Miller, Clarence J., to General Electric Co. Fluxless aluminum brazing. 3,373,483, 3–19–68, Cl. 29—501.

Miller, Earle C., R. C. Rivers, and M. J. Ivanisin, to Riley Stoker Corp. Drive for stoker. 3,373,618, 3–19–68, Cl. 74—87.

Miller, John J., to Ocean Minerals, Inc. Precipitation of minerals from brines. 3,374,081, 3–19–68, Cl. 71—11.

Miller, Kenneth H., to Carrier Corp. Fluid compressor. 3,373,927, 3–19–68, Cl. 230—116.

Miller, Lewis F., to International Business Machines Corp. Conductive element composition and method. 3,374,110, 3–19–68, Cl. 117—212.

Miller, Monroe A., to Milgo Electronic Corp. Operational amplifier with mode control switches. 3,374,362, 3–19–68, Cl. 307—230.

Miller, Park H., Jr., to Gulf General Atomic Inc. Method and apparatus for regenerating sound waves. 3,373,841, 3–19–68, Cl. 181—5.

Miller, Paul J., to The Weatherhead Co. Dual brake system safety device. 3,374,322, 3–19–68, Cl. 200—82.

Miller, Paul W. Vertical broiler. 3,373,678, 3–19–68, Cl. 99—389.

Mills, William W., Jr., to Thiokol Chemical Corp. Alignment checking device for penetrating radiation photography apparatus. 3,374,350, 3–19–68, Cl. 250—65.

Minchin, Marjorie D. Razor blade dispenser. 3,373,862, 3–19–68, Cl. 206—16.

Missioux, Jean, P. Soubrier, and J. Vennat, to Botalam. Apparatus for selecting rodlike members. 3,373,868, 3–19–68, Cl. 209—97.

Mitchell, Charles D.: *See*—
Heckles, John, and Mitchell. 3,374,250.

Mitchell, Charles D., to Armstrong Cork Co. Phenylacetonitrile oximes. 3,374,248, 3–19–68, Cl. 260—396.

Mitchell, Charles D., to Armstrong Cork Co. Phenylacetonitrile oximes. 3,374,249, 3–19–68, Cl. 260—396.

Mitchell, John R., to G. Q. Parachute Co., Ltd. Parachutes. 3,373,960, 3–19–68, Cl. 244—148.

Mitsubishi Rayon Co., Ltd.: *See*—
Senda, Kazuo, Ichikawa, Ohzeki, Nakajima, Sasaki, Yasui, and Hirose. 3,374,216.

Mizzoni, Renat H., and G. de Stevens, to Ciba Corp. Quaternary 5-ammoniummethyl-4-amino-2-alkylmercaptoalkylene pyrimidine salts. 3,374,236, 3–19–68, Cl. 260—256.5.

Mobil Oil Corp.: *See*—
Baum, Lester A. H., and Henschel. 3,374,104.
Davis, Robert H. 3,374,171.
Myers, Herbert. 3,374,291.
Williams, Sherrod A. 3,373,810.

Modern Faucet Mfg. Co.: *See*—
Ward, Irving A., and Rauh. 3,373,770.

Moeller, Gerd M., and A. H. K. Haeussler. Hydraulic press. 3,373,596. 3–19–68, Cl. 72—446.

Mogler, Emil, to Kassenfabrik Emil Mogler. Locking and alarm device. 3,373,931, 3–19–68, Cl. 235—22.

Moldovan, George L.: *See*—
Terry, Thomas H., and Moldovan. 3,373,831.

Molnar, Dennis: *See*—
Manney, Charles J., Robinson, and Molnar. 3,373,560.

Monn, Stanislaus. Device for the analysis of the sinking speed of blood corpuscles in a calibrated tube. 3,373,601, 3–19–68, Cl. 73—61.4.

Mono-Sol Division: *See*—
Bianco, Thomas S., and Kratz. 3,374,195.

Monsanto Chemicals Ltd.: *See*—
Hare, David G., and Stephenson. 3,374,187.

Monsanto Co.: *See*—

Rohm & Haas Co. : *See*—
Kelley, Everett J. 3,374,242.
Rolls-Royce of Canada, Ltd. : *See*—
Connor, Guy O. 3,374,034.
Rolls-Royce Ltd. : *See*—
Jubb, Albert. 3,373,561.
Colville, Francis J., and Kitson. 3 373,566.
Palfreyman, Jack, and Smith. 3,373,567.
Rom, Frank E., A. F. Lietzke, and R. E. Hyland, to United States of America, Administrator of the National Aeronautics and Space Administration. Nuclear reactor core for a rocket. 3,374,148, 3–19–68, Cl. 176—58.
Rom, John D., to General Motors Corp. Fan structure. 3,373,930, 3–19–68, Cl. 230—270.
Romack, Paul N. : *See*—
Stewart, James M., Pashaian, Romack, and Arnold. 3,375,877.
Roman, Edward A., and A. A. Fiorentinom, to Speakman Co. Plastic shower head plungers. 3,373,942, 3–19–68, Cl. 239—460.
Roosa, Vernon D. Fuel injection nozzle and adjusting means therefor. 3,373,943, 3–19–68, Cl. 239—533.
Rosemount Engineering Co. : *See*—
Lode, Tenny D. 3,374,430.
Rosenkrands, John W., to General Motors Corp. De dion suspension with torsionally active dead axle and cantilever spring elastic medium. 3,373,834, 3–19–68, Cl. 180—73.
Rosenthal, Louis A., to United States of America, Navy. Bridge circuit for determining the thermal parameters of bridgewires used in electro-explosive devices. 3,374,429, 3–19–68, Cl. 324—57.
Ross, Hardy E., and K. C. Finster, to The Dow Chemical Co. Non-blocking polyolefin compositions. 3,374,199, 3–19–68, Cl. 260—41.
Roth, Willy : *See*—
Varsanyi, Denis, and Roth. 3,374,235.
Rothe, Wilhelm E., and A. G. Loughead, to Belock Instrument Corp. Portable, north-indicating gyroscopic instrument. 3,373,499, 3–19–68, Cl. 33—226.
Roto-Swing Door Co., Inc. : *See*—
Ingham, Gary G. 3,373,529.
Rouch, Anthony J., Jr. Lint removing device. 3,373,457, 3–19–68, Cl. 15—104.
Rowe, Gayle L., and J. R. Wilson, to Union Carbide Corp. Apparatus for forming large carbonaceous bodies. 3,373,966, 3–19–68, Cl. 249—80.
Royal Typewriter Co., Inc. : *See*—
Anderson, Fred A. 3,374,333.
Rubelmann, Haydn. Control unit for automatic cathodic protection. 3,374,162, 3–19–68, Cl. 204—196.
Rudolph, Ralph H., and D. Douglas, to Douglas Plymouth Corp. Lighted beverage glass. 3,374,344, 3–19–68, Cl. 240—6.4.
Ruecker, Karl H. : *See*—
Schmidt, Oswald, and Ruecker. 3,374,177.
Ruetz, John A., W. H. Yocom, and R. M. Rogers, to Varian Associates. Traveling-wave tube having a slow-wave structure of the cloverleaf type wherein the height of the cloverleaf sections are tapered. 3,374,390, 3–19–68, Cl. 315—3.6.
Rumsey, Rollin D. : *See*—
Desmond, Charles F., and Rumsey. 3,373,633.
Rundt, John W., and W. F. Green, to The Timken Roller Bearing Co. Means for identifying defective wire and for rejecting articles made therefrom. 3,373,584, 3–19–68, Cl. 72—10.
Rusnok, Edward R. Automatic valve actuated urinal. 3,373,449, 3–19–68, Cl. 4—100.
Russell, Charles W., and T. Lerner, to Bell Aerospace Corp. Receiver tuning for radar and the like. 3,374,480, 3–19–68, Cl. 343—17.2.
Russell, Colonel J., Jr. : *See*—
Glass, Eugene D., and Russell. 3,373,804.
Russell, Robert G., J. H. Willis, and W. C. Shafer, to Owens-Corning Fiberglas Corp. Method for production of mineral fibers. 3,374,074, 3–19–68, Cl. 65—2.
Rustin, Anthony, and L. C. S. Fernandes, to Shawinigan Chemicals, Ltd. Production of peracetic acid. 3,374,205, 3–19–68, Cl. 260—502.
Rut, Tadeusz. Machine for upsetting or simultaneous upsetting and bending. 3,373,593, 3–19–68, Cl. 72—399.
Ryffel, Kaspar, and W. Zehnder, to Inventa A.G. fur Torschung und Patentverwertung. Continuous process for the extraction of monomers and oligomers from highly polymerized caprolactam granules. 3,374,207, 3–19–68, Cl. 260—78.
SCM Corp. : *See*—
Ostensen, Ralph G. 3,374,348.
Saari, Walfred S. : *See*—
Sax, Karl J., Saari, and Mahoney. 3,374,175.
Sachs, Elihu L. X-ray film package with water soluble separator and water soluble light opaque envelope. 3,374,352, 3–19–68, Cl. 250—68.
Saffir, Jacob A., to Dentists' Supply Co. Disposable hypodermic syringe. 3,373,743, 3–19–68, Cl. 128—218.
Saffir, Jacob A., to The Dentists' Supply Co. Dental X-ray film package wherein a projection of the X-ray film extends outside the wrapper. 3,374 353, 3–19–68, Cl. 260—69.
Safford, Donald E., to Sinclair Research, Inc. Method of forming a storage container. 3,374,136, 3–19–68, Cl. 156—293.
Sagal, Matthew W. : *See*—
Chang, James T. H., Gianola, and Sagal. 3,374,113.
Sakamoto, Kiichiro : *See*—
Tajima, Mataichi, and Sakamoto. 3,373,755.
Sander, Howard H., to United States of America, Atomic Energy Commission. Transistor having constant gain over a broad temperature range. 3,374,408, 3–19–68, Cl. 317—235.
Sanders Associates, Inc. : *See*—
Boucher, Gerald. 3,374,129.
Horn, Richard A., and Cole. 3,374,398.
Sandoz Ltd. (also known as Sandoz A.G.) : *See*—

Sommers, Roy W., to E. I. du Pont de Nemours and Co. Novel preparation of carboxymethyl cellulose. 3,374,224, 3–19–68, Cl. 260—231.
Soubrier, Pierre: *See*—
Missioux, Jean, Soubrier, and Vennat. 3,373,868.
Souri, Inc.: *See*—
Owens, Walter K. 3,373,956.
Sowers, Minerva L.: *See*—
Davis, Mitchell, and Sowers. 3,374,405.
Spainhour, James D., to Phillips Petroleum Co. Process for the production of aromatic thiols and aromatic sulfides. 3,374,274, 3–19–68, Cl. 260—609.
Spangler, Eugene C., to Marriott Corp. Automated food processing line. 3,373,783, 3–19–68, Cl. 146—1.
Speakman Co.: *See*—
Roman, Edward A., and Fiorentinom. 3,373,942.
Specialties Development Corp.: *See*—
Munn, Alfred J. 3,373,764.
Spectronics, Inc.: *See*—
Blau, William. 3,374,478.
Spengler, Ernst M., to United Shoe Machinery Corp. Apparatus for punching out workpieces. 3,373,643, 3–19–68, Cl. 83—620.
Sperry Rand Corp.: *See*—
Kline, Charles M., and Best. 3,373,503.
Lins, Stanley J., and Morrison. 3,373,481.
Spindelfabrik Sussen, Schurr, Stahlecker & Grill G.m.b.H.: *See*—
Stahlecker, Hans, and Kemmler. 3,373,556.
Spire, Etienne, to L'Air Liquide, Societe Anonyme Pour L'Etude et L'Exploitation Des Procedes Georges Claude. Metallurgical vessel with safety device. 3,373,986, 3–19–68, Cl. 266—39.
Sprenger, Gerhard: *See*—
Goldstein, Herman B., Kusiak, Peltier, and Sprenger. 3,374,100.
Square D Co.: *See*—
Bould, Fred. 3,374,332.
Squire, Herbert D., to Admiral Corp. Self-cleaning oven. 3,373,754, 3–19–68, Cl. 134—58.
Stacey, Cecil E. Powered trimaran with retractable pontoons. 3,373,715, 3–19–68, Cl. 115—70.
Stahl, Horst, and R. Rekewitz, to Siemens Aktiengesellschaft. Drawbar arrangement for selector bar translators. 3,373,858, 3–19–68, Cl. 197—17.
Stahlberg, Arthur R.: *See*—
O'Brien, John W., and Stahlberg. 3,374,165.
Stahlecker, Hans, and S. Kemmler, to Spindelfabrik Sussen, Schurr, Stahlecker & Grill G.m.b.H. Spindles for textile machines. 3,373,556, 3–19–68, Cl. 57—88.
Stahmer, Bernhardt. Cable take-up reel. 3,374,319, 3–19–68, Cl. 191—12.4.
Staley, David A. Combination cup dispenser and cap remover. 3,373,900, 3–19–68, Cl. 221—199.
Stallard, Ralph M.: *See*—
Mance, John J., and Stallard. 3,374,045.
Standard Pressed Steel Co.: *See*—
Kull, Francis R., and Waeltz. 3,374,014.
Standley, Wendell E.: *See*—
Nigrelli, Biagio J., and Standley. 3,373,543.
Stanley, Robert K., to Techniservice Corp. Strand treatment process. 3,374,302, 3–19–68, Cl. 264—168.
Stanley Works, The: *See*—
Whitehouse, Hugh L. 3,373,824.
Stant Mfg. Co., Inc.: *See*—
Johnson, Glen A. 3,373,894.
Stant, Vernon C.: *See*—
Black, James H., Coleman, and Stant. 3,373,870.
Staubly, Alan M. Container. 3,373,522, 3–19–68, Cl. 43—55.
Stautmeister, Erich, to A. Engelmann. Stepping transmission. 3,373,622, 3–19–68, Cl. 74—143.
Steden, Franz, L. Beer, and O. Lissner, to Badische Anilin & Soda-Fabrik Aktiengesellschaft. Curing polyepoxide compounds with a polyamine. 3,374,186, 3–19–68, Cl. 260—2.
Steffan, Edward: *See*—
Moore, Robert R., and Steffan. 3,373,668.
Steinberg, Amiram. Hydrofoil boat. 3,373,710, 3–19–68, Cl. 114—39.
Steinberg, Richard, I. Turinsky, and J. I. Vasquez, to Slant/Fin Corp. Heat transfer element. 3,373,803, 3–19–68, Cl. 165—182.
Steiner, Eginhard: *See*—
Biedermann, Walter, and Steiner. 3,374,219.
Steinmuller, L. & C., G.m.b.H.: *See*—
Jung, Richard. 3,373,704.
Stempel, Arthur: *See*—
Reeder, Earl, Stempel, and Sternbach. 3,374,225.
Stemple, Jerry L., to General Motors Corp. Air cushion device with height controlling bleed holes. 3,373,838, 3–19–68, Cl. 180—124.
Stephens-Adamson Mfg. Co.: *See*—
Moore, Chester C. 3,373,472.
Stephenson, Robert J.: *See*—
Hare, David G., and Stephenson. 3,374,187.
Stephenson, William M., to Nalco Chemical Co. Method of improving operational efficiency of white water recovery system by treatment with anionic copolymers of acrylic acid salts and acrylamide. 3,374,143, 3–19–68, Cl. 162—190.
Sternbach, Leo H.: *See*—
Reeder, Earl, Stempel, and Sternbach. 3,374,225.
Stewart, James M., S. Pashalan, P. N. Romack, and O. M. Arnold, to Ajem Laboratories, Inc. Filter device. 3,373,877, 3–19–68, Cl. 210—401.
Stewart, Richard D., to The Dow Chemical Co. Artificial body organ apparatus. 3,373,876, 3–19–68, Cl. 210—321.
Stewart, Robert F., to Litton Precision Products, Inc. Waveguide flange and coupling assembly. 3,374,450, 3–19–68, Cl. 333—98.
Steyvers, Winfried: *See*—
Robra, Helmut, Behrendt, and Steyvers. 3,373,592.
Stieber, Ortwin, to Tepro Technical Production Co. Ltd. Eight window for machines and containers. 3,373,610, 3–19–68, Cl. 73—334.
Stilwell, James, to Telesystems Corp. Pluggable filter assembly for use in electronic distribution system. 3,374,447, 3–19–68, Cl. 333—70.
Stokes, Edward H. G. to Armstrong Whitworth (Marine) Ltd. Anchor having pivotable flukes. 3,373,712, 3–19–68, Cl. 114—208.
Stolar, Morris E., to Miles Laboratories, Inc. Ophthalmic composition. 3,374,144, 3–19–68, Cl. 167—59.
Stone, Joseph K., to Kaiser Industries Corp. Process for producing aggregate containing oxygen steel process dust. 3,374,085, 3–19–68, Cl. 75—3.
Stone, Morris D., to United Engineering and Foundry Co. Crown control for rolling mill. 3,373,588, 3–19–68, Cl. 72—237.
Stone, Virgil D., to Gulf Oil Corp. Apparatus and method for drilling wells. 3,373,806, 3–19–68, Cl. 166—.5.
Stoop, Jan A.: *See*—
Sano, Karel M., and Stoop. 3,374,351.
Stoute, Richard: *See*—
May, John E., and Stoute. 3,374,178.
Strader, James R., to J. R. Wray, Jr. Container arrangement with coolant therein. 3,373,581, 3–19–68, Cl. 62—294.
Strange, Hinman F. Globe snow arrestor. 3,373,532, 3–19–68, Cl. 52—24.
Stricker, Robert H.: *See*—
Gubbay, Jacob D., Stricker, and Wittler. 3,373,709.
Stronza, Bernard J., to E. I. du Pont de Nemours and Co. Stabilized blasting compositions containing at least one iron sulfide and an antacid. 3,374,128, 3–19–68, Cl. 149—56.
Studen, Charles E. Method of making drinking utensil jacket. 3,374,298, 3–19–68, Cl. 264—41.
Sullivan, Dennis J., and J. W. Bryan. Electrical connector. 3,374,455, 3–19–68, Cl. 339—31.
Suman, Robert W., and K. E. Thomsen, to Link-Belt Co. Weighing mechanism for railroad car dumpers. 3,373,829, 3–19–68, Cl. 177—132.
Summers, Hugh B., Jr., W. D. Lloyd, and G. W. Hedrick, to United States of America, Agriculture. Isolation of resin acid mixtures rich in levopimaric acid. 3,374,217, 3–19–68, Cl. 260—109.

Summers, Thomas O. Gyro vehicle. 3,373,832, 3–19–68, Cl. 180—30.
Sun Chemical Corp.: *See*—
Goldstein, Herman B., Kusiak, Peltier, and Sprenger. 3,374,100.
Sundby, Per R. System for measuring the height of the liquid level in tanks. 3,373,609, 3–19–68, Cl. 73—299.
Sunray Stove Co.: *See*—
Harrington, Robert W., Covey, and McArthur. 3,373,733.
Superior Electric Co., The: *See*—
Perrins, Allen R., and Bremner. 3,374,411.
Weber, John P., Jr. 3,374,420.
Sureau, Robert F. M.: *See*—
Kremer, Gilbert V. H., and Sureau. 3,374,220.
Suzuki, Hideo, to Toyo Giken Co. Ltd. Biochemical oxygen demand continual detecting apparatus. 3,374,065, 3–19–68, Cl. 23—253.
Suzuki, Hirofumi: *See*—
Maruyama, Takaharu, Suzuki, and Yamauchi. 3,374,379.
Svenska Rotor Maskiner Aktiebolag: *See*—
Nyberg, Ake L. 3,373,797.
Swallow, Ian H., to British Nylon Spinners Ltd. Yarn winding mechanism. 3,373,949, 3–19–68, Cl. 242—43.
Swanson, Lynwood W.: *See*—
Charbonnier, Francis M., Martin, and Swanson. 3,374,386.
Swanson, Robert C., to Teletype Corp. Relay flip-flop. 3,374,401, 3–19–68, Cl. 317—140.
Sweet, H. C., Co., Inc.: *See*—
Sweet, Harold C. 3,373,938.
Sweet, Harold C., to H. C. Sweet Co., Inc. Boom directed spray marking devices. 3,373,938, 3–19–68, Cl. 239—148.
Sweetheart Plastics, Inc.: *See*—
Davis, Paul. 3,373,896.
Swidinsky, John, to S. B. Penick & Co. Manufacture of guaiacol. 3,374,276, 3–19–68, Cl. 260—613.
Swift-Hook, Donald T., J. K. Wright, and J. Maycock, to Central Electricity Generating Board. Magnetohydrodynamic apparatus. 3,374,368, 3–19–68, Cl. 310—11.
Swift-Hook, Donald T., to Central Electricity Generating Board. Magnetohydrodynamic electrical generators. 3,374,370, 3–19–68, Cl. 310—11.
Symington Wayne Corp.: *See*—
Smith, Loren W. 3,373,793.
Symonds, John M., to Western Electric Co., Inc. Methods of and apparatus for alternate-reverse twisting of indefinite lengths of strand material. 3,373,550, 3–19–68, Cl. 57—34.
Syntex Corp.: *See*—
Cross, Alexander D. 3,374,251.
Fried, John H. 3,374,253.
TRW, Inc.: *See*—
Hein, Frank J. 3,373,795.
Hickey, John J. 3,374,439.
Lord, Albert M., and Hacha. 3,374,158.

Tab Products Co.: *See*—
Le Baron, John E. 3,373,989.
Tabeling, Raymond W.: *See*—
Johnson, Donald R., and Tabeling. 3,373,598.
Tabuchi, Seiichi, H. Matsuzak, and T. Tsuboi, to Fujitsu Ltd. Compound electronic unit. 3,374,400, 3–19–68, Cl. 317—101.
Taft, Irvin M. Saber saw extension. 3,373,779, 3–19–68, Cl. 143—68.
Tagg, Howard L. Combination object moving devices and canes or walking sticks. 3,374,022, 3–19–68, Cl. 294—2.
Tajima, Mataichi, and K. Sakamoto, to Fuji Shashin Film Kabushiki Kaisha. Sheet material handling and treating apparatus. 3,373,755, 3–19–68, Cl. 134—134.
Takahashi, Jin, to The Singer Co. Drive motor mounting arrangement. 3,373,708, 3–19–68, Cl. 112—220.
Takashi, Yukichi: *See*—
Aishima, Itsuho, and Takashi. 3,374,214.
Taki, Hiromitsu: *See*—
Nitta, Tsuneharu, Taki, and Nagase. 3,374,185.
Tan, Henry H., to E. I. du Pont de Nemours and Co. Preparation of lower alkanoyloxypropionaldehydes. 3,374,267, 3–19–68, Cl. 260—494.
Tanos, Nicolaos. Asparagus cutter. 3,373,787, 3–19–68, Cl. 146—81.
Tanos, Nicolaos. Method of separating edible from fibrous portion of asparagus. 3,373,788, 3–19–68, Cl. 146—241.
Taplin, John F. Cylinder and piston unit having non-collapsible dual rolling diaphragm. 3,373,694, 3–19–68, Cl. 103—150.
Taplin, Lael B., to The Bendix Corp. Method for determining fluid characteristics untilizing fluid stream oscillating devices. 3,373,600, 3–19–68, Cl. 73—32.
Tapper, Robert. Electrical muscle stimulator device and razor attachment therefor. 3,373,747, 3–19–68, Cl. 128—422.
Tarbell, Harlan E.: *See*—
Muller, N. William, and Tarbell. 3,374,210.
Tarnas, Wincenty. Gaseous-fuel jet-fired heater. 3,373,732, 3–19–68, Cl. 126—116.
Tata, Raymond V.: *See*—
Brouwer, Charles W., and Tata. 3,373,718.
Tate, Kenneth L., H. R. Jaquith, H. S. Hopkins, and N. B. Nichols, to Taylor Instrument Companies. Instrument movement. 3,373,619. 3–19–68, Cl. 74—89.2.
Taubmann, Harro, and H. Boderke, to Didier-Werke A.G. Apparatus for operating a burner fired shaft furnace. 3,373,981, 3–19–68, Cl. 263—29.
Tavendale, Alister J., to Atomic Energy of Canada Ltd. Method of making lithium-drift diodes by diffusion. 3,374,124, 3–19–68, Cl. 148—186.
Taylor, Craig V., to C. V. Taylor and C. De Wald. Tabbing mechanism. 3,374,049, 3–19–68, Cl. 401—171.
Taylor Instrument Companies: *See*—
Tate, Kenneth L., Jaquith, Hopkins, and Nichols. 3,373,619.

Yui, Naoyuki H. : *See*—
Frank, Ernest, Yui, and Silvasi. 3,374,115.

Yuza, Rudolph A., to The Bastian Blissing Co. Carbonated water dispensing nozzle. 3,373,937, 3–19–68, Cl. 239—11.

Zahir, Sheik A.-C., to Ciba Ltd. Phosphono carboxamides. 3,374,292, 3–19–68, Cl. 260—943.

Zatz, Jules, to Beckman Instruments, Inc. External coulometric generator. 3,374,161, 3–19–68, Cl. 204—195.

Zechlin, Richard : *See*—
Henderson, Robert M., and Zechlin. 3,374,418.

Zehnder, Walter : *See*—
Ryffel, Kaspar, and Zehnder. 3,374,207.

Zeiss, Carl Stiftung : *See*—
Räntsch, Kurt, and Weyrauch. 3,374,046.

Zenith Radio Corp. : *See*—
Kessler, Seymour. 3,373,996.

Zenner, Karl-Friedrich : *See*—
Oertel, Gunter, Holtschmidt, and Zenner. 3,374,060.

Zero Mfg. Co. : *See*—
Duncan, Lloyd P. 3,373,720.

Zimmermann, Hans-Georg, and U. Schaller, to NSU Motorenwerke Aktiengesellschaft. Cooling system for the rotor of a rotary internal combustion engine. 3,373,722, 3–19–68, Cl. 123—8.

Zinser Textilmachinen Gesellschaft mit beschraenkter Haftung : *See*—
Scherr, Hermann. 3,373,552.

Zucker, Joseph : *See*—
Harrison, Richard I., and Zucker. 3,374,433.

Zur Hausen, Manfred, and W. Knepper, to Chemische Werke Huls Aktiengesellschaft. Process and catalyst for catalytic dehydrogenation of cyclododecanol. 3,374,270, 3–19–68, Cl. 260—586.

CLASSIFICATION OF PATENTS

ISSUED MARCH 19, 1968

NOTE.—First number, class; second number, subclass; third number, patent number

2— 9	3,373,443	37— 43	3,373,514	72—238	3,373,589	95— 11	3,373,670	128— 28	3,373,738	165— 40	3,373,801

HARMAL CORPORATION

Notice of Recordation of Trade Name

On December 15, 1967, there was published in the Federal Register (32 F.R. 17985) a notice of application for the recordation under section 42 of the Act of July 5, 1946, as amended (15 U.S.C. 1124) of the trade name HARMAL CORPORATION used by Harmal Corporation, an Illinois corporation, and Ball Machinery Company, an Illinois corporation. The notice advised that prior to final action on the application, filed pursuant to section 11.16, Customs Regulations (19 CFR 11.16), consideration would be given to relevant data, views, or arguments submitted in opposition to the recordation and received not later than 30 days from the date of publication of the notice. No responses were received in opposition to the application.

The name "HARMAL CORPORATION" is hereby recorded as the trade name of Harmal Corporation, a corporation organized under the laws of the State of Illinois, located at 939 West Lake Street, Chicago, Illinois, and Ball Machinery Company, an Illinois corporation, located at 939 West Lake Street, Chicago, Illinois, when applied to metal working machine tools, manufactured in Italy.

EDWIN F. RAINS,

Feb. 9, 1968. *Acting Commissioner of Customs.*

The TRADEMARK SECTION of the OFFICIAL GAZETTE, issued weekly, is mailed under the direction of the Superintendent of Documents, Government Printing Office, Washington, D.C., 20402 to whom all subscriptions should be made payable and all communications addressed; subscription price, $12.00 per annum, foreign mailing $4.00 additional; single copies, 25 cents each.

PRINTED COPIES OF TRADEMARK REGISTRATIONS are furnished by the Patent Office for 20 cents each. Address orders to the Commissioner of Patents, Washington, D.C. 20231.

MARKS PUBLISHED FOR OPPOSITION

SECTION 1

The following marks are published in compliance with section 12(a) of the Trademark Act of 1946. Application for the registration of these marks in more than one class has been filed as provided in section 30 of said act as amended by Public Law 772, 87th Congress, approved Oct. 9, 1962, 76 Stat. 769. Opposition under section 13 may be filed within thirty days of this publication. See Rules 2.101 to 2.105.

A separate fee of twenty-five dollars for each class opposed must accompany the opposition.

[NOTE: For publication of marks presented in applications for registration in one class, see section 2.]

SN 245,732. The Mercoid Corporation, Chicago, Ill. Filed May 16, 1966.

MERCOID CONTROL

Applicant disclaims exclusive rights to the word "Control," except in combination with the mark as shown. Owner of Reg. No. 156,669.

Class 21—Electrical Apparatus, Machines, and Supplies

For Vacuum Operated Electric Switches, Pressure Operated Electric Switches, Float Operated Electric Switches, Mechanically Operated Electric Switches, Mercury Switches, and Magnetically Operated Electric Switches (Int. Cl. 9).

Class 26—Measuring and Scientific Appliances

For Mercury Contact Devices, Temperature Devices, Timing Devices, Differential Pressure Devices, Pressure Actuated Mechanical Devices, Vacuum Controlling and Indicating Devices, and Float Controlling and Indicating Devices (Int. Cl. 9).

First use on or before Aug. 1, 1933.

SN 257,461. Consolidated Merchandising Corp., New York, N.Y. Filed Oct. 28, 1966.

SOUNDMASTER

Class 21—Electrical Apparatus, Machines, and Supplies

For Walkie Talkies and AM and FM Radio Receivers (Int. Cl. 9).
First use August 1966.

Class 36—Musical Instruments and Supplies

For Tape Recorders (Int. Cl. 9).
First use June 28, 1966.

SN 257,705. General Fire Extinguisher Corp., Northbrook, Ill. Filed Nov. 1, 1966.

QUICK AID

Class 6—Chemicals and Chemical Compositions

For Dry Chemical and Liquid Fire Extinguishing Agents (Int. Cl. 1).

Class 23—Cutlery, Machinery, and Tools, and Parts Thereof

For Portable Fire Extinguishers (Int. Cl. 7).

First use on or before Dec. 2, 1946.

SN 261,364. Develco, Incorporated, Norwalk, Conn. Filed Dec. 23, 1966.

DEVELCO

Class 23—Cutlery, Machinery, and Tools, and Parts Thereof

For Food Pumps (Int. Cl. 7).
First use at least as early as Feb. 15, 1961.

Class 26—Measuring and Scientific Appliances

For Environmental Test Chambers (Int. Cl. 9).
First use at least as early as Feb. 25, 1960.

SN 263,739. Borske Sklo, Narodni Podnik, Novy Bor, Czechoslovakia. Filed Feb. 1, 1967.

The word "Czechoslovakia" is disclaimed apart from the mark as shown. Owner of Czechoslovakian Reg. No. 156,676, dated Mar. 1, 1966.

Class 8—Smokers' Articles, Not Including Tobacco Products

For Smokers' Articles and Smokers' Kits—Namely, Ashtrays; Cigarette and Cigar Holders; Cigar, Cigarette and Tobacco Boxes and Cases (Int. Cl. 34).

Class 33—Glassware

For Utilitarian Household Glassware—Namely, Vases, Bowls, Jardinieres, Baskets, Cups, Tableware, Compote Sets, Tumblers, and Stemware (Int. Cl. 21).

SN 267,336. Joseph Chevrolet Co., Groesbeck, Ohio. Filed Mar. 22, 1967.

PONDEROSA

Class 101—Advertising and Business

For New and Used Automobile Dealership Services (Int. Cl. 35).

Class 103—Construction and Repair

For Automobile Maintenance Services (Int. Cl. 37).

First use Apr. 30, 1965.

SECTION 2

The following marks are published in compliance with section 12(a) of the Trademark Act of 1946. Opposition under section 13 may be filed within thirty days of publication. See Rules 2.101 to 2.105.

A fee of twenty-five dollars must accompany the opposition.

[NOTE: For publication of marks presented in a combined application for registration in more than one class, see section 1.]

Class 1—Raw or Partly Prepared Materials **Class 2—Receptades**

SN 256,357. The Goodyear Tire & Rubber Company, Akron, Ohio. Filed Oct. 13, 1966.

VYCELL

For Vinyl Shoe Sole Compound (Int. Cl. 1).
First use July 13, 1966.

SN 262,212. Standard Oil Company of California, San Francisco, Calif. Filed Jan. 9, 1967.

CHEVRON

Owner of Reg. No. 736,207 and others.
For Fibers Produced From Synthetic Resin (Int. Cl. 22).
First use Oct. 11, 1966.

SN 264,891. W. P. Adams II, d.b.a. ABC Ranch, Omaha, Nebr. Filed Feb. 17, 1967.

ABC

For Registered Hereford Cattle (Int. Cl. 31).
First use Mar. 1, 1959.

SN 269,567. The Richardson Company, Melrose Park, Ill. Filed Apr. 19, 1967.

Owner of Reg. Nos. 765,724 and 765,725.
For Thermoplastic and Thermosetting Resins (Int. Cl. 1).
First use during the fall of 1966.

SN 267,616. Hudson Foam Plastics Corporation, Edgewater, N.J. Filed Dec. 27, 1967.

CUSH-N-FOAM

Owner of Reg. Nos. 580,636, 750,924, and others.
For Rubber and Plastic Foam Sold in Sheet, Slab, Die-Cut, or Chopped Form (Int. Cl. 17).
First use May 12, 1952.

No exclusive claim is made to the letter "G" except as shown.

For Food and Drink Cooling and Serving Sets Comprising a Food or Beverage Container, a Cold Energy Liner and a Decorative Insulated Container for Said Cold Energy Liner (Int. Cl. 21).

First use Oct. 25, 1964; as early as June 30, 1963, in a different form.

SN 251,588. The Greif Bros. Cooperage Corporation, Delaware, Ohio. Filed Aug. 2, 1966.

PLAST-I-LINED

For Fibre and/or Metal Drums (Int. Cls. 6 and 20).
First use Apr. 13, 1965.

SN 254,877. H. D. Hudson Manufacturing Company, Chicago, Ill. Filed Sept. 21, 1966.

FELKER

For Tanks Used as Receptacles (Int. Cl. 6).
First use in or about 1928.

SN 260,390. American Hospital Supply Corporation, Evanston, Ill. Filed Dec. 9, 1966.

TOMAC

Owner of Reg. Nos. 526,450, 732,775, and 836,601.
For Jars, Trays, Utility Chests, Dispensing Cabinets, Bowls, Tumblers, Cups, Soap Dishes, Basins, Pans and Holders for Hospital Use; Dispensing Containers for Brushes, Drugs and Water; and Hampers and Bags for Laundry, Storage and Refuse (Int. Cls. 20 and 21).
First use in or before June 1914.

Class 3 — Baggage, Animal Equipments, Portfolios, and Pocketbooks

SN 261,353. Antler Limited, Bury, England. Filed Dec. 23, 1966.

ANTLER

Owner of British Reg. No. 871,912, dated Nov. 17, 1964.
For Travelling Cases, Travelling Bags, Attaché Cases, Suit Cases, Document Cases, Despatch Cases, Brief Cases, Valises, Trunks, and Portmanteaus (Int. Cl. 18).

SN 272,101. School House Products, Inc., New York, N.Y. Filed May 22, 1967.

HANDI-TOTE

For Book Straps (Int. Cl. 18).
First use June 1965.

Class 4 — Abrasives and Polishing Materials

SN 272,001. Armour and Company, d.b.a. Armour Abrasives Company, Chicago, Ill. Filed May 22, 1967.

RESILITE MARK II

Owner of Reg. No. 516,820.
For Coated Abrasives in the Form of Sheets and Belts (Int. Cl. 3).
First use on or prior to May 1, 1967.

SN 287,113. Alberto-Culver Company, Melrose Park, Ill. Filed Dec. 18, 1967.

PROCLAIM

For Furniture Polish (Int. Cl. 3).
First use Nov. 27, 1966.

SN 287,788. Simonis Company, Chicago, Ill. Filed Dec. 29, 1967.

UNIQUE

Owner of Reg. No. 781,518.
For Floor Wax (Int. Cl. 3).
First use Dec. 1, 1967.

Class 6 — Chemicals and Chemical Compositions

SN 262,231. Universal Oil Products Company, Des Plaines, Ill. Filed Jan. 9, 1967.

K-70

For Algaecide (Int. Cl. 5).
First use Feb. 22, 1961.

SN 266,452. Quikrete Company, Columbus, Ohio. Filed Mar. 10, 1967.

THERMO-LUBE

For Liquid Chemical Composition Used as an Additive for Concrete and Mortar Mixes To Reduce the Freezing Point of Such Mixes and To Increase the Workability Thereof in Cold Weather (Int. Cl. 1).
First use January 1962.

SN 274,099. Shell Oil Company, New York, N.Y. Filed June 16, 1967.

NEOFLEX

For Alcohol (Int. Cl. 1).
First use May 8, 1967.

SN 274,445. National Lead Company, New York, N.Y. Filed June 21, 1967.

Y47

For Pigment Especially Adapted for Yellow Traffic Marking Paints (Int. Cl. 2).
First use Apr. 22, 1963.

SN 274,626. Industrial Weed Killers, Inc., Lubbock, Tex. Filed June 23, 1967.

STAKILL

For Herbicide (Int. Cl. 5).
First use on or about Apr. 1, 1966.

Class 9 — Explosives, Firearms, Equipments, and Projectiles

SN 261,046. Commercial Solvents Corporation, New York, N.Y. Filed Dec. 19, 1966.

SHOT BAG

For Blasting Explosives (Int. Cl. 13).
First use Oct. 1, 1966.

Class 12 — Construction Materials

SN 257,960. Johns-Manville Corporation, New York, N.Y. Filed Nov. 4, 1966.

FIRE-GLASS

For Shingles, and Felts for Use as Underlayment for Shingles (Int. Cl. 19).
First use Sept. 29, 1966.

SN 259,402. The Borden Company, New York, N.Y. Filed Nov. 25, 1966.

ELASTATURF

For Rubber-Plastic Composition Material for Surfacing Playgrounds and Athletic Areas (Int. Cl. 19).
First use on or before Oct. 28, 1966.

SN 264,678. National Gypsum Company, Buffalo, N.Y. Filed Feb. 14, 1967.

FIRE/SHEATH

Owner of Reg. No. 735,169.
For Gypsum Sheathing (Int. Cl. 19).
First use May 6, 1966.

SN 269,454. Ranco Industrial Products Corporation, Cleveland, Ohio. Filed Apr. 18, 1967.

SEALO

For Homogenized, Non-Hardening Caulking and Glazing Compound (Int. Cl. 17).
First use on or about July 14, 1948.

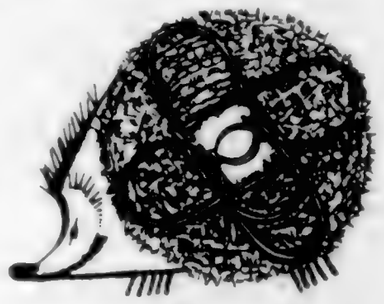
SN 270,046. Clopay Corporation, Cincinnati, Ohio. Filed Apr. 26, 1967.

DECORATOR

For Folding Doors (Int. Cl. 19).
First use Apr. 4, 1967.

Class 13 — Hardware and Plumbing and Steam-Fitting Supplies

SN 251,674. Westfälische Union Aktiengesellschaft für Eisen- und Drahtindustrie, Hamm, Westphalia, Germany. Filed Aug. 3, 1966.



Applicant makes no claim to a representation of the goods (barbed wire) apart from the distinctive silhouette shown.
For Barbed Wire (Int. Cl. 6).
First use November 1965; in commerce March 1966.

SN 255,529. E. F. Harster Company, St. Louis, Mo. Filed Sept. 30, 1966.

DUC-TIE

For Duct Tie Hangers (Int. Cl. 6).
First use 1956.

SN 260,262. Mason Industries, Inc., Hollis, N.Y. Filed Dec. 7, 1966.

LO-NOISE HUSH PIPE

For Flexible Hose and Flanges Used in Piping Systems (Int. Cl. 17).
First use Jan. 10, 1964.

SN 263,652. Advance Food Service Equipment, Inc., Westbury, N.Y. Filed Jan. 31, 1967.

For Pans and Sinks (Int. Cls. 6 and 21).
First use June 1962.

SN 263,761. Mills-McCanna Company, Carpentersville, Ill. Filed Feb. 1, 1967.

SAF-T-HANDLE

For Valves (Int. Cl. 6).
First use in or about May 1965.

SN 271,557. Whitten Corporation, Bellingham Center, Mass. Filed May 15, 1967.

UNIFLOW

For Water Supply Piping and Drainage Gutter Systems for Swimming Pools (Int. Cl. 6).
First use Apr. 8, 1966.

SN 271,898. ACF Industries, Incorporated, New York, N.Y. Filed May 19, 1967.

POW-R-SEAL

For Fluid Control Valves (Int. Cl. 6).
First use December 1962.

SN 273,382. E-Z Products Company, Culver City, Calif. Filed June 8, 1967.

CLIPACK

For Prepackaged Pipe Fittings (Int. Cl. 6).
First use Mar. 11, 1966.

SN 273,407. Parker-Kalon Corporation, Clifton, N.J. Filed June 9, 1967.

DRIL-KWICK

For Self-Tapping Screws (Int. Cl. 6).
First use Nov. 7, 1966.

SN 273,434. A.P.M. Corporation, Englewood, N.J. Filed May 15, 1967.

ADJUST-A-SEEL

For Self-Sealing Threaded Nuts (Int. Cl. 6).
First use Apr. 25, 1967.

Class 14 — Metals and Metal Castings and Forgings

SN 257,642. Nelsen Steel & Wire Company, Incorporated, Franklin Park, Ill. Filed Oct. 31, 1966.

The word "Steel" is disclaimed.
For Cold Drawn Steel Bars (Int. Cl. 6).
First use Jan. 10, 1959.

SN 257,643. Nelsen Steel & Wire Company, Incorporated, Franklin Park, Ill. Filed Oct. 31, 1966.

VIKING "100"

For Cold Drawn Steel Bars (Int. Cl. 6).
First use Nov. 29, 1963.

SN 260,160. Isabellenhuette Heusler, Kommanditgesellschaft, Dillenburg, Hessen, Germany. Filed Dec. 6, 1966.

ZERANIN

Owner of German Reg. No. 819,633, dated May 3, 1965.
For Alloy—Namely, Nickel-Manganese-Copper Alloy in the Form of Ingots, Plates, Rods, Wires, Sheets, Bands, Tubes, Wire Nets, Flat Wires, and in Any Other Form Suitable for Making Electrical Resistors (Int. Cl. 6).

SN 273,521. National Steel Corporation, Pittsburgh, Pa. Filed June 9, 1967.

JP

For Matte-Finish, Paintable, Galvanized Steel Sheets and Strip (Int. Cl. 6).
First use May 8, 1967.

Class 15—Oils and Greases

SN 274,620. H.R.L. Inc., d.b.a. HRLubricants Inc., Los Angeles, Calif. Filed June 23, 1967.

HRLubricants

The word "Lubricant" is disclaimed apart from the mark as shown. Owner of Reg. No. 691,157.
For Lubricant and Additive for Engines, Motors, Gears, Chain Drives, Transmissions, and Differentials (Int. Cl. 4).
First use Apr. 17, 1967.

SN 277,455. Golden Imperial, Inc., Indianapolis, Ind. Filed Aug. 3, 1967.

LONE STAR

For Motor Oil (Int. Cl. 4).
First use June 4, 1967.

Class 16—Protective and Decorative Coatings

SN 266,604. United Paint Mfg. Co., Spokane, Wash. Filed Mar. 13, 1967.

MONOCRYL

For Clear Acrylic Finish for Walls and Floors (Int. Cl. 2).
First use Dec. 1, 1965.

SN 267,442. Phelan-Faust Paint Manufacturing Company, St. Louis, Mo. Filed Mar. 23, 1967.

ULTRADEC

For Floor Coating—Namely, Two-Component Base Coats and Finish Coats (Int. Cl. 2).
First use Nov. 9, 1966.

SN 269,165. Geo. Brothers, Great Barrington, Mass. Filed Apr. 14, 1967.

LIN-SPEED

For Wood Finishing Oil, Especially for Gunstocks (Int. Cl. 2).
First use Jan. 15, 1951.

SN 269,695. The Sherwin-Williams Company, Cleveland, Ohio. Filed Apr. 20, 1967.

KEM-1-COAT

Owner of Reg. Nos. 275,775, 816,517, and others.
For House Paint (Int. Cl. 2).
First use Jan. 23, 1967.

SN 274,504. The Egyptian Lacquer Manufacturing Company, Kearny, N.J. Filed June 22, 1967.

LASTINA

For Nitrocellulose and Synthetic Resin Based Finishes—Namely, Air Drying and Baking Metal Coatings, Both Clear and Pigmented (Int. Cl. 2).
First use July 1892 on nitrocellulose lacquers.

SN 275,141. Hotopp Paint & Varnish Co., Jersey City, N.J. Filed June 30, 1967.

Dura

The drawing is lined for the color red, but no claim is made to color.
For Paints (Int. Cl. 2).
First use 1951; 1885 as to "Dura."

Class 17—Tobacco Products

SN 264,188. R. J. Reynolds Tobacco Company, Winston-Salem, N.C. Filed Feb. 13, 1967.

MINIT

For Cigarettes (Int. Cl. 34).
First use Jan. 4, 1967.

SN 280,254. R. J. Reynolds Tobacco Company, Winston-Salem, N.C. Filed Sept. 13, 1967.

CALUMET

For Cigarettes (Int. Cl. 34).
First use July 26, 1967.

SN 280,255. R. J. Reynolds Tobacco Company, Winston-Salem, N.C. Filed Sept. 13, 1967.

DUVAL

For Cigarettes (Int. Cl. 34).
First use Sept. 1, 1967.

SN 280,256. R. J. Reynolds Tobacco Company, Winston-Salem, N.C. Filed Sept. 13, 1967.

COURIER

For Cigarettes (Int. Cl. 34).
First use Aug. 31, 1967.

SN 280,257. R. J. Reynolds Tobacco Company, Winston-Salem, N.C. Filed Sept. 13, 1967.

REGATTA

For Cigarettes (Int. Cl. 34).
First use Aug. 31, 1967.

SN 280,258. R. J. Reynolds Tobacco Company, Winston-Salem, N.C. Filed Sept. 13, 1967.

POINTER

For Cigarettes (Int. Cl. 34).
First use Aug. 31, 1967.

SN 280,259. R. J. Reynolds Tobacco Company, Winston-Salem, N.C. Filed Sept. 13, 1967.

GOLD STRIPE

For Cigarettes (Int. Cl. 34).
First use Aug. 31, 1967.

SN 280,260. R. J. Reynolds Tobacco Company, Winston-Salem, N.C. Filed Sept. 13, 1967.

EMPIRE

For Cigarettes (Int. Cl. 34).
First use July 26, 1967.

SN 280,261. R. J. Reynolds Tobacco Company, Winston-Salem, N.C. Filed Sept. 13, 1967.

GLOBE

For Cigarettes (Int. Cl. 34).
First use Aug. 31, 1967.

Class 18—Medicines and Pharmaceutical Preparations

SN 225,466. Beecham Group Limited, d.b.a. Beecham Research Laboratories, Brentford, Middlesex, England. Filed Aug. 11, 1965.

BRL

For Antibiotics (Int. Cl. 5).
First use June 17, 1963; in commerce Nov. 8, 1954.

SN 259,445. Merck & Co., Inc., Rahway, N.J. Filed Nov. 25, 1966.

VITMOL

For Pharmaceutical Preparation for Use as a Tonic and Stimulant (Int. Cl. 5).
First use Nov. 15, 1966.

SN 259,838. La Preferida Tropical Products, Inc., Chicago, Ill. Filed Dec. 1, 1966.

SOL

For Rubbing Alcohol and Cough Syrup (Int. Cl. 5).
First use Aug. 31, 1958.

SN 271,158. The Kendall Company, Walpole, Mass. Filed May 10, 1967.

PROCTETS

For Disposable Medicated Tissues for Use in Treating Various Skin Disorders (Int. Cl. 5).
First use Oct. 7, 1966.

Class 19—Vehicles

SN 258,397. Monroe Auto Equipment Company, Monroe, Mich. Filed Nov. 10, 1966.

ROAD MASTER

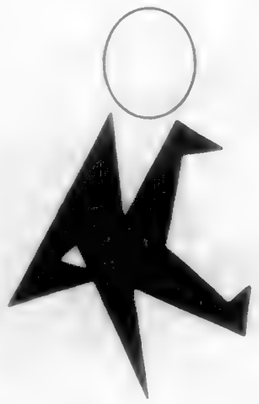
Owner of Reg. No. 766,240.
For Vehicle Shock Absorbers (Int. Cl. 12).
First use July 1, 1960.

SN 266,194. Bombardier Snowmobile Ltd., Valcourt, Quebec, Canada. Filed Mar. 8, 1967.

J5

For Tracked Vehicles Primarily Used for Hauling in Snow Country and Off-the-Road Terrain (Int. Cl. 12).
First use Oct. 27, 1954; in commerce Nov. 27, 1954.

SN 268,284. Auto-Kool, Inc., Lawton, Okla. Filed Apr. 4, 1967.



The mark consists of the stylized letters "AK" and design.
For Automobile Air-Conditioners (Int. Cl. 11).
First use Feb. 3, 1965.

SN 271,629. S. H. Leggitt Company, Marshall, Mich. Filed May 16, 1967.

EAGLE GRIP

For Detachable, Fender Mounted Rearview Mirrors (Int. Cl. 12).
First use Mar. 31, 1965.

SN 271,752. Biscayne Manufacturing Corporation, Miami, Fla. Filed May 18, 1967.

BODYGUARD

For Automobile Trim Strip (Int. Cl. 12).
First use January 1967.

Class 20 — Linoleum and Oiled Cloth

SN 256,340. American Rubber Corporation, Albertville, Ala. Filed Oct. 13, 1966.

MARLON

For Vinyl Floor Tile (Int. Cl. 19).
First use Mar. 2, 1966.

SN 263,351. Congoleum-Nairn Inc., Kearny, N.J. Filed Jan. 26, 1967.

HORIZON

For Plastic Coverings of the Smooth Surface, Resilient Type for Surfaces Such as Floors, Walls, Countertops, and the Like in the Form of Rolls, Rugs, and Tiles (Int. Cl. 27).
First use Dec. 22, 1966.

SN 263,353. Congoleum-Nairn Inc., Kearny, N.J. Filed Jan. 26, 1967.

FLAMENCO

For Plastic Coverings of the Smooth Surface, Resilient Type for Surfaces Such as Floors, Walls, Countertops, and the Like in the Form of Rolls, Rugs, and Tiles (Int. Cl. 27).
First use Dec. 22, 1966.

Class 21 — Electrical Apparatus, Machines, and Supplies

SN 248,251. Proctor-Silex Incorporated, Philadelphia, Pa., by merger and assignment from The Proctor-Silex Corporation, Philadelphia, Pa. Filed June 16, 1966.

lifelong

For Electric Irons, Toasters, and Coffeemakers (Int. Cls. 9 and 11).
First use May 23, 1966.

SN 250,712. The Manitowoc Company, Inc., Manitowoc, Wis. Filed July 21, 1966.

FROST-AWAY

For Automatic Electrical Controls for Refrigeration Defrosting Systems (Int. Cl. 9).
First use Dec. 12, 1960.

SN 251,911. General RF Fittings, Inc., Boston, Mass. Filed Aug. 8, 1966.

PTM

Owner of Reg. No. 708,030.
For Coaxial Transmission Line Apparatus, Parts and Components—Namely, Coaxial Terminations and Shorts (Int. Cl. 9.)
First use July 27, 1966.

SN 253,271. Automatic Valve Corporation, Farmington, Mich. Filed Aug. 29, 1966.

CYCLEMASTER

For Solenoid Operated Pilot Valve and Valve Timer Combination (Int. Cl. 9).
First use on or about June 21, 1966.

SN 254,029. Abbey Automation Systems, Inc., Linden, N.J. Filed Sept. 8, 1966.

Firepower

For Rectifier Circuits (Int. Cl. 9).
First use January 1966.

SN 255,944. Hi-Altitude Instrument Co., Inc., Denver, Colo. Filed Sept. 30, 1966.

HAICO

For Voltage Regulator (Int. Cl. 9).
First use on or about Oct. 1, 1963.

SN 256,161. Wanlass Electric Co., Santa Ana, Calif. Filed Oct. 10, 1966.

WANLASS ELECTRIC CO.

Applicant disclaims the words "Electric Co." apart from the mark as shown.
For Electrical Power Supplies, Voltage Regulators, and Filter Circuits (Int. Cl. 9).
First use Aug. 24, 1965.

SN 260,093. Steroline Systems Corporation, Santa Fe Springs, Calif. Filed Dec. 5, 1966.

Steroline

The drawing is lined for the color blue which is claimed as a preferred though not essential feature of the mark.
For Electronic Steriliser for Sterilising Liquids by Ultra-Violet Light (Int. Cl. 11).
First use Oct. 31, 1966.

SN 262,773. Dictograph Products Inc., Danbury, Conn. Filed Jan. 18, 1967.

UNICOM

For Electronic Communication Unit for Paging and Voice or Sound Signalling (Int. Cl. 9).
First use Dec. 14, 1966.

SN 263,417. United Air Specialists, Inc., Cleveland, Ohio. Filed Jan. 26, 1967.

CRYSTAL-AIRE

For Electronic Air Filtration and Cleaning Apparatus (Int. Cl. 11).
First use Dec. 1, 1966.

SN 263,957. Sireno Signal Mfg. Corp., Kearny, N.J. Filed Feb. 3, 1967.

TECRAFT

For Converters for Use With Radio and Wireless Communication Receivers (Int. Cl. 9).
First use in 1958.

SN 265,779. Alpha Industries, Inc., Newton Upper Falls, Mass. Filed Mar. 2, 1967.

MTI

The mark comprises the stylized letters "MTI" and design.
For Microwave and Solid State Components (Int. Cl. 9).
First use January 1965.

SN 265,780. Alpha Industries, Inc., Newton Upper Falls, Mass. Filed Mar. 2, 1967.

MO

The mark comprises the stylized letters "MO" and design.
For Microwave Diodes (Int. Cl. 9).
First use January 1965.

SN 268,296. Electro-Matic Products Co., Chicago, Ill. Filed Apr. 4, 1967.

DEMAG A TRON

For Demagnetizers Utilized for Demagnetizing Magnets, Both Electro-Magnets and Permanent Magnets, Used in Various Installations Such as in Machine Tools, and Including Manually Manipulated Control Elements and an Electronic Circuit Following Through a Predetermined Law of Operation Upon Manual Energization (Int. Cl. 9).
First use on or about Feb. 1, 1967.

SN 268,692. Brunswick Corporation, Chicago, Ill. Filed Apr. 10, 1967.

MERCATHODE

For Battery Actuated Solid State Circuitry, Including Electrodes, for Protecting Underwater Marine Propulsion Units Against Galvanic Corrosion (Int. Cl. 9).
First use at least as early as Jan. 5, 1967.

SN 269,497. Avantek, Inc., Santa Clara, Calif. Filed Apr. 19, 1967.

AVANTEK

For Solid State Amplifiers (Int. Cl. 9).
First use December 1965.

SN 269,874. Ethyl Corporation, Richmond, Va. Filed Apr. 24, 1967.

ETHYL

Owner of Reg. Nos. 187,410, 399,427, and others.
For Polyvinyl Chloride Pipe and Pipe Fittings Used as Electrical Conduit (Int. Cl. 9).
First use Nov. 25, 1964.

SN 270,341. Bantam-Lite, Inc., New York, N.Y. Filed May 1, 1967.

FLAIR

For Pocket Flashlights (Int. Cl. 11).
First use November 1966.

SN 274,468. Stromberg-Carlson Corporation, Rochester, N.Y. Filed June 21, 1967.

MINIWALL

For Telephone Sets (Int. Cl. 9).
First use Apr. 28, 1967.

SN 274,470. H. J. Theiler Corporation, Whitinsville, Mass. Filed June 21, 1967.

MINK

For Wall Plates for Switches, Electric Receptacles, Telephone Outlets, and Lights (Int. Cl. 9).
First use June 15, 1966.

SN 274,556. Charles Messenger, North Hollywood, Calif. Filed June 22, 1967.

MICROCYCLE

For Radio Transceivers and Receivers (Int. Cl. 9).
First use Jan. 15, 1967.

SN 274,670. Spartans Industries, Inc., New York, N.Y. Filed June 23, 1967.

K LINE

For Radios (Int. Cl. 9).
First use Feb. 1, 1966.

SN 274,674. System Analyser Corp., Nokomis, Ill. Filed June 23, 1967.

ROTOVERTER

For Electrical Rotary Converters (Int. Cl. 9).
First use Jan. 12, 1966.

SN 274,699. American District Telegraph Company, New York, N.Y. Filed June 26, 1967.

ADT

Owner of Reg. Nos. 700,676, 826,555, and others.
For Electrical Communication Equipment—Namely, Microphones, Horns, Amplifiers, Speakers and Control Equipment; Intercommunication Equipment—Namely, Speaker Intercom Systems and Telephone Intercom Systems; Nurses' Call Systems; and Message Programming Equipment (Int. Cl. 9).
First use May 1965 on intercommunication equipment.

SN 275,129. Federal Pacific Electric Company, Newark, N.J. Filed June 30, 1967.

PAGEANT

For Dimmers (Int. Cl. 9).
First use Apr. 25, 1967.

SN 275,607. Anzac Industries, Inc., Cleveland, Ohio. Filed July 10, 1967.

SEA HOOK

For Antennas (Int. Cl. 9).
First use May 9, 1967.

SN 275,649. Equality Plastics, Inc., New York, N.Y. Filed July 10, 1967.

EQUALITY

Owner of Reg. Nos. 750,547 and 788,800.
For Radios, Lighting Fixtures, Desk Lights, Flash Lights, Automobile Electrical Accessories—Namely, Defrosters, Warning Lights, Signal Lights, and Auto Vacuums (Int. Cls. 9 and 11).
First use Mar. 1, 1967.

SN 275,735. Amphenol Corporation, Broadview, Ill. Filed July 11, 1967.

APC-7

For Electrical Connectors and Parts Thereof (Int. Cl. 9).
First use May 31, 1967.

SN 275,975. Dee-Jay Overseas Trading Company, Inc., Hialeah, Fla. Filed July 13, 1967.

WAVERLY

For Radios (Int. Cl. 9).
First use Oct. 1, 1966.

SN 275,976. Dee-Jay Overseas Trading Company, Inc., Hialeah, Fla. Filed July 13, 1967.

WAVERLY SENTINEL

For Burglar Alarms (Int. Cl. 9).
First use Oct. 1, 1966.

SN 276,180. South Bay Cable Corp., Gardena, Calif. Filed July 17, 1967.

SBC

For Electrical Cables (Int. Cl. 9).
First use Feb. 1, 1962.

Class 22 — Games, Toys, and Sporting Goods

SN 245,660. Aktiebolaget Urfabriken, Svangsta, Sweden. Filed May 16, 1966.

CARDINAL

For Fishing Reels and Rods (Int. Cl. 28).
First use August 1963; in commerce March 1966.

SN 255,462. Robert E. Rodgers, Jr., d.b.a. Crajo Sports Company, Oxnard, Calif. Filed Sept. 29, 1966.

CRAJO BALL

No claim of exclusive right is made to the word "Ball" for the goods recited.
For Tethered Balls, Paddles and Ball Tether Blocks for Playing Paddle Ball Games (Int. Cl. 28).
First use Sept. 27, 1966.

SN 255,652. Richard L. Stevenson, Los Angeles, Calif. Filed Oct. 3, 1966.

MAKAHA

The word "Makaha" is derived from the Hawaiian term "Makahiki" which latter term designates a period of several months during which sports celebrations took place in ancient Hawaii. Owner of Reg. No. 789,337.
For Surfboards (Int. Cl. 28).
First use on or before Apr. 18, 1966.

SN 260,282. Aktiebolaget Urfabriken, Svangsta, Sweden. Filed Dec. 7, 1966.

TOBY

For Fishing Tackle (Int. Cl. 28).
First use Aug. 1, 1955; in commerce Aug. 1, 1964.

SN 260,662. Raymond L. Hall, Whippany, N.J. Filed Dec. 13, 1966.

SKI MATE

Applicant disclaims the word "Ski" apart from the mark as shown.
For Training and Exercising Apparatus for Simulating the Motions of Skiing With Respect to a Person in and on the Apparatus (Int. Cl. 28).
First use Sept. 1, 1966.

SN 266,344. Mangel Stores Corporation, New York, N.Y. Filed Mar. 9, 1967.

CY MANN

The mark "Cy Mann" is a fictitious name and not the name of any particular living individual.
For Golf Balls and Golf Clubs (Int. Cl. 28).
First use at least as early as January 1966.

SN 267,799. Milton Bradley Company, Springfield, Mass. Filed Mar. 29, 1967.

SLAP STICK

The word "Stick" is disclaimed apart from the mark as shown.
For Paddle Sticks and Cards, Sold as a Unit for Playing a Game (Int. Cl. 28).
First use Feb. 1, 1967.

SN 268,172. Eyerly Aircraft Co., Salem, Oreg. Filed Apr. 3, 1967.

SPIDER

For Amusement Park and/or Carnival Type Amusement Ride (Int. Cl. 28).
First use Feb. 7, 1967.

SN 270,494. Kohner Bros., Inc., East Paterson, N.J. Filed May 2, 1967.

PUZZLE PICKS

The word "Puzzle" is disclaimed from the mark as shown.
For Equipment Sold as a Unit for Playing a Puzzle-Type Game (Int. Cl. 28).
First use Apr. 17, 1967.

SN 271,945. Loral Corporation, New York, N.Y. Filed May 19, 1967.

PIZZA PARTY

For Operative Toy Oven (Int. Cl. 28).
First use Mar. 17, 1967.

SN 272,189. Ridge Runner Lures, Inc., Shreveport, La. Filed May 25, 1967.

Ole' Ben's

Speck-Taker

For Artificial Fishing Lures (Int. Cl. 28).
Filed Mar. 1, 1967.

SN 273,536. Spring Bloc Corporation of America, New York, N.Y. Filed June 9, 1967.

SPRING BLOC

For Golf Clubs (Int. Cl. 28).
First use Oct. 3, 1966.

SN 273,917. Wrather Corporation, Beverly Hills, Calif. Filed June 14, 1967.

LONE RANGER

Owner of Reg. Nos. 365,670; 527,916, and 770,530.
For Toy Guns and Holsters (Int. Cl. 28).
First use 1955.

SN 274,411. Chemold Corp., Jamaica, N.Y. Filed June 21, 1967.

CHEMFLITE

For Golf Balls (Int. Cl. 28).
First use June 9, 1967.

SN 277,903. Eyerly Aircraft Co., Salem, Oreg. Filed Aug. 9, 1967.

OCTOPUS

For Amusement Park and/or Carnival Type Amusement Ride (Int. Cl. 28).
First use Sept. 1, 1936.

SN 282,746. Mattel, Inc., Hawthorne, Calif. Filed Oct. 18, 1967.

BATHHOUSE BRASS

The term "Brass" is disclaimed apart from the mark as shown.
For Toy Musical Instruments (Int. Cl. 28).
First use Aug. 25, 1967.

SN 282,748. Mattel, Inc., Hawthorne, Calif. Filed Oct. 18, 1967.

FUN SPOTS

The term "Fun" is disclaimed apart from the mark as shown.
For Toy Bead-Making Sets (Int. Cl. 28).
First use Aug. 25, 1967.

SN 283,392. Mattel, Inc., Hawthorne, Calif. Filed Oct. 26, 1967.

UCKUCK BIRD

Applicant disclaims exclusive rights to the word "Bird," apart from the mark as shown for the goods recited.
For Stuffed Animal Toys (Int. Cl. 28).
First use Oct. 5, 1967.

SN 287,255. Mattel, Inc., Hawthorne, Calif. Filed Dec. 20, 1967.

TIFF

For Dolls, Doll Clothing, and Doll Accessories (Int. Cl. 28).
First use Sept. 28, 1967.

SN 287,286. Erwin Weller Company, Sioux City, Iowa. Filed Dec. 20, 1967.

TWISTEX

For Fishing Leaders (Int. Cl. 28).
First use Dec. 1, 1960.

Class 23 — Cutlery, Machinery, and Tools, and Parts Thereof

SN 239,090. Thrustbloc Limited, Oakville, Ontario, Canada. Filed Feb. 17, 1966.

THRUSTBLOC

Priority claimed under Sec. 44(d) on Canadian application, filed Aug. 19, 1965; Reg. No. 144,664, dated Apr. 1, 1966.
For Power Operated Valve Actuators (Int. Cl. 7).

SN 240,711. The Cross Company, Fraser, Mich. Filed Mar. 11, 1966.

MIL PAK

For Milling Heads for Machine Tools (Int. Cl. 7).
First use Feb. 8, 1966.

SN 252,895. John W. Roby & Co., Inc., Seattle, Wash. Filed Aug. 22, 1966.

ROBYCO

For Self-Priming and Centrifugal Pumps (Int. Cl. 7).
First use in the year of 1952.

SN 255,221. Monogram Industries, Inc., Monterey Park, Calif. Filed Sept. 27, 1966.

KLEKO

For Temporary Clamps for Clamping Two or More Work Thicknesses Together During Assembly Operation (Int. Cl. 6).
First use Mar. 17, 1958.

SN 257,079. Porta-Table Corporation, Chicago, Ill. Filed Oct. 24, 1966.

PORTA-TABLE

For Portable Cutting Table (Int. Cl. 7).
First use Jan. 5, 1965.

SN 260,065. Missouri-Rogers Corporation, Joplin, Mo. Filed Dec. 5, 1966.

ROADBUILDER

For Apron Feeders (Int. Cl. 7).
First use December 1959.

SN 260,240. Combination Pump Valve Company, Philadelphia, Pa. Filed Dec. 7, 1966.

PV

Owner of Reg. No. 712,013.
For Air Driven, Reciprocating Pumps (Int. Cl. 7).
First use March 1963.

SN 261,156. Norton-Aire, Inc., Erie, Pa. Filed Dec. 20, 1966.

NORTON-AIRE

For High and Low Pressure Air and Hydraulic Cylinders (Int. Cl. 7).
First use Aug. 3, 1964.

SN 263,070. International Parts Corporation, Chicago, Ill. Filed Jan. 23, 1967.

INPARCO

For Mufflers for Internal Combustion Engine Exhaust Systems (Int. Cl. 12).
First use on or about Dec. 22, 1966.

SN 263,071. International Parts Corporation, Chicago, Ill. Filed Jan. 23, 1967.

INPARCO

For Mufflers for Internal Combustion Engine Exhaust Systems (Int. Cl. 12).
First use on or about Dec. 22, 1966.

SN 264,493. American Hospital Supply Corporation, Evanston, Ill. Filed Feb. 13, 1967.

TOMAC

Owner of Reg. Nos. 326,450, 732,775, and 836,601.
For Hypodermic Needle Sharpeners, Mechanical Bed Lifts, Clamps for Controlling Flow Through Resilient Tubing, and Razors and Razor Blades (Int. Cls. 7 and 8).
First use on or before June 1, 1964.

SN 264,611. TRW Inc., Euclid, Ohio. Filed Feb. 13, 1967.

MRC TRW

The drawing is lined for the color yellow. Owner of Reg. Nos. 528,062, 620,549, and others.
For Ball, Roller, and Laminated Bearings (Int. Cl. 7).
First use Aug. 11, 1966.

SN 265,844. Carl Pohl, Brigantine, N.J. Filed Mar. 2, 1967.

X-80

For Automatic Electronically Controlled Equipment for Typewriters for Feeding Work Pieces to Typewriters and Positioning the Work Pieces for Manual or Automatic Typing on the Work Pieces, and Removing the Work Pieces (Int. Cl. 9).
First use May 1965.

SN 266,947. Textron Industries, Inc., Rockford, Ill. Filed Mar. 16, 1967.

TORX

For Heading Machine Punches (Int. Cl. 7).
First use Feb. 3, 1967.

SN 267,331. Hewitt-Robins Incorporated, Stamford, Conn. Filed Mar. 22, 1967.

LEVEL-LINE

For Conveyor Chain (Int. Cl. 7).
First use October 1966.

SN 267,621. Feed Service Corporation, Crete, Nebr. Filed Mar. 27, 1967.

MORAMATIC

For Liquid Feeders for Controlled and Free Choice Feeding of Animals (Int. Cl. 7).
First use May 15, 1966.

SN 267,726. Channel Construction, Inc., Keene, N.H. Filed Mar. 28, 1967.

BIG THUMB

For Clamping Attachment for Backhoes (Int. Cl. 7).
First use on or about Apr. 1, 1965.

SN 268,837. Wood Conversion Company, St. Paul, Minn. Filed Apr. 7, 1967.

CONWED

Owner of Reg. Nos. 820,946, 821,197, and others.
For Self-Propelled Logging Equipment Particularly a Transport for Logs (Int. Cl. 7).
First use on about June 1, 1966.

SN 270,868. Allyn Distributing Company, Denver, Colo. Filed May 8, 1967.

ALCO

For Sewing Machines, Attachments Therefor and Parts Thereof (Int. Cl. 7).
First use July 21, 1966.

SN 270,912. Esco Corporation, Portland, Oreg. Filed May 8, 1967.

KWIK TIP

Owner of Reg. No. 780,947.
For Replacement Parts for Crushing and Mixing Machinery—Namely, Impeller Bars and Hammer Assemblies (Int. Cl. 7).
First use Mar. 31, 1967, on hammer assemblies.

SN 270,919. Huyck Corporation, Rensselaer, N.Y. Filed May 8, 1967.

VACUFOIL

For Vacuum Augmented Dewatering Units for Use in Papermaking Machinery (Int. Cl. 7).
First use Apr. 26, 1967.

SN 271,196. J. Wiss and Sons Co., Newark, N.J. Filed May 10, 1967.

RE-NU

For Handles for Tools (Int. Cl. 8).
First use May 1, 1926.

SN 271,382. Nicholson File Company, Providence, R.I. Filed May 12, 1967.

Phoenix

For Saws (Int. Cl. 7).
First use Jan. 30, 1967.

SN 271,519. Rollway Bearing Company, Inc., Liverpool, N.Y. Filed May 15, 1967.

Air-Rol

For Roller Bearings (Int. Cl. 7).
First use Oct. 16, 1959.

SN 271,529. Alfred W. Schmidt, Saville, Ohio. Filed May 15, 1967.

MULTI-POWER

For Pneumatic and Hydraulic Cylinders (Int. Cl. 7).
First use Feb. 14, 1967.

SN 271,530. Alfred W. Schmidt, Seville, Ohio. Filed May 15, 1967.

THE PANCAKE LINE

For Pneumatic and Hydraulic Cylinders (Int. Cl. 7).
First use Oct. 10, 1956.

SN 271,925. Custom-Built Machinery, Inc., York, Pa. Filed May 19, 1967.

AD-A-CARD

For Machines To Feed Printed Inserts and the Like to High Speed Web Equipment (Int. Cl. 7).
First use Aug. 5, 1966.

SN 281,734. Watco Machine Products, Inc., Troy, N.Y. Filed Oct. 3, 1967.

TROY-BILT

For Self-Propelled Rotary Tillers for Use in Cultivating Gardens and the Like (Int. Cl. 7).
First use Aug. 23, 1967.

SN 282,656. Wilbur A. Larson, d.b.a. Hi-Life Rubber Products, Johnson Creek, Wis. Filed Oct. 17, 1967.

MILK MAID

For Milking Equipment—Namely, Inflations (Int. Cl. 7).
First use Sept. 22, 1967.

SN 282,657. Wilbur A. Larson, d.b.a. Hi-Life Rubber Products, Johnson Creek, Wis. Filed Oct. 17, 1967.

The representation of the milking inflations is disclaimed apart from the mark as shown.
For Milking Equipment—Namely, Inflations (Int. Cl. 7).
First use Sept. 22, 1967.

SN 282,750. Minnesota Mining and Manufacturing Company, St. Paul, Minn. Filed Oct. 18, 1967.

LOC PACK

For Machine for Dispensing Adhesive Tape (Int. Cl. 7).
First use Aug. 9, 1967.

SN 283,297. M.H.H. Engineering Company Ltd., Surrey, England. Filed Oct. 26, 1967.

TORQUEMASTER

For Torque Limiting Screwdrivers (Int. Cl. 8).
First use December 1956; in commerce Feb. 4, 1965.
Subj. to Intf. with SN 242,857 and SN 242,858.

Class 26—Measuring and Scientific Appliances

SN 234,833. Bausch & Lomb Incorporated, Rochester, N.Y., assignee of National Patent Development Corporation, New York, N.Y. Filed Dec. 17, 1965.

SOFLENZ

Owner of Reg. No. 279,937 and others.
For Contact Lenses (Int. Cl. 9).
First use Aug. 10, 1965.

SN 242,858. Torque Controls, Inc., South El Monte, Calif. Filed Apr. 6, 1966.

TORQUEMASTER

For Torque Testers and Torque Gages (Int. Cl. 9).
First use Feb. 23, 1966.
Subj. to Intf. with SN 283,297.

SN 243,188. Particle Data, Inc., Elmhurst, Ill. Filed Apr. 11, 1966.

CELLOSCOPE

For Particle Counter and Size Analyzer for the High Speed Automatic Counting and Sizing of Cells, Particulates, and Contaminants (Int. Cl. 9).
First use June 11, 1965.

SN 251,938. Machine-O-Matic, Inc., Evanston, Ill. Filed Aug. 8, 1966.

TATI

For Electronic Equipment for Measuring the Thickness of a Coating Which Is Applied to a Moving Web, and for Regulating the Rate of Movement of the Web Accordingly (Int. Cl. 9).
First use on or about June 8, 1966.

SN 254,229. Bolt Beranek and Newman Inc., Cambridge, Mass. Filed Sept. 12, 1966.

bbn

For Electronic, Electrical, and Mechanical Systems Which Transmit and Receive Data in Graphical and Alpha-Numeric Form and Which Display Same (Int. Cl. 9).
First use Nov. 1, 1965.

SN 255,795. General Dynamics Corporation, Rochester, N.Y. Filed Oct. 5, 1966.

SUBTRAC

For Underwater Tracking Systems for Locating and Tracking Underwater Objects Such as Submarines and Divers (Int. Cl. 9).
First use at least as early as June 13, 1966.

SN 255,859. Autoscan, Inc., Culver City, Calif. Filed Oct. 6, 1966.

AUTOSCAN

For Electronic Instruments for Measuring Performance Characteristics of Automobile Engines, Such as the Ignition Characteristics of the Cylinders in the Engines (Int. Cl. 9).
First use May 1, 1956.

SN 255,884. HC Electronics, Inc., Tiburon, Calif. Filed Oct. 6, 1966.

PHONIC EAR

For Auditory Trainer for Amplifying Sounds for Hard of Hearing Individuals (Int. Cl. 9).
First use on or about June 6, 1966.

SN 256,477. Sickles Enterprises, Inc., Scottsdale, Ariz. Filed Oct. 14, 1966.

EMBY

For Photographic Equipment—Namely, a Vertical Optical Printer, Having Parts Including the Following: Film Notcher-Cutter, Lens, Photocell Timer, Condenser, Electric Counter, Reflexviewer, and Accessory Kit (Int. Cl. 9).
First use September 1953.

SN 257,035. Conductron Corporation, Ann Arbor, Mich. Filed Oct. 24, 1966.

FOPEN

For Radar Systems and Equipment—Namely, Antennas, Transmitters, Receivers, Digital Moving Target Equipment and Control Systems (Int. Cl. 9).
First use Dec. 3, 1965.

SN 257,678. Wire Hardware Mfg. Inc., Michigan City, Ind. Filed Oct. 31, 1966.

See Aids

For Eyeglass Accessory Products—Namely, a Repair Kit Consisting of Screwdriver, Magnifying Glass and Replacement Screws; Pressure Pads for Application to Pertinent Parts of Eyeglass Frame; Rubber Hinge Rings; Rubber Sleeves for Back End of Temple Pieces; and Aluminum Chain for Attachment to Temple Pieces (Int. Cl. 9).
First use Sept. 1, 1966.

SN 257,921. Athena Controls, Incorporated, Conshohocken, Pa. Filed Nov. 4, 1966.

ATHENA

For Industrial Heat Sensitive Electronic Systems—Namely, Thermistors, Thermocouples and Related Circuits for Controlling Heat, Recording Temperatures, and Indicating Temperatures (Int. Cl. 9).
First use on or about Apr. 12, 1965.

SN 260,256. Howe Richardson Scale Company, Clifton, N.J. Filed Dec. 7, 1966.

54 XL

For Weighing Apparatus—Namely, Scales (Int. Cl. 9).
First use April 1965.

SN 262,404. Data Pathing Incorporated, Sunnyvale, Calif. Filed Jan. 12, 1967.

DPI SOLAR

For Computerized Data Collection Systems and Parts Therefor (Int. Cl. 9).
First use Nov. 25, 1966.

SN 263,684. The New York Air Brake Company, New York, N.Y. Filed Jan. 31, 1967.

BIF

For Flow Meters for Liquids, Flow Meters for Gases, Flow Meters for Dry Bulk Material, Rotary Integrating Flow Meters, Rate of Flow Controllers, Fluid Pressure Controllers, Multiple Valve Control Systems, Metering Valves, Flow Indicators, Flow Recorders, Flow Totalizers, Volumetric Feeders and Weighers, Gravimetric Feeders and Weighers, Chlorine Gas Feeders, Mechanical Controllers, Pneumatic Controllers, Electric Controllers, Devices for Translating a Variable Input Quantity Into a Pneuamtic Pressure Output, Electric Telemeters, Pneumatic Telemeters, Telemetric Controllers, and Parts and Accessories Therefor (Int. Cl. 9).
First use July 1954 on multiple valve systems.

SN 265,390. Avant Incorporated, Lincoln, Mass. Filed Feb. 24, 1967.

MONOCARD

For Camera for Photocomposing and Printing by Photography a Composite Identification Card Bearing a Photograph of a Subject and Related Printed Identification Data (Int. Cl. 9).
First use Oct. 7, 1966.

SN 265,438. Ross Porta-Plant, Inc., Brownwood, Tex. Filed Feb. 24, 1967.

KARD-A-MATIC

For Automatic Punch Card Systems for Controlling and Recording the Batching, Mixing and Discharging of Certain Predetermined Materials (Int. Cl. 9).
First use Jan. 3, 1967.

SN 265,441. Scott Industries, Inc., Lancaster, N.Y. Filed Feb. 24, 1967.

SCOTT-GLO

For Illuminated Control Panels (Int. Cl. 11).
First use on or about Jan. 23, 1967.

SN 267,635. Roy H. Jellissen, d.b.a. R. Jellisen Mfg. Co., River Grove, Ill. Filed Mar. 27, 1967.

NAVIDERS

For Interval Dividers for Use in Conjunction With Sectional Navigational Charts (Int. Cl. 9).
First use Dec. 27, 1965.

SN 269,179. Gamco Industries, Inc., d.b.a. Educational Computer Products, Big Spring, Tex. Filed Apr. 14, 1967.

MATH-MASTER

Owner of Reg. Nos. 693,200, 695,313, and 755,069.
For Educational Computers (Int. Cl. 9).
First use Mar. 16, 1967.

SN 269,572. Science Accessories Corporation, Southport, Conn. Filed Apr. 19, 1967.

MIDAS

For Modular Readout Device for Digitising and Sorting Data From Magnetostrictive Spark Chamber and Other Transducers (Int. Cl. 9).
First use August 1966.

SN 269,869. Electronic Automation Systems, Inc., Grand Island, N.Y. Filed Apr. 24, 1967.

FORMATEL

For Formation Tester for Measuring the Uniformity of a Moving Web by On-Machine Scanning (Int. Cl. 9).
First use Aug. 16, 1965.

SN 271,966. Science Accessories Corporation, Southport, Conn. Filed May 19, 1967.

SAC

For Components of a Data-Acquisition System for Use in Physics Experiments—Namely, Spark Chambers, Spark Gaps, Spark Chamber Pulsers, High Voltage Probes, Adjustable Delays, Multiple Input Data Acquisition System, Memory Systems (Int. Cl. 9).
First use March 1967.

SN 272,203. Paragon Electric Company, Inc., Two Rivers, Wis. Filed May 23, 1967.

CHRONO-TEMP

For Electrically Operated Controls, and Parts Thereof, Having Time Oriented Operation To Control a Flow of Current to Electrical Equipment (Int. Cl. 9).
First use May 1963.

SN 272,204. Paragon Electric Company, Inc., Two Rivers, Wis. Filed May 23, 1967.

CHRONO-SPRAY

Owner of Reg. No. 562,791.
For Electrically Operated Controls, and Parts Thereof, Having Time Oriented Operation To Control a Flow of Current to Electrical Equipment (Int. Cl. 9).
First use August 1948.

SN 273,735. Baldwin-Lima-Hamilton Corporation, d.b.a. BLH Electronics, Chicago, Ill. Filed June 13, 1967.

THERMOTIP

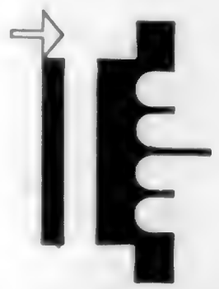
For Recording Oscillographs—Namely, Electronic High Speed Strip Chart Recorders (Int. Cl. 9).
First use on or prior to Sept. 1, 1965.

SN 275,879. Standard Gage Company, Inc., Poughkeepsie, N.Y. Filed July 12, 1967.

INTERBLOC

For Comparator Gages (Int. Cl. 9).
First use Jan. 25, 1966.

SN 276,233. Electro Development Corporation, Seattle, Wash. Filed July 18, 1967.

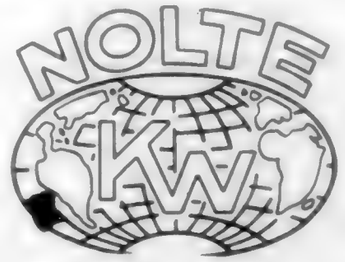


For Electrical Proximity Switches (Int. Cl. 9).
First use Apr. 4, 1967.

SN 277,415. A.O.K. Tool Corp., Ozone Park, N.Y. Filed Aug. 3, 1967.

For Precision Dial Indicators, Magnetic Holding Devices for Dial Measuring Instruments (Int. Cl. 9).
First use Nov. 15, 1965.

SN 278,112. Kingmann-White, Inc., Placentia, Calif. Filed Aug. 11, 1967.



For Accumulated Fluid Flow Integrators, Fluid Flow Meters, Fluid Flow Recording Integrators, and Parts Thereof (Int. Cl. 9).
First use May 31, 1967.

SN 287,041. Perfect Film & Chemical Corporation, Manhasset, N.Y. Filed Dec. 15, 1967.

For Stroboscopic Flash Attachment for Cameras (Int. Cl. 9).
First use Sept. 1, 1967.

SN 288,258. Ehrenreich Photo-Optical Industries, Inc., Garden City, N.Y. Filed Jan. 8, 1968.

For Photographic Equipment—Namely, Air Release, Blower Brush, Cable Releases, Camera Grips, Changing Bags, Coil Cords, Enlarging Easels, Flash Bracket, Flash Guns, Film for Minox, Film Wiper, Magnifying Glasses, Neck Straps, Print Tongs, Pen Brush, Print Roller, Self Timers, Shoulder Pad, Slide Binders, Strobe Lights, Thermometers, Tripods, Viewers, and Wrist Straps, and Pistol Grips (Int. Cl. 9).
First use July 11, 1963.

Class 27 — Horological Instruments

SN 246,433. Associated Barr Stores, Inc., d.b.a. Barr's and Barr's Jewelers, Philadelphia, Pa. Filed May 24, 1966.

Carlisle

For Watches and Parts Thereof (Int. Cl. 14).
First use May 18, 1956.

SN 271,337. Bulova Watch Company, Inc., Flushing, N.Y. Filed May 12, 1967.

For Watches and Parts Thereof (Int. Cl. 14).
First use Apr. 25, 1967.

Class 28 — Jewelry and Precious-Metal Ware

SN 274,890. Poole Silver Co., Inc., Taunton, Mass. Filed June 27, 1967.

POOLE

Owner of Reg. No. 766,[illegible].
For Holloware Made in Whole or in Part of Precious Metal (Int. Cl. 14).
First use in or about 1[illegible]3.

SN 277,202. Oneida Ltd., Oneida, N.Y. Filed July 31, 1967.
Owner of Reg. No. 840,877.

WILL 'O' WISP

For Sterling Silver Flatware (Int. Cl. 8).
First use July 5, 1967.

SN 279,123. Union Carbide Corporation, New York, N.Y. Filed Aug. 25, 1967.

Q

For Jewelry (Int. Cl. 14).
First use on or about July 18, 1967.

Class 31 — Filters and Refrigerators

SN 265,635. Richard D. Johnson, Des Plaines, Ill. Filed Feb. 28, 1967.

SAVANT

For Water Softeners and Systems and Components Therefor (Int. Cl. 11).
First use Feb. 13, 1967.

SN 268,034. Degremont S.A., Suresnes (Seine), France. Filed Mar. 31, 1967.

AQUAZUR

Owner of French Reg. No. 7,278, dated Feb. 1, 1961 (Versailles); Natl. Inst. No. 159,476.
For Filtration Apparatus for the Treatment of Water and Waste in a Purification Plant (Int. Cl. 11).

SN 269,346. Purolator Products, Inc., Rahway, N.J. Filed Apr. 17, 1967.

POSIPORE

For Filters, Elements, and Parts Thereof, for the Purification of Oil, Water, Fuel, Air, and Other Fluids (Int. Cl. 11).
First use on or about July 16, 1963.

Class 32 — Furniture and Upholstery

SN 260,117. U.S. Plywood-Champion Papers Inc., New York, N.Y., by merger and change of name from United States Plywood Corporation, New York, N.Y. Filed Dec. 2, 1966.

MODULE-X

For Furniture, i.e., Desks, Bookcases, Shelves, File Bins, File Cabinets, Magazine Shelves, Tables, and Partitioned Organizers; and Parts and Components for Furniture, i.e., Table Tops and Legs (Int. Cl. 20).
First use on or about Nov. 14, 1966.

SN 269,625. Edgar W. Blair, Republic, Mo. Filed Apr. 20, 1967.

ROTOSELL

For Merchandise Display Rack in the Form of a Wheel (Int. Cl. 20).
First use Oct. 20, 1965.

SN 279,034. Acme Spring Company, Los Angeles, Calif. Filed Aug. 25, 1967.

The words "Mattress" and "Springs" are disclaimed apart from the mark as shown.
For Mattresses and Boxsprings (Int. Cl. 20).
First use December 1954.

Class 33 — Glassware

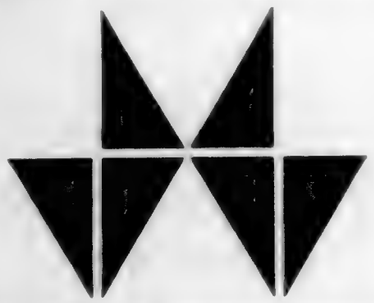
SN 254,749. United Glass Limited, Staines, Middlesex, England. Filed Sept. 19, 1966.

TITANISED

Owner of British Reg. No. B875,527, dated Feb. 11, 1965.
For Glass Containers and Tableware (Int. Cl. 21).

Class 34 — Heating, Lighting, and Ventilating Apparatus

SN 247,228. Harper-Wyman Company, Hinsdale, Ill. Filed June 3, 1966.



For Heating and Cooking Appliance Components—Namely, Valves and Temperature Controls for Gas Ranges (Int. Cl. 9).
First use about July 1962.

SN 262,790. Holophane Company, Inc., New York, N.Y. Filed Jan. 18, 1967.

DUO-PRISM

For Illumination Equipment—Namely, Lamp Panels, Screens, Globes, Reflectors, Refractors, and Fixtures (Int. Cl. 11).
First use Dec. 30, 1966.

SN 267,688. The Tappan Company, Mansfield, Ohio. Filed Mar. 27, 1967.

PATENTS

NOTICES

Board of Appeals Decisions Rendered in the Month of February 1968

Examiner affirmed	147
Examiner affirmed in part	20
Examiner reversed	44
Total	211

Foreign Patents Received in the Scientific Library as of February 29, 1968

Source	Date received	Highest number
Australia:		
(*Abstracts*)	Feb. 13, 1968	29,351/67
(*Patents*)	Feb. 5, 1968	276,877
Austria	Feb. 6, 1968	258,550
Belgium	Jan. 4, 1968	672,000
Canada	Feb. 26, 1968	778,985
Czechoslovakia	Feb. 12, 1968	123,200
Denmark	Nov. 15, 1967	108,185
East Germany	Feb. 26, 1968	60,007
Egypt	June 28, 1967	6,873
Finland	Dec. 4, 1967	36,456
France:		
(*Patents*)	Feb. 29, 1968	1,500,700
(*Additions*)	Feb. 8, 1968	90,100
(*Medicaments*)	Feb. 29, 1968	4,850 M
(*Additions*)	May 24, 1967	112 CAM
Germany:		
(*Auslegeschriften*)	Feb. 2, 1968	1,256,590
(*Patents*)	Nov. 8, 1967	1,235,193
Great Britain	Feb. 26, 1968	1,101,900
India	Aug. 17, 1967	100,376
Ireland	Feb. 29, 1968	26,959
Italy	Aug. 30, 1967	660,000
Japan	Feb. 26, 1968	2,280/68
Netherlands:		
(*Octrooiaanvragen*)	Nov. 8, 1967	10,414/67
(*Patents*)	Feb. 29, 1968	123,617
Norway	Jan. 26, 1968	112,140
Pakistan	Feb. 3, 1964	112,446
Philippine Republic	Apr. 13, 1962	458
Poland	Feb. 16, 1968	54,314
Rumania	Dec. 21, 1967	48,496
Sweden	Jan. 23, 1968	216,927
Switzerland	Feb. 12, 1968	441,956
U.S.S.R.	Feb. 1, 1968	201,981

Australia: First 2,000 incomplete
Belgium: First printed 493,079/1950
Canada: First printed 445,931/1948
Czechoslovakia: Not received between 81,300/1[illegible]52 and 91,901/1959
Finland: First printed 19,428/1941
First 500 incomplete
Hungary: First received 5,792/1896
Latest 140,582/1951
Ireland: First received 10,000/1929
Italy: First 243,000 incomplete
Rumania: First received 40,380/1957
U.S.S.R.: Not received between 2,496/1928 and 116,000/1958
Yugoslavia: First received 10,001/1933
Latest 16,461/1941

Adverse Decisions in Interferences

In the designated interferences involving the indicated claims of the following patents final decisions have been rendered that the respective patentees were not the first inventors with respect to the claims listed.

Patent No. 2,916,486, J. C. Babcock, J. A. Campbell and J. A. Hogg, 6-FLUORO STEROIDS AND INTERMEDIATES THEREFOR, decided Nov. 29, 1967. Interference No. 95,452, claims 1, 2, 3, 4, 5, 6, 8, 10, 11 and 13.

Patent No. 3,039,993, L. Friedman, POLYETHYLENE STABILIZERS, decided Nov. 13, 1967, Interference No. 95,216, claim 1.

Patent No. 3,140,305, J. G. Lowenstein, PREPARATION OF DIISOCYANATES, decided Jan. 23, 1968, Interference No. 95,201, claim 2.

Patent No. 3,146,486, H. J. Gerber, STEPPING MOTOR DRIVE, decided Jan. 26, 1968, Interference No. 95,342, claims 1, 2, 3, 4, 6 and 9.

Patent No. 3,155,478, W. D. O'Brien, ADJUSTMENT OF SEALED REED CONTACTS, decided Jan. 25, 1968, Interference No. 95,974, claims 1, 2, 4, 5, 6, 7, 8 and 9.

Patent No. 3,188,758, B. A. Denton, LIQUID SPRAY IRON, decided Feb. 7, 1968, Interference No. 95,728, claims 1, 2, 3, 4, 5, 6 and 8.

Patent No. 3,200,901, M. T. Hassechus, LOUD-SPEAKER, decided Jan. 23, 1968, Interference No. 95,722, claims 1, 2 and 3.

Patent No. 3,201,520, J. Bereznak, ELECTRONIC SWITCHING MATRIX, decided Feb. 2, 1968, Interference No. 95,601, claims 1 and 3.

Patent No. 3,225,264, I. F. Weiss, WIRE WAY FOR ELECTRICAL CONTROL PANEL, decided Jan. 25, 1968, Interference No. 95,622, claims 4 and 7.

Patent No. 3,230,215, T. Komeno, 2,3-EPITHIO-STEROIDS AND PRODUCTION THEREOF, decided Jan. 3, 1968, Interference No. 95,555, claims 12, 13, 14, 16 and 17.

Patent No. 3,234,924, M. G. May, PROCESS AND APPARATUS FOR REDUCING THE AMOUNT OF INCOMPLETELY BURNED PRODUCTS OF COMBUSTION IN THE EXHAUST GASES OF INTERNAL COMBUSTION ENGINES, decided Jan. 12, 1968, Interference No. 96,014, claim 11.

Patent No. 3,241,124, V. L. Newhouse, RANKING MATRIX, decided Jan. 12, 1968, Interference No. 96,009, claims 1 and 2.

Patent No. 3,244,965, F. W. Gutzwiller, PHASE CONTROLLED ALTERNATING CURRENT CIRCUITS, decided Jan. 19, 1968, Interference No. 94,817, claims 1, 2 and 3.

Patent No. 3,275,090, C. Weiland, METHOD AND APPARATUS FOR INCREASING THE EFFECTIVENESS OF AIR CUSHION VEHICLES, decided Jan. 23, 1968, Interference No. [illegible]5,996, claim 13.

New Applications Received During February 1968

Patents	7342
Designs	406
Plant Patents	10
Reissues	20
Total	7778

Issue—March 26, 1968

Patents	1042—No. 3,[illegible]74,487 to No. 3,375,[illegible]8, incl.
Designs	81—No. 210,567 to No. 210,[illegible]47, incl.
Total	1123

Disclaimers and Dedications

2,990,774.—*Lester W. Toelke*, Houston, Tex. RETRIEVABLE CARRIER FOR A SHAPED CHARGE PERFORATOR. Patent dated July 4, 1961. Disclaimer and dedication filed Nov. 14, 1967, by the assignee, *Borg-Warner Corporation*.

Hereby disclaims and dedicates to the Public the terminal portion of the term of the patent subsequent to Dec. 31, 1966.

3,013,491.—*Thomas C. Poulter*, Palo Alto, Calif. MULTIPLE-JET SHAPED EXPLOSIVE CHARGE PERFORATING DEVICE. Patent dated Dec. 19, 1961. Disclaimer and dedication filed Nov. 14, 1967, by the assignees, *Borg-Warner Corporation* and *Halliburton Company*.

Hereby disclaim and dedicate to the Public the terminal portion of the term of the patent subsequent to Dec. 21, 1966.

3,021,784.—*Lorrain D. Meddick*, Whittier, Calif. SHAPED CHARGE UNIT FOR WELL PERFORATORS. Patent dated Feb. 20, 1962. Disclaimer and dedication filed Nov. 14, 1967, by the assignee, *Borg-Warner Corporation*.

Hereby disclaims and dedicates to the Public the terminal portion of the term of the patent subsequent to Dec. 31, 1966.

3,027,838.—*Lorrain D. Meddick*, Whittier, Calif. SHAPED CHARGE. Patent dated Apr. 3, 1962. Disclaimer and dedication filed Nov. 14, 1967, by the assignee, *Borg-Warner Corporation*.

Hereby disclaims and dedicates to the Public the terminal portion of the term of the patent subsequent to Dec. 31, 1966.

3,075,462.—*Bliss Adamson, Jr.*, Houston, Tex. COMBINATION PROJECTILE AND SHAPED CHARGE WELL PERFORATING APPARATUS. Patent dated Jan. 29, 1963. Disclaimer and dedication filed Nov. 14, 1967, by the assignee, *Halliburton Company*.

Hereby disclaims and dedicates to the Public the terminal portion of the term of the patent subsequent to Dec. 31, 1966.

3,077,834.—*Blake M. Caldwell*, Fort Worth, Tex. LINED SHAPED EXPLOSIVE CHARGE AND LINER THEREFOR. Patent dated Feb. 19, 1963. Disclaimer and dedication filed Nov. 14, 1967, by the assignee, *Jet Research Center, Inc.*

Hereby disclaims and dedicates to the Public the terminal portion of the term of the patent subsequent to Dec. 31, 1966.

3,100,445.—*Thomas C. Poulter*, Palo Alto, Calif. SHAPED CHARGE AND METHOD OF FIRING THE SAME. Patent dated Aug. 13, 1963. Disclaimer and dedication filed Nov. 14, 1967, by the assignees, *Borg-Warner Corporation* and *Halliburton Company*.

Hereby disclaim and dedicate to the Public the terminal portion of the term of the patent subsequent to Dec. 31, 1966.

3,107,611.—*Blake M. Caldwell* and *Harrold D. Owen*, Fort Worth, Tex. WELL PERFORATING ASSEMBLY. Patent dated Oct. 22, 1963. Disclaimer and dedication filed Nov. 14, 1967, by the assignee, *Halliburton Company*.

Hereby disclaims and dedicates to the Public the terminal portion of the term of the patent subsequent to Dec. 31, 1966.

3,107,612.—*Blake M. Caldwell* and *Harrold D. Owen*, Fort Worth, Tex. WELL PERFORATING ASSEMBLY. Patent dated Oct. 22, 1963. Disclaimer and dedication filed Nov. 14, 1967, by the assignee, *Halliburton Company*.

Hereby disclaims and dedicates to the Public the terminal portion of the term of the patent subsequent to Dec. 31, 1966.

3,116,689.—*Cyril R. Sumner*, Fort Worth, Tex. WELL PERFORATING APPARATUS AND SWITCH. Patent dated Jan. 7, 1964. Disclaimer and dedication filed Nov. 14, 1967, by the assignee, *Halliburton Company*.

Hereby disclaims and dedicates to the Public the terminal portion of the term of the patent subsequent to Dec. 31, 1966.

PATENT EXAMINING CORPS

R. A. WAHL, Assistant Commissioner

CONDITION OF PATENT APPLICATIONS AS OF JANUARY 15, 1968

PATENT EXAMINING OPERATIONS AND GROUPS	Actual Filing Date of Oldest Case Awaiting Action	
	New	Amended
CHEMICAL EXAMINING OPERATION—I. MARCUS, Director.		
GENERAL CHEMISTRY AND PETROLEUM CHEMISTRY, GROUP 110—R. L. CAMPBELL, Manager	7-28-64	6-28-62
Inorganic Compounds; Inorganic Compositions; Organo-Metal and Organo-Metalloid Chemistry; Metallurgy; Metal Stock; Electro Chemistry; Batteries; Hydrocarbons; Mineral Oil Technology; Lubricating Compositions; Gaseous Compositions; Fuel and Igniting Devices.		
GENERAL ORGANIC CHEMISTRY, GROUP 120—M. STERMAN, Manager	11-27-64	7-23-62
Heterocyclic; Amides; Alkaloids; Azo; Sulfur; Misc. Esters; Carbohydrates; Herbicides; Poisons; Medicines; Cosmetics; Steroids; Oxo and Oxy; Quinones; Acids; Carboxylic Acid Esters; Acid Anhydrides; Acid Halides.		
HIGH POLYMER CHEMISTRY, PLASTICS AND MOLDING, GROUP 140—L. J. BERCOVITZ, Manager	3-22-65	5-15-62
Synthetic Resins; Rubber; Proteins; Macromolecular Carbohydrates; Mixed Synthetic Resin Compositions; Synthetic Resins With Natural Polymers and Resins; Natural Resins; Reclaiming; Pore-Forming; Compositions (Part) e.g.: Coating; Molding; Ink; Adhesive and Abrading Compositions; Molding, Shaping and Treating Processes.		
COATING AND LAMINATING, BLEACHING, DYEING AND PHOTOGRAPHY, GROUP 160—J. R. LIBERMAN, Manager	12-30-64	7-12-62
Coating; Processes and Misc. Products; Laminating Methods and Apparatus; Stock Materials; Adhesive Bonding; Special Chemical Manufactures; Special Utility Compositions; Bleaching; Dyeing and Photography.		
SPECIALIZED CHEMICAL INDUSTRIES AND CHEMICAL ENGINEERING, GROUP 170—W. B. KNIGHT, Manager	6- 1-64	9-26-62
Fertilizers; Foods; Fermentation; Analytical Chemistry; Reactors; Sugar and Starch; Paper Making; Glass Manufacture; Gas; Heating and Illuminating; Cleaning Processes; Liquid Purification; Distillation; Preserving; Liquid and Solid Separation; Gas and Liquid Contact Apparatus; Refrigeration; Concentrative Evaporators; Mineral Oils Apparatus; Misc. Physical Processes.		
ELECTRICAL EXAMINING OPERATION—N. H. EVANS, Director.		
INDUSTRIAL ELECTRONICS AND RELATED ELEMENTS, GROUP 210—E. J. SAX, Manager	5- 4-65	9-12-63
Generation and Utilization; General Applications; Conversion and Distribution; Heating and Related Art Conductors; Switches; Miscellaneous.		
SECURITY, GROUP 220—S. BOYD, Manager	2- 5-65	8-19-64
Ordnance, Firearms and Ammunition; Radar, Underwater Signalling, Directional Radio, Torpedoes, Seismic Exploring, Radio-Active Batteries; Nuclear Reactors, Powder Metallurgy, Rocket Fuels; Radio-Active Material.		
INFORMATION TRANSMISSION, STORAGE AND RETRIEVAL, GROUP 230—M. L. LEVY, Manager	6-25-64	6- 1-62
Communications; Multiplexing Techniques; Facsimile; Data Processing, Computation and Conversion; Storage Devices and Related Arts.		
ELECTRONIC COMPONENT SYSTEMS AND DEVICES, GROUP 250—W. L. CARLSON, Manager	9- 2-64	3-14-62
Semi-Conductor and Space Discharge Systems and Devices; Electronic Component Circuits; Wave Transmission Lines and Networks; Optics; Radiant Energy; Measuring.		
PHYSICS, GROUP 280—R. L. EVANS, Manager	4-14-65	6-24-63
Photography; Sound and Lighting; Indicators and Optics; Measuring and Testing; Geometrical Instruments.		
DESIGNS, GROUP 290—S. BOYD, Manager	1- 9-67	11-15-67
Industrial Arts; Household, Personal and Fine Arts.		

Total number of pending applications (excluding Designs)	175,238
Total number of Design applications pending	3,722
Total number of applications awaiting action (excluding Designs)	124,993
Total number of Design applications awaiting action	1,562
Date of oldest new application awaiting action	June 1, 1964
Date of oldest amended application awaiting action	March 14, 1962

EXPIRATION OF PATENTS

The patents within the range of numbers indicated below expire during March 1968, except those which may have been extended under the provisions of the Veterans Patent Extension Act (64 Stat. 316 as amended by 66 Stat. 321) and those which may have expired earlier due to shortened terms under the provisions of Public Law 690. A list of Veterans' patents which have been extended appears in the *Annual Index of Patents—1968*.

Patents ..... Numbers 2,543,744 to 2,546,957, inclusive

Plant Patents ..... Numbers 1,007 to 1,009, inclusive

PATENT EXAMINING OPERATIONS AND GROUPS (Continued)	Actual Filing Date of Oldest Case Awaiting Action	
	New	Amended
MECHANICAL EXAMINING OPERATION—F. H. BRONAUGH, Director.		
HANDLING AND TRANSPORTING MEDIA, GROUP 310—A. BERLIN, Manager Conveyors; Hoists; Elevators; Article Handling Implements; Store Service; Sheet and Web Feeding; Dispensing; Fluid Sprinkling; Fire Extinguishers; Coin Handling; Check Controlled Apparatus; Classifying and Assorting Solids; Boats; Ships; Aeronautics; Motor and Land Vehicles and Appurtenances; Railways and Railway Equipment; Brakes; Rigid Flexible and Special Receptacles and Packages.	10- 3-66	11-23-64
MATERIAL SHAPING, ARTICLE MANUFACTURING, TOOLS, GROUP 320—N. BERGER, Manager Manufacturing Processes, Assembling, Combined Machines, Special Article Making; Metal Deforming; Sheet Metal and Wire Working; Metal Fusion—Bonding, Metal Founding; Metallurgical Apparatus; Plastics Working Apparatus; Plastic Block and Earthenware Apparatus; Machine Tools for Shaping or Dividing; Work and Tool Holders; Woodworking; Tools; Cutlery; Jacks.	4- 1-66	3-27-63
AMUSEMENT, HUSBANDRY, PERSONAL TREATMENT, INFORMATION, GROUP 330—A. RUEGG, Manager Amusement and Exercising Devices; Projectors; Animal and Plant Husbandry; Butchering; Earth Working and Excavating; Fishing, etc.; Tobacco; Artificial Body Members; Dentistry; Jewelry; Surgery; Toiletry; Printing; Typewriters; Stationery; Information Dissemination.	8- 6-65	5-14-64
HEAT AND POWER ENGINEERING, GROUP 340—C. F. GAREAU, Manager Power Plants; Combustion Engines; Fluid Motors; Pumps; Turbines; Heat Generation and Exchange; Refrigeration; Ventilation; Drying; Vaporizing; Temperature and Humidity Regulation; Machine Elements; Power Transmission.	8- 8-66	4-26-65
FIXED CONSTRUCTIONS, SUPPORTS, AND HARDWARE, GROUP 350—T. J. HICKEY, Manager Joints; Fasteners; Rod, Pipe and Electrical Connectors; Miscellaneous Hardware; Locks; Building Structures; Closure Operators; Bridges; Closures; Earth Engineering; Drilling; Mining; Furniture; Receptacles; Supports; Cabinet Structures.	7-11-66	1-16-64
TEXTILES, CLEANING AND FLUID HANDLING, GROUP 360—W. S. COLE, Manager Fluid Handling, including Valves; Conduits; Filling Receptacles; Lubrication; Joint Packing; Bathroom Fixtures; Centrifugal Separators; Cleaning; Coating; Pressing; Agitating; Foods; Textiles; Apparel and Shoes and their Manufacture; Sewing Machines; Winding and Reeling.	10-23-65	4-19-63

DECISIONS IN PATENT AND TRADEMARK CASES

In the United States Patent Office Before the Board of Appeals

EX PARTE ALEXANDER D. ARGOUDELIS, CLARENCE DE BOER, THOMAS E. EBLE, AND ROSS R. HERR

Appeal No. 717—71. Decided December 11, 1967

1. APPLICATION—DISCLOSURE—SUFFICIENCY OF DISCLOSURE—DEPOSIT OF CULTURE IN DEPOSITORY.

"The question in cases of this kind is not whether any particular deposit [of a culture] or type of deposit has or has not been made, but is the same fundamental question presented by the statute for all cases, of whether a person skilled in the art can reproduce the invention from the written description at the time the application is filed. The person skilled in the art is supposed to have before him whatever is known and available to such persons skilled in the art. There is no requirement in the statute or in any Patent Office rule or order for any deposit or any particular type of deposit. The practice has developed of depositing microorganisms in a stock culture collection prior to filing an application for patent. These culture collections are maintained by various types of organizations, including universities and some governmental organizations and exist in foreign countries as well as the United States. The objective in applicants making such deposits is to put themselves into a position where they would have evidence conveniently at hand to show that a person skilled in the art could reproduce the invention."

2. SAME—SAME—SAME—SAME.

"If an applicant can show that at the time of filing the application the organisms involved were known and available to persons skilled in the art then the question of sufficiency of disclosure of the type here involved would not arise. This is a question of fact, subject to proof by evidence. Applicants may have recourse to any competent evidence to show this fact with or without having made any deposit. Of course making a certain character of deposit in a stock culture collection prior to filing the application would greatly simplify the problem of proof."

3. SAME—SAME—SAME—SAME—35 U.S.C. 112.

"Apparently appellants seem to consider that they have made the substance deposited elsewhere a part of the disclosure of the application in this case as filed. There is no authority in 35 U.S.C. 112 for anything but a written description as the disclosure in an application for patent, and certainly there is no authority for either the Patent Office or an applicant to modify the requirements of the statute."

4. SAME—SAME—SAME—SAME—EX PARTE SCHMIDT-KASTNER AND HACKMANN OVERRULED.

"Appellants refer to *Ex parte Schmidt-Kastner and Hackmann*, 153 USPQ 473, published after the first two decisions in this case and apparently inconsistent therewith. This decision will not be followed and is over-ruled to the extent that it may have reference to a deposit [of a culture] not publicly available at the time the application is filed * * *."

5. PATENTABILITY—REFERENCE—ENABLING DISCLOSURE.

"Claims 4 through 8 stand rejected on the Anzai reference. This rejection was affirmed in the first two decisions [in a prior appeal on the case] but it is evident that the rejection was maintained in the case purely as cumulative. In the prior appeal appellants urged, among other matters, that the reference did not contain a sufficient description of the organism mentioned. In Appeal No 717–72, in a commonly assigned application, which was heard at the same time as the first hearing in the present appeal, the question involved was the utilization against the applicants of a disclosure in a foreign specification which contained such description of the organism and was otherwise similar to the disclosure in *Ex parte Kropp*. Counsel argued in the brief that such a disclosure is meaningless, 'just as meaningless as if a "philosopher's stone" were recited as usable to make' the antibiotic. In that case the rejection of the Examiner was reversed, predicated upon the insufficiency of the disclosure 'in

the absence of any evidence of what may have been known or available to the public on the date involved,' citing *Ex parte Kropp* and *In re LeGrice*, 49 CCPA 1124, 301 F.2d 929, 1962 CD 707, 785 OG 741, 133 USPQ 365. In view of this, therefore, we believe that the rejection on the Anzai publication should not be pressed and this rejection will not be affirmed."

APPEAL from the Examiner (Sam Rosen) of Group 120. Serial No. 147,873.*

AFFIRMED.

Eugene O. Retter, George T. Johannesen, and Roman Saliwanchik for appellants.

Before FEDERICO and ROSA, *Examiners-in-Chief* and STONE, *Acting Examiner-in-Chief*

FEDERICO, *Examiner-in-Chief*.

This is the second appeal in this application and involves all the claims in the case, 1 through 8 and 10 through 15. The first appeal involved claims 4 through 8 only, rejected by the Examiner on the Anzai publication, the other claims having been allowed by the Examiner. In the first decision the rejection on the reference was affirmed and a new ground of rejection was made. This new ground was based on the finding that the specification was insufficient. Appellants requested reconsideration of both grounds of rejection of the involved claims and the matter was gone into again in a second decision which maintained the position previously taken. The Examiner then reopened the case, entering a rejection on the basis of insufficient disclosure of the claims which stood allowed and repeating the rejections which had been affirmed by the Board. Following the reopening, appellants have appealed a second time, from the rejection of all the claims. The anomalous situation of claims 4 through 8 is ignored and as to these claims the present appeal is in effect a further reconsideration. After a hearing was held in the present appeal it was decided that a second hearing would be held before an augmented panel in view of the importance of the principal issue involved and the possibility that consideration thereof might involve disagreement with some other decision.

The entire case has been considered by the presently constituted panel of the Board of Appeals as a new decision on the issues. However, matters stated in the previous two decisions will not be repeated and these prior decisions are incorporated by reference and considered a part of the present decision except to the extent that changes are pointed out.

The issue of insufficient disclosure is of the same character as that involved in *Ex parte Kropp*, 143 USPQ 148. With the exception of the particular point raised by appellants, the specification of the present application is of substantially the same character as the specification involved in the *Kropp* case. Appellants acknowledge that such a specification does not comply with 35 U.S.C. 112.

Appellants have filed an affidavit by a microbiologist purporting to show that the invention can be reproduced by a person skilled in the art from the present specification. However, this affidavit confirms that the invention cannot be reproduced from the written description since it specifically refers to the fact that access to the microorganism used is necessary. It is obvious that, with the microorganism at hand, the invention can be reproduced.

* This decision is being appealed to the U.S. Court of Customs and Patent Appeals.

Appellants' position is that the fact of having made a particular type of deposit, which is referred to in the specification, relieves the disclosure of the deficiency and hence the rejection cannot be maintained.

[1] The question in cases of this kind is not whether any particular deposit or type of deposit has or has not been made, but is the same fundamental question presented by the statute for all cases, of whether a person skilled in the art can reproduce the invention from the written description at the time the application is filed. The person skilled in the art is supposed to have before him whatever is known and available to such persons skilled in the art. There is no requirement in the statute or in any Patent Office rule or order for any deposit or any particular type of deposit. The practice has developed of depositing microorganisms in a stock culture collection prior to filing an application for patent. These culture collections are maintained by various types of organizations, including universities and some governmental organizations and exist in foreign countries as well as the United States. The objective in applicants making such deposits is to put themselves into a position where they would have evidence conveniently at hand to show that a person skilled in the art could reproduce the invention. As stated in *Ex parte Kropp*, in holding that the specification there involved did not comply with 35 U.S.C. 112:

"If appellant were dealing with a known organism which had a well defined source and which had been obtained and used by others before, or even with an organism which was merely known and available to persons skilled in the art, the present question of the sufficiency of the disclosure would not arise."

[2] If an applicant can show that at the time of filing the application the organisms involved were known and available to persons skilled in the art then the question of sufficiency of disclosure of the type here involved would not arise. This is a question of fact, subject to proof by evidence. Applicants may have recourse to any competent evidence to show this fact with or without having made any deposit. Of course making a certain character of deposit in a stock culture collection prior to filing the application would greatly simplify the problem of proof. Attention may be called to a recent decision of a District Court: *Merck and Co., Inc.* v. *Chase Chemical Co. et al.*, 155 USPQ 139, (D.C., New Jersey, 1967). This suit involved a patent directed to vitamin B_{12} which was produced through the action of a microorganism. This was stated to be the strain of *Streptomyces griseus* which produced the antibiotic *grisein*. The specification was attacked in the suit as allegedly insufficient in accordance with the reasoning involved in *Ex parte Kropp*. The court apparently accepted the decision and after quoting the same passage quoted above, found that the patent was dealing with a known and available organism. There had been a deposit with the stock culture collection of Rutgers University where the microorganism was available and could be obtained by anyone for any purpose, prior to the filing of the application, and the identification of the particular strain had also been published, prior to the filing of the application. These findings were based upon uncontradicted testimony in the case. A second patent involved in the same suit related to the production of vitamin B_{12}-active compsitions. The court merely states that the testimony established that microbiologists following the teachings of the specification would be able to produce the particular compositions. The specification of the patent indicates that a strain of *Streptomyces griseus* producing the antibiotic *grisein* was used, and

also disclosed a number of known species of organisms with a description of how the strains utilized could be produced from them.

Appellants do not in fact show or attempt to show that at the time of filing the application the microorganism used was known and available to the public; it is clear from the record that the deposit was secret or confidential and was not available to anyone without appellants' permission. The statement in the specification referring to the deposit and stating that the organism could be obtained does not state and was not intended to mean that at the time of filing the application the organism could be obtained freely (meaning without appellants' permission or dispensation) by any one or any person skilled in the art.

[3] Apparently appellants seem to consider that they have made the substance deposited elsewhere a part of the disclosure of the application in this case as filed. There is no authority in 35 U.S.C. 112 for anything but a written description as the disclosure in an application for patent, and certainly there is no authority for either the Patent Office or an applicant to modify the requirements of the statute.

It is noted that the particular stock culture collection utilized by appellants is an agency in the Department of Agriculture. In response to a specific inquiry, appellants do not take the position that being a government agency is *per se* material, but that the particular (according to appellants) manner of making deposits in any suitable depository would be sufficient. To contend otherwise would involve considerable anomalies since such collections are maintained by various universities here and abroad and also by agencies of various foreign governments, and no distinction could be made.

[4] Appellants refer to *Ex parte Schmidt-Kastner and Hackmann*, 153 USPQ 473, published after the first two decisions in this case and apparently inconsistent therewith. This decision will not be followed and is over-ruled to the extent that it may have reference to a deposit not publicly available at the time the application is filed, nor do we agree with the analogy in this decision.

Appellants question the use of the word "agent" in the second decision. The word was used only figuratively and had reference to the statement by the depository that it would refrain from distributing the culture (until after a patent was issued) except "upon receipt of written authorization from your company." These depositories are not parts of the Patent Office nor agents of the Patent Office, nor are any of their contents parts of patent applications and could hardly be unilaterally made so by anyone without the consent of the statute.

[5] Claims 4 through 8 stand rejected on the Anzai reference. This rejection was affirmed in the first two decisions but it is evident that the rejection was maintained in the case purely as cumulative. In the prior appeal appellants urged, among other matters, that the reference did not contain a sufficient description of the organism mentioned. In Appeal No. 717—72, in a commonly assigned application, which was heard at the same time as the first hearing in the present appeal, the question involved was the utilization against the applicants of a disclosure in a foreign specification which contained such description of the organism and was otherwise similar to the disclosure in *Ex parte Kropp*. Counsel argued in the brief that such a disclosure is meaningless, "just as meaningless as if a 'philosopher's stone' were recited as usable to make" the antibiotic. In that case the rejection of the Examiner was reversed, predicated upon the insufficiency of the disclosure "in the absence of any evidence of what may have been known or available to the public on the date involved," citing *Ex parte Kropp* and *In re LeGrice*, 49 CCPA 1124, 301 F.2d 929, 1962 CD 707, 785 OG 741, 133 USPQ 365. In view of this, therefore, we believe that the rejection on the Anzai publication should not be pressed and this rejection will not be affirmed.

The rejection of the claims on the ground of insufficient disclosure is affirmed.

AFFIRMED.

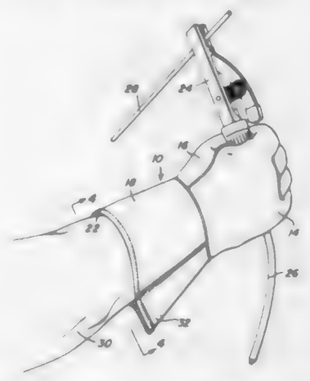
PATENTS

GENERAL AND MECHANICAL

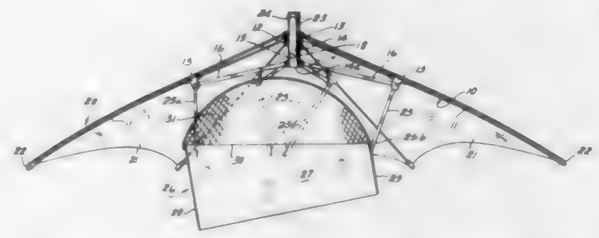
GRANTED MARCH 26, 1968

3,374,487
WELDER'S GLOVE
Morris L. Slimovitz, P.O. Box 219, Newbern, Tenn. 38059
Filed Feb. 3, 1967, Ser. No. 613,841
1 Claim. (Cl. 2—161)



A glove especially adapted for use by welders and includes a relatively large protective cuff that is retained in a snug engagement with the sleeve of a garment of a welder by employing strips of fastening material known as "Velcro" which retain the cuff in the desired snug engaging condition but also enables the glove to be readily removed from the hand of the welder by the welder moving his arm and hand in a rapid arcuate manner such that the glove will be slung off of the hand with the outward forces exerted on the glove being sufficient to overcome the retention forces of the "Velcro" so that the cuff of the glove will automatically expand to its full size so that the glove may be slung off without requiring the use of the other hand to release fastener devices such as are conventionally employed for retaining the cuff of a glove in snug engagement with the sleeve of a garment of a wearer.

3,374,488
COLLAPSIBLE HEADGEAR
Ruth C. Erbb, 2 Sutton Place S., New York, N.Y. 10022
Filed Oct. 23, 1965, Ser. No. 503,257
3 Claims. (Cl. 2—177)

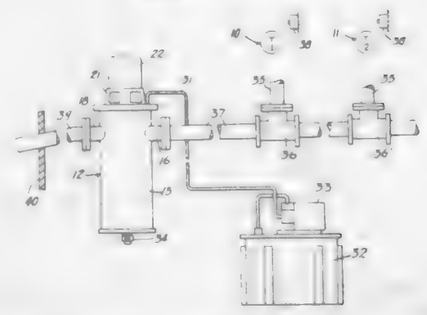


A collapsible headgear comprising a conventional umbrella-like frame having a flexible cover secured to a plurality of ribs hinged to a central stem, hinge mountings centrally of said ribs, a plurality of radial brace members hingedly secured to said hinge mountings at one of their ends and at the other of their ends to an elongated central ferrule adapted for slidable engagement and disengagement with respect to said stem, said ferrule and brace members when in full engagement with said stem being above the plane of said hinge mountings and being yieldably supported in said locked position by the tension of said flexible cover, each of said hinge mountings also hingedly supporting a strut member downwardly extending from each rib, said strut members being of substantially uniform length and being fixedly secured to the upper edge portion of a resiliently flexible head encircling band, said band being gradually tapered from a wide front portion to a relatively narrow rear portion, at least two of said struts at the front of said band extending substantially straight down from said hinge mountings and engaging said band at positions widely spaced from each other and from adjacent side struts, and spaced pairs of struts at the side and rear of said band extending downwardly from said hinge mountings at convergent angles to dispose the band engaging ends of each of said pairs in close proximity to each other, whereby said band in extended head engaging position is disposed in a forwardly offset position with respect to the center of said frame, and is supported against relative rotary movement with respect to said frame. A preferred adaptation of the device has eight ribs and eight struts with two of said struts extending straight down from the hinge mountings and the other six being arranged in three convergent pairs.

3,374,489
ARTIFICIAL HEART VALVE
Francisco R. Alvarez Diaz, Antonio Arias 12, Madrid, Spain
Filed Mar. 26, 1965, Ser. No. 442,897
Claims priority, application Spain, Apr. 7, 1964, 298,382
12 Claims. (Cl. 3—1)

An artificial mitral valve for intracardiac implantation includes a ring constituting a valve seat having an outer portion for suturing in position, and a disc-shaped valve member loosely connected with said ring to oscillate between open and closed positions.

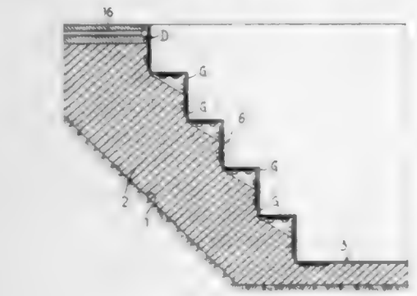
3,374,490
APPARATUS FOR CHLORINATION OF DISPOSAL FROM A SERIES OF TOILET BOWLS
Gordon R. Carlson, 19 James Place, Metuchen, N.J. 08840
Filed Sept. 1, 1965, Ser. No. 484,246
11 Claims. (Cl. 4—115)

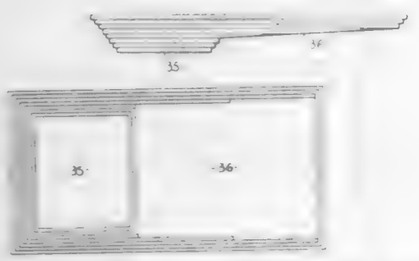


This invention relates to apparatus for chlorination of disposal from a series of toilet bowls onboard ships or

any vessel containing two or more toilets by delivery of the disposal from the several toilets to a treatment tank or unit. More particularly, the invention deals in arranging a macerator tube centrally of the tank, into the upper portion of which the disposal or waste is delivered and in arranging a plurality of blades on a shaft arranged longitudinally of said tube in providing an efficient breaking-up of the solids and mixture thereof with the treatment material or agent injected into the waste material just prior to entrance into said tube.

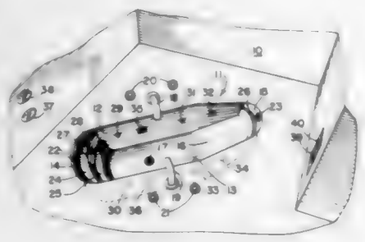
3,374,491
SUNKEN SWIMMING POOL
Pierre Patin and René Chautru, Paris, France, assignors to Thermacier, Paris, France, a French corporation
Filed June 30, 1965, Ser. No. 468,236
Claims priority, application France, July 3, 1964, 980,598
9 Claims. (Cl. 4—172)





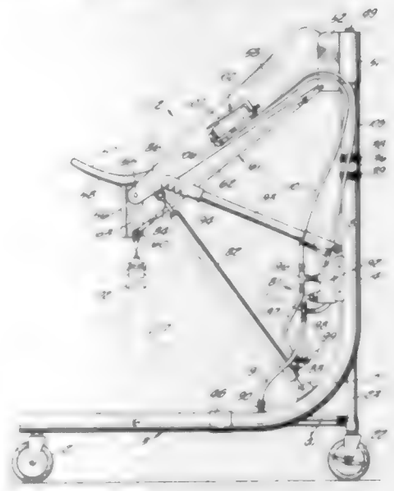
Sunken swimming pool comprising lining means which define the water-receiving basin and include side walls having a plurality of substantially horizontally extending steps in superimposed relation to each other substantially throughout the vertical extent of the side walls, the steps having a mean slope which is downwardly inclined inwardly of the pool.

3,374,492
THERAPEUTIC BATHTUB
Max J. Ruderian, Santa Monica, Calif., assignor to American Physical Fitness Research Institute, Inc., a corporation of California
Filed Oct. 23, 1965, Ser. No. 503,494
5 Claims. (Cl. 4—178)



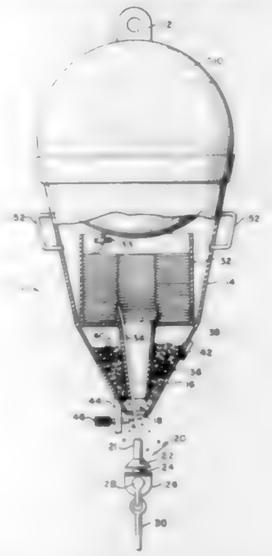
This disclosure relates to a therapeutic bathtub designed with a sloping back surface and steps for the comfort of the user and having dual centrally located fill spouts. The sides and at at least one end wall of the tub include built in water jets through which water is circulated by an external timer means and pump arrangement. There is thus provided an automatically controlled hot water massaging of a user in the tub.

3,374,493
DEVICE FOR LIFTING INVALIDS
Albert M. Herrera, 7828 Cucamonga Ave., Sacramento, Calif. 95826
Filed Sept. 27, 1966, Ser. No. 582,450
8 Claims. (Cl. 5—86)



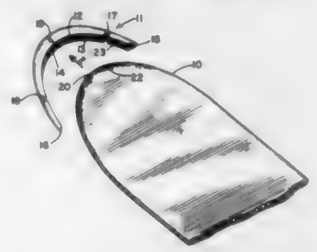
A castered framework includes a pair of vertically movable arms actuated by hydraulic mechanism controlled by the user, the user being supported by a depending sling seat and a pair of armpit crutch supports on the arms.

3,374,494
VARIABLE BUOYANCY MESSENGER BUOY
William H. Hunley, 449 Argyle Drive, Alexandria, Va. 22305
Filed Nov. 16, 1966, Ser. No. 595,319
10 Claims. (Cl. 9—8)



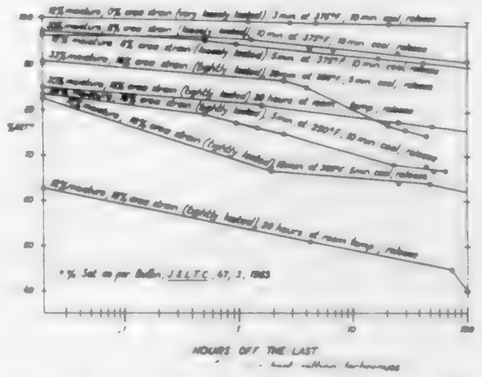
1. A messenger buoy for carrying a messenger line from a position on a submerged wreck to the surface, comprising:
a buoyant portion;
a messenger line;
a first compartment portion for containing said messenger line attached to the buoyant portion;
a quantity of particulate material heavier than water;
a second compartment portion attached to the buoyant portion for containing said quantity of particulate material; and
a connector-plug attached to said messenger line and removably secured to said second compartment for plugging both said first and second compartment portions to retain said particulate material.

3,374,495
SURFBOARD NOSE BUMPER
William P. Joyce, 18702 Pacific Coast Highway, Malibu, Calif. 90265
Filed Aug. 22, 1967, Ser. No. 662,400
3 Claims. (Cl. 9—310)



This disclosure relates to a guard or protecting sheath for the nose portion of a surfboard in the form of an integrally molded plastic member defining a curved channel receivable over the front curved nose portion of the surfboard.

3,374,496
METHOD OF LASTING LEATHER UPPERS
Robert Stubbings, 7721 N. Regent Road, Milwaukee, Wis. 53217
Filed Nov. 3, 1965, Ser. No. 506,250
7 Claims. (Cl. 12—145)

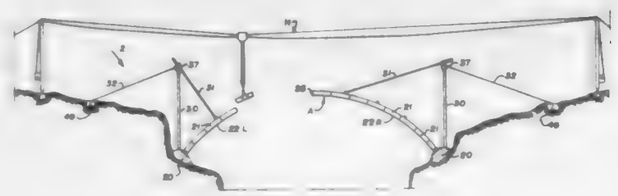


Process of shoemaking wherein a leather upper is assembled on a last without substantial stretching so that the upper assumes the general contour of the last, drying the unlasted upper (if not already moisture free when assembled on the last and heating the upper to between 250° and 450° F. to shrink the upper and cause it to last itself.

3,374,497
APPARATUS FOR ERECTING A BRIDGE ARCH
Homayoun J. Meheen, 6464 N. 14th Ave., Denver, Colo. 80214
Filed June 1, 1965, Ser. No. 460,170
11 Claims. (Cl. 14—26)

A method and apparatus for erecting an arch bridge, wherein each half of the arch is erected separately as a self supporting, cantilevered structure by holding it with rods extending from the top of an erection tower upstanding from the bridge abutment. Each tower is laterally stabilized and held by a tie back cable extending to an anchor behind its abutment. Completion of the erection is effected by bringing the arch halves together at the crown of the arch.

Each half of the arch is formed by erecting and joining sequentially an array of segments commencing with a first segment at the abutment at the base of the tower. A tie rod extends from the top of the tower to hold the completed arch portion of segments in place and to permit the next segment in the outward sequence to be erected and secured to the completed segments to cantilever outwardly therefrom. Another tie rod is then extended to this outward segment and pulled to lift the



completed arch portion to permit the first mentioned tie rod to be released. The operation is repeated by the construction of another outward segment and replacement of ties until the arch half is completed.

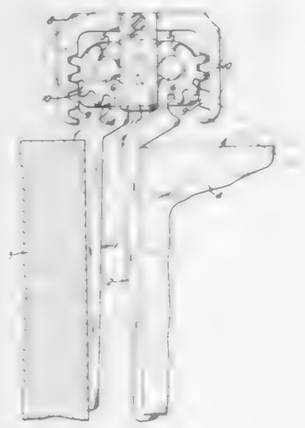
As a structural feature, the tower is provided with a head having a jack supporting saddle, to hold the several tie rods in predetermined positions and to permit easy shifting of a pulling jack from one tie rod to another. The saddle is arranged to direct the resultant pull forces of the tie rods and the tie back cable downwardly and in alignment with the tower insofar as possible to produce a minimum of eccentricity of compressive loading on the tower when a maximum pull is occurring, with the completed arch half.

3,374,498
MOP FOR CLEANING OR WAXING
Roy A. Bailey, P.O. Box B, Northvale, N.J. 07647
Filed Mar. 15, 1967, Ser. No. 623,318
2 Claims. (Cl. 15—119)

A sponge mop of elongated shape having an axial bore and end faces with an abutment plate fixedly secured to each end face of the sponge mop and a central opening in each abutment plate coaxial with the axial bore. The sponge mop is mounted on a rod support that extends through the registering openings and axial bore of the abutment plates and sponge mop, respectively.

The rod has an integral shank attached to a handle member there being on the shank, a manually operated pusher knob and a flexible pusher sleeve engaging the pusher knob at one end and at its other end the abutment plate at the inner end of the sponge pad. A retainer element on the outer free terminal end of the rod serves to lock the parts in assembled relation on the rod and shank as well as to receive the thrust when the pusher knob and flexible sleeve are pushed up along the shank and rod to axially compress the sponge mop.

3,374,499
HINGE WITH A PAIR OF PARALLEL PIVOTS
Robert L. Horstman, Clarks Summit, Pa., assignor to McKinney Manufacturing Company, Scranton, Pa., a corporation of Pennsylvania
Filed Sept. 12, 1966, Ser. No. 578,650
5 Claims. (Cl. 16—163)



1. A hinge comprising a channel having a web and side flanges, the inner sides of said flanges being provided with longitudinal rack teeth, a pivot bar disposed inside the channel lengthwise thereof and spaced therefrom, the bar having cylindrical edge portions adjacent said flanges forming parallel pivot pins, a pair of opposed hinge leaves extending outwardly away from the open side of the channel, and a transversely arcuate barrel segment extending lengthwise along the inner edge of each hinge leaf and joined thereto, the barrel segments being disposed in said channel between said flanges and pivot bar and fitting part way around said pivot pins for rotation thereon, and the outside of said barrel segments being provided with longitudinal gear teeth meshing with said rack teeth, whereby when said hinge leaves are swung apart the barrel segments will move the channel web away from the segments.

3,374,500
APPARATUS FOR MAKING THIN WALL FOAMED POLYMERIC ARTICLES
John W. Drenning, Baltimore, Md., assignor to Sinclair-Koppers Company, a partnership
Filed July 8, 1966, Ser. No. 563,869
8 Claims. (Cl. 18—5)

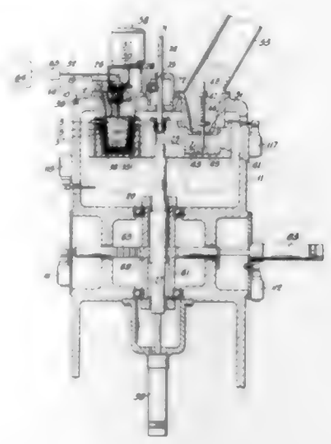
1. Apparatus for expanding and fusing expandable bead-like thermoplastic materials into self-sustaining articles comprising

complementary core and cavity mold elements adapted, when closed, to define a molding space therebetween,

means for applying an electrical potential to said core mold element,

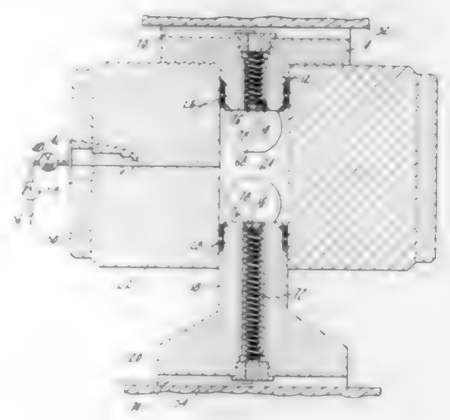
means for contacting said core mold element with a surplus of beads to coat the wall of the core with adhering beads,

means for closing said mold, and



means for subjecting the beads retained on said core mold element to heat whereupon said beads expand and fuse together to form a foamed structure corresponding to the configuration of the space between said mold elements.

3,374,501
HIGH PRESSURE PRESS
Donald H. Newhall, Walpole, Mass., assignor to Harwood Engineering Company, Walpole, Mass., a corporation of Massachusetts
Filed May 21, 1965, Ser. No. 457,700
7 Claims. (Cl. 18—16.5)



The disclosure of the invention comprises a high pressure press assembly having, in combination, a pair of opposed anvil elements,

each comprising a cylindrical base of large cross sectional area for supporting a maximum axially directed load imposed on said high pressure press assembly, and

adjacent said base converging surfaces terminating in a specimen engaging work face of relatively smaller area concentrating said axially directed load therein,

a support cylinder having an internal cylindrical wall extending between and overlying each of said cylindrical bases,

fluid pressure containing seals between said internal cylindrical wall and each of said cylindrical bases,

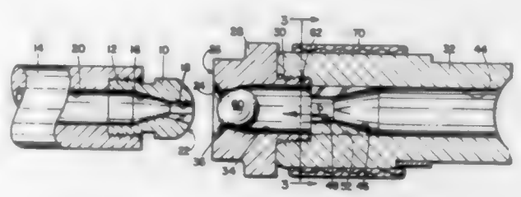
providing with said support cylinder and anvil elements a pressure fluid containing enclosure,

means for subjecting said anvil elements to an axially directed compression pressure, and

means directing fluid under pressure into said fluid pressure containing enclosure providing an evironmental pressure against any included specimen and exposed surface of said anvil elements between said seals including said converging surfaces and specimen engaging work faces, including means for controlling the fluid pressure within said enclosure to establish a desired relationship of said environmental fluid pressure to axial thrust which is independent of volumetric variation of said enclosure.

A layer of plastic material may overlie said specimen between the anvil elements for protection from said pressure fluid. The specimen may be engaged by a supporting ring of high tensile strength with a sealing ring between the ring and each adjacent anvil element. The construction may also include an anvil tip of transparent material and a supporting anvil base formed with a visual inspection channel therein.

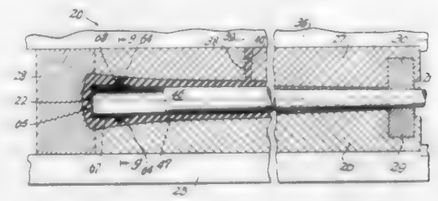
3,374,502
SPRUE BUSHING AND NOZZLE ASSEMBLY
Ralph P. Lazzara, Westfield, Mass., assignor to Osley & Whitney, Inc., Westfield, Mass., a corporation
Filed Oct. 12, 1965, Ser. No. 495,206
1 Claim. (Cl. 18—30)



In an injection molding machine of the type wherein an injection nozzle is engageable in a recess of a bored sprue bushing on a heated sprue extension having a bore which communicates with the bore of the sprue bushing whereby molten thermoplastic material fed under pressure into the injection nozzle is directed through the sprue bushing and sprue extension, the improvement in means for precluding leakage of thermoplastic material from the sprue bushing comprising: a pair of valve seats, one adjacent the recess in the sprue bushing and one adjacent the bore of the sprue extension, and a shut-off ball valve freely mounted in the bore of the sprue bushing for limited movement between said valve seats, said shut-off ball valve when seated against the valve seat adjacent the bore of the sprue extension permitting the introduction of molten thermoplastic material into the bore of the sprue extension and when seated against the valve seat adjacent the recess in the sprue bushing precluding the leakage of thermoplastic material from the sprue bushing following removal of the injection nozzle from engagement in the recess.

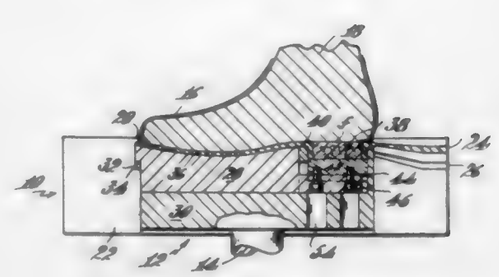
3,374,503
MEANS FOR MOLDING A GRIP OR THE LIKE
Richard M. Boniger, Westfield, Mass., assignor to A. G. Spalding & Bros., Inc., Chicopee, Mass., a corporation of Delaware
Filed May 5, 1964, Ser. No. 364,903
11 Claims. (Cl. 18—36)

An apparatus for injection molding a grip on the end of a hollow golf shaft wherein a free end of the shaft is inserted in a mold and is oriented and held against longitudinal movement and has a cap closing the end of the shaft, which cap is provided with a skirt overlying the side of the shaft and having projections for engaging the mold to prevent lateral movement of the end of the shaft with the projections providing passages for the moldable material as it is forced into the mold cavity to enable a



completely closed grip to be molded thereon while the end of the shaft is held against longitudinal and lateral movement under the pressures of the injected material.

3,374,504
MOLD ASSEMBLY WITH COMPOSITE SOLE PLATE FOR DOUBLE INJECTION
Herbert Ludwig, Desmastr. 112, Usen, near Bremen, Germany
Filed Apr. 11, 1966, Ser. No. 547,060
14 Claims. (Cl. 18—42)

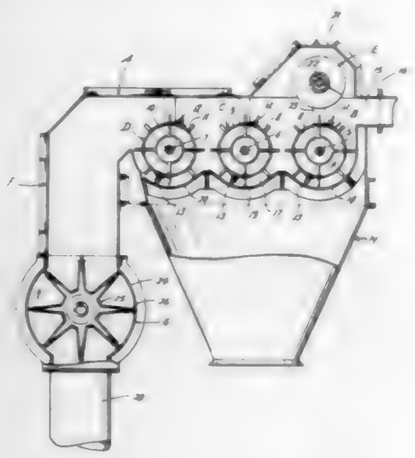


14. A mold assembly comprising a side ring and a composite sole plate, said sole plate embodying parts which have surfaces confronting the bottom, said surfaces collectively corresponding in area to the bottom of the shoe, and said parts being relatively movable in each of two positions to form with the bottom cavities of different depth for receiving a first injection of an elastomer of one kind and a second injection of an elastomer of another kind, in one position to place two of the surfaces at the same distance from the bottom and the other at a different distance and in the other position to place one of the two and the other at the same distance from the bottom and the other one of the two at a different distance.

3,374,505
AIRLINE SEPARATOR FOR SEED COTTON
Joseph C. Neitzel, Dallas, and G. W. Dickson, Mesquite, Tex., assignors to The Murray Company of Texas, Inc., Dallas, Tex., a corporation of Texas
Filed July 13, 1965, Ser. No. 471,518
2 Claims. (Cl. 19—93)

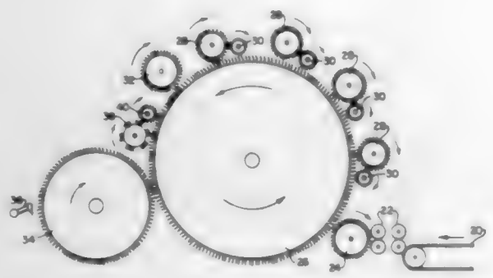
A machine for separating air from seed cotton being fed into a gin house including a distributor at the entrance of the machine and a plurality of pronged rollers arranged side by side in the path of flow for keeping the cotton suspended in the feed passage, while the vehicle air passes

downwardly through screens beneath the pronged rollers. The pronged rollers also carry wipers which pass over the



screens to keep them clear of waste which may be caught thereby.

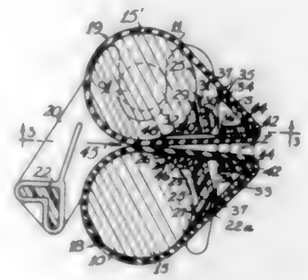
3,374,506
SPLASH YARN
Alden J. MacKay, Rochester, N.H., assignor to Baxter Woolen Co., Inc., East Rochester, N.H., a corporation of New Hampshire
Filed Sept. 2, 1966, Ser. No. 577,123
2 Claims. (Cl. 19—99)



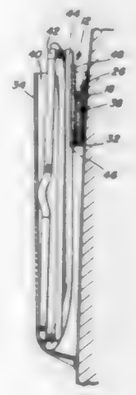
The production of splash yarn on a carding set by subjecting the fibers on a main carding cylinder to an intermittent drawing action to elongate and reduce the section of portions of the fibers.

3,374,507
CRADLE FOR FIBER SUPPORTING APRONS
Richard K. Whitehead, Sr., Richard K. Whitehead, Jr., and Harry C. Whitehead, all of 1202 Zonolite Road, Atlanta, Ga. 30306
Filed May 27, 1966, Ser. No. 553,507
10 Claims. (Cl. 19—245)

1. In a cradle for a fiber drafting system; a pair of side walls, a first drafting roll and a second drafting roll rotatably positioned between said side walls with their axes of rotation substantially parallel, a continuous first apron enclosing said first drafting roll and a continuous second apron enclosing said second drafting roll, and a first apron support positioned within said first apron with said first drafting roll and a second apron support positioned within said second apron with said second drafting roll; said first apron support and said second apron support each comprising: (*a*) an apron positioning means for fixedly positioning an apron in a predetermined path between a line of tangency with a drafting roll and a second line parallel to and remote from said line of tangency, (*b*) an apron tensioning means for maintaining substantially constant tension in an apron by motion of the apron in other than said predetermined path, (*c*) a first cleaning means for scraping debris from a drafting roll for passage of said debris with an apron along said predetermined path, and (*d*) a second cleaning means for scraping debris from an apron laterally outward toward said side walls as the apron passes along said predetermined path; said side walls being open adjacent said second cleaning means of said first apron support and adjacent said second cleaning means of said second apron support to provide for discharge of debris from between said side walls, and the predetermined path provided by the apron positioning means of said first apron support and the predetermined path provided by the apron positioning means of said second apron support being positioned relative to each other to define a fiber handling zone.

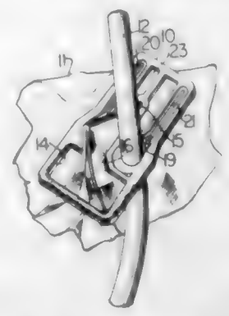


3,374,508
FASTENER ASSEMBLY
Morris L. Slimovitz, % Morris Manufacturing Co., P.O. Box 219, Newbern, Tenn. 38059
Filed Sept. 2, 1966, Ser. No. 576,983
5 Claims. (Cl. 24—3)



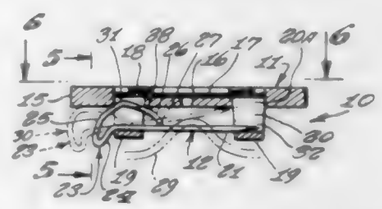
A two member fastener assembly for attaching articles to a garment, one member including a backing plate with a loop which provides a means for retaining a safety pin therein. One surface of the backing plate includes a strip of Velcro bonded thereto. The pin may be attached to a garment thereby providing a means for swivelling the Velcro covered backing plate about the pin. This Velcro covered plate is adapted to mate with an object to which a strip of Velcro has been directly attached. Likewise, the pinned plate is adapted to mate with a second Velcro covered plate including a clip fastener attached thereto, one arm of the clip including a straight pin connected thereto which enables the connection of the second Velcro plate with a fabric-like article.

3,374,509
CLAMP
Earl A. Logan, Hazelwood, Mo., and George T. Maloney, North Plains, and Ralph Carson, Kearney, N.J., assignors to C. R. Bard, Inc., Murray Hill, N.J., a corporation of New York
Filed May 27, 1966, Ser. No. 553,550
1 Claim. (Cl. 24—81)



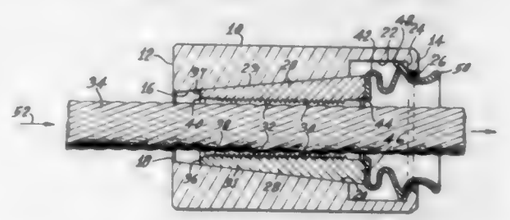
A one-piece clamp, normally of rigid plastic material, having key-hole shaped openings one of which is adapted to receive and engage a part of a bed covering and at least one other of which is adapted to receive a flexible drainage tube, the larger portion of the latter opening permitting the tube to function without restriction and the smaller portion of said opening being proportioned to pinch the tube closed when the tube is moved into said latter portion.

3,374,510
QUICK REMOVABLE AND ATTACHABLE BUTTON
Joseph A. Freed, 849 Beck St., Bronx, N.Y. 10459
Filed Aug. 23, 1965, Ser. No. 481,462
1 Claim. (Cl. 24—103)



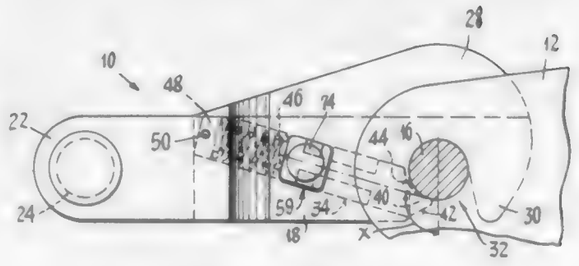
A garment button including a button member having a depression on its rear side to hold slidably captive a configurated pin member used to secure the assembly to a garment.

3,374,511
CABLE GRIP
Arthur Kenneth Barker, Alwoodley, Leeds, England, assignor to Cable Cover Limited, London, England, a company of Great Britain
Filed Jan. 10, 1966, Ser. No. 519,490
10 Claims. (Cl. 24—126)



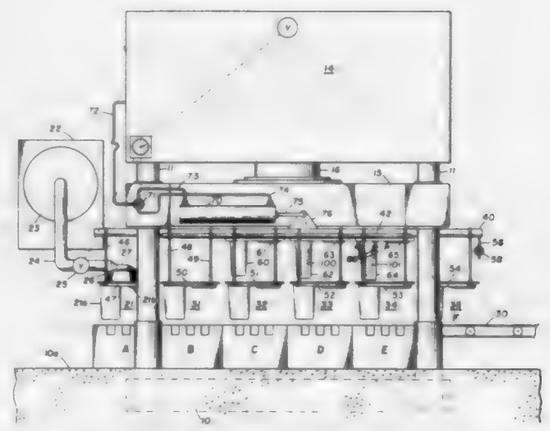
A strand chuck including a unitary barrel having a centrally disposed and tapered bore through the barrel and a plurality of circumferentially arranged jaws slidably mounted in the bore and correspondingly tapered to engage the tapered walls in an axial direction of the bore, with the larger end of the bore being sufficiently large in dimension such that the jaws may pass freely therethrough. The barrel of the chuck has a shoulder generally facing the narrow end of the bore and being positioned closely adjacent the larger end of the bore. The strand chuck further includes a generally conical shaped resilient member in the form of a coil spring or rubber bellows positioned within the bore and having its larger end abutting the shoulder and its smaller end abutting the larger ends of the jaws to forcibly urge the jaws toward the narrow end of the bore and to maintain the jaws within the bore.

3,374,512
RELEASABLE CLASP
Joseph R. Metz, Ridgefield, Conn., assignor to Norco, Inc., Ridgefield, Conn., a corporation of Connecticut
Filed Jan. 3, 1966, Ser. No. 518,063
10 Claims. (Cl. 24—241)



Heavy duty releasable clasp comprising a hook formation having a spring-charged locking slide bolt to close the gap of the hook. A cross release bolt has a cam connection with the locking bolt and is adapted to be struck a hammer blow from either side of the hook formation to retract the locking bolt and release a part held captive in said formation.

3,374,513
PRESSURE FORMING SYSTEM
Cornelius J. Kelleher, Dallas, Tex., assignor to Verson Manufacturing Co., Dallas, Tex., a corporation of Texas
Original application Jan. 14, 1963, Ser. No. 251,166. Divided and this application Oct. 22, 1965, Ser. No. 509,673
5 Claims. (Cl. 25—23)

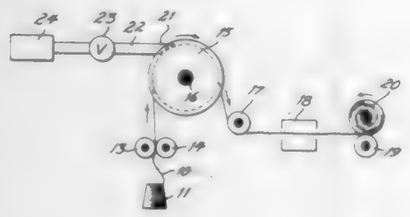


4. A system for forming deep ceramic containers having relatively thin walls from semi-dry granular clay charges which comprises:

(a) a base,

(b) a hydraulic ram platen powered for movement with multi-ton force toward and away from said base,
(c) at least one rigid mold having an open-topped cavity mounted on said base under said platen having inner walls sloping downwardly and inwardly from said top at angles of but a few degrees,
(d) at least one metallic mold liner having continuous unbroken wall and bottom surfaces and shaped to nest in said mold and adapted to contain said charge,
(e) at least one die mounted on said platen and positioned for mating with said at least one mold, with substantially uniform clearance from the bottom and the side walls of a mating mold liner to mold said charge, and
(f) means operable in synchronism upon retraction of said platen to extract said at least one liner from said at least one mold.

3,374,514
STRAND TREATMENT
Charles A. McClure, R.D. 2, Malvern, Pa. 19355
Filed Apr. 20, 1966, Ser. No. 543,957
8 Claims. (Cl. 28—72)



This invention relates to treatment of textile strands, concerning especially strand-crimping. A process is provided for directing hot fluid obliquely onto one side of a textile strand, the opposite side of which is maintained relatively cool. The strand so treated subsequently assumes a crimped configuration upon being forwarded away from the treating location.

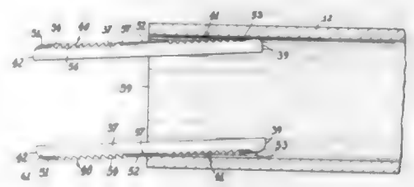
3,374,515
METHOD OF MAKING AN ELECTRICAL CAPACITOR
Arthur L. Girard, North Adams, Mass., assignor to Sprague Electric Company, North Adams, Mass., a corporation of Massachusetts
Filed June 3, 1966, Ser. No. 555,188
1 Claim. (Cl. 29—25.42)

A capacitor of non-speared metallized thin-film dielectrics is produced by metallizing a base, then forming a film on the metal, then heating to cure the film and produce an adhesion between the film and the metal that is greater than the adhesion between the metal and the base, and then stripping the metal and film from the base.

3,374,516
HONING TOOLS AND METHOD
Windell Matthew, Rte. 1, Campbellsburg, Ind. 47108
Filed Jan. 28, 1966, Ser. No. 523,751
14 Claims. (Cl. 29—76)

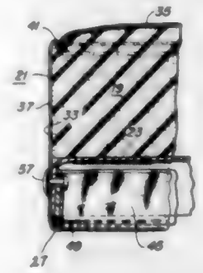
1. In a honing machine, the combination comprising: an elongated bar;

a plurality of outwardly projecting teeth along the top of said bar;



a plurality of bearing surfaces on the top of said bar, said bearing surfaces being at a level below the crests of said teeth but above the bases of said teeth.

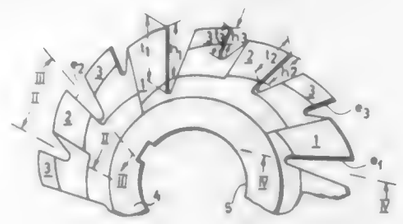
3,374,517
BICYCLE SADDLE CUSHION CONSTRUCTION METHOD
George W. Worley, Bolivar, Tenn., assignor to Troxel Manufacturing Company, a corporation of Tennessee
Filed Dec. 27, 1965, Ser. No. 516,333
6 Claims. (Cl. 29—91.1)



1. A method of constructing a bicycle saddle cushion component utilizing a base member including a substantially planar horizontal main portion and a substantially thin flanged portion depending from and circumferentially extending about said main portion and with said flanged portion having a circumferentially extending downwardly directed distal edge portion; a pad member of resilient material having oppositely facing generally planar upper and lower surfaces and a circumferentially extending edge surface; and a cover member including a substantially planar horizontal main portion, a skirt portion depending from and extending circumferentially about said main portion and including a circumferentially extending distal portion and a retainer band confrontingly arranged relative to and extending circumferentially contiguous the inward side surface of said skirt portion and with the lower edge of said skirt portion and the lower edge portion of said retaining band being securely conjoined in a circumferentially extending seam and with the upper edge portion of said band being unattached and substantially freely displaceable away from said skirt portion of said cover member; the method comprising:
(a) positioning in stacked order said base, pad and cover members with the upper surface of said pad member engaging the main portion of said cover member and with the lower surface of said pad member engaging the main portion of said base member with said skirt portion substantially closely surrounding said pad member edge surface and with said skirt portion and said retaining band of said cover member substantially closely surrounding respectively said pad member edge surface and said base member flanged portion;
(b) exerting a compressive force on and moving relatively together said base member main portion and said cover member main portion thereby compressing said pad member and causing said cover member skirt portion and conjoined retaining band

to move downwardly along the outward side of said base member flanged portion;
(c) continuing the movement respectively of said base and cover member main portions until the upper edge portion of said retaining band is substantially contiguous the lower edge portion of said base flanged portion;
(d) holding said pad member compressed and with the relative arrangement of parts arranged as recited in the immediately preceding step, and while holding thusly
(e) working the upper edge portion of said band inwardly along the circumferential extension of said band and inwardly underneath and past the distal edge portion of said base member flanged portion and thereby disposing the base member flanged portion substantially between the upper edge portion of said band and the depending skirt portion of said cover member, and then
(f) releasing the compressive force on said base member and cover member main portions and on said pad member, thereby allowing the resiliency of said pad member to move said base and cover member main portions apart and cause the distal edge portion of said base member flanged portion to substantially seat against the circumferentially extending conjoined seam portions of said retaining band and said skirt portion of said cover member.

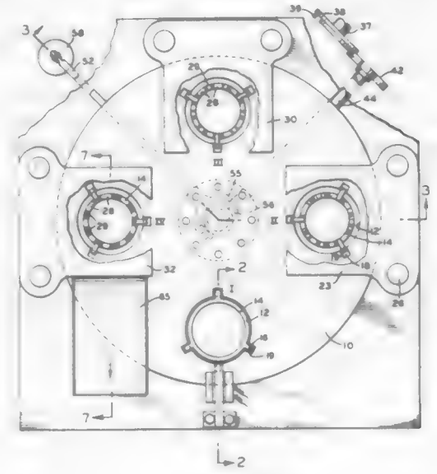
3,374,518
HOB
Bernd Bentjens, Schwarzenbek, near Hamburg, Germany, assignor to Fa. Wilhelm Fette Prazisionswerkzeug-Fabrik, Schwarzenbek, near Hamburg, Germany
Filed Sept. 16, 1965, Ser. No. 487,825
Claims priority, application Germany, Sept. 18, 1964, F 44,004
11 Claims. (Cl. 29—103)



A rotary milling cutter includes a plurality of teeth which define a helix about the periphery of the cutter and which are arranged in a plurality of substantially axially extending rows. Some of the rows consist of teeth having a first length and others of the rows consist of teeth having a length which is less than the first length, and all teeth of all rows have a top land provided with a cutting edge and two mutually inclined side faces which flank the cutting edge. The mutual inclination of the side faces is the same for all of the teeth of the cutter.

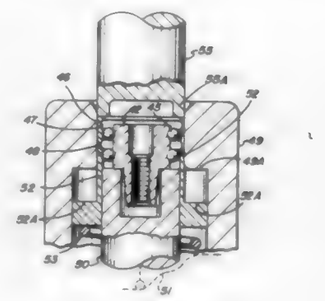
3,374,519
MACHINE AND METHOD OF FORMING SHEET METAL ARTICLES
Warren D. Anderson, Stamford, Conn., assignor to Norma-Hoffmann Bearings Company, Division of Universal American Corporation, a corporation of Delaware
Filed Aug. 30, 1965, Ser. No. 483,644
9 Claims. (Cl. 29—148.4)

Method and apparatus for die forming ring-like workpieces where the diameter of the piece gets smaller as successive operations are performed, which consists in forming radial tabs on the piece and placing them in radial



slots, which are sufficiently long to retain the tabs during the forming operations and finally cutting off the tabs.

3,374,520
PROCESS FOR ASSEMBLING BALL BEARING DEVICES
Walter S. Sutowski, 6976 Crestview Drive, Brecksville, Ohio 44141
Original application Feb. 11, 1965, Ser. No. 431,852, now Patent No. 3,337,937, dated Aug. 27, 1967. Divided and this application Mar. 13, 1967, Ser. No. 622,719
5 Claims. (Cl. 29—148.4)



Process for assembling race members together with ball bearings positioned therebetween, the outer race member being split and resiliently biased toward closed position, which includes the supporting of the inner race member and positioning balls in a circle disposed in a horizontal plane in the raceway of the inner race member, temporarily confining the balls in position in the raceway of the inner race member, and pressing the outer race member downwardly over the balls so as to position them in the raceway of the outer race member as said temporary confinement is progressively withdrawn.

3,374,521
TAPPING APPARATUS AND METHOD
Frederick Clarke, Lafayette, La., assignor to Tenneco Inc., Houston, Tex., a corporation of Delaware
Filed Jan. 20, 1964, Ser. No. 338,751
20 Claims. (Cl. 29—157)

1. The method of performing a hot tapping operation on a container having a first fluid under pressure contained therein, comprising the steps of:
forming an enclosed chamber adjacent to and in communication with a portion of the external wall of said container,

positioning a fluid pressure actuated drilling means with a drill bit within said chamber and holding said bit in drilling engagement with said wall,

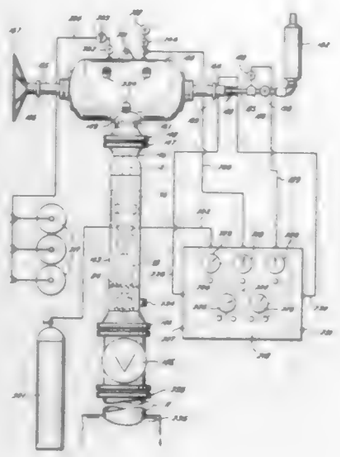
applying a second fluid under pressure to said chamber to thereby operate said drilling means,

advancing said bit into said wall during operation of said drilling means,

continuing the application of said second fluid until said bit initially penetrates said wall, to thereby permit the escape of said first fluid from said container into said chamber,

applying said first fluid to operate said drilling means to complete the cutting of an opening into said container.

5. An apparatus for performing a hot tap operation on a container having a fluid under pressure contained therein, comprising:



an elongate fluid tight housing having an open end adapted for securing to said container and enclosing the section of the wall of said container which is to be tapped,

a cutting means disposed within said housing with the cutting surface thereof adapted to engage said wall,

driving means connected to said cutting means for rotating said cutting means during operation of the apparatus,

releasable anchor means connected to said driving means and releasably engaging the inside wall of said housing in a fixed relationship during operation of the apparatus, and

means for advancing said cutting means toward said wall while said anchor means is engaged.

3,374,522
METHOD OF MAKING DIAPHRAGM VALVE BODIES
Henry W. Boteler, East Greenwich, R.I., assignor to Grinnell Corporation, Providence, R.I., a corporation of Delaware
Continuation of application Ser. No. 50,670, Aug. 19, 1960. This application Jan. 22, 1965, Ser. No. 432,043
1 Claim. (Cl. 29—157.1)

1. A method of fabricating from metal stocks which:

(A) are flat,

(B) are of substantially uniform thickness, a diaphragm valve body having a pair of end openings, walls extending between said end openings along either side of a longitudinal seam and with interior surfaces defining a flow passageway, a diaphragm opening through one side of said walls between said end openings and communicating with said flow passageway, a flange around said opening and a raised weir opposite said diaphragm opening and having a diaphragm seating thereon, said method comprising:

(I) cutting each of two identical pieces of said stock with:

(a) an end opening edge,

(b) at least one diaphragm opening edge segment,

(c) at least one weir engaging edge segment,

(d) two wall seam edges,

(II) wrapping each said piece:

(a) until said wall seam edges abut each other,

(b) until each point which,

(1) is on a diaphragm opening edge segment,

(2) is on one side surface of said piece, remains on at least one straight line which:

(3) is completely within said one side surface of said piece,

(4) extends to a point on one section of said end opening edge,

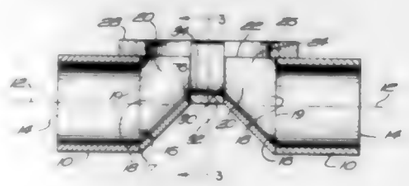
(c) until each point which:

(1) is on a weir engaging edge segment,

(2) is on said one side surface of said piece,

also remains on at least one straight line which:

(3) is completely within said one side surface,



(4) extends to a point on the remaining section of said end opening edge,

(III) butt welding together one wall seam of each said piece to the other wall seam of said piece,

(IV) cutting a third piece of said stocks:

(a) a pair of diaphragm half openings separated by weir strip,

(b) an outer edge spaced from said openings and strip,

(V) bending depressing said weir strip into a curved diaphragm seating surface,

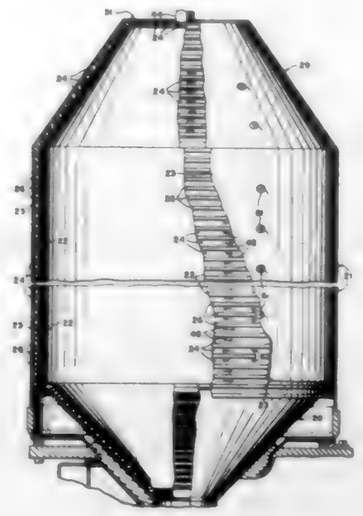
(VI) welding the weir engaging edge segment of each wrapped piece to the edge of said weir strip for one half-opening,

(VII) welding the diaphragm opening edge segment of each wrapped piece to the third piece around the remainder of said half opening.

3,374,523
HIGH POWER ELECTRON TUBE APPARATUS
Albert D. La Rue, Los Altos, Calif., assignor to Varian Associates, Palo Alto, Calif., a corporation of California
Continuation of application Ser. No. 299,001, July 31, 1963. This application Nov. 16, 1966, Ser. No. 595,309
2 Claims. (Cl. 29—157.3)

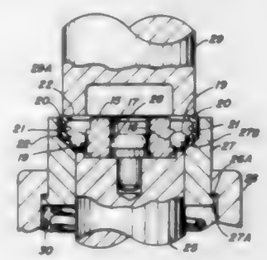
A collector assembly for large high power electron tubes such as klystrons. The collector assembly is formed

of simple geometrical sections such as cones and cylinders brazed together at their edges. Each of the sections is formed by rolling a composite sheet comprising a layer



of stainless steel brazed to a layer of copper, into the abutting side of which fluid coolant passages have been formed.

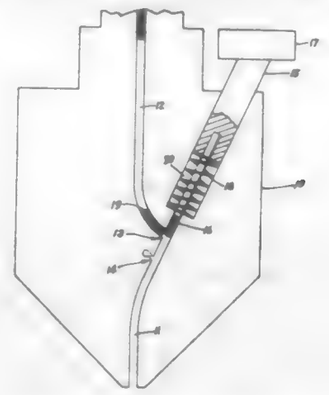
3,374,524
APPARATUS FOR ASSEMBLING BALL BEARING DEVICES
Walter S. Sutowski, 6976 Crestview Drive, Brecksville, Ohio 44141
Original application Feb. 11, 1965, Ser. No. 431,852, now Patent No. 3,337,937, dated Aug. 27, 1967. Divided and this application Mar. 13, 1967, Ser. No. 622,720
5 Claims. (Cl. 29—201)



Apparatus having opposed parts one movable in an axial direction relative to the other for moving ball bearing race members together, the outer race member being split, and to position the ball bearings between the race members in opposed raceways provided therein in the moving of the race members together, to form the assembly of race members with the ball bearings positioned in place in the opposed raceways.

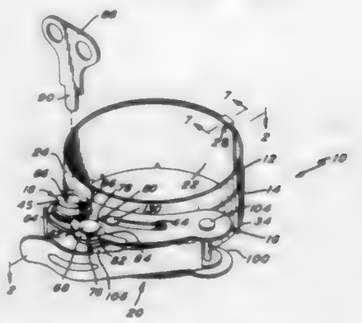
3,374,525
COMPONENT PLACEMENT APPARATUS
Eduard C. Petry, Hopkins, Minn., assignor to Fabri-Tek Incorporated, Minneapolis, Minn., a corporation of Wisconsin
Filed Oct. 14, 1965, Ser. No. 496,028
18 Claims. (Cl. 29—203)

Magnetic core placement apparatus having a block including a pair of intersecting channels, one of the channels opening out of the block to receive cores, and the other channel opening out of the block at a different location for placement of the core. A fluid jet port is provided at a point between the channel intersection and the channel opening for placement. A plunger, including a magnetic tip for releasably holding the cores, is mounted within the placement channel, and is movable between the intersection and the jet port, so that on reciprocation of the plunger the magnetic tip carries a single magnetic core



from the intersection to the jet port where the core is knocked off the magnetic tip by a fluid jet, to fall through the channel and out the placement opening. The apparatus is rotatably mounted to provide for programmed angular placement of the cores.

3,374,526
PISTON RING COMPRESSOR
Smith Kyser, Ionia County, Mich., assignor to Aircraft Specialties, Inc., Lapeer, Mich., a corporation of Delaware
Filed Sept. 3, 1965, Ser. No. 484,868
9 Claims. (Cl. 29—222)

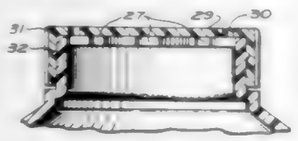


A piston ring compressor which includes a spring compression band, a housing and a tension band associated with the housing which embraces and limits the diameter of the compression band. Adjusting means are also provided which are attached to the tension band for adjusting the diameter of the compression band. Lever means are also connected to the tension band for quickly expanding and restoring the diameter of the compression band to facilitate placement on and removal from a piston without requiring further adjustment.

3,374,527
METHOD OF MAKING DISPENSING CONTAINER
Carl L. Jarrett, Kansas City, Mo., assignor to Consolidated Thermoplastics Company, Los Angeles, Calif., a corporation of Delaware
Original application Oct. 15, 1963, Ser. No. 316,327, now Patent No. 3,255,937, dated June 14, 1966. Divided and this application Sept. 18, 1964, Ser. No. 404,997
1 Claim. (Cl. 29—434)

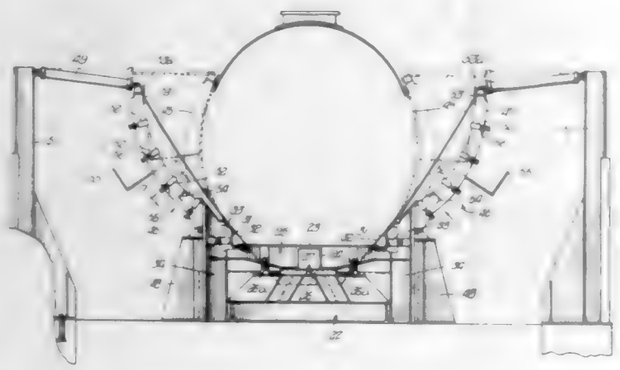
A method for fabricating a plastic container having a body portion and a cap portion wherein a seal is effected

between the body portion and cap portion by flexing flanges on the upper end of the body portion inwardly



thereof when the cap is attached to the body portion.

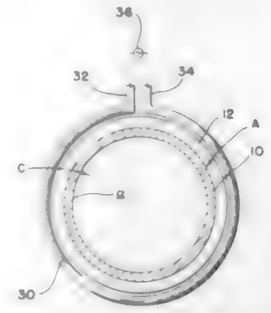
3,374,528
HOPPER CAR FABRICATION
Alvin A. Bowcutt, Park Forest, Ill., David J. Bolliker, Gary, Ind., and Bronius Polikaitis, Chicago, Ill., assignors to Union Tank Car Company, Chicago, Ill., a corporation of New Jersey
Filed Apr. 1, 1965, Ser. No. 444,737
4 Claims. (Cl. 29—471.1)



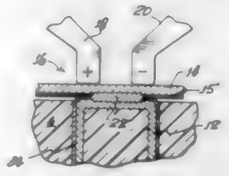
4. In the manufacture of hopper cars, the method comprising the steps of: mounting a bottom support assembly on a fabricating jig; attaching end and intermediate bulkhead assemblies in place on said bottom support assembly; attaching a roof assembly atop of said end and intermediate bulkhead assemblies; affixing the bottom edge portions of a pair of elongate one piece metal sheets to the respective sides of said bottom support assembly with the main portions of said sheets supported respectively on a plurality of forming arms having forward edge portions compatible with the curved side edges of said end and intermediate bulkhead assemblies; simultaneously moving said forming arms to force said side sheets against said side edges of said end and intermediate bulkhead assemblies so as to fit said side sheets to the curvature of said end and intermediate bulkhead assemblies; and affixing said side sheets in place against said end and intermediate bulkhead assemblies to semi-complete said hopper car.

3,374,529
METHOD OF BUTT WELDING
Harry B. Osborn, Jr., University Heights, and Harry V. Beronius, Kenton, Ohio; said Osborn assignor to Park-Ohio Industries, Inc., a corporation of Ohio
Filed Feb. 7, 1963, Ser. No. 256,939
4 Claims. (Cl. 29—482)

There is provided a method of butt welding the matching, peripheral joining flanges of two generally hollow workpieces, such as the housing portions of a sealed compressor. Ribs are provided around the flanges adjacent the outside thereof, and the ribs are inductively heated to a temperature below the melting point of the material forming the ribs without heating the flange to a great extent. Thereafter, the ribs are pressed together to weld them by pressure.



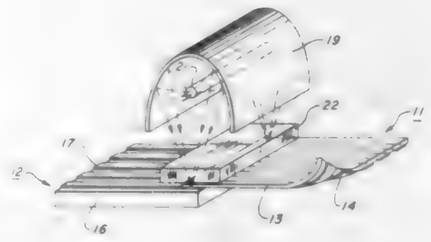
3,374,530
PROCESS FOR THE JOINDER OF METALLIC MEMBERS
Andrew E. Flanders, Pomona, and Claude E. Feighner, Ontario, Calif., assignors to General Dynamics Corporation (Pomona Division), Pomona, Calif., a corporation of Delaware
Continuation-in-part of application Ser. No. 294,644, July 12, 1963. This application July 16, 1965, Ser. No. 477,075
19 Claims. (Cl. 29—484)



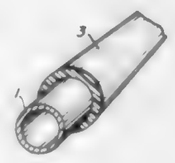
This disclosure relates to transmission or conductive material suitable for welding applications, particularly surface welding applications, and to a solution from which the transmission material is coated. The conductive or transmission material in the as-plated condition is constructed of a base metal with a layer or coating of at least indium and gold. The base metal may be, for example, nickel, copper, silver, chromium, or nickel-iron alloy such as Kovar, each having atomic radii compatible with welding techniques. A surface welding technique in conjunction with the coating effects an interface bond between joined members. At least one of the two members to be welded is coated and the members are positioned face to face with the coated surface or surfaces in abutment. The two electrodes of the welding machine are positioned on one side and in contact with the exposed surface of one of the positioned members to be welded with a predetermined pressure applied thereto. Energy is then rapidly applied in predetermined quantity through the electrodes, as a result of which heat is rapidly applied to an area localized to the material disposed intermediate the members being joined. The metal of the material being interconnected is thereupon caused to diffuse, fuse and coact, creating a bond between the members which is strong in the shear direction but which may be broken by peeling, and may be rewelded a number of times without degradation of the rewelded joint.

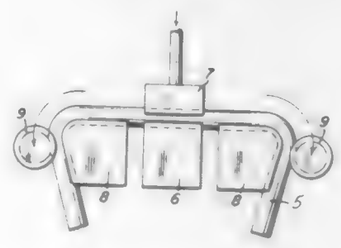
3,374,531
METHOD OF SOLDERING WITH RADIANT ENERGY
David Vernon Bruce, Ewing Township, Mercer County, N.J., assignor to Western Electric Company, Incorporated, New York, N.Y., a corporation of New York
Filed Apr. 21, 1965, Ser. No. 449,768
8 Claims. (Cl. 29—498)

Radiant energy, such as infrared, is employed to effect a given process, such as soldering a workpiece, without damage to heat sensitive materials were the process is carried out at a temperature deleterious to the heat sensitive materials and the radiant energy is passed through the heat sensitive materials. This is accomplished by employing a radiation transparent heat sink in contact with the heat sensitive material which permits the radiant energy to be passed through the heat sensitive material while conducting sufficient heat away from the heat sensitive material to prevent damage thereto.



3,374,532
METHOD OF MAKING A WALL-RUNG
Heinrich Zenhausern, Birmensdorferstrasse 134, Urdorf, Switzerland
Filed Oct. 5, 1962, Ser. No. 228,521
3 Claims. (Cl. 29—505)

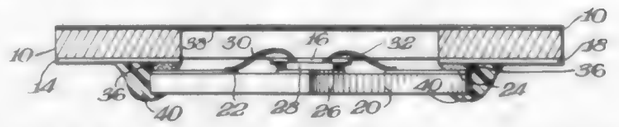




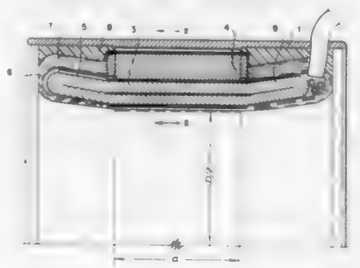
1. A method of making a wall-rung from a metal tube covered with a sleeve of synthetic material comprising the steps of loosely mounting the sleeve in a cold state on the tube, holding the tube and sleeve at the middle between the ends thereof, and bending the tube into a wall-rung shape and at the same time lengthwise stretching the sleeve to cause the same to grip the tube.

3,374,533
SEMICONDUCTOR MOUNTING AND ASSEMBLY METHOD
Darnall P. Burks, Williamstown, Mass., and John H. Fabricius, Stamford, Vt., assignors to Sprague Electric Company, North Adams, Mass., a corporation of Massachusetts
Filed May 26, 1965, Ser. No. 458,930
5 Claims. (Cl. 29—577)

A semiconductor device is mounted on a mounting chip of insulating material. Elements of the semiconductor device are in electrical contact with spaced discrete conductive pads on the mounting chip. The mounting chip is secured to a circuit substrate with the conductive pads in conductive contact with circuit lands on the substrate.



3,374,534
METHOD OF MAKING STATOR WINDINGS OF ELECTRIC MOTORS IN VIBRATORY-BATTING DEVICES
Reinhold P. Kuska, Kuznia Raciborska, and Dionizy Simson and Eugeniusz Makowski, Solec Kujawski, Poland, assignors to Zaklady Sprzetu Budowlanego Nr 2, an enterprise of the Polish State
Filed Oct. 23, 1963, Ser. No. 318,248
2 Claims. (Cl. 29—605)



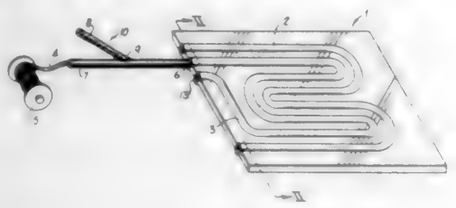
1. A method for manufacturing a stator assembly for vibrating and vibrating-percussive equipment having a stator core and associated winding wires, a portion of said wires extending axially from said core, said method comprising the steps of:

(a) surrounding said stator core and said associated winding wires with a metal sleeve, said portion of said winding wires being spaced from the inner surface of said sleeve,
(b) heating the whole assembly to a uniform temperature,
(c) impregnating the whole heated assembly with a first liquid comprised of a mixture of a resin, an initiator, and an activating agent,
(d) cooling said impregnated assembly to harden said first liquid,
(e) binding the outside periphery of said portion of said winding wires with glass cloth impregnated with a second liquid comprised of a mixture of a resin, an initiator, and an activating agent,
(f) filling the spaces between said binding and said winding wires with said first liquid and an addition of a filler,
(g) allowing the whole assembly to harden,
(h) covering the windings with glass cloth impregnated with said second liquid, and
(i) filling the remainder of said space between the covered outside of said portion of said winding wire and said inner surface of said sleeve, with said second liquid and an addition of a filler.

3,374,535
METHOD OF MAKING ELECTRIC HEATERS
Lester J. Tranel, St. Louis, Mo., assignor to Olin Mathieson Chemical Corporation, East Alton, Ill., a corporation of Virginia
Filed Mar. 9, 1960, Ser. No. 13,836
11 Claims. (Cl. 29—611)

8. The method of installing a heater wire in a serpentine passage, comprising the steps of: providing a coil

of heater wire; disposing the end of the coil of heater wire adjacent an outlet end of the passage; and forcibly pulsating fluid against the wire and into the outlet end

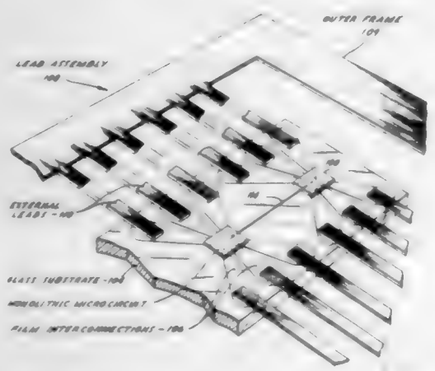


of the passage to carry the wire therewith longitudinally into the passage.

3,374,536
INCAPSULATION OF ELECTRICAL UNITS
Walter W. Schroeder, Williamstown, Mass., John H. Fabricius, Stamford, Vt., and Alphonse E. Will, Adams, Mass., assignors to Sprague Electric Company, Adams, Mass., a corporation of Massachusetts
Filed Oct. 29, 1964, Ser. No. 407,490
8 Claims. (Cl. 29—613)

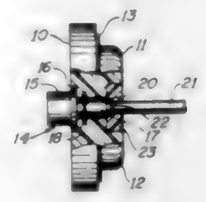
An electrical unit is encased in a moldable material by mounting wire terminals in a spaced relation on a support and preformed resin shells are carried on the wire terminals in such a manner that successively electrical units can be constructed on the ends of the terminals and the shells then move around the units.

3,374,537
METHOD OF CONNECTING LEADS TO A SEMICONDUCTIVE DEVICE
Walter L. Doelp, Jr., Chalfont, Pa., assignor to Philco-Ford Corporation, a corporation of Delaware
Filed Mar. 22, 1965, Ser. No. 441,621
1 Claim. (Cl. 29—627)



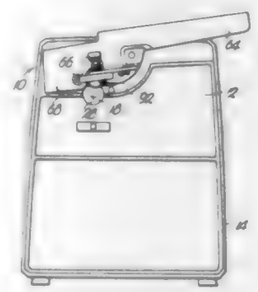
Packaged semiconductor device and assembly method utilizing semiconductor chip with surface contact areas joined to respective contact leads by respective interconnection films on substrate which supports chip and leads. Substrate, chip, and inner ends of leads are epoxy-encapsulated. All leads are attached to substrate simultaneously by means of discardable outer frame member from which leads extend inwardly.

3,374,538
METHOD FOR MAKING CAPACITOR END CAP
Myles N. Murray, Chagrin Falls, Ohio, assignor to Industrial Electronic Rubber Company, Twinsburg, Ohio, a corporation of Ohio
Filed May 3, 1965, Ser. No. 452,490
8 Claims. (Cl. 29—627)



Method and apparatus for making a capacitor end cap having a major body part molded about a terminal, with one end of the latter projecting from one end of this body part and the other terminal end exposed in a recess at the other end of the part. A connector wire is welded to the terminal end within the recess, and the recess is then filled with settable composition to form a minor part of the cap fully imbedding the welded joint and being substantially flush with the end of the major part.

3,374,539
AUTOMATIC CAN OPENER APPARATUS
Jack E. Briar, Mission, and Foster Lisle Talge, Jr., Overland Park, Kans., and Henry J. Talge, Kansas City, Mo., assignors to Dazey Products Company, Kansas City, Mo., a corporation of Missouri
Filed Mar. 23, 1966, Ser. No. 536,697
14 Claims. (Cl. 30—4)

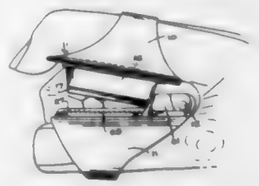


An automatic electric can opener having an improved cutting wheel and supporting linkages therefor, in which the wheel configuration prevents undue penetration of the cutting portion of the wheel into the lid of a can even under strong spring forces used to maintain the desired cutting relationship, and the linkages are so arranged as to utilize the engagement between the cutter wheel and a can lid as a fulcrum facilitating positive automatic control over operation of the drive motor responsive to the positioning of the cutting wheel and linkages and without damage or undue wear to the parts or danger to a user upon release of the wheel from one position to another under strong spring forces as the lid being cut becomes completely severed from the can.

3,374,540
RAZOR
Ernst de Longuyon, Pullach, Munich, Germany, assignor to Climar A.G., Zug, Switzerland
Original application June 24, 1964, Ser. No. 377,621, now Patent No. 3,311,975, dated Apr. 4, 1967. Divided and this application Feb. 27, 1967, Ser. No. 641,072
Claims priority, application Switzerland, July 31, 1963, 9,535/63
3 Claims. (Cl. 30—62)

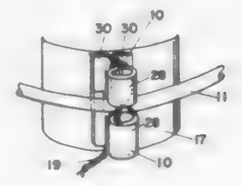
In a safety razor having a pair of resiliently pressed blade clamping plates, one of which forms a gripping member for coaction with a separate gripping member having a centrally disposed slot therein. The gripping members are assembled together in a lengthwise direction into a tapered socket or sleeve functioning as a handle. A bayonet-type lock or a snap or spring-type catch operates to secure the interconnection between the gripping members and the casing.

3,374,541
DEVICE FOR CUTTING FLOWER STEMS AND THE LIKE
Frank W. Earnest III, Williamsport, and Albert H. Torongo, Jr., Yardley, Pa., assignors to Frank W. Earnest, Jr., doing business as Frank Earnest Company, Williamsport, Pa.
Continuation-in-part of application Ser. No. 541,157, Apr. 8, 1966. This application Jan. 27, 1967, Ser. No. 612,152
5 Claims. (Cl. 30—232)



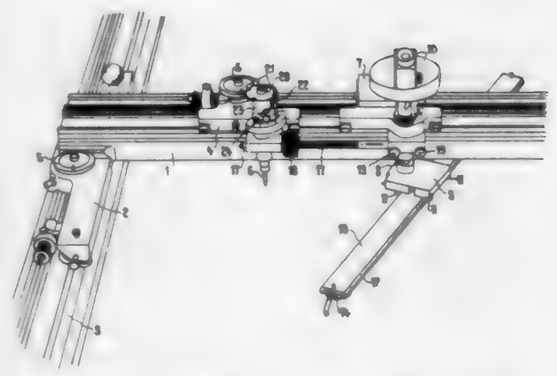
The device embodying the present invention is a gardening tool characterized by the provision of a pair of pivotally connected members which are respectively provided with shearing elements, the pivoted members being designed to be respectively engaged and held by the thumb and a finger of the hand of a user so that upon conjoint movement of the thumb and finger the members are moved relatively to one another in a scissors-like manner to sever and trim flower stems and effect light pruning of shrubbery and the like.

3,374,542
ORTHODONTIC BRACKET
George P. Moylan, Jr., Orchard Beach Road, R.D. 1, North East, Pa. 16428
Filed Oct. 23, 1965, Ser. No. 502,822
11 Claims. (Cl. 32—14)



The orthodontic device disclosed herein provides caps for teeth having brackets with knife edges that engage the arch wire in both occlusal and gingival. This knife edge contact does not depend on a pin but is a function of the bracket. Because of the nature of forces imposed by the device, the arch wire tends to remain seated in its slot and, therefore, the pin or cap is used to prevent accidental displacement.

3,374,543
COORDINATOGRAPH
Bernhard R. Bachmann, Koniz, Switzerland, assignor to Haag-Streit A.G., Liebefeld-Bern, Switzerland
Filed Oct. 10, 1966, Ser. No. 585,341
Claims priority, application Germany, Oct. 22, 1965, H 57,495
7 Claims. (Cl. 33—18)



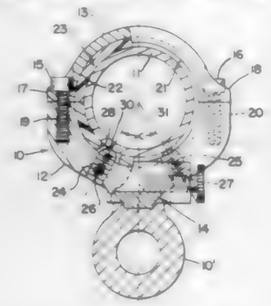
A coordinatograph having a carriage adjustable according to rectangular coordinates, a ruler firmly attachable to the drawing table of the coordinatograph, guide means associated with said carriage and removably engaging said ruler for guiding said carriage along said ruler, and an angle-measuring instrument indicating the angle of said ruler relatively to said rectangular coordinates.

3,374,544
FRONT GUN TELESCOPE MOUNT
Richard L. Pitchford, Brockport, N.Y., assignor to Bausch & Lomb Incorporated, Rochester, N.Y., a corporation of New York
Filed Sept. 16, 1966, Ser. No. 580,079
5 Claims. (Cl. 33—50)

1. In a front gun telescope mount having a ring-like frame composed of upper and lower substantially semicircular parts wherein a clearance opening is formed for the telescope and having retaining means for securing one of said parts in aligned engagement with the other and further having a ring of resilient material held within said opening in contact with the boundary surface thereof,

the improvement consisting of two rigid telescope seating elements which are secured in said lower part at angularly spaced positions which lie in the same plane along said boundary surface and are located substantially symmetrically of the vertical transverse center line of said opening, said ring having openings through which said elements extend, the seating surfaces of said elements lying normally slightly below the inner surface of the resilient ring,

whereby the compressive force caused in the resilient ring during clamping of the telescope causes a reaction force which firmly seats the telescope on said elements regardless of small pivotal adjusting movements of the telescope about the front mount.

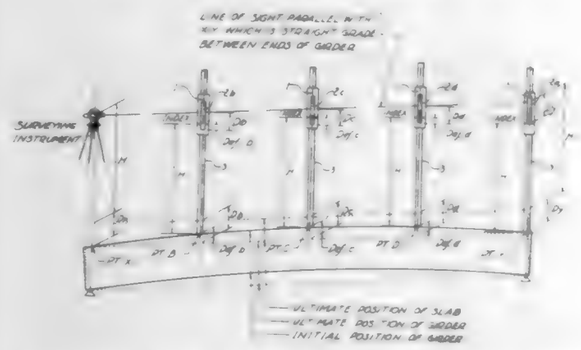


5. A front and rear gun telescope mount which cooperate to hold an aiming telescope on a gun, said rear mount including orthogonally arranged elevation and windage adjusting abutment members, said front mount being composed of mating upper and lower semi-circular parts which are clamped together, said parts having inner surfaces which cooperate to form a cylindrical opening in which the telescope is held,

an elastic ring mounted on and clamped by said inner surfaces of said parts against said telescope, said elastic ring having an outer cylindrical surface in contact with said inner surfaces of said parts and having an inner cylindrical surface in contact with said telescope, the axis of said inner cylindrical surface being inclined relative to the axis of said outer cylindrical surface and lying in a radial plane extending substantially midway between said abutment members so that the thickest portion of the rear edge of said ring lies substantially angularly opposite to said members,

whereby said thick portion of the ring forces the telescope against said abutment members when the telescope is clamped in place.

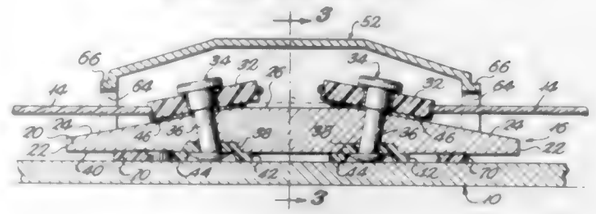
3,374,545
CAMBER GAUGE
Lloyd I. Monroe, 15 Belmont St., Danbury, Conn. 06810
Filed May 3, 1965, Ser. No. 452,529
2 Claims. (Cl. 33—74)



LINE OF SIGHT PARALLEL WITH KEY WHICH IS STRAIGHT GRADE BETWEEN ENDS OF GIRDER
SURVEYING INSTRUMENT
ULTIMATE POSITION OF SLAB
ULTIMATE POSITION OF GIRDER
INITIAL POSITION OF GIRDER

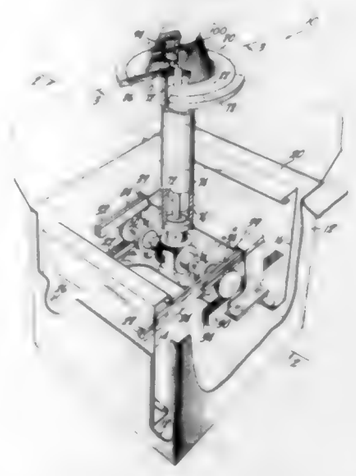
A camber gauge having a staff on which is slidably mounted a slide having a plurality of adjustable scales. This camber gauge is used for determining the true relationship of a finished deck slab and the supporting girders of bridges taking into account allowance which must be made for deflections, offsets and vertical curves.

3,374,546
MOBILE DRAFTING APPARATUS WITH SUPPORT SKIDS AND REMOVABLE CORD PULLEYS
Charles E. Justis, Sr., 825 Greenwood Road, Jenkintown, Pa. 19046
Filed Dec. 22, 1966, Ser. No. 603,869
6 Claims. (Cl. 33—80)



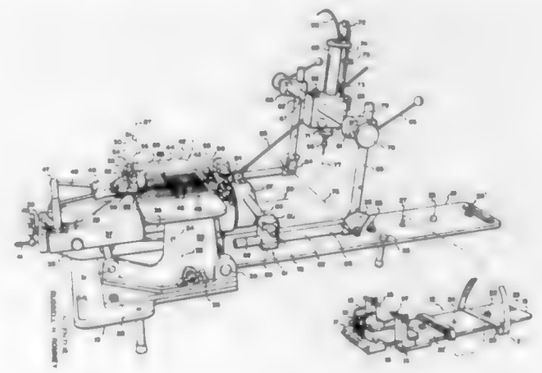
A straightedge blade body having parallel guiding edges includes two pulleys at each end thereof which engage the fixed guide cable. These guide pulleys may be mounted either in a substantially parallel relationship to the underlying drafting board or at an angle thereto. In a first form, the mounting means for the pulleys includes a rivet having a head thereof disposed within a cup washer the undersurface of which slides on the supporting surface to provide a skid means to facilitate movement. In another form of the invention, mounting means includes a headed member having a threaded bore therewithin and a stud member threaded into this threaded bore, the head of the stud member engaging an underlying surface. In further modifications, a tapered wedge-shaped pedestal is provided for supporting the pulleys substantially parallel with the drafting board. Additional skid members are attached to the undersurface of the blade body. In a further modified form, a snap-on skid member is provided including integral depending skid portions and having opposite ends adapted to snap onto the associated blade body.

3,374,547
CASE MEASURING DEVICE
Horace P. Abbott, Old Greenwich, Conn., assignor to Lever Brothers Company, New York, N.Y., a corporation of Maine
Filed June 6, 1966, Ser. No. 555,454
7 Claims. (Cl. 33—143)



Case measuring device in which a knob drives through torque-limiting mechanism a shaft driving a pair of spaced pinions each meshing with a pair of racks to drive them in opposite directions. The racks meshed with each pinion are each coupled to a respective one of two spaced plates each supported by two spaced racks at locations near the plate perimeter. The knob driving action is converted into a plate separation movement arrested by engagement of the plates with opposite inner sides of a case, the greatest realized separation being indicated by a measuring scale.

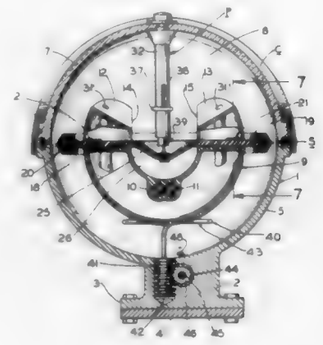
3,374,548
STEREOTAXIC SYSTEM
Russell H. Romney, 3259 Bon View Drive, Salt Lake City, Utah 84109
Filed Mar. 23, 1965, Ser. No. 441,970
14 Claims. (Cl. 33—174)



A stereotaxic system including an instrument positionable in any orientation relative to and for use upon a subject which is secured to a stage, that may be situated upon the stereotaxic base in any one of a plurality of useful orientations and removed when desired from the base to facilitate securing the subject thereon or to reorient the subject relative to the instrument. Comparator structure associated with the instrument for joint movement with the instrument so that displacement of comparator components, such as in response to following of a graphic representation of the subject, will cause duplicate displacement of the instrument.

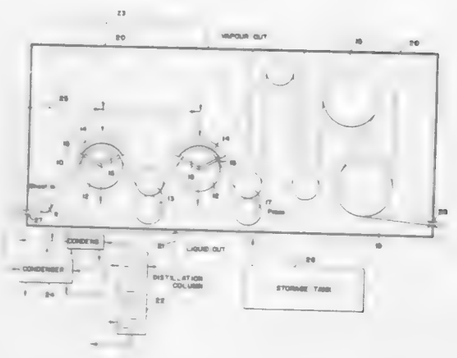
3,374,549
ORIENTATOR
Roy R. Hanson, Maryland Heights, Mo., assignor of one-fourth each to William H. Anderson, Glencoe, the estate of Joseph H. Schierman, late of St. Louis, and George A. Blase, St. Louis, Mo.
Continuation-in-part of application Ser. No. 182,239, Mar. 26, 1962. This application May 9, 1966, Ser. No. 559,666
5 Claims. (Cl. 33—223)

1. An orienting device for use in a vehicle for indicating both the heading and the attitude of said vehicle comprising, in combination, a housing having a heading and an attitude reference, a floating member within the housing and adapted for pivotal mounting therein, a fluid within the housing coordinated with the floating member to render the latter buoyant, a transparent closure member on the housing for viewing a portion of the interior thereof, vertical pivot means extending downward from said housing into the fluid and having vertical resilience, pivot engaging means on the floating member pivotally engaged with the pivot means, said floating member being cut away to permit pivoting around the pivot means, a permanent magnet having a mounting physically mounting it within the floating member beneath the pivot point of the floating member, an azimuth ring related to said floating member in compass coordinated relationship with the permanent magnet within the floating member and the heading reference of the housing and in attitude coordinated relationship with the permanent magnet within the floating member and the attitude reference of the housing, means for adjustably coupling the azimuth ring to the permanent magnet mounting about the east-west axis thereof defined by the azimuth ring and for positionally adjusting the azimuth ring with respect to the permanent magnet mounting to compensate for deviations in the indicated attitude, whereby the azimuth ring serves the twofold purpose of providing magnetic heading and attitude



references, said adjusting means comprising a seating ring oriented beneath the permanent magnet mounting, a cooperating abutment means on the vertical pivot means, the seating ring being movable for temporary engagement with the permanent magnet mounting means for temporary engagement with the permanent magnet mounting to engage the azimuth ring with the abutment means to adjust the relationship between the permanent magnet mounting and the azimuth ring.

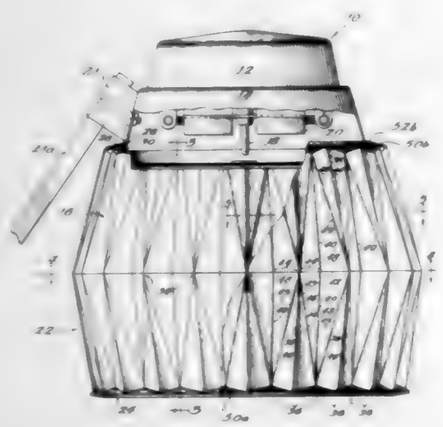
3,374,550
PROCESS AND APPARATUS FOR DRYING PAPER
Jean D. Belleau, Ville St. Laurent, Quebec, Canada, assignor to Dominion Engineering Works, Limited, Lachine, Quebec, Canada, a corporation of Canada
Filed Oct. 20, 1966, Ser. No. 588,076
10 Claims. (Cl. 34—9)



1. A method for drying a continuously moving web of newly formed paper having a high water content comprising the steps of: advancing the web of paper towards a drying station, introducing into the web just prior to the drying station a substitute liquid more volatile than water so that the said liquid replaces a portion of the water originally present in the paper, applying a vacuum to the web simultaneously with the addition of the more

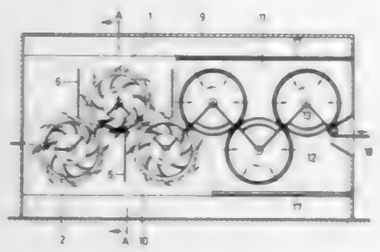
volatile liquid to remove the excess more volatile liquid and water from the web, and subsequently advancing the web to a drying station and removing substantially all of the remainder of the moisture from the web.

3,374,551
HAIR DRYER BONNET
Russell E. Petrick, Park Ridge, Ill., assignor to Bretford Manufacturing, Inc., a corporation of Illinois
Filed Mar. 2, 1966, Ser. No. 531,315
4 Claims. (Cl. 34—99)



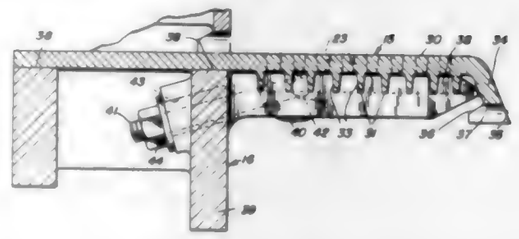
A hair dryer bonnet wherein the wall is defined by a plurality of folded pleats meeting in inwardly and outwardly folded vertices, forming vertical channels in the interior of the bonnet. Also the panels of each pleat are further slightly folded about a diagonally extending line.

3,374,552
SIEVE DRUM DRYER
Heinz Fleissner, Egelsbach, near Frankfurt, Germany, assignor to Anstalt fur Patentdienst, Vaduz, Liechtenstein
Filed May 7, 1965, Ser. No. 453,970
Claims priority, application Switzerland, May 8, 1964, 6,041/64
10 Claims. (Cl. 34—115)



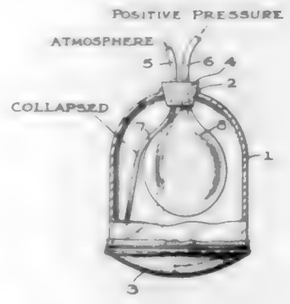
The present disclosure relates to an apparatus for the treatment of materials, for example textile materials, which comprises a substantially closed housing, more than one conveying means rotatably disposed within said housing, said conveying means being disposed in at least two rows which are staggered to each other, partition means dividing the apparatus into a treatment chamber and a fan chamber, radial fan wheel means disposed within said fan chamber, and air guide means disposed in the spaces between at least some of the radial fan wheel means, into which spaces flows the exhausted air from the conveying means.

3,374,553
CLINKER COOLER GRATE PLATES
William J. Gillman, 15800 Rim Rock Road, Apple Valley, Calif. 92307
Filed July 16, 1965, Ser. No. 472,631
4 Claims. (Cl. 34—164)



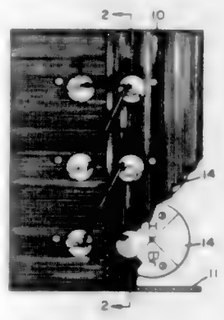
Grate plates for movable type cement clinker coolers having orifices spaced for effective distribution of cooling air, and an underneath grid structure to direct air to orifices and prevent warping of top surfaces of plates.

3,374,554
EDUCATIONAL OR TEACHING DEVICE FOR DEMONSTRATING THE SEVERAL ACTIONS OF THE LUNGS AND BLOOD VESSELS IN A HUMAN BODY
Isabelle D. De Bella, 4105 Wisconsin Ave. NW., Apt. 301, Washington, D.C. 20016
Filed Oct. 22, 1965, Ser. No. 500,715
2 Claims. (Cl. 35—17)



An educational device for teaching and demonstrating the actions of the lungs, blood vessels and diaphragm in a body during the inhaling and exhaling processes.

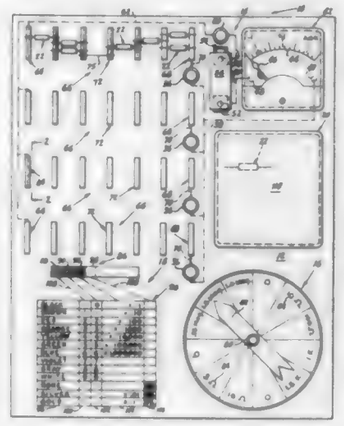
3,374,555
TEACHING DEVICE
James H. Hart, 4 Rocky Hill Road, Andover, Mass. 01810
Filed Nov. 9, 1965, Ser. No. 506,931
6 Claims. (Cl. 35—18)



An apparatus for demonstrating the theory of chemical valence having a support with openings in the support. A plurality of rotatable members having chemical indicia thereon are positioned adjacent the support so that when rotated the chemical indicia is brought into register with

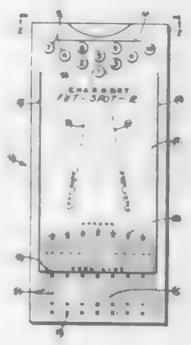
the openings. Elongated adjustable members are provided for connection between opposite valence charges of the chemical indicia to represent satisfaction of the valence charges between reactants.

3,374,556
GAME
Walter P. Brown, Reedsville, Ohio 45772
Filed Nov. 29, 1965, Ser. No. 510,193
6 Claims. (Cl. 35—19)



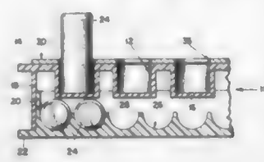
Apparatus including a game board on which are mounted a plurality of electrical components arranged and disposed in a plurality of open electrical circuits including a source of electrical energy and an electrical current indicating means, the components including as parts thereof a plurality of sequences of electrically insulated electrical connector means to releasably receive and electrically connect in series and in parallel randomly selected electrical resistances of differing ohmic values to complete one or more of the circuits, each of the sequences being in parallel with the others, and switch means connecting the current indicating means in the completed electrical circuits to indicate if such completed circuits satisfy Ohm's law.

3,374,557
GAME GUIDE
Charles R. Lotarius, Box 684, Pacific Palisades, Calif. 90272
Filed May 17, 1965, Ser. No. 456,158
4 Claims. (Cl. 35—29)



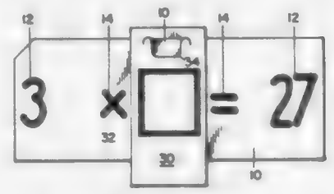
A two-piece game guide is disclosed for assisting a player to hit a remote target with a projectile which includes a base member having indicia representative of targets imprinted on the surface of the member and having a designated starting area imprinted on the surface of the member spaced apart from the target indicia. Aiming marks are imprinted on the surface of the member between the starting area designation and the target indicia. A transparent overlay having a graphic indication composed of straight lines imprinted thereon is arranged in friction-engaging contact with the member and when held in a selected location by the fingers of the user, is adapted to cooperate with the indicia on the member to show a relationship between the target indicia, the aiming marks and the starting designation.

3,374,558
EDUCATIONAL PEG BOARD
Luke J. Smith, Jr., East Longmeadow, Mass., assignor to Milton Bradley Company, Springfield, Mass., a corporation of Massachusetts
Filed Feb. 16, 1966, Ser. No. 527,794
1 Claim. (Cl. 35—31)



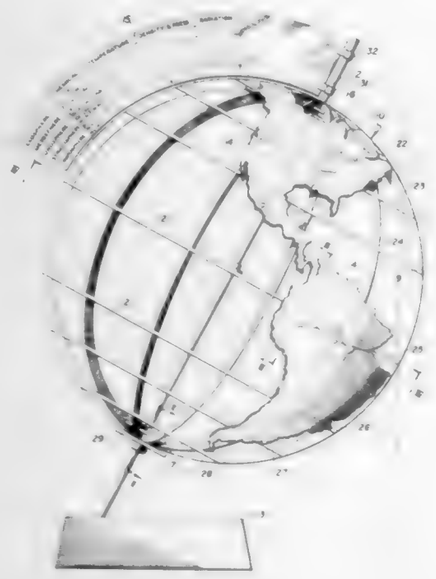
A teaching device comprising a peg board having openings therein, a plurality of opaque overlay cards, each card having sets of openings therein alignable with certain of the openings in the peg board when one of the overlay cards is superposed on the peg board, and a plurality of pegs insertible in the openings in the overlay card and peg board, the sets of openings in the overlay cards being of odd and even number, and the peg board being in the form of an enclosed container having a base wall provided with a plurality of spaced parallel, arcuate grooves separated by upstanding ribs, the grooves being complemental to the pegs for storage of the pegs in an orderly manner when not in use.

3,374,559
TEACHING DEVICE
Luke J. Smith, Jr., East Longmeadow, Mass., assignor to Milton Bradley Company, Springfield, Mass., a corporation of Massachusetts
Filed June 28, 1966, Ser. No. 561,158
2 Claims. (Cl. 35—31)



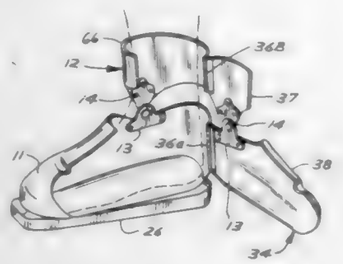
1. A teaching device comprising in combination,
(a) a flashcard;
(b) indicia on the flashcard pertaining to a subject with the indicia on the card appearing on both faces thereof and with the indicia on each face being identical in subject matter.
(c) means slidably related to the flashcard for concealing certain of the indicia thereon and consisting of:
(a) a slide member cut scored to define a tab;
(b) the tab having a sight opening therein;
(c) the tab being engageable with an edge of the flash card with the sight opening therein being registrable with certain of the indicia on one face of the flashcard;
(d) the slide member proper concealing certain indicia on the other face of the flashcard; and
(e) the certain indicia on the other face of the flashcard corresponding to the indicia on the one face appearing through the sight opening in the tab.

3,374,560
TEACHING AID
Maria K. Forsyth, Worcester, Mass. (% American Embassy, APO Box 260, New York, N.Y. 09080)
Continuation of application Ser. No. 413,405, Nov. 24, 1964. This application Mar. 14, 1967, Ser. No. 641,397
1 Claim. (Cl. 35—46)



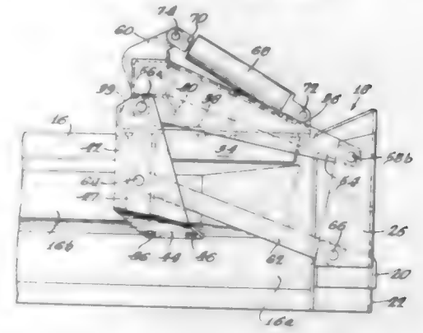
A skeleton globe which is assembled element-by-element from a shaft, a series of elongated semi-circular curved elements, a series of ring-like elements, detachable resilient land mass elements and a planetary ring concentric with the globe.

3,374,561
HYDROSTATIC PAD FOR SKI BOOT
Frank D. Werner, Bloomington, and Paul S. Petersen, Minnetonka, Minn., assignors to Rosemount Engineering Company, Minneapolis, Minn., a corporation of Minnesota
Filed Oct. 20, 1965, Ser. No. 498,242
13 Claims. (Cl. 36—2.5)



A ski boot having a base portion and a cuff portion with access means to permit foot insertion and access means that hold the foot of the wearer of the boot securely, and which includes padding in the cuff portion that holds the lower part of the leg of the wearer and which has a quickly conformable pad at the high load portions of the cuff. The quickly conformable pad distributes shock loads caused during skiing along the longitudinal length of the leg to equalize the pressure on the leg and thereby increase its ability to withstand the high load.

3,374,562
BLADE GATE
Herbert C. Glesmann, Omaha, Nebr., assignor to Omsteel Industries, Inc., a corporation of Nebraska
Filed Apr. 30, 1965, Ser. No. 452,172
13 Claims. (Cl. 37—50)

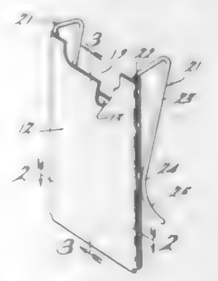


Gate mechanism for a moldboard including mounting means for rigid attachment to a moldboard, a gate adapted to be disposed at one end of a moldboard, a linkage on the order of a parallelogram linkage connecting the gate and a mounting means so that the gate may be raised or lowered relative to the moldboard and a power means mounted on the mounting means and connected to the gate for raising and lowering the same.

3,374,563
ELECTRIC IRON
Anton Schlechter, Box 122, Aylesbury, Saskatchewan, Canada
Filed Jan. 30, 1967, Ser. No. 612,713
4 Claims. (Cl. 38—74)

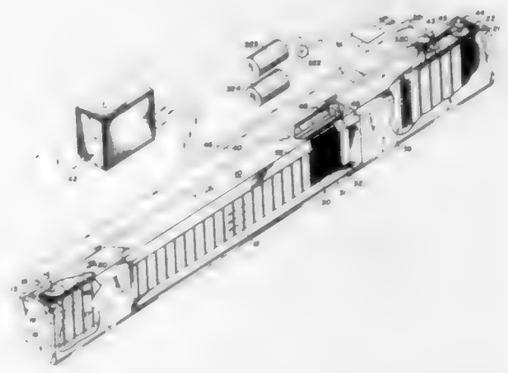
An electric iron having a lint disposing means secured therein, and an electric motor for creating a vacuum to operate the lint disposing means. Included in the sole plot of the iron are uniformly placed perforations for passing the lint.

3,374,564
CARD HOLDER
Philip Balaban, 19500 Sorrento, Detroit, Mich. 48235
Filed May 26, 1965, Ser. No. 458,972
2 Claims. (Cl. 40—11)



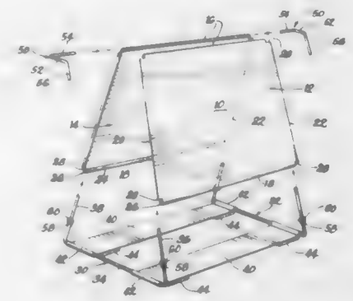
1. A card holder made from a strip of transparent material having a wide section and a narrow section folded adjacent to the junction therebetween to be in abutting relation to each other, tubular edges formed on the wide section which extend over and engage the edges of the narrow section and retain it against the wider section, and clips of U-shape, having a straight leg which extends into the tubular edges and a bent leg which abuts against the tubular edges.

3,374,565
MOVING DISPLAY SYSTEM
Robert L. Woolfolk, Dallas, Tex., assignor to Recognition Equipment Incorporated, Dallas, Tex., a corporation of Delaware
Filed Sept. 27, 1965, Ser. No. 490,529
16 Claims. (Cl. 40—37)



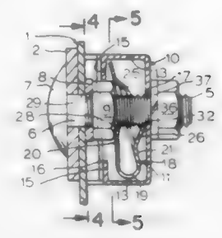
An information display system having a continuous track for supporting and translating a plurality of display panels sequentially past a writing zone and a display zone where each panel has disks mounted for rotation about a horizontal axis having opposite faces which contrast in visual appearance. At the writing zone, air jets selectively directed onto individual disks control the face position of a disk in accordance with input language information. The panel speed may be varied in dependence upon the rate of flow of display information to the system.

3,374,566
DISPLAY AND ADVERTISING DEVICE
Robert R. Snediker, Winnetka, Ill., assignor to Chicago Show Printing Company, Chicago, Ill., a corporation of Illinois
Filed Nov. 29, 1965, Ser. No. 510,209
11 Claims. (Cl. 40—125)



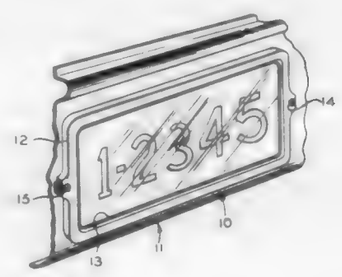
A presentation device to be mounted at the point of sale and it relates more particularly to a device to be used in advertisement and adapted to be mounted in full view on the top of a sales device or other surface.

3,374,567
IDENTIFICATION AND LOCKING MEANS FOR AUTOMOBILE LICENSE PLATE
William S. Salisbury, 3712 25th St., San Francisco, Calif. 94110
Filed June 23, 1965, Ser. No. 466,184
3 Claims. (Cl. 40—203)



A locking member adapted to be secured against the outer face of an automobile license plate by the conventional bolts for securing such plate to the automobile, which locking means is adapted to carry annual identifying data, and require destruction thereof for locking purpose in order to remove it from the bolts preparatory to replacement, thereby giving visible evidence of tampering with the license plate.

3,374,568
LICENSE PLATE HOLDER
Earl M. Trammell, Jr., Ladue, Mo. (P.O. Box 435, St. Louis, Mo. 63166)
Continuation-in-part of application Ser No. 422,648, Dec. 31, 1965. This application June 30, 1965, Ser. No. 468,422
16 Claims. (Cl. 40—209)

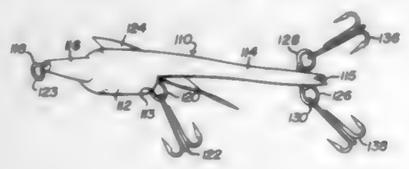


The license plate holder includes a frame for holding a license plate, the frame having a hook at one side and a snap fastener at the opposite side. The hook interfits one of a pair of spaced holes in the bumper and by swinging the frame about the hook connection in one of the spaced holes, the snap fastener may be connected to the other spaced hole. The fasteners include a flange which extends behind the frame, and a resilient pad is secured to each flange. The pad engages the license plate, and thereby accommodates vibration.

3,374,569
FISHING LURE
John Kurlovich, 32225 MacKenzie, Garden City, Mich. 48135
Continuation-in-part of application Ser. No. 411,205, Nov. 16, 1964. This application June 7, 1967, Ser. No. 644,162
5 Claims. (Cl. 43—42.36)

The disclosure includes a fishing lure with a body portion and a thin tail portion extending longitudinally from the top of the body portion which provides a surface on

the under side of the tail portion for the attachment of a spinner blade adjacent the body portion with the spinner

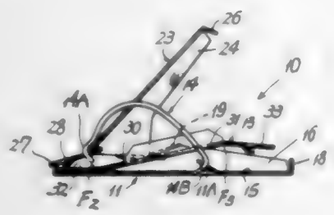


blade extending transversely of the tail portion on each side thereof and mountings for fish hooks below, above and on said tail portion.

3,374,570
FISHHOOK DISGORGER
Erwin C. Lenzen, Carver, Minn. 55315
Filed Dec. 15, 1965, Ser. No. 514,042
10 Claims. (Cl. 43—53.5)

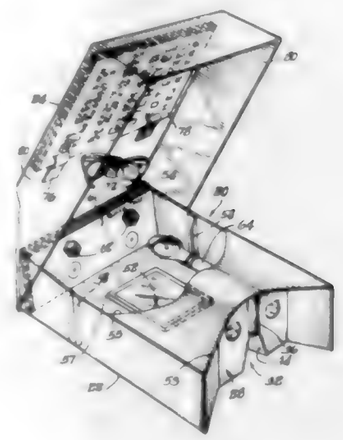
A fishhook disgorger having a linear handle extended between a thumb loop and a working eye. The eye has a pair of connected V-shaped sections both converging in a forward direction. The V-shaped sections are connected with a transverse member having a longitudinal groove on the top side for receiving the shank of a fishhook. The V-sections are longitudinally spaced from each other so that in use the hook engages the bottom of the noses or apex portions of the V-sections and the top of the mid-portion of the transverse member.

3,374,571
TRAP
George W. Oakes, Crystal City, Mo. 63019
Filed July 14, 1965, Ser. No. 471,845
1 Claim. (Cl. 43—83.5)



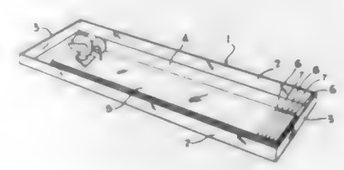
A trap having a fixed jaw member with a jaw end portion and a finger set portion. A movable jaw member is provided also having a jaw end portion and a finger set portion. Each of the jaw members have complementary bearing means intermediate the ends thereof about which the movable jaw member pivots about the fixed jaw member. A trigger is pivotally connected to the fixed jaw member and a C-shaped spring is provided that has its respective end portions anchored to the respective jaw members. Advantageously, the jaw members are maintained in a set open position when the end of the spring anchored to the movable jaw member is disposed below the bearing means of the jaw members.

3,374,572
TOY EYE EXAMINATION KIT
John A. Course, 18025 Dixie Highway, Homewood, Ill. 60430
Filed Oct. 22, 1965, Ser. No. 501,914
8 Claims. (Cl. 46—11)



A toy eye examination kit is disclosed comprising a viewer in the form of a box which is adapted to retain card means and instruments used in the examination.

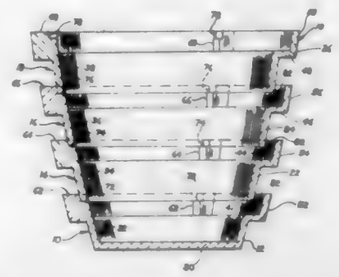
3,374,573
MAGNETICALLY ACTUATED TOY HAVING MOVABLE FEATURES
Gustav H. Bishoff, 7489 Drexel Ave., University City, Mo. 63130
Filed Oct. 24, 1965, Ser. No. 504,307
6 Claims. (Cl. 46—237)



1. An action toy a part of which is moved manually with respect to another part, comprising a base including an elongate strip of magnetic material having a multiplicity of narrow poles each of which has the same polarity along a surface of the strip and successive of which have opposite polarity and all of said poles extending transversely of and across the strip, and an object adapted to be supported by and moved along and relative to the surface of the said base strip, said object carrying a magnet adjacent said strip when said object is resting thereon, said magnet being alternately attracted and repelled as the object is manually translated and being connected to at least one element of said object to produce an alternating movement of the element as the object is moved manually lengthwise of said strip.

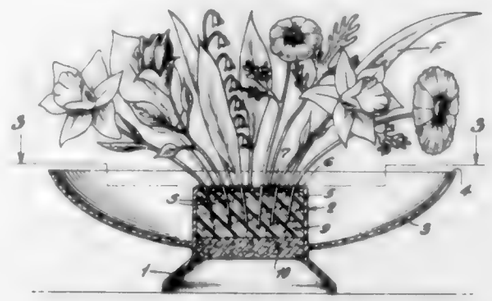
3,374,574
SECTIONAL PLANTER
Ernest Hall, 30 Cadwallader Terrace, Trenton, N.J. 08618
Filed June 21, 1966, Ser. No. 559,192
8 Claims. (Cl. 47—34.12)

A series of separately formed, interfitting, open-bottomed, annular dished sections are stacked one upon another to a selected height, to produce a planter the interior of which is continuous in the sense of being wholly unbroken by dividers or partitions. Earth is thus retained by the planter in a correspondingly continuous and unbroken, solid core. The sections are so formed that when stacked to a selected height, they expose the earth at the



side of the planter throughout its circumference at each of the several levels occurring between adjacent superimposed sections, to permit both side and top planting.

3,374,575
INTEGRALLY MOLDED FLOWER HOLDER
Duncan Tong, 23C Robinson Road, Victoria, Hong Kong
Filed June 29, 1966, Ser. No. 561,503
4 Claims. (Cl. 47—41.12)



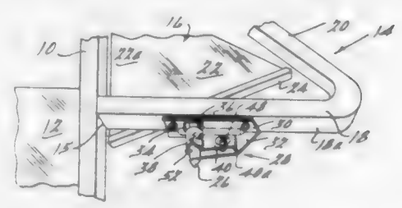
1. An integrally molded flower holder of hardened plastic material, comprising a base and a bowl receptacle diverging upwardly from said base, an open-bottomed housing extending upwardly from said base within the confines of said bowl with the top wall of said housing below the mouth of said bowl, said top wall having a plurality of perforations therein for the reception of the stems of flowers therethrough, said housing containing in its interior a body of flexible porous holding material which is insertable through the bottom thereof for retaining said stems in impaled position while the flowers assume natural positions above the mouth of said bowl, and a mass of solid material heavier than said porous flexible material in said housing below said last-mentioned material to impart stability to said flower holder.

3,374,576
JALOUSIE WINDOW STRUCTURES
Cecil W. Duclon, 834 W. Crestline Ave., Littleton, Colo. 80120, and Conrad J. Morgan, 1300 Kennamer Drive SE., Huntsville, Ala. 35801
Filed Apr. 7, 1966, Ser. No. 540,926
8 Claims. (Cl. 49—81)

1. In a jalousie window, a generally rectangular frame, a plurality of spaced parallel louvers pivotally and slidably mounted by one longitudinal edge portion at their opposite ends in opposed side portions of said frame, an endmost one of said louvers having along its outer longitudinal edge an inwardly projecting flange interhookable in an outwardly projecting flange on a cross-piece in the adjacent end of said frame, all of the other of said louvers having an inwardly projecting flange on the outer longitudinal edge thereof for interhookable engagement on outwardly projecting flanges on the inner or pivoted longitudinal edges of the neighboring louvers including the first endmost one, but excluding the other endmost one, means for turning all of said louvers in one direction about their pivots in one direction for opening and in the opposite direction for closing, said means being operatively connected with all of said louvers alike, excepting

that the last named endmost louver is movable by said means in a direction away from all of the other louvers after the interhooking of the outwardly extending and inwardly extending flanges on neighboring louvers so that the interhooked louvers are all pulled into tighter interhooked relationship for good sealing action and the first endmost louver is similarly pulled into tighter interhooked relationship with the aforesaid cross-piece and means for operating the last mentioned means.

3,374,577
MOUNTING CLIP FOR VENT WINDOW ASSEMBLY
James S. Salloum, Warren, Mich., assignor to Chrysler Corporation, Highland Park, Mich., a corporation of Delaware
Filed Oct. 3, 1966, Ser. No. 583,752
5 Claims. (Cl. 49—391)



1. A one-piece sheet metal mounting clip for frictionally embracing the lower end of the swivel shaft of a motor vehicle vent window after the shaft has passed downwardly through a longitudinal support member carried by the door of the vehicle, comprising:

(A) a horizontal flange portion adapted to be rigidly secured to the underface of said support member and having an aperture therein to pass said swivel shaft;

(B) a longitudinally extending wall portion extending generally vertically downwardly from one longitudinal edge of said flange portion and bent upon itself about the axis of said shaft on a bend radius approximating the radius of said shaft to form

(1) a socket portion at the bend rotatably receiving the shaft and

(2) a resilient arm portion extending from said socket portion in parallel and confronting relation to the adjacent surface of the unbent section of said wall portion;

(C) means defining aligned openings in said arm portion and in said unbent section of said wall portion;

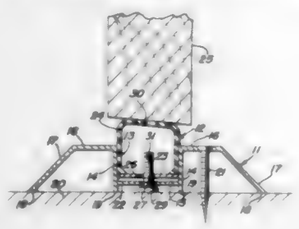
(D) a threaded fastener member adapted to be passed through said aligned openings; and

(E) means at the periphery of one of said openings for adjustably gripping the threads of said fastener element, whereby said element may be selectively turned to adjust the frictional grip of said socket portion on said shaft.

3,374,578
STRIP MEMBERS FOR FORMING SLIDEWAYS FOR GLASS PANES
Francois Mesnel, Neuilly-sur-Seine, France, assignor to Societe Anonyme des Etablissements Mesnel, Colombes, Seine, France
Continuation of application Ser. No. 457,327, May 20, 1965. This application Aug. 31, 1967, Ser. No. 664,892
Claims priority, application France, June 3, 1964, 976,900
4 Claims. (Cl. 49—440)

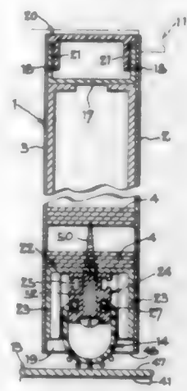
A frame member for a glass pane comprising a holder having a generally U-shaped cross-section in which is force-fitted a slideway for directly receiving the glass pane for sliding displacement therein. The slideway is constituted by an elongated extruded body which is U-shaped in cross section and is of a size to fit into the holder groove. A plurality of independent resilient strips are embedded in the base to extend transversely thereof at spaced intervals. The strips have sharp ends and a length greater than the width of the base and of the groove whereby the body is force-fitted into the groove to the bottom thereof with the retaining strip indening into the walls of the groove to retain the body in position in the groove.

3,374,579
ADJUSTABLE THRESHOLD
Edsel B. Neff, 2513 Park Drive, Roswell, N. Mex. 88201
Filed Apr. 29, 1966, Ser. No. 546,353
8 Claims. (Cl. 49—468)



1. An adjustable threshold comprising in combination, an elongated threshold body adapted to rest upon and be secured to a floor, said body being provided with a central longitudinal channel having an open top, a pair of side walls and a connecting bottom wall, said bottom wall being spaced above the bottom of said body to provide a central longitudinal recess in the bottom of the body below said channel, an adjustable threshold section extending longitudinally in said channel, said adjustable section including a strap-like base member overlying said bottom wall and a deformable door engaging member secured to said base member and projecting upwardly from said channel, said base member being provided with a plurality of screw threaded apertures, said door engaging member and said bottom wall being formed with openings in register with said apertures, and a plurality of adjusting screws engaging the screw threaded apertures in said base member and extending downwardly through the openings in said bottom wall to bear against the floor, said screws being accessible and adjustable through the openings in said door engaging member, whereby the adjustable threshold section may be raised and lowered in said channel relative to the threshold body.

3,374,580
WEATHER SEALING STRIP FOR DOORS
Robert O. Ruff, Cincinnati, Ohio, assignor to The Steelcraft Manufacturing Company, Rossmoyne, Ohio, a corporation of Ohio
Filed Apr. 22, 1965, Ser. No. 449,975
3 Claims. (Cl. 49—482)

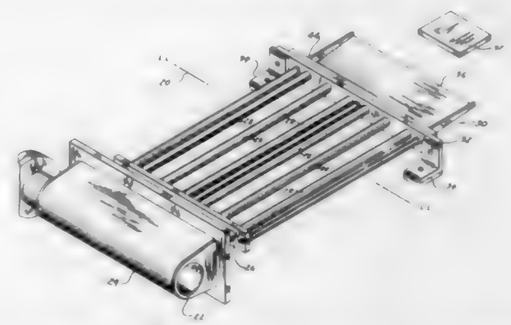


The invention essentially comprises an adjustable sealing strip mounted within a channel-shaped recess formed in the lower edge portion of a sheet metal door, the sealing strip being formed of resilient material and arranged to provide one or a plurality of line seals with reference to the surface of the threshold or sill of the door frame. In order to impart adjustability, the sealing strip, which is generally channel-shaped in cross section and of resilient or deformable material, includes mounting flanges along its free edges engaged in pairs of opposed slots formed in the opposite side portions of a rigid mounting rail secured in the downwardly facing channel-shaped recess of the sheet metal door. The channel-shaped sealing strip is deformable upwardly under pressure and includes flexible fins which extend outwardly a sufficient distance to engage the sill of the door frame. The combination of the mounting rail, the resilient sealing strip and its fins, permits the sealing strip to be selectively mounted in any one of the pairs of slots to compensate for variations in the distance between the lower edge portion of the door and the top surface of the sill, thereby to provide one or more line seals between the surface of the sill and the free end portions of the flexible fins.

3,374,581
NON-CLOGGING TYPE BLAST DEVICE
Robert G. Millhiser, Detroit, and Raymond C. Winger, Livonia, Mich., assignors to Ajen Laboratories, Inc., Livonia, Mich.
Continuation-in-part of application Ser. No. 394,198, Sept. 3, 1964. This application June 14, 1966, Ser. No. 562,420
6 Claims. (Cl. 51—8)

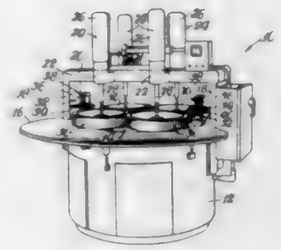
A non-clogging nozzle for liquid grit blasting useful for making minor adjustments in direction of blasts from fixed grit blasting devices and also in converting a spaced

series of blasts into a continuous ribbon blast. In place of the old enclosed nozzles, this novel non-clogging nozzle



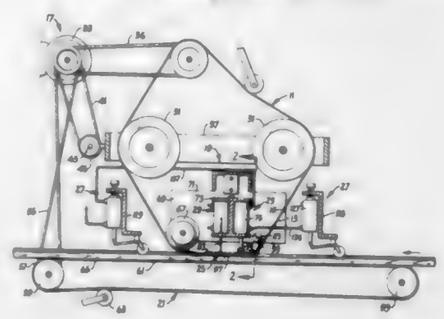
uses an open deflector plate mounted to intersect the liquid grit blast, preferably encroaching on the blast slightly and at an angle of 5° to 15°.

3,374,582
LAPPING MACHINE
Stephen A. Boettcher, Deerfield, Ill., assignor to Speedfam Corporation, a corporation of Illinois
Filed Dec. 8, 1964, Ser. No. 416,825
14 Claims. (Cl. 51—131)



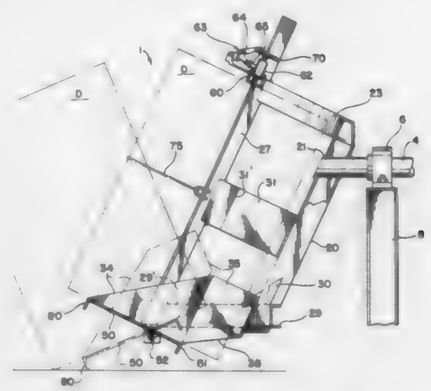
A contour control member positionable with the lower annular surface thereof in engagement with the outer portion of the periphery of a lapping disc between adjacent truing and retaining rings for dressing the lapping surface of the disc.

3,374,583
APPARATUS FOR FINISHING SURFACES
Arno M. Jacobi, Belmont, Calif., assignor to Walter Jacobi & Sons, Inc., Belmont, Calif., a corporation of California
Filed Sept. 20, 1965, Ser. No. 488,375
16 Claims. (Cl. 51—141)



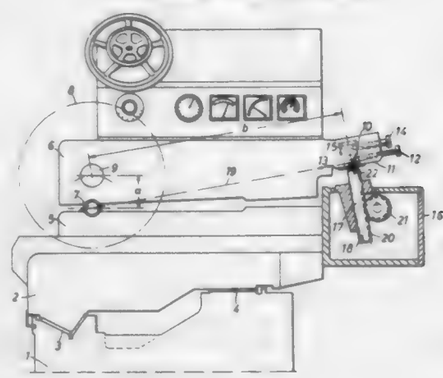
1. Apparatus for finishing surfaces on work pieces comprising a continuous belt having an abrasive surface and a backing surface, means for driving said belt through a work station, means for moving a work piece through said work station with the work piece surface to be finished adjacent said abrasive surface, a backing unit at said work station engaging said backing surface, said backing unit including shaping means for varying the configuration of said belt at said work station, sensing means for sensing the configuration of said work piece surface as the work piece is moved through the apparatus, and actuating means responsive to said sensing means for adjusting said shaping means to cause said belt to assume substantially the same configuration as said work piece surface.

3,374,584
DRUM-TUMBLER HOLDER
Glenn J. Haught, Cuyahoga Falls, Ohio, assignor, by mesne assignments, to U.S. Stoneware Inc., a corporation of Massachusetts
Filed June 30, 1965, Ser. No. 468,350
1 Claim. (Cl. 51—164)



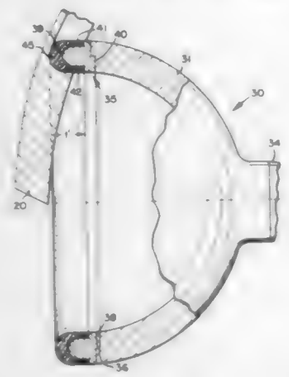
A drum-tumbler holder having a generally hemicylindrical cradle structure tilted in one direction, and a bottom for the holder having a fulcrum pivotally connected to opposite sides of the cradle structure, and two unequal levers extending from the fulcrum, the greater of the levers extending away from the cradle structure so that the bottom, under the influence of gravity, is normally tilted in a direction opposite to the direction in which the cradle structure is tilted.

3,374,585
GRINDING DEVICE
Artur Klein, Austrasse 6a, Netphen, Kreis Siegen, Germany
Filed Feb. 11, 1965, Ser. No. 433,254
Claims priority, application Germany, Feb. 15, 1964, W 36,177/64
4 Claims. (Cl. 51—165)



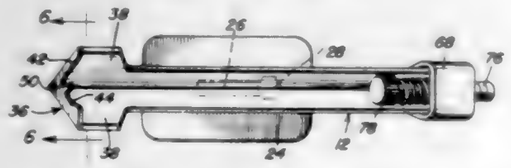
A grinding machine for grinding conical articles is provided with a grinding wheel carrier which is swingable upon an axle parallel to the axis of the workpiece. The rough adjustment is carried out by a shaft while the fine adjustment is carried out by a roller movable relatively to said axis.

3,374,586
LENS-GRINDING WHEEL
Solon Stone, Geneva, N.Y., assignor to Textron, Inc., Providence, R.I., a corporation of Rhode Island
Filed May 3, 1965, Ser. No. 452,575
1 Claim. (Cl. 51—206)



A rotary-type grinding wheel for lenses has an abrasive material sintered around the annular tip portion of the wheel to form an arcuate edge extending on the outside and inside of the wheel for a height greater than the amount of the stock that is to be removed from the lens blank. The abrasive material may be sintered to a metal ring, which is secured to the annular, open end of the wheel.

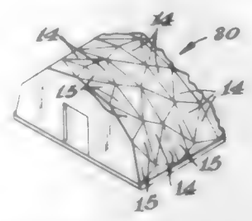
3,374,587
DRILL GRINDING ATTACHMENT
Thomas W. Simpkins, 4605 Leeds St., El Paso, Tex. 79903, and Howard H. Crawford, El Paso, Tex.; said Crawford assignor to said Simpkins
Filed Mar. 16, 1966, Ser. No. 534,894
9 Claims. (Cl. 51—219)



1. A drill grinding attachment comprising an elongated drill receiving trough, said trough having forward and rear ends, a drill guide on the forward end of said trough, said drill guide including an upwardly directed inner edge defined by two generally converging edge portions, an integral upwardly projecting lug positioned substantially at the point of juncture of said edge portions and defining an abutment face at the adjacent end of a first of said edge portions for engagement of the leading edge of a drill thereagainst, the second of said edge portions being above the inner surface of the trough and arcuately concave between said lug and the outer end thereof so as to define a drill edge engaging surface adapted to engage a following edge of different size drills upon the engagement of a leading edge of the corresponding drill against said abutment face.

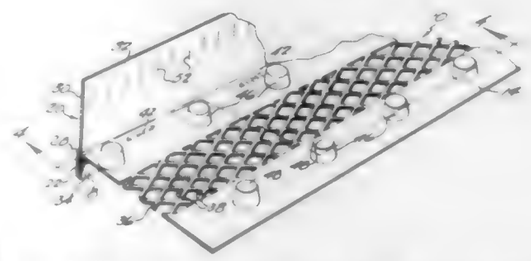
3,374,588
MODULAR, CURVED STRUCTURE AND METHOD OF ASSEMBLY
Turner Alfrey, Jr., and Douglas S. Chisholm, Midland, Mich., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware
Filed Mar. 30, 1964, Ser. No. 355,715
5 Claims. (Cl. 52—81)

1. A structure comprising a plurality of triangular panels, the triangular panels being of a right unsymmetrical configuration, the structure conforming generally to at least a portion of the cylindrical surface, the structure comprising a plurality of adjacent connected segments prepared from the triangular panels, adjacent segments being composed of triangular panels of opposite hand,



each of the segments comprising panels of like hand wherein panels are joined to similar panels with similar sides common, the hypotenuses of the triangles forming edges of the segments, the edges of the segments being disposed in a generally circumferential manner.

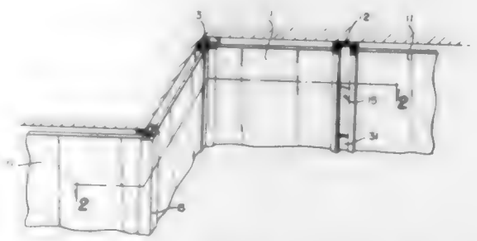
3,374,589
COURSE SPACER AND MORTAR BARRIER
Fred Neal, Jr., Paris, Tex.
(Rte. 2, Box 206, Hallsville, Tex. 75650)
Filed Oct. 12, 1965, Ser. No. 495,076
6 Claims. (Cl. 52—105)



(1) For use in erecting a masonry wall, a course guide comprising: a flat sheet of flexible material; opposed flanges normal to said sheet in opposite directions on the same side of said sheet and rows of spacing means projecting out of said sheet.

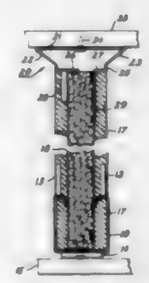
(2) A masonry wall comprising: upper and lower brick courses; a sheet of material positioned between and vertically spacing said courses, said sheet being pervious to mortar, and flanges on said sheet at the rear of said sheet and overlying adjacent courses.

3,374,590
STRUCTURAL WALL MEMBERS
Milton Kessler, 4535 Grove Drive, Youngstown, Ohio 44505
Filed Feb. 26, 1965, Ser. No. 435,439
6 Claims. (Cl. 52—221)



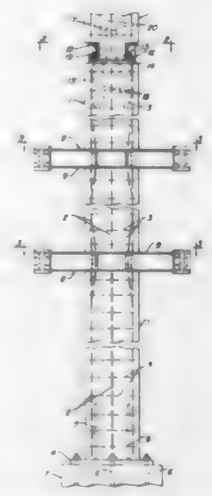
An extruded plastic structural member for retaining and edging wall panels and providing a deep channel between adjacent panels for visual effect and optionally providing concealed ducts for electrical wiring.

3,374,591
RESILIENT PARTITION STRUCTURE
Paul W. Tillisch, George E. Meyer and Rocco Papalia, Antioch, Calif., assignors to Kaiser Gypsum Company, Inc., Oakland, Calif., a corporation of Washington
Continuation of application Ser. No. 247,976, Dec. 28, 1962. This application Jan. 20, 1966, Ser. No. 521,886
9 Claims. (Cl. 52—241)



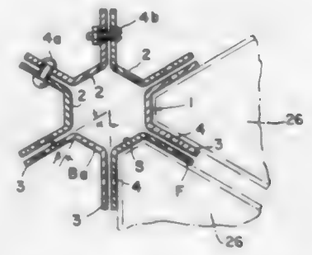
5. A non-loadbearing partition construction comprising a channel ceiling track, a channel floor track vertically yieldably affixed to a floor in vertical alignment with said ceiling track, wall board extending between and supported by said tracks, said ceiling track having a web affixed to a ceiling and a yieldable means adapted to abut the top portion of said wall board and having means to support said wall board in upright position, the bottom portion of said wall board being disposed in said floor track, and a plaster coating disposed on said wall board and maintained out of contact with the interior of said ceiling track and filled into said floor track, said plaster coating on said wall board and in the floor track forming a continuous layer.

3,374,592
PRECAST COLUMN WITH SHEAR-HEAD SECTIONS
David B. Cheskin, 407 S. Dearborn St., Chicago, Ill. 60605
Filed Dec. 24, 1964, Ser. No. 421,000
3 Claims. (Cl. 52—260)



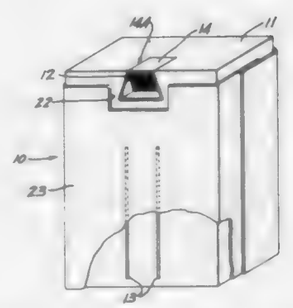
1. A composite precast column with shear-head framing integrated therewith in the casting step, which comprises in combination, a reinforced concrete column section with internally placed longitudinal reinforcing steel and a support-connector means at each end thereof, at least one laterally extending shear-head section spaced along the length of said column section, with each shear-head section comprising at least one laterally projecting steel framing member which is cast into and fixedly connected with the reinforced column section to accommodate shear and bending moments, said steel framing member in turn having a plurality of dowel members projecting therefrom at right angles thereto in two directions and connecting into the body of the column section such that there is a bonding and splicing with said longitudinal steel reinforcing therein, and said steel framing member being positioned to have web portions set back from the periphery of the column to provide thereby a resulting peripheral notched section for at least the depth of said steel framing member entirely around the body of said column at each shear-head section, whereby concrete subsequently being poured around the column over each shear-head section will key into the column periphery at each floor level.

3,374,593
STRUCTURAL ASSEMBLY
Eberhard G. Rensch, Lerchesbergring 24, Frankfurt am Main, Germany
Continuation-in-part of application Ser. No. 309,777, Sept. 18, 1963. This application June 6, 1966, Ser. No. 555,452
Claims priority, application Germany, June 9, 1965, R 40,822; Dec. 21, 1965, R 42,270
5 Claims. (Cl. 52—283)



Structure of the type disclosed in copending application Ser. No. 309,777, with one or more profiled columns supporting a slab composed of triangular plates, the present improvement residing in the provision of a column composed of complementary, rigidly interconnected vertical profile members of constant horizontal cross-section serving as anchorages for the slab plates and for adjoining walls.

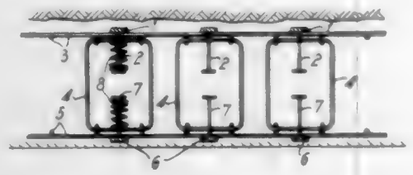
3,374,594
REFRACTORY BRICK FOR USE IN SUSPENDED ROOFS
Carl A. Tate, Pittsburgh, Pa., assignor to Harbison-Walker Refractories Company, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Jan. 30, 1964, Ser. No. 341,450
2 Claims. (Cl. 52—598)



1. A composite refractory shape comprised of a refractory body having opposed ends and sides extending between the ends, an aperture formed through an intersecting side and end said aperture having a base and sidewalls which converge to form a narrow aperture at one of the ends of said body, a tubular oxidizable metal

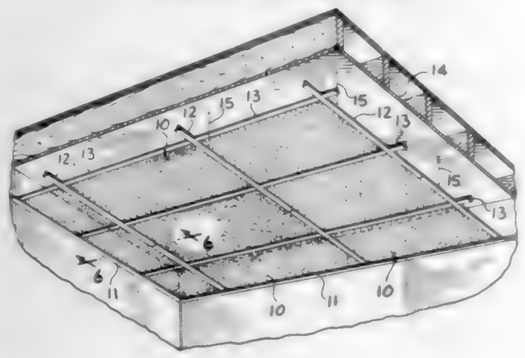
insert of cross-sectional configuration mating the cross-section of said aperture, said insert fixed in said aperture and filling the cross-section thereof, said insert being fixed against upward and downward movement perpendicular to the ends of said body, the said metal insert having at least one planar outer face which is substantially coplanar with the remainder of the end of the shape through which the aperture is formed.

3,374,595
REINFORCED CONCRETE REINFORCEMENT FOR HIGHLY STRESSED STRUCTURAL COMPONENTS
Gerhard Heiwolt, Braunschweig, and Guenter Voss, Wolfenbuttel, Germany, assignors to Salzgitter Industriebau Gesellschaft m.b.H., Salzgitter-Drutte, Germany
Filed Dec. 14, 1965, Ser. No. 513,778
Claims priority, application Germany, Dec. 18, 1964, S 94,695
8 Claims. (Cl. 52—648)



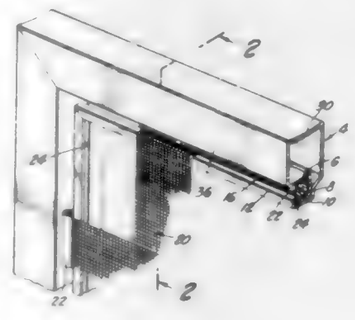
A reinforcement arrangement for concrete bodies, particularly for tunnel arches and the like, comprising in combination, a plurality of longitudinally arrayed outer arched unitary reinforcing elements each provided with inwardly projecting elongated pegs, a plurality of longitudinally arrayed inner arched unitary reinforcing elements each received with spacing within the confines of one of the outer elements and having outwardly projecting elongated pegs, and reinforcing filler means interposed between respective sets composed of an inner and an outer arched element, the pegs meshing with the filler means whereby, when the arrangement is embedded in a body of hardened concrete the pegs interconnect the elements of the sets and the filler means in shear-resistant relationship.

3,374,596
SUSPENDED CEILING SYSTEM
George A. O'Brien and George A. Kochanowski, Chicago, Ill., assignors to Kinkead Industries Incorporated, Chicago, Ill., a corporation of Illinois
Filed May 17, 1965, Ser. No. 456,227
7 Claims. (Cl. 52—664)



An improved frame structure for use in a grid for a suspended ceiling system in which each frame member is provided with a locking tongue projecting from one end of the member and having an aperture near the end of the tongue for forming a vertical locking surface facing rearwardly of the leading edge of the tongue. A pair of opposed longitudinal, vertically spaced tabs project from the vertical fin of the adjacent frame member so as to define a channel for receiving the tongue and holding the tongue firmly against one side of the vertical fin. The tabs are formed from the vertical fin, such as by stamping operation, with the opposed longitudinal edges of the tabs being spaced apart to form a divider web therebetween. One end of the divider web is cut away from the vertical fin so as to form a longitudinal tang between the tabs with an end portion of the tang being bent out of the plane of the fin so as to be biased against the tongue inserted between the tabs. The end of the tang engages the vertical locking surface formed by the aperture in the end portion of the tongue so as to lock the tongue longitudinally and prevent retraction thereof from between the tabs. The entrance end of each of the tabs is beveled longitudinally so as to form a V-shaped mouth for facilitating insertion of the tongue and at the same time strengthening the base portion of the locking and biasing tang.

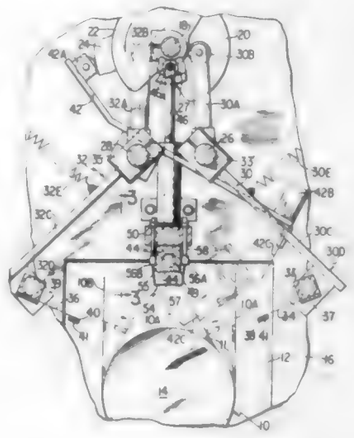
3,374,597
ROLLED METAL SCREEN FRAME
Gary L. Whitener, Long Beach, Calif., assignor to Universal Molding Company, Lynwood, Calif., a corporation of California
Filed Mar. 9, 1965, Ser. No. 438,237
1 Claim. (Cl. 52—738)



1. In a metal screen frame section or the like, a rolled tubular body having a smooth external surface, said body having laterally and thence upwardly extending flanges whose edges terminate in laterally spaced relation to said body to define a spline groove, one flange edge comprising an outer edge portion rolled over the other edge, and terminating in said outer edge portion above the bottom of the spline groove to provide a spline retaining shoulder and a continuous locking groove rolled longitudinally into said first mentioned flange exteriorly of the spline groove and upwardly from the bottom of the spline groove relative to said shoulder and inwardly from said other edge to clamp the rolled over flange edge thereof to said other flange, said face of one flange edge in contact with a face of the other flange edge being knurled along the continuous locking portion provided by said continuous locking groove.

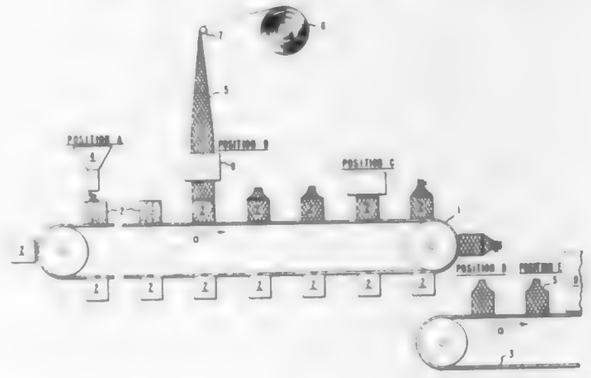
3,374,598
SEAL AND THE METHOD AND APPARATUS FOR MAKING SAME
Miroslav J. Piroutek, Stamford, Conn., assignor, by mesne assignments, to Corning Glass Works, Corning, N.Y., a corporation of New York
Filed Nov. 17, 1964, Ser. No. 411,819
10 Claims. (Cl. 53—3)

A seal is made in resilient plastic sheet material held tightly wrapped around articles to be packaged, in regions of plastic material which are unsupported from inside the package, by melt-piercing overlapped edges of the material to leave the edges fastened together by spaced rings of fused plastic. An automatic machine wraps the sheet and holds the overlapped edges of the plastic material



against its resilience while the seal is formed by groups of melt-pierced holes located at positions between the spaced peripheries of the articles in the package.

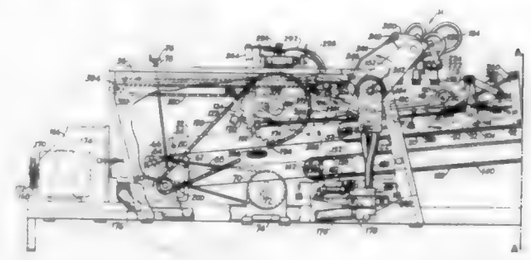
3,374,599
METHOD FOR PACKAGING AND APPARATUS THEREFOR
George Francis Sanders, Grand Island, N.Y., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Filed Jan. 26, 1966, Ser. No. 523,100
6 Claims. (Cl. 53—29)



1. A method for packaging articles in bags formed from a continuous length of tubular netting of thermoplastic material which comprises placing a length of said tubular netting material over a receptacle which contains therewithin the article to be packaged; severing said tubular netting at a point above said receptacle and sealing the end portion of said tubular netting; separating said receptacle from said tubular netting thereby permitting said article to remain in said tubular netting and sealing the open end of said tubular netting thereby to obtain said article in a sealed package of tubular netting of thermoplastic material.

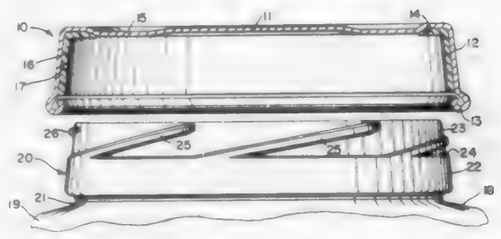
3,374,600
METHOD AND APPARATUS FOR PACKAGING
Robert Ernst Rademacher and Fred Dominic Marasso, Richmond, Va., assignors to American Machine & Foundry Company, a corporation of New Jersey
Filed Dec. 15, 1964, Ser. No. 418,391
6 Claims. (Cl. 53—35)

1. Apparatus for placing a group of articles in a package, which comprises: first conveyor means for advancing a tray containing group of ariticles to a first station, a second conveyor mounted below and in spaced relationship with said first conveyor, said second conveyor being driven in the direction reverse to that of the first conveyor, an article transfer head mounted adjacent said first station, means mounted on said articles transfer head for engaging and holding articles at said first station, means for advancing a container to a container cradle



mounted at a second station, means connected to said article transfer head operable to transport it from said first station to said second station, means operable to transfer empty trays from said first conveyor to said second conveyor means operable to deactivate said article engaging and holding means at said second station to cause the articles held therein to be inserted in said container.

3,374,601
ROTATABLE CLOSURE
Robert P. White, Winnetka, Ill., assignor to Continental Can Company, Inc., New York, N.Y., a corporation of New York
Filed Sept. 1, 1965, Ser. No. 484,335
3 Claims. (Cl. 53—42)

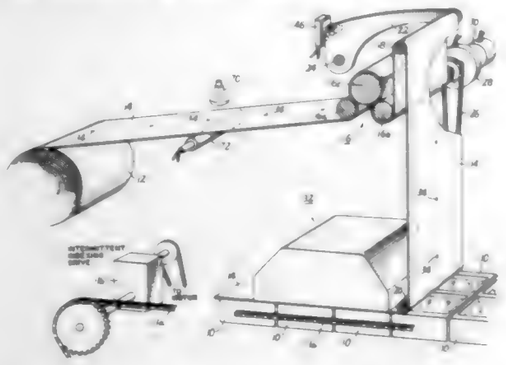


1. The method of capping a container to form threads permitting removal and re-application of said caps, said method comprising the steps of lining a closure shell with a gasket material having sufficient adhesion to preclude tearing away from the shell during cap application and removal, applying said cap over a threaded portion of a container finish with a press-on type motion while simultaneously rotating said shell to shape said gasket material to conform to the threaded portion of said container finish, said gasket material having sufficient toughness at the surface thereof during application to preclude tearing, and curing said shaped gasket material to a hardness whereby it has sufficient rigidity to permit removal of said cap by rotating the same relative to said container while being sufficiently resilient to form a hermetic seal.

3,374,602
INDICIA REGISTRATION METHOD AND APPARATUS
Joel A. Hamilton, Clifton, N.J., assignor to Mahaffy & Harder Engineering Co., Totowa, N.J.
Filed Aug. 18, 1965, Ser. No. 480,739
14 Claims. (Cl. 53—51)

It is difficult to apply a web of cover material that has units of printed matter repeated at uniform points along its length to a series of trays as they index on a packaging line, so that each unit of printed matter on the web

is aligned with a tray. To achieve the desired alignment between tray and cover, the apparatus and method of this patent use a web of cover material on which the length of the units or "repeats" of printed matter is slightly less than the length of a tray. The cover web is fed to the



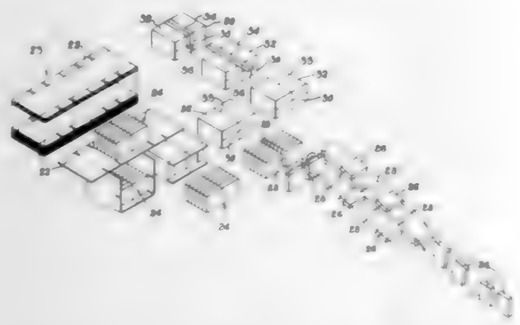
trays in increments of one "repeat" of the printed matter as the trays index. Continued movement of the trays for a short period after feeding of the web has stopped, stretches the increment of web so that it is as long as a tray, thereby aligning the printed matter on the web with the tray.

3,374,603

APPARATUS FOR PACKING AND SEALING CARTONS OF PRODUCT IN A CASE

Joseph A. Miller, Englewood, and Frank A. Kruglinski, North Bergen, N.J., assignors to General Corrugated Machinery Co., Inc., Palisades Park, N.J., a corporation of New Jersey

Filed Oct. 8, 1965, Ser. No. 493,972
9 Claims. (Cl. 53—58)



1. Apparatus for packing and sealing cartons of product in a case which may be opened without damage to the cartons and their contents so as to expose predetermined ends of the cartons when the case is opened comprising in combination:

means for orienting the cartons into a bundle having at least two rows with a predetermined number of cartons in each row so that the carton surfaces, to be exposed, of each of the two rows face each other at a given plane passing between the rows;

means for moving the bundle to a predetermined location on a precut, scored blank having a length between ends equal to the perimeter of the bundle and a width greater than the corresponding width between sides of the bundle;

means for folding the length of the blank completely around the perimeter of the bundle until the ends of the blank abut one another, said predetermined location being such that the ends of the blank are each brought to the given plane passing between the rows;

means for folding the width of the precut, scored blank over the sides of the bundle to complete the case and form the ends thereof;

means for sealing the ends of the case with adhesive; and

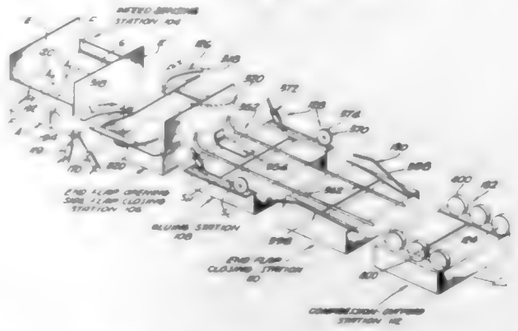
means for sealing at least the top of the formed case over the abutting ends of the blank with an easily removable closure whereby the same may be removed and the portions of the case on each side of the given plane passing between the rows pivoted away from each other to expose the desired surfaces of both rows of cartons.

3,374,604

AUTOMATIC CARTON HANDLING MACHINE

Lawrence C. Roesner, Downey, and Lenard E. Moen, Whittier, Calif., assignors to Precision Produce Specialties, Inc., Los Angeles, Calif., a corporation of California

Filed Dec. 23, 1965, Ser. No. 516,028
34 Claims. (Cl. 53—75)



8. In a machine for closing and sealing cartons each having an open side bounded by hinged, generally erect side and end flaps with outer and inner surfaces adapted to be folded to overlapping closed positions wherein the flaps close said open side and said end flaps overlie said side flaps with their inner surfaces contacting the outer surfaces of said side flaps, the combination comprising:

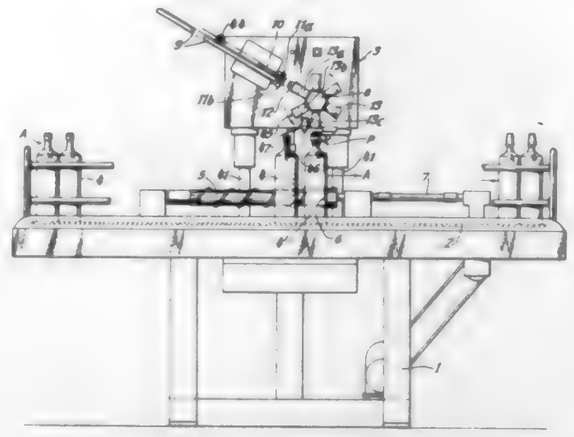
a frame having infeed and outfeed ends, conveyor means on said frame for successively transporting said cartons along said frame from said infeed end to said outfeed end with said side flaps of each carton facing generally lengthwise of said frame, there being a flap folding station along said frame through which each carton travels, power driven cyclically movable flap folding means mounted on said frame within said station and over said conveyor means for successively engaging the end flaps and trailing side flap of each carton traveling through said station in such manner as to initially fold the end flaps of the respective carton laterally outwardly to gluing position wherein the latter flaps are disposed laterally outwardly of the adjacent ends of the side flaps on the respective carton and thereafter fold the trailing side flap of the respective carton forwardly to its closed position over the open side of the carton, side flap closing means mounted on said frame over said conveyor means following said folding means relative to the direction of travel of said cartons along said frame for folding the leading side flap of each carton traveling through said station rearwardly to its closed position over the open side of the respective carton after folding of the end flaps of the respective carton to said gluing positions, end flap closing means on said frame following said folding means for folding said end flaps of each carton to their closed positions of overlapping engagement with the side flaps of the respective carton, and means for driving said conveyor means and folding means in timed relation in such manner as to effect successive movement of said cartons through said station in timed relation to the cyclic movement of said folding means.

3,374,605

APPARATUS FOR AUTOMATICALLY LOCATING CAPSULES ON THE NECKS OF BOTTLES

John S. Satchwell, Coventry, and Norman H. Brashaw, Cheshunt, England, assignors to Betts and Company Limited, London, England, a British company

Filed Dec. 27, 1965, Ser. No. 516,456
Claims priority, application Great Britain, Feb. 4, 1965, 4,829/65
10 Claims. (Cl. 53—307)



1. Apparatus for locating a lead foil capsule on the neck of a bottle comprising:

(a) means down which a stick of inverted capsules can slide by gravity,

(b) a retractable stop which is contacted by and prevents the discharge of the lowermost capsule in said stick,

(c) means for retracting said stop from contact with the lowermost capsule in the stick prior to removal of the lowermost capsule,

(d) an opposed pair of clamping jaws spaced from the retractable stop and having substantially complete semicircular gripping surfaces which in a closed position of the jaws embrace the skirt of the pen-ultimate capsule in the stick,

(e) a plurality of nozzle outlets disposed in spaced relationship around the gripping surface of each jaw along that edge of the jaws closest to the retractable stop,

(f) means for closing the jaws around the skirt of the penultimate capsule,

(g) means for supplying gas under pressure to the nozzle outlets after the penultimate capsule has been gripped by the jaws and when the lowermost capsule is to be removed,

(h) means for receiving a capsule blown from the stick and moving the capsule to a position above a bottle station,

(i) means for moving a bottle into said bottle station, and

(j) means for causing the capsule positioned above the bottle station to fall on to the neck of the bottle.

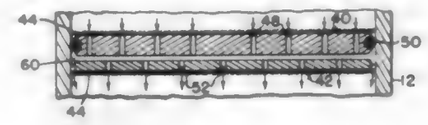
3,374,606

METHOD OF AND APPARATUS FOR CHROMATOGRAPHIC SEPARATIONS

Raymond F. Baddour, Belmont, Mass., assignor, by mesne assignments, to Abcor, Inc., Cambridge, Mass., a corporation of Massachusetts

Continuation-in-part of applications Ser. No. 246,782, Dec. 24, 1962, and Ser. No. 435,649, Feb. 26, 1965. This application Sept. 10, 1965, Ser. No. 491,482
41 Claims. (Cl. 55—67)

A chromatographic column having enhanced resolving power for the separation of gas mixtures is provided by incorporating partition elements having a plurality of flow passages therein such as sieve plates in the column. The partition elements may have separatory packing material on each side or be placed in a close back-to-back



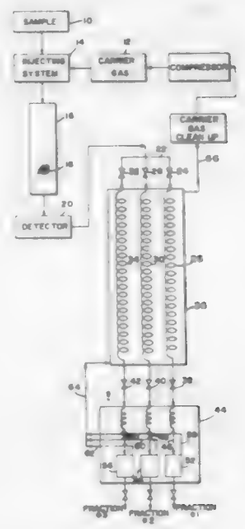
position to define a flat disc-like mixing space between the elements. The partition elements promote radial mixing and lateral flow of the sample and carrier streams in the column.

3,374,607

APPARATUS FOR AND METHOD OF COLLECTING GAS CHROMATOGRAPHIC FRACTIONS

Robert E. Fisher, Allentown, Pa., and James M. Ryan, Weston, and Michael Modell, Brighton, Mass., assignors, by mesne assignments, to Abcor, Inc., Cambridge, Mass., a corporation of Massachusetts

Filed Apr. 4, 1966, Ser. No. 540,079
21 Claims. (Cl. 55—67)



A gas chromatographic apparatus and process which includes gradually cooling and condensing a gas effluent stream by the use of a cool fluid stream in a counter-current flow direction and heat exchange relationship by the use of a single or plural zones. A gas effluent stream containing a carrier gas and a gas fraction to be recovered is withdrawn from a chromatographic column and passed to plural and separate heat exchanger and recovery zones. Carrier gas cooled in the recovery zone is recycled in a counter-current direction to the gas effluent stream in the heat exchange zone. The temperature gradient provided in the heat exchange zone by the recycled carrier gas prevents aerosol formation of the gas fraction and efficiently employs the cool carrier gas to condense the gas fraction in the heat exchange zone.

3,374,608

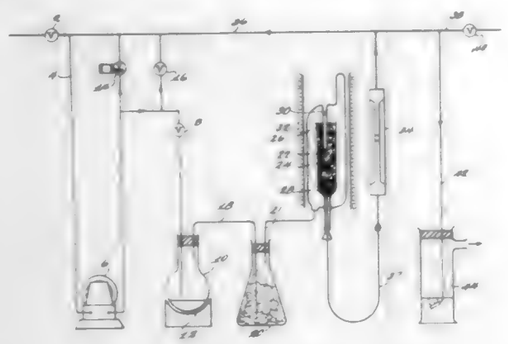
SILVER IMPREGNATED CARBON

Milton Manes, Pittsburgh, Pa., assignor to Pittsburgh Activated Carbon Company, Pittsburgh, Pa., a corporation of Pennsylvania

Filed Aug. 30, 1966, Ser. No. 575,989
6 Claims. (Cl. 55—72)

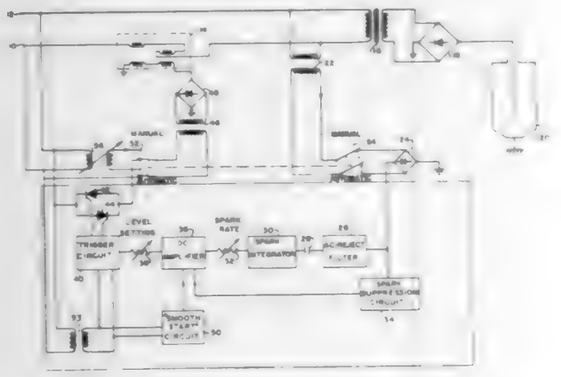
A process for removing mercury from a gas stream contaminated with mercury by passing the gas stream containing mercury over an activated carbon impregnated

with a metallic silver having a crystallite size of not over 250 A. The metallic silver is formed by reducing a silver



thiocyanate complex impregnated on the activated carbon.

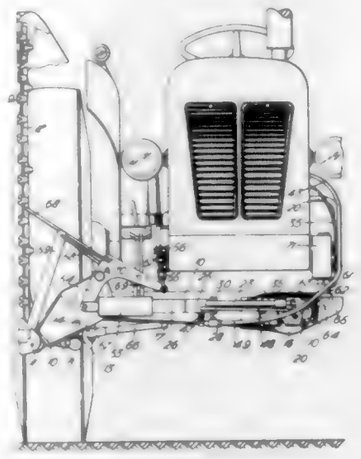
3,374,609
ELECTROSTATIC PRECIPITATOR CONTROL CIRCUIT
Leif Aa. Kide, Goteborg, Sweden, assignor to Aktiebolaget Tudor, Stockholm, Sweden, a corporation of Sweden
Filed Feb. 10, 1965, Ser. No. 431,669
10 Claims. (Cl. 55—105)



An apparatus for stabilizing the operation conditions of an electrostatic precipitator wherein an electrical field is maintained by means of an alternating power source which source is connected to the precipitator through a transformer and a saturable core reactor is connected in series between said power source and the transformer primary winding and a voltage generator is provide to control said saturable core reactor and thereby the input to said transformer, said voltage generator being operatively connected and responsive to flashovers in the precipitator.

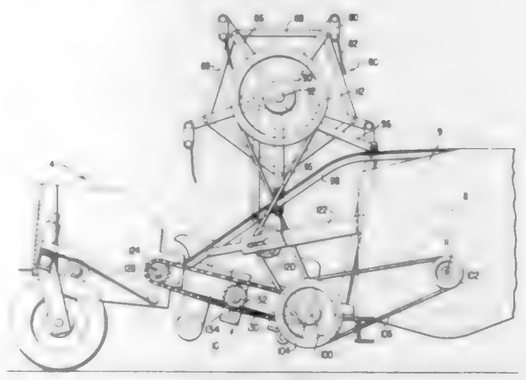
3,374,610
MOWING MACHINES
James Neville Brade, Churchtown, Southport, England, assignor to Harrison, McGregor and Guest Limited
Filed Nov. 16, 1964, Ser. No. 411,481
Claims priority, application Great Britain, Nov. 23, 1963, 46,332/63
12 Claims. (Cl. 56—25)

A tractor-mounted mowing machine having a hydraulic motor for reciprocating the knife-bar and a hydraulic jack for raising the machine out of work is so constructed and arranged that the motor and jack are connectible in series in a pressurized hydraulic circuit to pass the whole hydraulic oil flows through the motor while the machine is being raised and thus minimize the risk of jamming of the knife-bar by crop material during raising of the machine. A valve is provided in the circuit selectively mov-



able between a position to establish the series connection and another position wherein the oil flow bypasses the jack. The jack includes a high pressure relief valve.

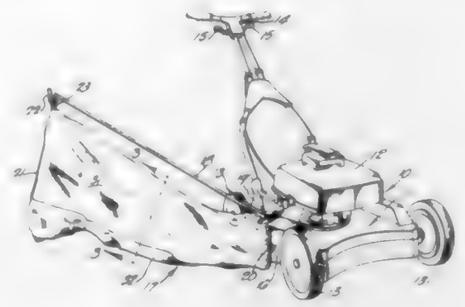
3,374,611
AGRICULTURAL COMBINES
Benjamin M. Grant, Rte. 1, Box 43, Pasco, Wash. 99301
Filed Dec. 4, 1964, Ser. No. 416,082
10 Claims. (Cl. 56—27)



A shaker mechanism for separating rocks and clods of dirt from harvested crops after pickup and before thrashing in a combine. The shaker mechanism includes a screen inclined downwardly towards the thrasher, a plurality of resilient fingers overlying the screen to support the harvested crop above the screen, a vibrating device for vibrating the screen together with the spring fingers, and a horizontal bar positioned across the screen at the thrasher end for preventing large rocks from passing to the thrasher. Preferably a rotatable reel is placed above the screen for advancing crop over the screen to the thrasher.

3,374,612
GRASS CATCHER BAG
Harold Leader, Birmingham, Ala., assignor to Allied Flexible Products Inc., Birmingham, Ala.
Filed July 20, 1965, Ser. No. 473,309
3 Claims. (Cl. 56—202)

1. As a new article of manufacture, a grass catcher bag having an integral closed end, the other end being open and adapted to be attached to a mower discharge duct and a plastic bottom portion, said bag having a tapered formation so that it is wider at the open end than



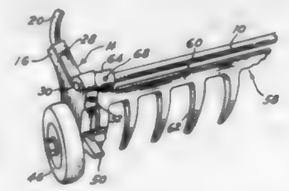
it is at the closed end, said bag having only one longitudinal seam on the upper portion thereof opposite the plastic bottom portion.

3,374,613
FRUIT PICKER
Samuel A. McDonald, 626 S. Banana River Drive, Merritt Island, Fla. 32952
Filed July 21, 1965, Ser. No. 473,618
13 Claims. (Cl. 56—334)

1. A device for picking fruit by severing the stem thereof comprising an elongated tube, handle means at one end of the tube, a pair of pivoting, normally open, cutting jaws mounted over the other end, opposite said one end of the tube, and actuating means for said pair of jaws including electric actuating means mechanically connected to said jaws, electric circuit means for energizing said electric actuating means, and a normally open contact switch for closing said circuit means, thereby energizing said electric circuit means, said contact switch positioned adjacent said jaws so that an individual fruit may pass between the jaws when open, and press against said switch to close said circuit, thereby causing said jaws to be closed to sever said individual fruit from its stem.

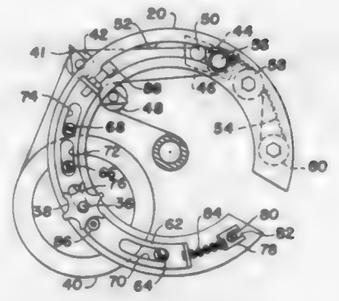
3,374,614
SELF-CLEANING HAND RAKE
Louis F. Dacheux, Jr., 50 Locust Lane E., York, Pa. 17403
Filed Oct. 20, 1965, Ser. No. 498,279
6 Claims. (Cl. 56—400.2)

1. A self-cleaning hand rake comprising in combination, a transverse spacing member, a pair of complementary brackets respectively connected to the opposite ends of said spacing member and having depending portions thereon, a handle, a connecting yoke connected to one end of said handle and having a pair of legs projecting forwardly therefrom and spaced similarly to said brackets, means connecting the forward ends of said legs respectively to said brackets, said depending portions of said brackets having slots extending substantially perpendicularly to the plane of said connecting yoke, trunnion members extending through said slots for adjustable positioning longitudinally thereof and respectively extending outwardly in opposite directions from said brackets, supporting wheels rotatably supported upon said trunnion members, a rake element having a longitudinal bar and a plurality of spaced tines projecting transversely therefrom, bearings connected to said longitudinal bar of said rake



element adjacent opposite ends thereof, said bearings being mounted rotatably on said spacing member adjacent said brackets and the endmost tines of said rake element also being disposed adjacent said brackets, said wheels supporting said brackets and rake element in desired vertical position relative to the ground, and stop members fixed to and projecting inwardly from the lower extremities of said depending portions of said brackets for engagement by the lower portions of the endmost tines of said rake element to maintain said rake element in operative position substantially perpendicular to the handle when raking toward the operator and said bearings permitting said rake element to move rearwardly away from said stops and toward the plane of said connecting yoke when the rake is being pushed away from the operator but gravity serving to restore the rake element to said operative position when the rake is next pulled toward the operator.

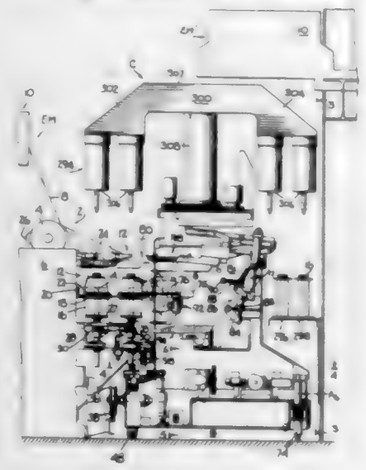
3,374,615
TAPE WRAPPING MACHINE
Joseph Evanicsko, Jr., Spanish Villa R.D. 2, Jeannette, Pa. 15644
Filed June 8, 1966, Ser. No. 556,171
10 Claims. (Cl. 57—10)



1. Apparatus for wrapping spooled material on an elongated object comprising a frame, a circular yoke member rotatably mounted on said frame, means for mounting a spool of said spooled material on said rotatable yoke member, material take-up means carried on said rotatable yoke member for storing a length of material unwrapped from the spool and supplying it continuously to said elongated object, means for rotatably driving said

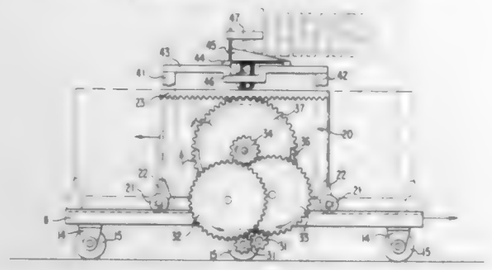
yoke member to wrap said stored material on said elongated object, means for incrementally supplying material from said spool to said take-up means and including detent means for selectively permitting and preventing rotation of said spool, and a slide mounted on said yoke member and movable under the tension of material being wrapped onto said elongated object for actuating said detent means to permit rotation of the spool only when the length of material stored by said take-up means is less than a predetermined length.

3,374,616
DOFFING MACHINE
William P. Hidden, Wenham, and Gregory C. Kekopoulos, Ipswich, Mass., assignors, by mesne assignments, to Celanese Corporation, a corporation of Delaware
Filed Sept. 30, 1965, Ser. No. 491,688
66 Claims. (Cl. 57—53)



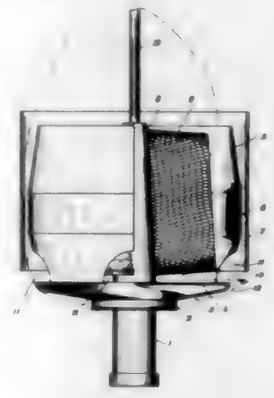
1. A doffing machine for operating sequentially at successive winding stations of a multistation winding machine at each station of which a strand is wound onto a package while being traversed along the length of said package by traversing means moving back and forth along the package, said doffing machine being movable from winding station to winding station during its sequential operation, means, carried by said doffing machine, for performing at least one portion of a package doffing cycle while said traversing means continues its back-and-forth movement, and means responsive to the position of the traversing means at a winding station for initiating operation at said station of said doff-performing means.

3,374,617
VEHICLE FOR DOFFING AND COLLECTING BOBBINS FROM A SPINNING FRAME
Morris M. Bryan, Jr., Jefferson, Ga., assignor to The Jefferson Mills, Jefferson, Ga., a corporation of Georgia
Filed Mar. 4, 1966, Ser. No. 531,869
10 Claims. (Cl. 57—53)



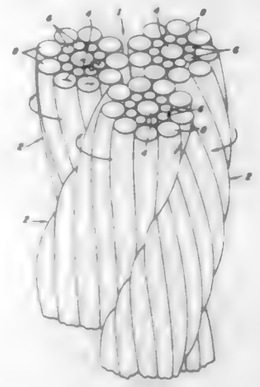
Disclosed herein is an apparatus for doffing and collecting bobbins from a spinning frame which includes a movable inclined plane having an edge that engages the lower edges of the bobbins so as to move each bobbin upwardly as the bobbin slides along the edge between a lower portion and an upper portion by that vertical motion required to disengage the bobbin from a spindle and which includes a bin simultaneously movable with and relative to the inclined plane. The motion of the bin relative to the inclined plane serves to distribute bobbins along the length of the bin even as the bin moves with the inclined plane along a spinning frame.

3,374,618
PROTECTIVE POT FOR TWO-FOR-ONE TWISTING SPINDLES
Gustav Franzen, Neersen, near Krefeld, Germany, assignor to Palitex Project-Company G.m.b.H., Krefeld, Germany
Filed Apr. 27, 1967, Ser. No. 634,307
Claims priority, application Germany, May 6, 1966, P 39,382; Apr. 13, 1967, P 41,878
4 Claims. (Cl. 57—56)



The present invention relates to a protective pot for two-for-one twisting spindles, in which the pot comprises a bottom portion and a tubular mantle portion which latter adjacent said bottom portion is provided with passage means in which, in view of the rotation of the spindle rotor, a suction is created for withdrawing lint and similar deposits from the bottom of the protective pot.

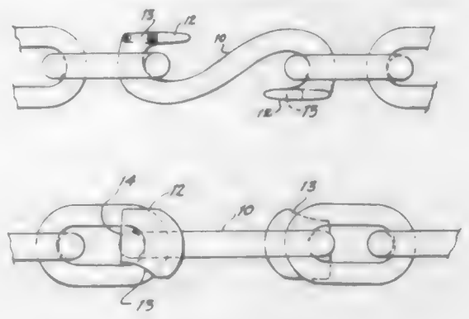
3,374,619
TORQUE BALANCED ROPE
William E. Adams, Hamden, and Wilbert A. Lucht, Orange, Conn., assignors to United States Steel Corporation, a corporation of Delaware
Filed Apr. 27, 1966, Ser. No. 545,726
9 Claims. (Cl. 57—148)



1. A torque balanced regular lay rope comprising between three and six strands spiraled together, the angle of lay of the outer wires in each strand being at least

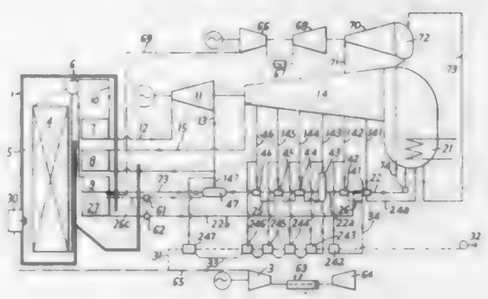
1¾ times that of the angle of lay of the strands in the rope, the torque exerted by the rope being approximately equal to the torque exerted by the strands.

3,374,620
S-SHAPED CONNECTOR DEVICE
Roger L. Gower, P.O. Box 65, Canaan, Maine 04924
Filed June 5, 1967, Ser. No. 643,445
2 Claims. (Cl. 59—93)



The present invention relates to weldless connector means for chain and cable assemblies.

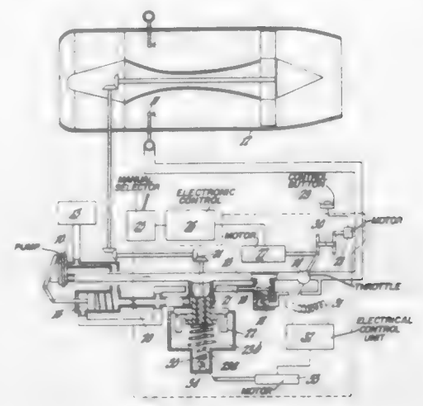
3,374,621
GAS TURBINE AUXILIARY FOR STEAM POWER PLANTS
Pierre Henri Pacault, Ville d'Avray, and Paul Cosar, Paris, France, assignors to Societe Francaise des Constructions Babcock & Wilcox, Paris, France, a corporation of France
Filed Jan. 24, 1966, Ser. No. 522,589
Claims priority, application France, Jan. 26, 1965, 3,289
6 Claims. (Cl. 60—39.18)



The invention embodies means for more economically utilizing, in a steam power plant, the hot gas output of turbine auxiliaries. The hot exhaust of the auxiliary is used to heat feed water and to supply oxygen to the combustion chamber of the boiler. The use of one or two of such auxiliaries is described. As the exhaust gases of the auxiliary increase, the amount of steam required by the economizer and the in-take air heaters is increasingly diminished, freeing such steam for production of power.

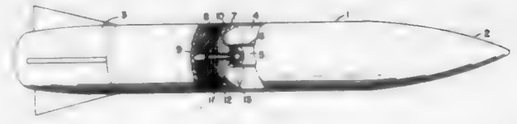
3,374,622
FUEL SYSTEMS FOR GAS TURBINE ENGINES
Thomas Charles Yates, Solihull, England, assignor to Joseph Lucas (Industries) Limited, Birmingham, England
Filed June 9, 1966, Ser. No. 556,442
2 Claims. (Cl. 60—39.28)

A fuel system for a gas turbine engine having a throttle arranged on the downstream side of a fuel pump and an engine speed reponsive governor for protecting the engine from overspeeding by limiting the amount of fuel delivered. A main manually operable power means for varying the throttle setting and an auxiliary manually operable power means for varying the throttle setting due to failure of the main power means are provided. Also



included are means energized when the auxiliary power means is energized and responsive to changes in the throttle setting and arranged to modify the response of the governor to engine speed.

3,374,623
METHOD OF OPERATING A LIQUID OXIDIZER FEED PISTON
Billy L. Crosswhite, Decatur, Ala., and John F. Kinney, Atlanta, Ga., assignors, by direct and mesne assignments, to the United States of America as represented by the Secretary of the Army
Filed Nov. 16, 1965, Ser. No. 508,175
4 Claims. (Cl. 60—39.48)

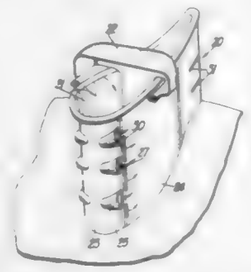


A fuel-rich gas-driven piston for feeding liquid oxidizer in a rocket propulsion system is improved by providing in the pressure chamber behind the piston a volatile or thermally decomposable material which releases an inert gas at a temperature of about 200 to 1000° F. The inert gas, which is released upon contact with the hot, fuel-rich pressurizing gas mixture, blankets the chamber and decreases the intensity of reaction of the fuel-rich gas with small amounts of oxidizer in the chamber. The temperature increase due to this reaction is minimized, and the possibility of an explosive reaction is avoided.

3,374,624
GAS TURBINE ENGINE COMBUSTION EQUIPMENT
John Frederick Coplin, Littleover, Derby, England, assignor to Rolls-Royce Limited, Derby, England, a British company
Filed Aug. 29, 1966, Ser. No. 575,844
Claims priority, application Great Britain, Sept. 9, 1965, 38,604/65
3 Claims. (Cl. 60—39.65)

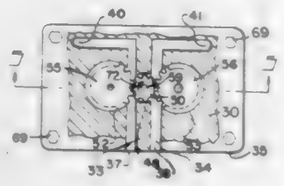
The invention concerns a gas turbine combustion chamber having a flame tube, a plurality of axially relatively long nozzle guide vanes mounted within and extending radially completely across the flame tube. Each nozzle

guide vane is hollow and is arranged to receive dilution air. Adjacent the leading edge of each guide vane a plurality of raised integral baffles are provided which serve



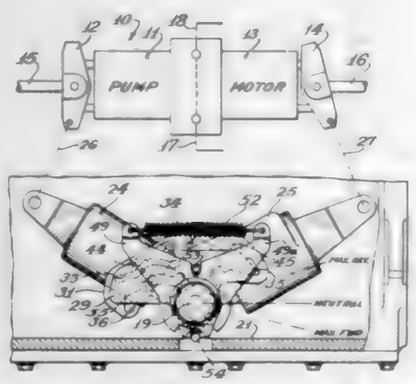
to deflect dilution air non-axially from the interior of the nozzle guide vane via apertures provided under each baffle.

3,374,625
VALVELESS HYDRAULIC ACTUATING UNITS
Whitfield M. P. Stuart, 5910 Charles St., North Burnaby, British Columbia, Canada
Filed Oct. 23, 1965, Ser. No. 503,445
8 Claims. (Cl. 60—52)



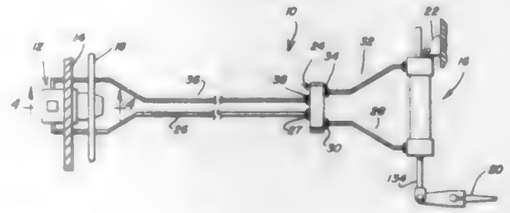
A hydraulic actuating unit particularly for use in the servo cylinder field having two independent passages therein with first and second gear means associated with said passages and operable in unison selectively to direct fluid in either direction through one passage while at the same time directing fluid through the other passage in the opposite direction.

3,374,626
CONSTANT TORQUE CENTERING DEVICE FOR HYDROSTATIC TRANSMISSION CONTROL
Frank R. Catuara, Chicago Ridge, Donald W. Moyer, Downers Grove, and Pierce F. Richardson, Hinsdale, Ill., assignors to International Harvester Company, Chicago, Ill., a corporation of Delaware
Filed July 5, 1966, Ser. No. 562,611
10 Claims. (Cl. 60—53)



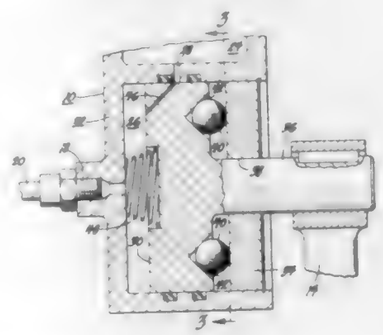
1. In a reversible hydrostatic transmission, a reversible variable displacement swash plate pump, a reversible variable displacement swash plate motor, cam plate means pivotally movable in opposite directions from a neutral center position and having separate portions thereon for independently controlling displacement of the pump and displacement of the motor on movement in either direction from the neutral center position, actuating means connected to said cam plate means and operable upon application of an external force for pivoting said cam plate means in opposite directions from a neutral center position, lever means pivotally mounted for movement in opposite directions from a neutral center position and engageable by said cam plate means for selective movement in opposite directions therewith, resilient means connected to and reactive upon said lever means for normally urging the latter means toward a neutral center position and operative upon release of the external actuating force for urging said cam plate means to a neutral center position.

3,374,627
HYDRAULIC REMOTE STEERING CONTROL
Carl G. Hebel, 390 Jefferson Ave., Haworth, N.J. 07641; James C. Herman, 146 Central Ave., Bogota, N.J. 07603; and Louis Rossi, 41 Washington Ave., Hillsdale, N.J. 07642
Filed Nov. 3, 1965, Ser. No. 506,253
10 Claims. (Cl. 60—54.5)



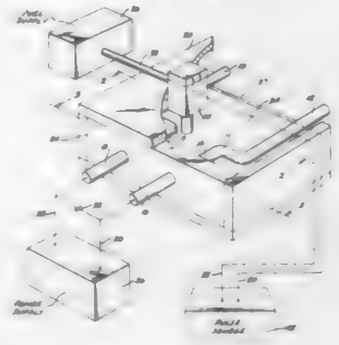
A master pump unit is operated to displace liquid through a closed fluid circuit for remote control of fluid operated slave units. The pump unit is of the positive displacement type operative to charge the fluid circuit with liquid from a reservoir as well as to purge air from the circuit.

3,374,628
BALL AND RAMP TYPE MASTER CYLINDER
Gerald B. Jacoby and Frank W. Brooks, Dayton, Ohio, assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Oct. 23, 1965, Ser. No. 503,300
1 Claim. (Cl. 60—54.6)



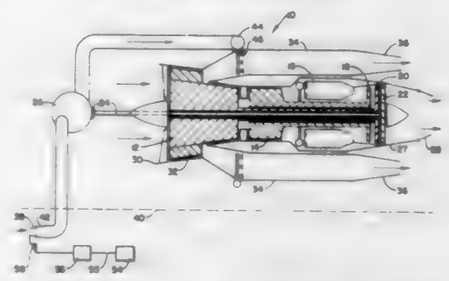
This invention teaches a master cylinder for a vehicle braking system in which an actuator is rotated along the longitudinal axis of the piston in the master cylinder. This rotational movement generated in the piston is converted to a linear movement of the piston along its longitudinal axis by means of balls positioned in tear drop shaped ramps on the piston acting against a stator wall to advance the piston when it is rotated.

3,374,629
HIGH EFFICIENCY PARALLEL RAIL ACCELERATOR
Roland A. Boucher, Los Angeles, Calif., assignor to Hughes Aircraft Company, Culver City, Calif., a corporation of Delaware
Filed July 28, 1965, Ser. No. 475,550
6 Claims. (Cl. 60—202)



6. A propulsion device comprising
first and second conductors each having first and second ends and positioned substantially parallel to each other along an axis with a space therebetween over the majority of the length thereof and a substantially smaller space over portions thereof at said first ends,
a power supply including a storage capacitor coupled to the first ends of said conductors,
a source of conductable gas positioned between said first and second conductors at said smaller space to supply said gas thereto for being ionized into current conductive plasma,
and an enclosure of magnetic material positioned around said first and second conductors and extending in a direction parallel to said axis for establishing magnetic flux paths through said spaces, said magnetic material having a sufficiently low reluctance, hysteresis loss and eddy current loss that magnetic fields are provided through said magnetic flux paths, whereby said gas is injected into said smaller space to conduct current through said rails and develop a magnetic field therebetween, said current flowing through said gas reacting with said magnetic field to force said gas to the second ends of said conductors while applying an oppositely directed force to said first and second conductors along said axis.

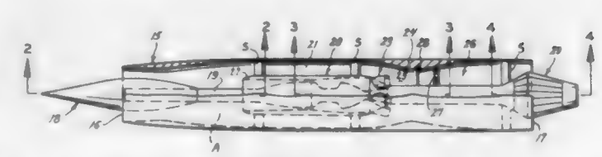
3,374,630
MARINE PROPULSION SYSTEM
William R. Davison, Wapping, and Choate A. Brown, Vernon, Conn., assignors to United Aircraft Corporation, East Hartford, Conn., a corporation of Delaware
Filed Oct. 3, 1966, Ser. No. 583,862
8 Claims. (Cl. 60—226)



1. A propulsion system for propelling a marine vehicle through water including:
air stream propulsive duct means mounted on the vehicle to be propelled;
exhaust nozzle means at the discharge end of said propulsive duct;
engine means for generating an airflow stream through said duct means and said exhaust nozzle means for the generation of a propulsive stream;
water intake means for inducting water into the propulsive system; and
water delivery means connected from said water intake means to said duct means upstream of said exhaust nozzle means for delivering water to said duct means for injecting into and mixing with said airflow stream in said duct means to produce a mixed stream of air and water for discharge through said exhaust nozzle.

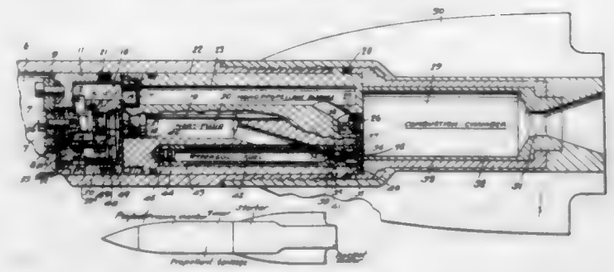
5. A propulsion system as in claim 1 wherein:
said engine means is a bypass turbofan gas turbine engine;
said bypass turbofan gas turbine engine having a main engine combustion gas passage for discharging combustion gases from the turbine of said gas turbine engine; and wherein
said duct means is a bypass airflow passage from the fan of said turbofan engine to said exhaust nozzle means at the discharge end of said duct means, said bypass airflow passage being separate from said main engine combustion gas passage.

3,374,631
COMBINATION SUBSONIC AND SUPERSONIC PROPULSION SYSTEM AND APPARATUS
Marvin D. Marks, Hazelwood, Mo., assignor to McDonnell Aircraft Corporation, St. Louis, Mo., a corporation of Maryland
Filed Aug. 16, 1965, Ser. No. 480,045
8 Claims. (Cl. 60—244)



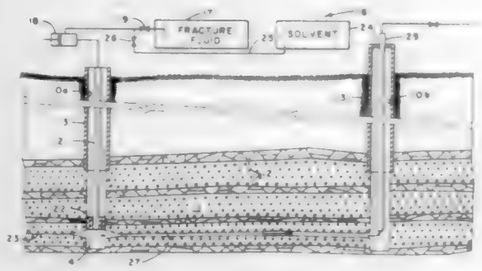
A combination propulsion apparatus of a turbojet engine positioned in axial alignment with a ramjet propulsion casing such that both engine and ramjet are able to operate together, and including a spin-jet thrust device driven by the exhaust gas from the turbojet engine for augmenting the overall thrust developed by the combined apparatus.

3,374,632
LIQUID PROPELLANT ROCKET
William F. Donovan, Aberdeen, Md., assignor to the United States of America as represented by the Secretary of the Navy
Filed Nov. 23, 1965, Ser. No. 510,157
6 Claims. (Cl. 60—259)



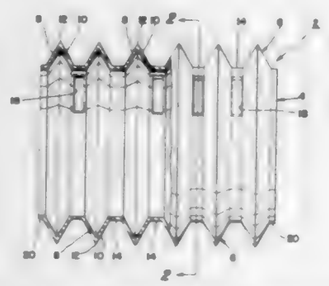
The rocket-projectile is fired from a gun and inertia during acceleration sets a timer into operation. After a pre-determined time-delay a monopropellant from cavity **6** and a hypergolic fuel from cavity **42** are forced into combustion chamber **29** where ignition and burning occur to generate thrust.

3,374,633
UNDERGROUND STORAGE AND METHOD OF FORMING THE SAME
Carl T. Brandt, Tulsa, Okla., assignor to Continental Oil Company, Ponca City, Okla., a corporation of Delaware
Filed June 10, 1964, Ser. No. 374,060
16 Claims. (Cl. 61—.5)



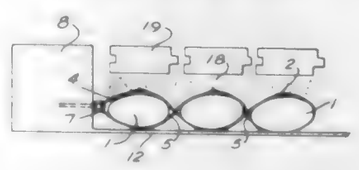
1. The method of forming an underground cavity in a soluble formation using a first and a second bore hole which comprises the steps of:
- contacting a portion of said formation adjacent said first bore hole with a fluid which is a nonsolvent for the material of the formation;
- increasing the pressure of said nonsolvent fluid until said formation is fractured in the direction of said second bore hole;
- continuing to inject a fluid which is a nonsolvent for the material of the formation into the formation to complete a fracture between said second and first bore holes;
- circulating a fluid which is a solvent for the material of the formation between said bore holes through said fracture, whereby a portion of the formation adjacent the fracture is removed to form a chamber and removing said solvent containing material of the formation from one of said bore holes.

3,374,634
CORRUGATED TUBING STRUCTURE
Helmut P. Fochler, Chagrin Falls, Ohio, assignor, by mesne assignments, to Continental Oil Company, a corporation of Delaware
Filed June 15, 1964, Ser. No. 374,902
5 Claims. (Cl. 61—10)



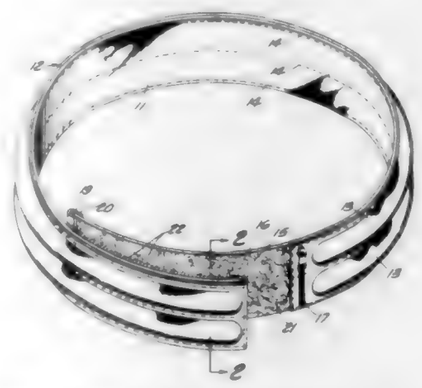
1. A flexible, high strength tubing product for use in the drainage and conveyance of fluid materials beneath the surface of the ground or the like, said tubing product comprising an elongated, generally cylindrical tubing member made from a polymeric material, said tubing member including a plurality of radially symmetrical imperforate corrugations, each corrugation extending continuously circumferentially in substantially a plane perpendicular to the longitudinal axis of said members, said corrugations being in equally spaced relation longitudinally along the length of said member, said corrugations each including generally flat side wall which converge upwardly into one another in a direction away from the longitudinal central axis of the tubing member to define a generally triangular configuration in cross-section, the side walls of each of said corrugations being connected circumferentially together by trough portions which extend generally planar in section parallel to the longitudinal central axis of the tubing member, said portions being imperforate walls on at least the lower half of the tubing member and at least two parallel rows of spaced fluid transmitting openings disposed only in an upper half of the tubing member and extending longitudinally along the length of the tubing member, said openings extending through said trough portions only for draining and conveying fluid materials through the tubing member.

3,374,635
BAGS FOR USE IN REVETMENT STRUCTURES
Horace C. Crandall, Reading, Mass.
(35 Middlesex Road, Waltham, Mass. 02154)
Filed June 29, 1966, Ser. No. 562,449
4 Claims. (Cl. 61—38)



This invention relates to revetment structures, and particularly to a sandbag or cranion with an integral, longitudinal lip of unique construction utilized with cross lacing to form a flexible, erosion resistant covering therefor.

3,374,636
DIVER'S WEIGHT BELT
Daniel F. Mason, 6110 N. Vineland, Apt. 3, North Hollywood, Calif. 91606
Filed Oct. 22, 1965, Ser. No. 501,792
1 Claim. (Cl. 61—70)

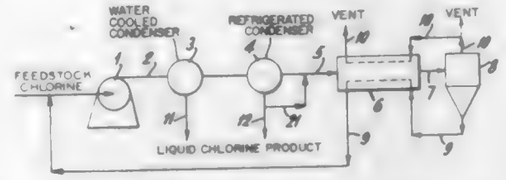


A weight carrying belt for use by divers having tubular compartments extending the length of the belt to contain lead shot so that the weight is uniformly distributed about the diver's body and wherein the belt is made of a resilient material so that it more readily conforms to the body of the wearer.

3,374,637
RECOVERY OF CHLORINE
Carroll J. Wenzke, Peekskill, N.Y., assignor to FMC Corporation, New York, N.Y., a corporation of Delaware
Filed Dec. 13, 1965, Ser. No. 513,345
10 Claims. (Cl. 62—23)

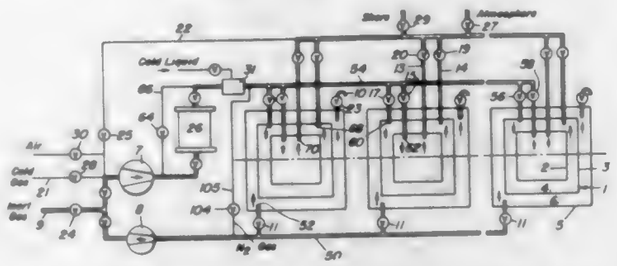
A process for separating chlorine from a mixture of chlorine and inert gases (inerts) in which said mixture is compressed to between 3 and 15 atmospheres and

cooled to produce one stream containing liquid chlorine which is recovered, and a second stream containing chlorine together with substantially all of the inerts. The second stream of chlorine and inerts is refrigerated to a temperature of at least −80° F. to liquify chlorine and produce a mixture of liquid chlorine and gases which is separated into two fractions. The first fraction con-



tains substantially all of the liquid chlorine and a minor portion, e.g., 25% of the inerts, and a second fraction containing a major portion of said inerts. The first fraction is then volatilized in heat exchange relationship to the hereinbefore defined second stream of chlorine and inerts being refrigerated to provide the necessary refrigeration to lower the temperature of said compressed mixture to at least −80° F.

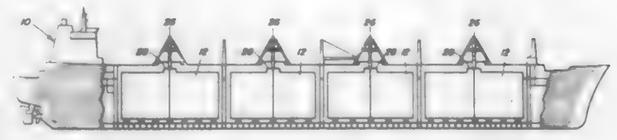
3,374,638
SYSTEM FOR COOLING, PURGING AND WARMING LIQUEFIED GAS STORAGE TANKS AND FOR CONTROLLING THE BOIL-OFF RATE OF CARGO THEREIN
Norman K. Basile, Bronx, and Donald R. Yearwood, Brooklyn, N.Y., assignors to John J. McMullen, Montclair, N.J.
Filed Apr. 19, 1966, Ser. No. 543,602
14 Claims. (Cl. 62—45)



A liquefied gas storage tank system including inner and outer tanks and a spaced supporting structure and a supply header and distribution piping system for uniformly introducing inert purified flue gas or heated or cooled cargo gas for warming or cooling the tank walls, and a return header system arranged in the void space, outer tank space and inner tank to remove and bleed displaced gas therefrom or recirculate the same through heating or cooling means back to those spaces. The system warms and cools the tanks by effecting novel methods without over-stressing the tank structure and controls the boil-off rate within the inner tank by circulating warmed cargo gas within the outer tank space or returning warmed cargo gas back to the inner tank.

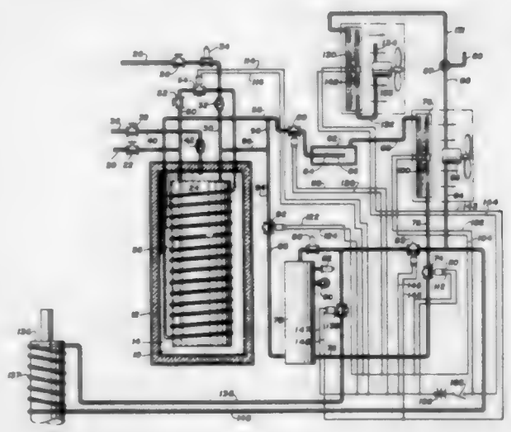
3,374,639
LEAK DETECTION AND PRESSURE RELIEF SYSTEM FOR INSULATED LIQUEFIED GAS STORAGE TANKS
Charles A. Burke and John E. Gale, Staten Island, and Norman K. Basile, Bronx, N.Y., assignors to John J. McMullen, Montclair, N.J.
Filed Oct. 25, 1966, Ser. No. 589,360
13 Claims. (Cl. 62—45)

A tank for storing liquefied gas or the like at about ambient pressure including an outer coating of thermal insulation in which gas conveying grooves are formed against the outer surface of the tank. The insulation is gas impervious. In the event of leakage through the tank wall, vapors are conveyed through the insulation grooves to various header grooves and thereafter conveyed away



from the tank so as to prevent pressure buildup behind the insulation and resulting damage thereto. A gas analyzer is provided to detect the gas within the grooves so that if cargo gas appears, a tank leak condition is indicated.

3,374,640
LIQUID GAS REFRIGERATION SYSTEM
Harold L. Boese, Duncanville, Tex., assignor to Boese Corporation, Dallas, Tex., a corporation of Texas
Filed Jan. 12, 1966, Ser. No. 520,254
22 Claims. (Cl. 62—52)

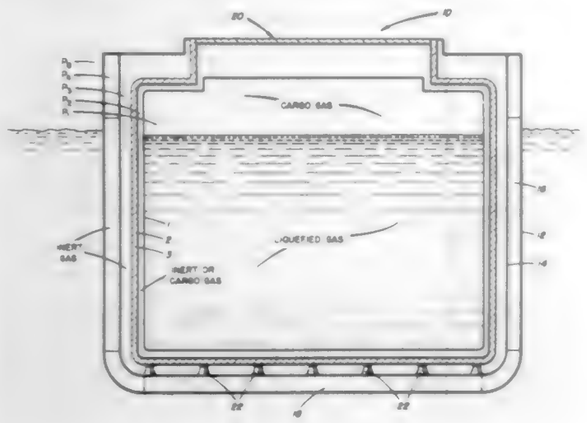


This invention relates to a refrigeration system utilizing a liquid gas as a cold reservoir. A vaporizer is employed to convert the liquid gas to a vapor in which form it is passed through a set of cooling coils across which a ventilator forces a flow of air. The vaporizer is disposed remote from the air flow to prevent erratic operation, and in a preferred embodiment, the volumes of the vaporizer and cooling coils are substantially equal to equalize the vapor pressures within the system.

3,374,641
ARRANGEMENT FOR PROTECTING LIQUEFIED GAS TRANSPORTING VEHICLES
Ralph A. Corvino, Spring Valley, and Norman K. Basile, Bronx, N.Y., assignors to John J. McMullen, Montclair, N.J.
Filed Apr. 25, 1966, Ser. No. 544,979
3 Claims. (Cl. 62—55)

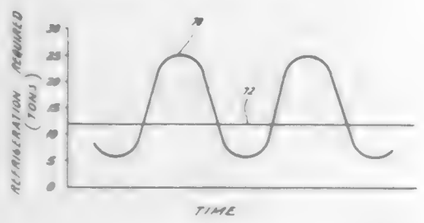
A liquefied gas tanker including free standing double wall tanks. For the first time, the invention provides inert gas within the wing tanks so that they can be pressurized to greater than ambient pressure insuring in the case of collision that gas will migrate outward away from the vessel instead of permitting a rush of air inward to within the ship. Further protection is provided by a pres-

sure gradient increasing from the wing tanks toward the cargo gas within the inner tank also to insure that



the passage of gas is from inward toward the ambient in the case of leaks or collision.

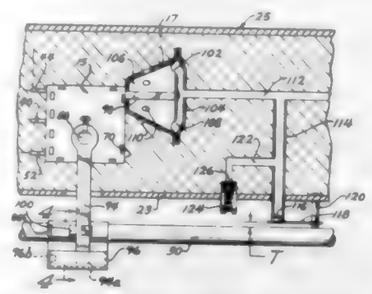
3,374,642
REFRIGERATION METHOD AND APPARATUS FOR CYCLICAL REQUIREMENTS
Robert E. McMinn, Oklahoma City, Okla., assignor to Black, Sivalls & Bryson, Inc., Kansas City, Mo., a corporation of Delaware
Filed Aug. 18, 1966, Ser. No. 573,387
18 Claims. (Cl. 62—115)



The present invention is directed to an improvement in refrigeration units and more particularly an improvement in such units used to meet cyclical requirements. The present invention utilizes a portion of the substance cooled by the unit during minimum requirement periods to supercool the refrigerant in the unit; thereby giving this refrigerant sensible heat capacity or additional sensible heat capacity, as the case may be, in addition to its latent heat capacity. The invention then utilizes this super-cooled refrigerant during periods of maximum requirement, the cooling capacity provided by the refrigeration unit alone being insufficient to cool the substance during these maximum requirement periods. The added sensible heat capacity, however, provides the necessary additional cooling power.

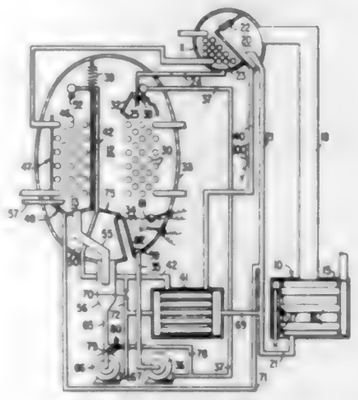
3,374,643
DEFROSTER CONTROL
Robert H. Thorner, 8750–F W. Chicago Blvd., Detroit, Mich. 48204
Application Feb. 3, 1964, Ser. No. 342,216, now Patent No. 3,321,928, dated May 30, 1967, which is a continuation of application Ser. No. 43,825, July 19, 1960. Divided and this application Oct. 24, 1966, Ser. No. 588,915
30 Claims. (Cl. 62—140)

The main disclosure in this patent comprises a fluid (air) pressure circuit including frost-sensing valve means mounted a predetermined distance from a cooling surface corresponding to the thickness of frost formed on the cooling surface and also includes a pressure-responsive member for operating the control means (such as a switch) for regulating defrost heat, and further includes means to periodically produce pulses of pressure in the circuit. When no frost exists on the cooling surface, the sensing valve can open as a result of the pressure pulses



to dissipate pressure in the circuit so the switch cannot be operated. When frost forms to the predetermined thickness, the sensing valve is blocked which enables the periodic pressure to operate the switch and initiate the defrost heater. Secondary disclosures herein comprise several means to provide automatic initiation such as by a bimetal operated integrating mechanism (FIG. 11).

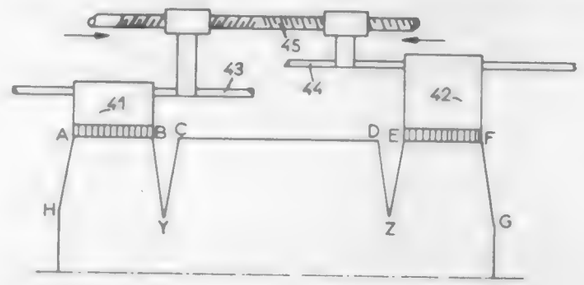
3,374,644
ABSORPTION REFRIGERATION SYSTEM
Glenn B. Foster, Liverpool, N.Y., assignor to Carrier Corporation, Syracuse, N.Y., a corporation of Delaware
Filed Jan. 3, 1967, Ser. No. 606,983
14 Claims. (Cl. 62—141)



Concentration control for an absurption refrigeration system having means effective at a predetermined solution temperature to maintain the solution and refrigerant pumping means operative following shut down of the system to reduce solution concentration. The control includes means adapted to introduce refrigerant into the system solution circuit to reduce solution concentration when refrigerant in the evaporator exceeds a preset amount.

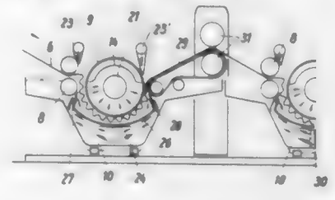
3,374,645
METHODS OF MANUFACTURING KNITTED GOODS INCORPORATING DARTS, AND ARTICLES OBTAINED THEREBY
Marcel Léon Cointe, Nanteuil-les-Meaux, France, assignor to Etablissements Gaston Verdier, Paris, France, a corporation of France
Filed Nov. 5, 1964, Ser. No. 409,105
Claims priority, application France, Nov. 8, 1963, 953,248
12 Claims. (Cl. 66—89)

1. A method of manufacturing knitted goods, provided with dart means, on a flat, straight frame, full-fashioned hosiery machine, comprising operating the latter to successively effect the steps of: knitting a fabric blank panel portion upon starting from the bottom thereof up to the level selected for making at least one dart start from a point thereon by feeding yarn to the active needles from at least one yarn carrier; proceeding with knitting courses on either side of said point while progressively narrowing them outwards by sidewise shifting the yarn loops in opposite directions to the left hand side and to the right hand side of said point, respectively, by means of at least two regular loop transfer point combs carried by narrowing fingers moving laterally outwards relative to each other, so as to form at least one diverging slit dividing the knitted material at and from said point into two strips separately and substantially simultaneously knitted each one with the same number of courses fed by at least two yarn carriers, respectively, replacing the aforesaid single one, said strips extending upwards from said level



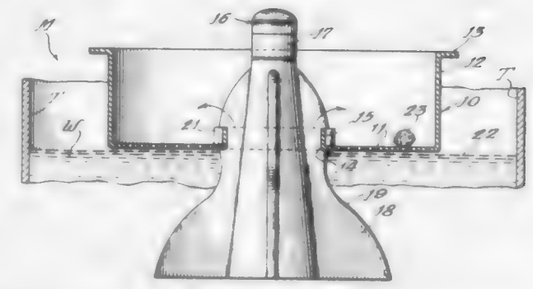
and having progressively outward narrowed, inner selvages issuing from said point to define an at least approximately V-shaped notch therebetween; and transferring all the stitches of the last knitted course of one strip by a distance substantially equal to the gap top width of said notch corresponding to the spacing between the inner selvage top ends, by means of at least one tickler having a point comb length substantially equal to the length of said last knitted course of said one strip so as to span the active needles required for the knitting of said last knitted course, whereby the innermost end loop of said course is brought and knitted together with the adjacent innermost end loop of the last knitted course of said other strip to form a resulting single aggregate course joining both strip tops into a single continuous one of wider area and closing the top gap of said notch which thus becomes an elongated narrow slit with a closed contour.

3,374,646
APPARATUS FOR TREATING TEXTILE FABRICS AND THE LIKE
Heinz Fleissner, Egelsbach, near Frankfurt, Germany, assignor to Anstalt fuer Patentdienst, Vaduz, Liechtenstein
Filed Aug. 25, 1964, Ser. No. 391,994
Claims priority, application Switzerland, Aug. 26, 1963, 10,538/63
16 Claims. (Cl. 68—9)



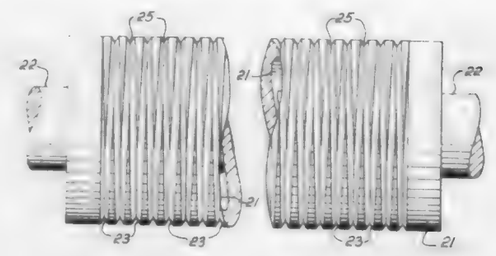
1. An apparatus for treating textile materials which are fed to said apparatus as a material panel, comprising at least one perforated suction drum adapted to be driven at a uniform rate of speed, a bath containing a treating liquid, said suction drum being disposed within said bath and adapted to revolve in said liquid, means for applying a suction to the inside of said drum, and feeding means for feeding a textile material toward said drum, for bunching said material during the feeding movement together so as to form uniform and equally spaced wavelike folds, and for applying the inner crests of said folds upon the surface of said rotating drum on which they are held by the suction of said drum.

3,374,647
LINT FILTER FOR USE IN WASHING MACHINES
Charles E. Morgenstern, St. Joseph, Mich., assignor to Whirlpool Corporation, a corporation of Delaware
Filed July 25, 1960, Ser. No. 44,966
14 Claims. (Cl. 68—18)



1. In a washing machine having a tub and a rotatively oscillatable agitator provided with a post having an outermost annular wall surface and a vane extending from said surface for agitating washing liquid and material to be washed in the tub, a lint filter comprising: a foraminous member having an upper surface, a peripheral portion, and a central opening slightly larger than said surface at the upper surface of the washing liquid in the tub to provide a flow passage therebetween; means on the foraminous member for preventing liquid flow over the peripheral portion of the foraminous member; and means for supporting the foraminous member with the post extending axially through the opening for movement with the agitator horizontally adjacent the upper surface of the washing liquid to strain washing liquid delivered through said flow passage to the upper surface of said member as a result of the agitating oscillation of the vane.

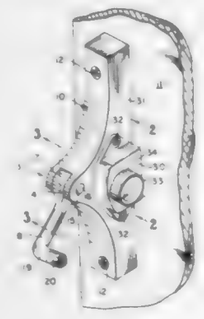
3,374,648
TEXTILE TREATING APPARATUS WITH A PLASTIC COATED OR METAL ROLL HAVING LEFT- AND RIGHT-HAND HELICAL THREADS
Leo Russell Maguire, Whitfield, Reading, Pa., assignor to Crompton & Knowles Corporation, Worcester, Mass., a corporation of Massachusetts
Filed Sept. 29, 1966, Ser. No. 582,987
5 Claims. (Cl. 68—180)



1. A log roll adapted for use in combination with a take-up roll on wet processing textile machines characterized in that its surface in the body section that is to be in contact with and extend across a fabric web during

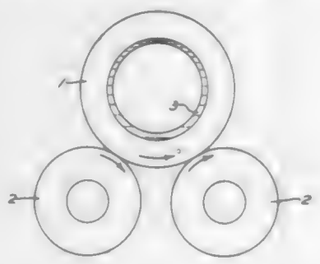
roll-up is provided with a grooved pattern formed by a helical left handed thread and a helical right hand thread, both threads having about the same pitch and running from end to end of the body section.

3,374,649
MEANS FOR DOGGING A PANIC EXIT BAR IN A LATCH-RETRACTED POSITION
Stanley R. Weidman, Indianapolis, Ind., assignor to Von Duprin Inc., Indianapolis, Ind., a corporation of Indiana
Filed Aug. 26, 1966, Ser. No. 575,288
11 Claims. (Cl. 70—92)



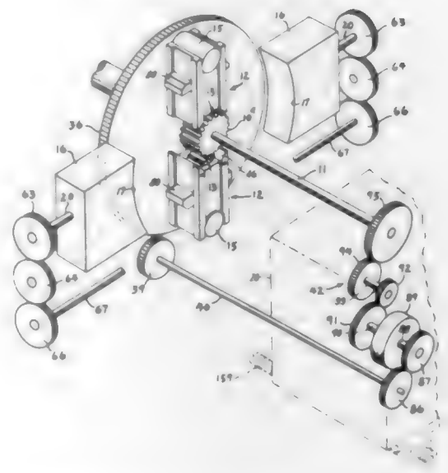
A dogging means for retaining the latch-actuating lever of a panic exit device in latch-retracted position, comprising a wedge means spring-biased to lever-blocking position, cam follower means operatively connected to move with said wedge means, and cam means cooperative with said cam follower means to move and hold said wedge means affirmatively out of such lever-blocking position. In its preferred form, said cam means is actuatable only through a key-operated lock mechanism disposed on an axis substantially parallel with the pivotal axis of the latch-actuating lever.

3,374,650
MANUFACTURING SEAMLESS TUBES
Albert Henri Calmes, Crans, Sierre, Valais, Switzerland, assignor to Contubind Société Anonyme, Lausanne, Switzerland, a Swiss company and Lorraine-Escaut Société Anonyme, Paris, France, a French company
Filed Oct. 22, 1965, Ser. No. 501,368
Claims priority, application Great Britain, Nov. 19, 1964, 47,117/64
4 Claims. (Cl. 72—46)



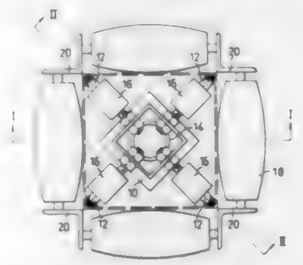
1. In the process of producing a seamless tube from a hot solid metal body, the steps comprising forming said body into a cylindrical hollow blank, distributing meltable protective flux along the inside of said hollow blank at the time it is formed, the flux melting at a temperature substantially lower than the temperature of said body so as to form liquid flux in the blank, as soon as said blank is formed rotating it about its axis at a speed that spreads the liquid flux out into a layer covering the inner peripheral surface of the blank, and continuing said rotation while the blank is proceeding to a subsequent step in which the blank is converted into a seamless tube.

3,374,651
MACHINE FOR FORMING GEARS
Edward W. Haug, Rockford, Ill., assignor to Barber-Colman Company, Rockford, Ill., a corporation of Illinois
Filed Oct. 23, 1965, Ser. No. 503,193
21 Claims. (Cl. 72—76)



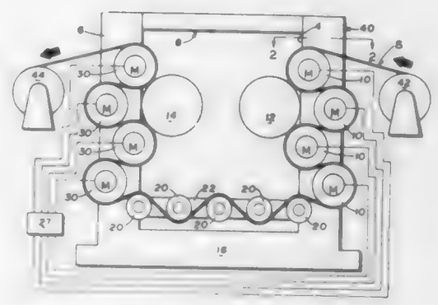
1. A machine for forming teeth on a cylindrical workpiece comprising a spindle adapted to support the workpiece, a tool support mounted for rotation about the longitudinal axis of said spindle, a pair of slides mounted on diametrically opposite sides of said tool support and each operable to move radially of said axis and toward and away from the workpiece, a tool mounted on the inner end of each of said slides to oppose the periphery of the workpiece and having a shape correlated to the shape of a tooth to be formed, drive mechanism for rotating said spindle and said tool support about said axis but at different angular speeds whereby the tool support turns angularly relative to the spindle, and cam mechanism operable in timed relation to said drive mechanism to move said slides inwardly after each time said tool support turns relative to said spindle through an angle equal to the angular spacing of the teeth on the workpiece whereby said tools impact the periphery of the workpiece and successively form the teeth.

3,374,652
TUBE SHAPING APPARATUSES
John Edvin Hjalmarsson, Stallgatan 3, Broby, Sweden
Filed Oct. 15, 1965, Ser. No. 496,274
Claims priority, application Sweden, Oct. 21, 1964, 12,647/64
6 Claims. (Cl. 72—113)



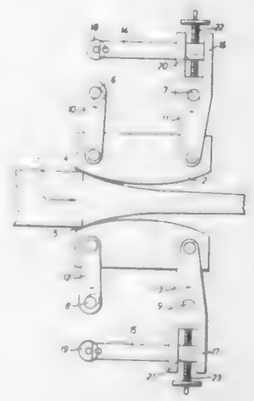
1. An apparatus for continuously shaping tubes of round cross section, preferably metal tubes for ventilating and the like systems into tubes of angular cross section and substantially planar side surfaces, wherein the tube of round cross section is passed onto a mandrel and wherein each corner of the angular cross section the mandrel has rotatably mounted thereon edge-producing rollers, and in the proximity of and substantially between said edge-producing rollers on the mandrel further rollers are rotatably mounted around the mandrel for shaping the side surfaces of the angular cross section, said further rollers having their axes extending in parallel with the side surfaces of the angular cross section.

3,374,653
STRIP LEVELING APPARATUS
Paul P. Zeigler, Spokane, Wash., assignor to Kaiser Aluminum & Chemical Corporation, Oakland, Calif., a corporation of Delaware
Filed May 28, 1965, Ser. No. 459,743
14 Claims. (Cl. 72—161)



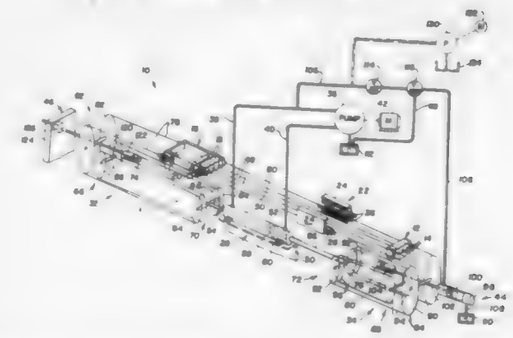
Apparatus for leveling continuously moving strip material and comprised of an improved arrangement of separate tension-inducing and bending rolls wherein a uniquely arranged pinch roll means is cooperatively associated with a tension-inducing roll so as to control in a precise fashion the tension applied to the strip by the tension-inducing roll.

3,374,654
STRETCH FORGING MACHINE
Heinrich Uebing, Lintorf, Bezirk Dusseldorf, Germany, assignor to Firma Friedrich Kocks, Dusseldorf, Germany
Filed May 5, 1967, Ser. No. 636,308
Claims priority, application Germany, May 11, 1966, K 59,222
2 Claims. (Cl. 72—189)



Driving mechanism for moving a pair of walking jaws of a machine for stretch forging ductile material towards one another and forwards to deform the material and advance it through the machine, and then away from one another and backwards to release the material and return the walking jaws to their initial position, which includes two sets of driving means, one set for each of the walking jaws. Each of the sets of driving means has a first link, a first rotatable driving shaft, means pivotally connecting one end of the first link to the respective walking jaw, eccentric means pivotally connecting the other end of the first link to the first rotatable driving shaft, a second link, a second rotatable driving shaft, means pivotally connecting one end of the second link to the walking jaw, and eccentric means pivotally connecting the second link to the second rotatable driving shaft at a position intermediate the ends of the second link, and a third link, a third rotatable shaft, eccentric means pivotally connecting one end of the third link to the third rotatable driving shaft, and means pivotally connecting the other end of the third link to the second link at a position between the connection of the second link to the second rotatable driving shaft and the end of the second link remote from the walking jaw. The driving means also includes means for rotating the first, second and third driving shafts at the same speed. The first and second links extend transversely to the material travel direction through the machine and control the movement of the pair of walking jaws toward and away from each other, and the third link extends substantially parallel to the material travel direction and controls the forward and backward movement of the pair of walking jaws.

3,374,655
CABLE-TYPE DRAWBENCHES
Fred E. Halstead, Rochester, Pa., assignor to Halstead Metal Products, Inc., Zelienople, Pa., a corporation of Pennsylvania
Filed Dec. 27, 1965, Ser. No. 516,488
5 Claims. (Cl. 72—287)

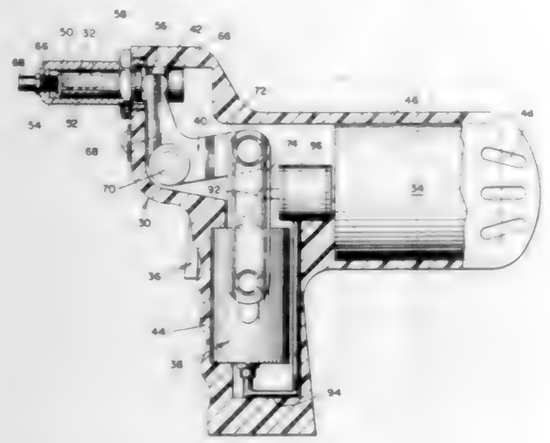


1. In a drawbench having a drawing die, a track structure extending parallel to the central axis of said drawing die, a draw carriage movable along said track structure for pulling workpieces through said drawing die, return cable means connected to said draw carriage and extending therefrom in a direction opposite to the direction of draw, and means operable on said return cable means for returning said draw carriage adjacent said drawing die, the improvement comprising: means including a hydraulic cylinder for applying a preselected tensile force on said return cable means in a direction opposite to the direction of draw and of an amount sufficient to eliminate substantially entirely all sag in said return cable means.

3,374,656
TOOL FOR SETTING TUBULAR RIVETS
Anthony E. Di Maio, Georgetown, Mass., assignor to Marson Fastener Corporation, Chelsea, Mass., a corporation of Massachusetts
Filed Jan. 25, 1966, Ser. No. 522,898
5 Claims. (Cl. 72—391)

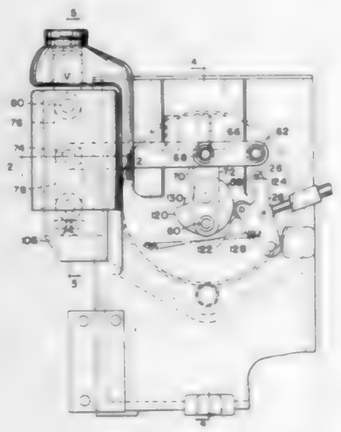
1. A tool for setting tubular rivets of the type having an outer barrel portion and an inner mandril portion, said outer barrel portion having a rearward flange, said mandril portion having a head at the forward end of said outer barrel portion and a stem extending rearwardly from said head and from said outer barrel portion, said tool comprising a housing having a nose portion and a grip portion, a collet case affixed to said nose portion, an electric motor in said housing, a hydraulic pump operatively

connected to said electric motor, hydraulic cylinder means communicating with said hydraulic pump, a collet reciprocable in said collet case between a forward position



and a rearward position, said collet when in said forward position being open to receive said stem and when in said rearward position being closed to retract said stem, said hydraulic cylinder being operatively connected to said collet case.

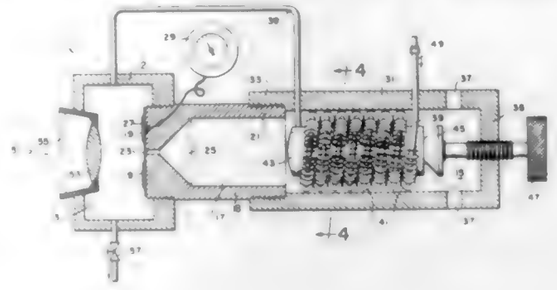
3,374,657
METHOD AND APPARATUS FOR CRIMPING ELECTRICAL CONNECTORS
Joseph W. Baldyga, Utica, Mich., assignor to Diamond Die & Mold Co., Mount Clemens, Mich., a corporation of Michigan
Filed May 24, 1965, Ser. No. 458,141
7 Claims. (Cl. 72—413)



Crimping apparatus and its method of operation comprising a movable ram, a pair of toggle devices connected in series, crank mechanism connected to one of said toggle devices, said crank mechanism including a connecting rod, and drive means for effecting substantially 360° rotation of the crank from a starting position in which the connecting rod is in substantial alignment with a line joining the axis of the crank and the pivot connection between the links of the toggle to which the crank is connected.

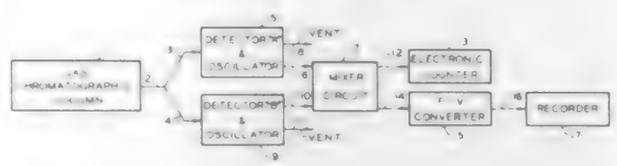
3,374,658
HIGH PRESSURE GAS FROST-POINT INDICATOR
Stephen H. Ford, 211 Hanover St., Annapolis, Md. 21401
Filed Jan. 28, 1965, Ser. No. 428,881
7 Claims. (Cl. 73—17)

An instrument for indicating the moisture content of pressurized gases. Inside the indicator gas flows across a polished mirror-like metal plate and through a small orifice in the center of the metal plate. In passing through the orifice to atmospheric pressure, the rapidly expanding air cools the metal plate until the plate is cooled to the frost-point temperature of the gas. The condensate



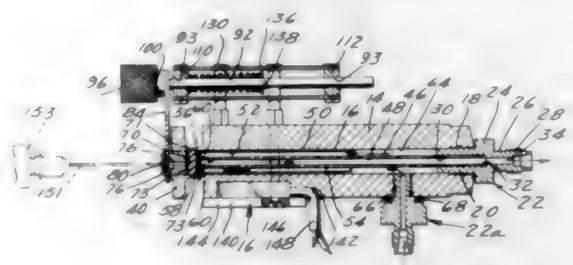
and the temperature of the plate are then observed by the operator to determine the moisture content of the pressurized gas. The expanded gas is passed over a heat exchanger, through which the gas is introduced into the system to precool the pressurized gas before it flows across the mirror.

3,374,659
GAS ANALYSIS
Richard A. Sanford and Edwin K. Clardy, Bartlesville, Okla., assignors to Phillips Petroleum Company, a corporation of Delaware
Filed Jan. 22, 1965, Ser. No. 427,251
5 Claims. (Cl. 73—23.1)



Overlapping peaks manifested on an analyzing recorder are separated by use of at least two oscillator circuits each having at least one piezoelectric crystal which carries a material that is preferentially sorptive for at least one component present in the stream being analyzed, each material on each crystal being preferential to a different component or components.

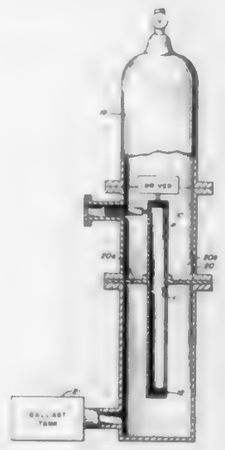
3,374,660
INLET FOR CHROMATOGRAPHS AND THE LIKE
Carlton B. McKinney, Los Angeles, and William M. Sheppard, Whittier, Calif., assignors to Hamilton Company, Whittier, Calif., a corporation of California
Filed June 28, 1966, Ser. No. 561,085
19 Claims. (Cl. 73—23.1)



18. In an inlet for chromatographs and the like:
(A) an elongated body having a longitudinally extending passage therethrough;
(B) a column fitting secured in one end of said passage, said fitting having an axial bore extending forwardly

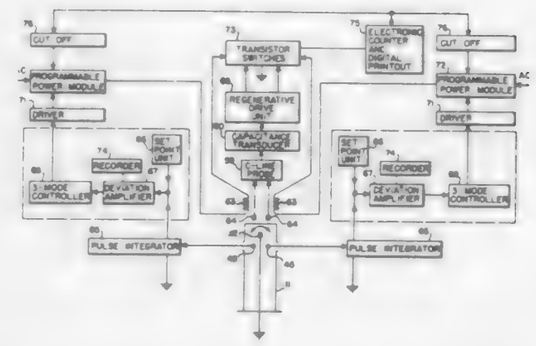
from the inner end and from the forward end of which a reduced diameter fluid discharge bore extends;
(C) a vaporizer tube of inactive material, said tube being of smaller outside diameter than the inside diameter of the passage through the body, a forward end portion of said vaporizer tube being snugly received in the axial bore of said fitting, the outer end of said vaporizer tube being spaced rearwardly of the outer end of the passage through the body and having notch means therein;
(D) a liner of inactive material, said liner having a passage extending longitudinally therein, there being a wall at the outer end of said passage with a relatively small instrument axial opening therethrough, for reception of the needle of a sample handling instrument, the outside diameter of the liner being such as to be snugly received in the passage of the body, the inside diameter of said liner being greater than the outside diameter of the vaporizer tube and fitting over an outer end portion of said vaporizer tube to provide an annular chamber about the vaporizer tube having a fluid connect with the interior of said vaporizer tube, there being an inlet into said annular chamber, the outer end of said liner being spaced inwardly of the outer end of the passage through the body with the wall at the outer end of said liner resting on the outer end of the vaporizer tube, the opening in the end wall of the liner registering with the passage through the vaporizer tube;
(E) a septum in the outer end portion of the body passage, said septum abutting the outer side of the liner end wall;
(F) a septum retainer slidable and removably received within the outer end portion of the body passage, said retainer having a small axial guide bore for reception of a needle of a sample delivering instrument, said guide bore being aligned with the opening in the end wall of the liner;
(G) and resilient means for urging said retainer against the septum with a predetermined pressure.

3,374,661
ADMITTANCE MEASUREMENTS OF SOLID PROPELLANTS
Samuel N. Foner, Adelphi, and Richard L. Hudson, Silver Spring, Md., assignors to the United States of America as represented by the Secretary of the Navy
Filed Jan. 28, 1965, Ser. No. 428,888
14 Claims. (Cl. 73—35)



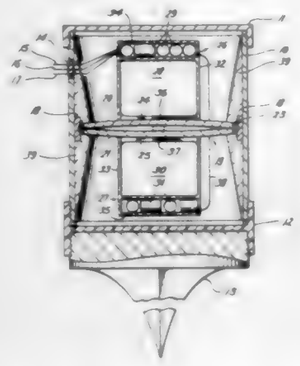
A method and apparatus for determining the response of a burning solid propellant surface wherein a propellant is arranged at one end of a centrally vented cavity and a phase-locked mechanical driver for exciting the cavity in a resonant mode is arranged at the other end. The bandwidth of resonance of the system is determined by phase modulating the mechanical driver and measuring the resultant sideband amplitudes, and the decay constant of the cavity used in the system is measured by momentarily shorting out the mechanical drive system and observing the free-decay or growth of oscillations.

3,374,662
FLEXURAL FATIGUE MACHINE
Meyer R. Achter, Washington, D.C., Hugh H. Smith, Oxon Hill, Md., and Robert J. Riley, Springfield, and Richard L. Stegman, Annandale, Va., assignors to the United States of America as represented by the Secretary of the Navy
Filed Apr. 29, 1966, Ser. No. 547,073
2 Claims. (Cl. 73—67.4)



1. In combination in a reverse-bending fatigue testing device,
an elongated gas-tight chamber having a magnetically transparent upper end cover,
specimen holding means within said chamber for holding one end of a test specimen,
an extension rod for attaching to the opposite end of said test specimen, and extending upwardly in close proximity to said cover,
a permanent magnet attached to the upper end of said extension rod juxtaposed the chamber cover,
spaced electromagnets secured above said chamber cover equi-distant from the axis of said chamber,
spaced capacitor plate elements secured above said chamber cover within the spacing of said electromagnets and equi-distant from the axis of said chamber,
a pair of radially adjustable electrical contact members extending into the upper end of said chamber normal to the axis thereof and secured in opposed radial relationship to each other,
a separate electrical feedback circuit connected to each of said electrical contact members and connected separately to each of said electromagnets,
an electrical circuit connected with said capacitor plates and to a pair of electrical switches,
said pair of electrical switches completing the circuit for each of said separate feedback circuits to pass current separately through each of said electromagnets to energize the electromagnets,
whereby said permanent magnet on the end of said extension rod is repelled by each of said electromagnets to move the extension rod through its amplitude thereby flexing a specimen secured to said specimen holder and to the end of the extension rod while generating a switch signal to control said switches.

3,374,663
VIBRATION DETECTOR
Harold B. Morris, Houston, Tex., assignor to Electronic Systems, Inc., Houston, Tex., a corporation of Texas
Filed Apr. 16, 1965, Ser. No. 448,684
11 Claims. (Cl. 73—71.2)



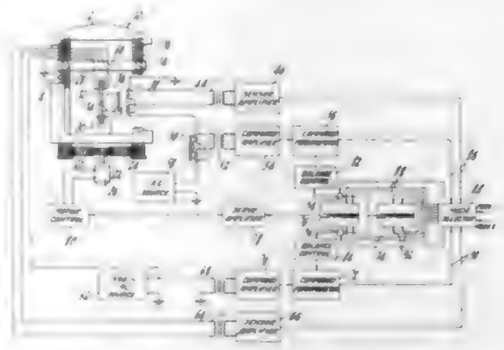
A vibration detector having at least one pair of piezoelectric crystals assembled with their edges joined and the central portions spaced apart, mounted in a case and having an inertial mass means associated with the central portion of the crystals. A spacer element between the central portions of the crystals causes the crystals to bow outwardly with respect to each other to a loaded position, thus increasing the sensitivity to vibrations.

3,374,664
DEVICE FOR MEASURING PORE-FLUID PRESSURES
Joseph R. Lefelhocz, Cletus E. Peeler, Jr., and Allan D. Bergmann, Painesville, Ohio, assignors to Diamond Shamrock Corporation, a corporation of Delaware
Filed June 1, 1966, Ser. No. 554,416
3 Claims. (Cl. 73—73)

1. In an apparatus for determining pore-fluid pressures comprising a hollow, porous tube having a stopper in one end and a riser tube extending from its other end, the improvement which consists in providing said porous tube with a covering of a flexible, corrosion resistant, fluid-permeable screen.

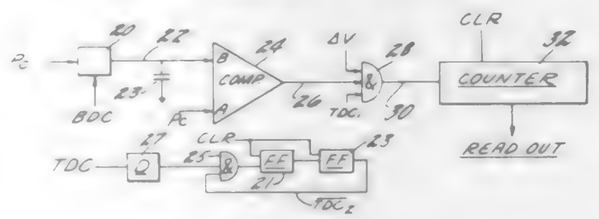
3,374,665
MATERIALS TESTING CONTROL CIRCUITRY
John Linnartz Preston, Needham, Mass., assignor to Instron Corporation, Canton, Mass., a corporation of Massachusetts
Filed Oct. 5, 1965, Ser. No. 493,054
3 Claims. (Cl. 73—90)

Materials testing device having a movable crosshead subject to control under either of two variable commands, in which circuitry is provided to apply whichever command is in control to a motor control for the device, and simultaneously to maintain the other command commensurate with the actual condition of the specimen, so



that conversion from one mode of control to another will not require sudden gross adjustment of the crosshead position.

3,374,666
VOLUMETRIC EFFICIENCY COMPUTER
Arthur B. Shattuck, East Hartford, Conn., assignor to United Aircraft Corporation, East Hartford, Conn., a corporation of Delaware
Filed Apr. 21, 1966, Ser. No. 544,253
9 Claims. (Cl. 73—115)

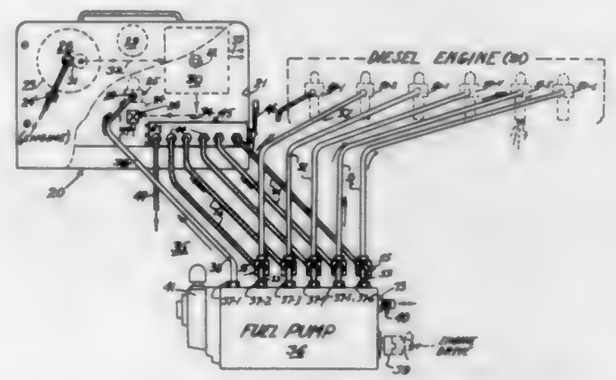


1. A device for computing the volmetric efficiency of a cylinder having a piston comprising:
means for generating a signal indicative of the botton dead center position of the piston in the cylinder,
means for generating a signal indicative of equal volume increments swept out by the piston within the cylinder,
means for generating a signal indicative of the pressure within the cylinder,
means for storing the pressure signal of the cylinder corresponding to the pressure of the cylinder when the piston is at the bottom dead center position,
means for comparing said stored pressure signal with said pressure signal and producing a signal indicative when said pressure signal is less than said stored pressure signal, and
means activated by said comparison signal for counting said equal volume increments.

3,374,667
TESTER SYSTEM FOR DIESEL FUEL PUMPS
Helmut O. Mayer, Middletown Township, Monmouth County, N.J., assignor of thirty percent to Richard A. Marsen, Middletown, N.J.
Continuation-in-part of application Ser. No. 223,119, Sept. 12, 1962. This application Oct. 22, 1965, Ser. No. 522,335
8 Claims. (Cl. 73—119)

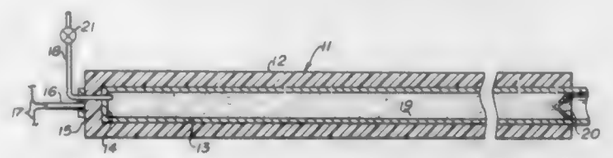
1. In a system for in-position testing the discharge of fuel from the individual output sections of the injection pump coupled by lines to the plural spray nozzles of a diesel engine and driven thereby, and wherein the setting of a unitary control element adjusts the volume of

fuel discharged per stroke in succession by each pump section for its associated spray nozzle: a fuel volume measuring unit; means fro conducting the fuel output of a selected for testing pump section to said measuring unit; and control means for reducing fuel output to the nozzles from the remaining associated sections of the pump, and thereby correspondingly substantially uniformly control the reduced amount of fuel entering their respective spray nozzles of the engine for its operation



of the pump during its in-position testing as compared with the basic fuel output from said sections normally determined by the indicated control element setting, said control means comprising pulsatable means actuated by the successive fuel discharges by the remaining pump sections, whereby the engine is operatively fueled by said remaining pump sections while the selected pump section is being tested.

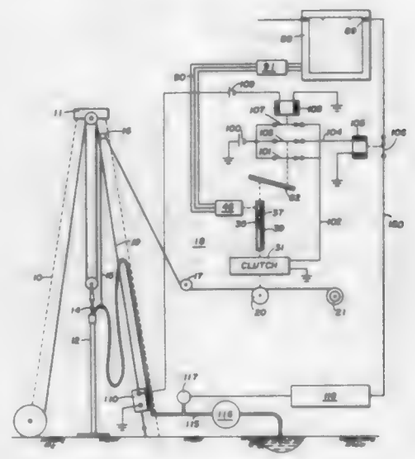
3,374,668
HIGH EXPLOSIVE DRIVEN GAS INJECTOR AND FACILITY
Charles S. Godfrey, Berkeley, Calif., assignor to Physics International Company, Berkeley, Calif., a corporation of California
Filed Oct. 19, 1964, Ser. No. 404,837
18 Claims. (Cl. 73—147)



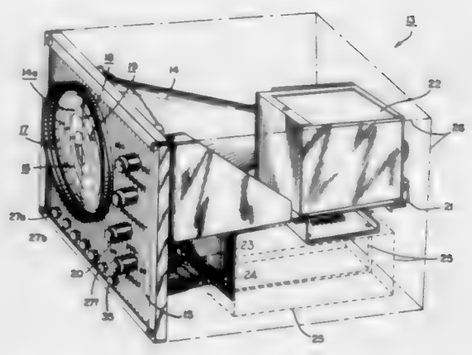
1. A method for creating a high pressure shock front in a gas comprising the steps of confining a mass of gas within a long cylindrical volume defined by a liner material, explosively imploding said liner material radially inward progressively along the length of said volume from one extreme end thereof to the other whereby said gas is progressively gathered and driven at high velocity along the axis of said volume and thereby forms a shock front at the interface between the driven high velocity gas and the as yet unshocked gas mass and wherein said shock front travels along the length of said cylindrical volume.

3,374,669
DRILLING RATE LOGGER
Fletcher H. Redwine, Irving, Tex., assignor to Arps Corporation, Garland, Tex., a corporation of Delaware
Filed Dec. 23, 1964, Ser. No. 420,554
9 Claims. (Cl. 73—151.5)

A penetration rate recording system has a depth line attached to a drill string support which is repeatedly moved from adjacent to the derrick floor to a region of the crown block. The depth line passes over a depth line sheave disposed in the region of the crown block, and also passes over a measuring sheave provided to measure the movement of the depth line. A lead screw is connected to the measuring sheave to rotate in response to the measured movement of the depth line. A traveling nut is mounted on the lead screw and is keyed to a cylinder for slide movement relative thereto, but constrained against rotation relative to the cylinder. A pulse generator is driven by the cylinder and a recorder driven in proportion to the rotation of the cylinder records the generator pulses as an indication of the rate of penetration as a function of depth.



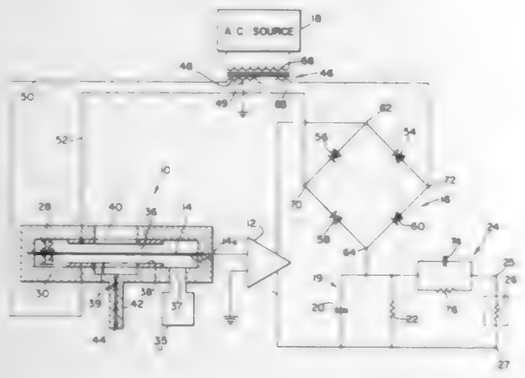
3,374,670
NAVIGATION INSTRUMENTATION
Paul F. Maeder, East Providence, R.I., assignor, by mesne assignments, to MacCleaster-Schwarz, a division of William M. Pearson Travel Agency, Inc., Providence, R.I., a corporation of Rhode Island
Filed Apr. 26, 1965, Ser. No. 450,585
28 Claims. (Cl. 73—178)



Navigation instrumentation for measurement of different types of navigation data including a cathode ray tube display surface having navigation measurement indicia thereon, and control means for producing display data on the cathode ray tube in response to signals from one of a number of electrical transducers which are mounted in various positions on the craft. Each of the transducers sense the relation of the craft to the navigation condition under measurement and through their associated transmitting circuitry selectively apply signals representative of the navigation condition to the display control means, to give a visual indication on the display surface of the measured condition. The transducers and the transmitting circuitry are adapted to measure and transmit signals to

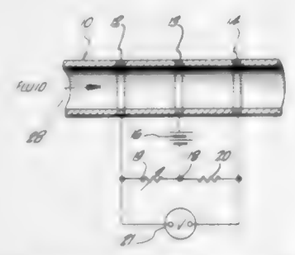
the display tube representative of ocean floor depth, the direction and wind velocity relative to the craft, speed of the craft in the water, absolute wind velocity, radio direction finding information, and the orientation of magnetic north relative to the craft heading and radio direction.

3,374,671
VERTICAL RATE SENSOR
Sidney B. Williams, Lexington, and Edward T. Rigney, Wayland, Mass., assignors to Trans-Sonics, Inc., Burlington, Mass.
Filed Mar. 31, 1965, Ser. No. 444,137
12 Claims. (Cl. 73—179)



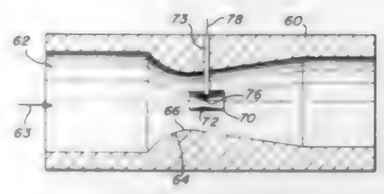
A vertical rate sensor having high resolution of vertical direction and fast response to changes in rate employs a differential pressure transducer and an electrical compensating circuit that develops the sensor output signal in response to the transducer signal. The transducer compares two pressures developed by sensing the atmospheric pressure with a pneumatic circuit of essentially zero time constant and a pneumatic circuit of relatively long time constant. The compensating circuit is a lead circuit having an electrical time constant matched to the longer time constant of the two pneumatic circuits to offset the delay introduced by that long time constant.

3,374,672
FLOWMETER
Arthur P. Horne, Arcadia, Calif., assignor to California Institute Research Foundation, Pasadena, Calif., a corporation of California
Filed July 6, 1965, Ser. No. 469,647
3 Claims. (Cl. 73—194)



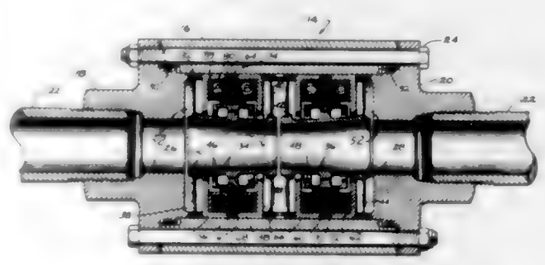
A flowmeter for measuring flow rate of a fluid in a conduit. Three electrodes are mounted in and insulated from the conduit, the electrodes being terminated flush with the inner surface of the conduit. The electrodes make electrical contact with the fluid, and are spaced apart to form an array of an upstream electrode, a central electrode, and a downstream electrode. Voltages are impressed across the electrodes to cause electrical currents to flow through the fluid, and differences in the currents are measured to determine fluid flow rate.

3,374,673
MASS FLOWMETER STRUCTURE
James H. Trageser, Kettering, Ohio, assignor to Technology Incorporated, Dayton, Ohio, a corporation of Ohio
Filed Oct. 1, 1965, Ser. No. 492,179
4 Claims. (Cl. 73—204)



This invention relates to a mass flowmeter. The invention relates still more particularly to conduit structure for use in combination with mass flowmeter apparatus. The conduit structure comprises means for substantially eliminating turbulence therein and discloses the use of thermally responsive sensor means positioned in the conduit in a location of negligible turbulence.

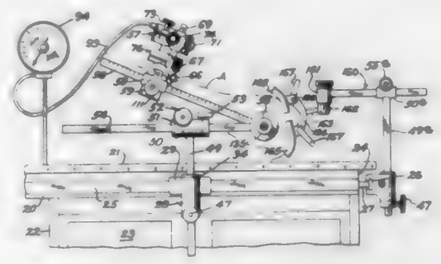
3,374,674
FLUID FLOWMETER
Everett H. Schwartzman, 457 34th St., Manhattan Beach, Calif. 90266
Filed Feb. 23, 1965, Ser. No. 434,179
14 Claims. (Cl. 73—213)



A flowmeter including two generally-similar, venturi members defining tapered internal passages, which members are held independently spaced apart by diaphragm structures so as to receive the fluid stream that is to be measured. The spaced displacement of the venturi members allows them to respond to variations in fluid flow with opposed movements which are sensed by electrical apparatus to manifest the measured flow as an electrical signal. The requisite opposed movements of the venturi members to measure flow renders the structure immune from various other factors, as acceleration forces and so on. The disclosure includes inductive, capacitive and resistance elements for providing an electrical signal indicative of flow.

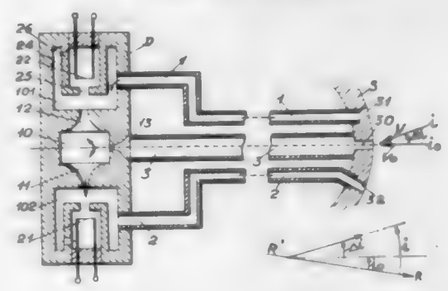
3,374,675
ISOMETRIC MUSCLE TESTING APPARATUS
Michael Keropian, 683 7th Ave., San Francisco, Calif. 94118
Filed Jan. 4, 1965, Ser. No. 423,082
8 Claims. (Cl. 73—379)

4. In a muscle testing device of the character described, the combination of a table support and a pressure indicating gauge, rail means mounted on and extending longitudinally of said table support, slide means on said rail means and having a generally upright support means, a positioning bar mounted on said support means for longitudinal movement relative to said table, a measuring arm hingedly connected to one end of said bar for pivotal movement relative thereto whereby said arm is adapted to be arranged adjacent and to generally conform to the position assumed by the member of a person's anatomy being tested, means for locking said arm in position, a load cell means mounted for longitudinal movement on said positioning bar to a position most suitable for the



particular member being tested arranged adjacent said arm, said load cell means having a pressure chamber and flexible diaphragm, a fluid conduit between said chamber and said gauge, a body part engaging means associated with said load cell means for attachment to the member being tested whereby movement of the muscles in the member being tested is transmitted to said pressure chamber and to said gauge.

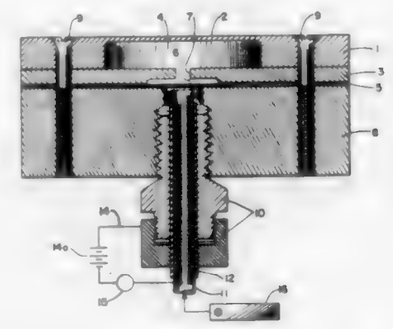
3,374,676
THERMAL GAS FLOW COMPARATOR
Claude Brenot, Paris, France, assignor to CSF—Compagnie Generale de Telegraphie Sans Fil, a corporation of France
Filed Jan. 26, 1965, Ser. No. 428,045
Claims priority, application France, Jan. 27, 1964, 961,591, Patent 1,391,867
6 Claims. (Cl. 73—399)



The invention provides an arrangement for comparing gas pressures at two different points of the outer surface of a body in a gas flow. Two ducts have their outer ends arranged for receiving the gas flow; their inner ends open in a chamber, in which two heating elements are positioned for being cooled by said ducts; means derive a signal which is a predetermined function of the differential cooling of said elements.

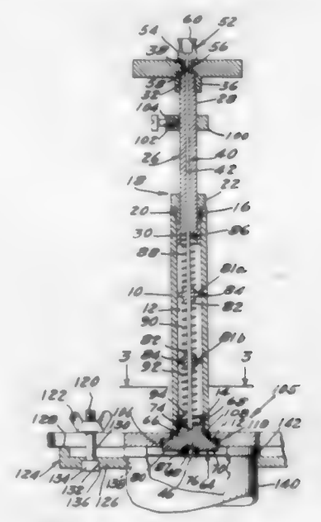
3,374,677
PRESSURE MEASURING DEVICE EMPLOYING A DIAPHRAGM-TYPE PRESSURE RESPONSIVE UNIT
Ernest L. Corp and Robert C. Bates, Spokane, Wash., assignors to the United States of America as represented by the Secretary of the Interior
Filed Dec. 21, 1965, Ser. No. 515,486
8 Claims. (Cl. 73—406)

A pressure measuring device as described, having an outer diaphragm integrally united to its face plate, an inner diaphragm, a sealed fluid reservoir between diaphagms, and an air conveying tube outside the reservoir perpendicularly displaced with respect to the inner diaphragm. Pressure of the granular mass against the outer diaphragm indirectly urges the inner diaphragm into contact with the tube which closes a circuit. As increasing



known amounts of air are injected into the tube, the air pressure reaches a magnitude which counteracts the granular mass pressure. This action moves the diaphragm out of contact with the tube and breaks the circuit.

3,374,678
HEAD SPACE SAMPLER
Melvin E. McGuckin, Rowland Heights, Calif., assignor to Hamilton Company, Whittier, Calif., a corporation of California
Filed Oct. 14, 1965, Ser. No. 496,104
21 Claims. (Cl. 73—421.5)

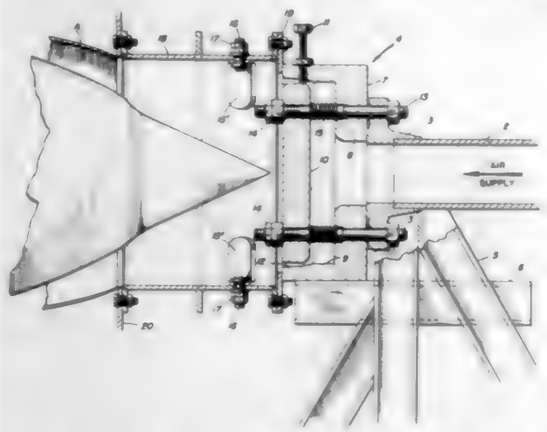


An apparatus for securing uncontaminated samples of gasses or liquids in the head space of cans, bottles and other containers. A penetrating needle is used for gaining access to the interior of the container and withdrawing samples of the contents thereof.

3,374,679
MISSILE FLIGHT SIMULATOR
Dennis Richards, Garrett Park, and Frank Bader and George P. Maggos, Silver Spring, Md., assignors to the United States of America as represented by the Secretary of the Navy
Filed July 14, 1965, Ser. No. 472,070
8 Claims. (Cl. 73—432)

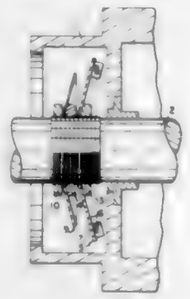
The present invention provides apparatus for testing a missile under wide conditions of airflow turbulence and vibration frequencies. According to the invention, high

pressure air is passed through an acoustic generator which directs a desired pattern of turbulent airflow through and



about the inlet, diffuser and combustor of a missile mounted in a test tunnel. Means are provided for producing a wide range of test frequencies.

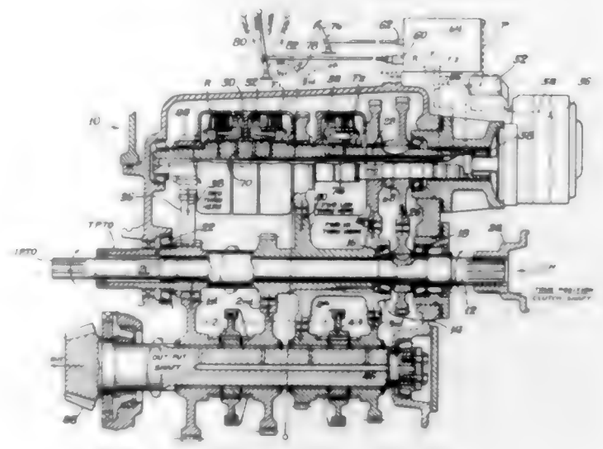
3,374,680
SHAFT SPEED LIMITING DEVICE
Carl H. Geary, Irwin, Pa., assignor to Carrier Corporation, Syracuse, N.Y., a corporation of Delaware
Filed Sept. 13, 1965, Ser. No. 486,816
2 Claims. (Cl. 73—538)



1. A trip mechanism for shaft speed governing apparatus comprising a first Belleville control spring encircling the shaft, collars mounted on said shaft at opposite sides of said spring, the first of said collars normally engaging the inner area of the concave side of the spring, the second of said collars on the opposite side of said spring normally engaging the convex side of said spring, said first Belleville spring having weights mounted on the concave side of the spring. the said spring and weights being so proportioned and related that the spring will snap over when the shaft starts to exceed a predetermined maximum speed and will snap back when the speed is reduced, a second Belleville spring positioned between the said second collar and a third collar, said second collar engaging the inner area of the concave side of said second spring, said second spring being so proportioned and related to said first spring that it will stress the first spring toward the low speed position when said first spring is in the high-speed, snapped-over position.

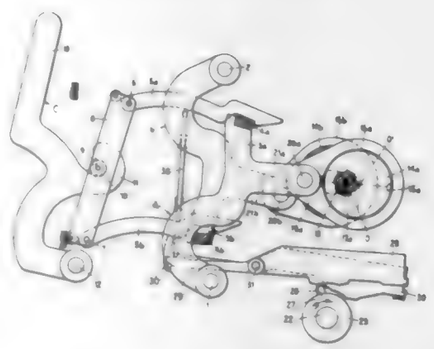
3,374,681
CONCENTRIC POWER TAKE-OFFS
Frederick M. Hugh, Mount Prospect, and Norman E. Williams, Park Ridge, Ill., assignors to International Harvester Company, Chicago, Ill., a corporation of Delaware
Filed July 22, 1966, Ser. No. 567,306
20 Claims. (Cl. 74—15.66)

1. In a vehicle transmission having an input portion, and fluid-operated and mechanical shift clutches:
clutch, IPTO, and output shafts, having their centerlines in a triangular arrangement as viewed in cross section;
a transfer portion (14) in the transmission coupled to the input portion by means of the clutch shaft and a plurality of the fluid-operated clutches thereon, and



coupled to the output shaft by means of a plurality of the mechanical shift clutches thereon; and
a TPTO shaft, said transmission having the input portion drivingly connected in common to the clutch and IPTO shafts, and having the transfer portion drivingly connected to the TPTO shaft.

3,374,682
ROCKER ARM DRIVE ASSEMBLY FOR WEAVING APPARATUS
Luigi Milani, Vanzaghello Magnago, Milan, Italy, assignor to Brevitex Etablissement pour l'Exploitation de Brevets Textiles, Vaduz, Liechtenstein
Filed Oct. 20, 1965, Ser. No. 498,917
Claims priority, application Italy, Dec. 4, 1964, 26,048/64, Patent 743,819
3 Claims. (Cl. 74—43)



A driving mechanism for operating the pawls which, in turn, operate the means for lifting the heddles of a dobbie of a loom, is disclosed as including a driven shaft rotated by the loom main shaft and having secured thereon a plurality of circular bushes. Each bush is operatively associated with a respective knife bearing arm for operating a pawl, and the center of each circular bush is offset radially from the axis of the driven shaft.

A plate is operatively associated with each bush and is formed with a circular opening rotatably embracing the associated bush, and each plate has a pivotal connection closely adjacent its circular opening and pivotally connecting the plate to a respective knife bearing arm at a point spaced from the pivotal mounting of the latter.

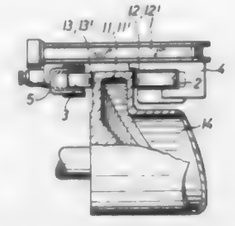
Each plate thus forms a short crank rod for the associated knife bearing arm, and has an appreciable dwell time at dead center which assures secure engagement between its associated knife bearing arm and the associated pawl, for drawing the pawl, during rotation of the associated bush, without appreciable play.

3,374,683
TRANSMISSION DEVICES FOR CONVERTING ROTARY MOTION INTO RECIPROCATING MOTION
Gerhard Helmut Jesse, Am Bostelberg 147, Hellendorf, Hannover, Germany
Filed Mar. 9, 1966, Ser. No. 533,091
Claims priority, application Germany, Mar. 10, 1965, J 27,668
10 Claims. (Cl. 74—50)

1. A transmission device for converting rotary motion into reciprocating motion comprising a pair of guides extending in mutually perpendicular directions, first and second rotatable members connected to each other and slidably disposed one in each of said guides and each mounted for rotation about a separate one of two spaced parallel axes, a third rotatable member operatively connected to one of said first and second members and rotatable about a third axis between and parallel to said two spaced axes and contained in the plane of said two spaced axes, means for rotating said third member about a fourth axis parallel to said two spaced axes and passing through the intersection of said guides, a reciprocable member operatively engaged by one of said first and second members and reciprocable in a first direction in a plane normal to said axes whilst permitting displacement of the engaged one of said first and second members in a second direction normal to said first direction and in the same plane, and means operable angularly to adjust said two guides about said fourth axis to control the amplitude of reciprocation of said reciprocable member.

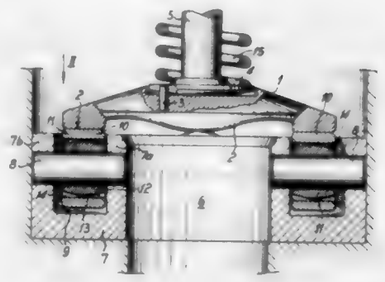
3,374,684
CARRIAGE-RECIPROCATING STRUCTURE FOR A MACHINE SUCH AS A DRAWING MACHINE
Johann Greven, Aachen, Germany, assignor to Schumag Schumacher Metallwerke GmbH, Aachen, Germany, a corporation of Germany
Filed Oct. 22, 1965, Ser. No. 502,169
Claims priority, application Germany, Apr. 17, 1965, Sch 36,904
4 Claims. (Cl. 74—56)

In a machine, carriage means cyclically movable along a given path first forwardly from a given starting position to a given end position and then rearwardly from the end position back to the starting position, a pair of cam-follower rollers displaced one with respect to the other along the path and defining a given space between themselves, a pair of support means carried by the carriage means and respectively supporting the rollers for rotary movement, and elongated cam means extending through the space between the cam-follower rollers and between the latter and movable in a direction generally transverse to the path, the cam means having a pair of opposed camming faces engaging the cam-follower rollers and respectively cooperating therewith to provide by cooperation of



one of the camming faces with one of the rollers forward movement of the carriage means and by cooperation of the other of the camming faces with the other of the rollers rearward movement of the carriage means, one of the support means which supports the cam-follower roller which cooperates with the cam means to provide rearward movement of the carirage means supporting the latter roller for resilient yieldable movement in the direction of movement of the carriage means.

3,374,685
FACE CAM DISC AND CAM FOLLOWER ARRANGEMENT
Franz Eheim, Rosenbergstrasse 53a, Stuttgart, Germany
Filed Jan. 26, 1966, Ser. No. 523,225
Claims priority, application Germany, Feb. 20, 1965, B 80,616
3 Claims. (Cl. 74—56)

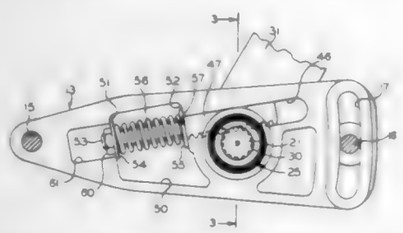


A disc with a camming face on a surface is located in a housing; outer surfaces of a cylindrical bearing sleeve engage the camming face, and a support element having pherical outer surfaces is located with the bearing sleeve, having a diameter less than the inner diameter of the inner bearing surfaces of the sleeve to provide clearance and permit inclination of the axis of the sleeve with respect to the axis of the support element.

3,374,686
DRIVE-TENSIONING APPARATUS
Carl T. Brewer, % Brewer Machine & Gear Co., 1441 N. 2nd St., St. Louis, Mo. 63102
Filed Dec. 1, 1965, Ser. No. 510,834
8 Claims (Cl. 74—242.11)

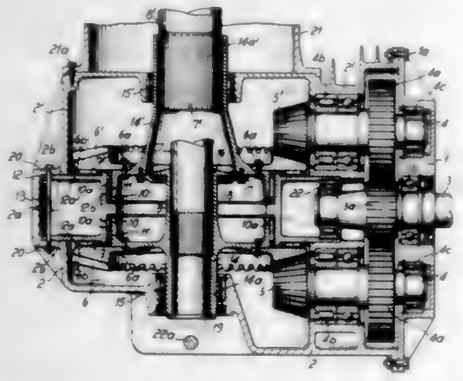
The drive tensioner includes a base having a shaft mounted to it, the shaft being connected external of the base to a transverse arm. The transverse arm is provided

with a pulley which engages a belt drive. Internally of the base, the shaft is connected to a pinion which operates a double-acting spring-loaded rack member. Angular rota-



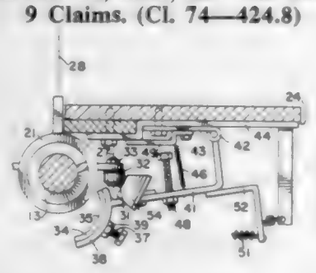
tion of the arm, in either direction from a neutral position, increases the compression in the spring-loaded rack mechanism. The tensioner is thus reversible.

3,374,687
TRANSMISSION FOR HELICOPTER ROTOR SHAFTS
Alfred Vogt, Friedrichshafen-Fischbach, Germany, assignor to Josef Wagner, Friedrichshafen-Fischbach, Germany
Filed Mar. 7, 1966, Ser. No. 532,274
Claims priority, application Germany, Mar. 20, 1965, W 38,810
10 Claims. (Cl. 74—417)



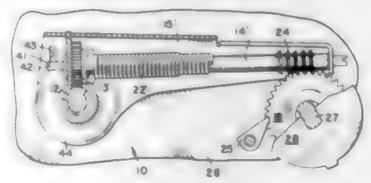
Two helicopter rotor shafts are secured to driven bevel gears which are supported on a bearing located between the driven bevel gears so that axial forces produced by drive bevel gear means acting on said driven bevel gears, and also by said helicopter rotor shafts are taken up by the bearing.

3,374,688
VIBRATION DAMPER SYSTEM
John Henry Schildmeier, 6038 Crows Nest Drive, Indianapolis, Ind. 46208
Filed Oct. 21, 1965, Ser. No. 499,424
9 Claims. (Cl. 74—424.8)



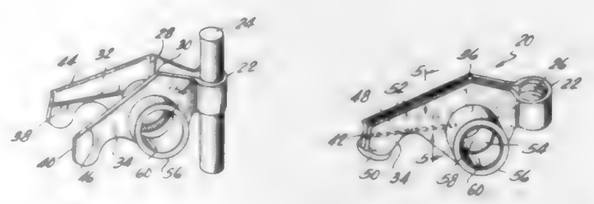
A drapery sizing machine including two parallel drive screws of substantial length and drive nuts thereon to drive a finger box up and down on the frame. A pair of semi-cylindrical shaft supports intermediate the ends of each shaft to prevent whipping, each including a three-section cam follower plate engageable by cam rollers on the drive nut during movement of the nut up or down to enable the nut to pass the support. Return springs constantly urging the supports against the drive screw and returning the supports to contact with the drive screw after the spreading of the supports by the cam and follower during passage thereof by the drive nut.

3,374,689
WORM GEAR ESCAPEMENT
Gianni A. Dotto, Dayton, Ohio, assignor to P. R. Mallory & Co. Inc., Indianapolis, Ind., a corporation of Delaware
Original application July 27, 1964, Ser. No. 385,402, now Patent No. 3,307,417, dated Mar. 7, 1967. Divided and this application Jan. 16, 1967, Ser. No. 632,473
7 Claims. (Cl. 74—426)



A worm gear escapement including a spring, a shaft having an off center portion, a pin coupled to the off center portion and a slotted retaining means. The off center portion of the shaft, the pin and the slotted retaining means cooperating so as to translate a rotary motion to an intermittent motion.

3,374,690
ROCKER ARMS FOR INTERNAL COMBUSTION ENGINES
Kazuo Hirose, 9 Tajima Saitama-ken, Urawa-shi, Japan
Filed Oct. 19, 1965, Ser. No. 497,858
Claims priority, application Japan, Apr. 22, 1965, 40/23,471
2 Claims. (Cl. 74—519)

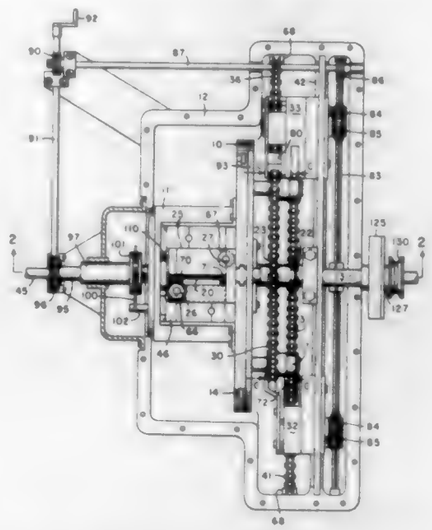


A rocker arm constructed of sheet metal formed from a pair of complementary sheets integrally interconnected by an arcuate eye portion. The sheets have an opposite end hammered and shaped to form a hardened valve head contact. The sheets are spot welded together in a manner so that flanges surrounding bores through the sheets form flanges. The sheets have complementary grooves forming oil passages with the upper edges of the sheets and being divergently flared and communicating with the grooves.

3,374,691
VARIABLE SPEED TRANSMISSION
Charles R. Schottel, 115 Kingsbury Court, Collinsville, Ill. 62234
Filed May 11, 1966, Ser. No. 549,415
18 Claims. (Cl. 74—674)

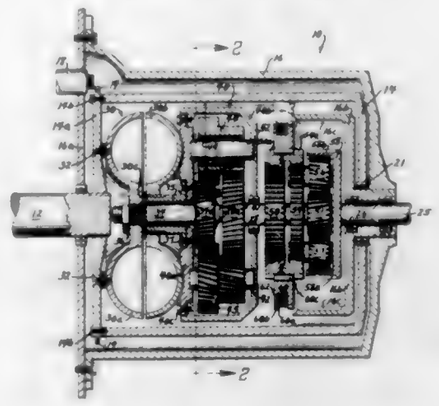
1. In a variable speed transmission:
(a) a drive shaft,
(b) a rotary head defining a rotative axis,
(c) a driven shaft operatively connected to and driven by the rotary head,

(d) sprockets rotatively mounted on and carried by the rotary head,
(e) a non-rotating chain defining a perimeter and meshing with the sprockets,
(f) a drive means operatively interconnecting the drive shaft and sprockets to rotate the sprockets, and consequently turn the rotary head and the driven shaft as the sprockets move around the chain,
(g) a mechanism carrying the chain and movable to accommodate the flexing action of the chain as the sprockets revolve around the chain perimeter,



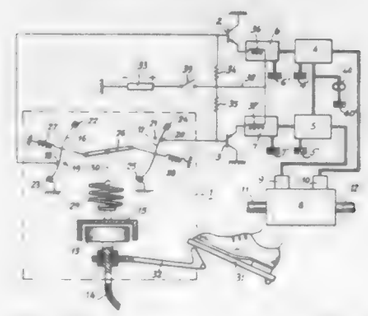
(h) sprocket-adjusting means operatively connected to the sprockets to position the sprockets selectively at predetermined distances from the rotative axis of the rotary head to vary the speed ratio of the drive shaft and driven shaft, and
(i) chain-adjusting means operatively connected to the chain for selectively changing the length of the chain perimeter to accommodate any change in sprocket position and to maintain effective meshing engagement of the sprockets and chain.

3,374,692
AUTOMATIC TRANSMISSION
Benjamin M. Kitch, 2563 N. Evans Ave., and David M. Kitch, 3604 Stringtown, Road, both of Evansville, Ind. 47711
Filed Oct. 12, 1964, Ser. No. 403,047
8 Claims. (Cl. 74—688)



1. An automatic transmission comprising a crankshaft connecting to a power source, a rotatable drum connecting to said crankshaft, a fluid coupling disposed within said rotatable drum having a drive portion and a driven portion, said drive portion connecting to and rotating simultaneously with said crankshaft, an inner drum disposed within said rotatable drum, said inner drum connecting to and rotatable simultaneously with said driven portion of said fluid coupling, a rotatable shaft secured to said drive portion of said fluid coupling and having a drive gear disposed thereon within said inner drum, a driven gear disposed within said inner drum on an intermediate axle, a plurality of axles positioned within said inner drum, each axle having a gear disposed thereon in cluster arrangement with said drive gear and said driven gear, said intermediate axle also having a first and a second gear disposed thereon, a plate member encircling said intermediate axle and having a plurality of gears rotatably disposed thereon in operational relationship with said second gear, said plate member having a geared outer surface, a drive shaft having a drum secured thereto in operational relationship with said second gear, said drum having a geared outer surface, a fixed member having a geared inner surface, and clutch-brake means including a slidable operating member which selectively connects the said first gear and the said plate member, the said plate member and the said inner surface of said fixed member, and the said outer surface of said drum, the said plate member and the said inner surface of said fixed member.

3,374,693
AUTOMATIC SPEED-CHANGING MECHANISM FOR AUTOMOBILE VEHICLES
Gaëtan de Coye de Castelet, Billancourt, France, assignor to Regie Nationale des Usines Renault, Billancourt, France
Filed Oct. 24, 1965, Ser. No. 504,353
Claims priority, application France, Nov. 17, 1964, 995,227, Patent 1,423,015
3 Claims. (Cl. 74—865)

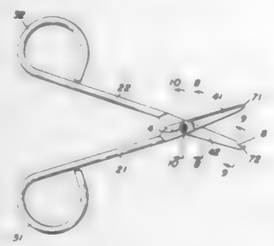


An automatic control mechanism for automobile gearboxes comprising a tachometric governor operatively connected to actuate a gearbox by means of jacks selectively actuated through transistorized amplifiers and discharge electromagnetic valves controlling distributors which feed the jacks. The transistor amplifiers have bases which are selectively grounded through a rest contact of the governor and connected to a positive power source through a damping resistance, the emitters are connected to the positive terminal through the exciting coil of said valve and the collectors are grounded.

3,374,694
METHOD OF MAKING SCISSORS
Arthur Eizenberg, Tarzana, Calif., assignor to Pharmaseal Laboratories, Glendale, Calif., a corporation of California
Filed Oct. 22, 1965, Ser. No. 500,707
5 Claims. (Cl. 76—104)

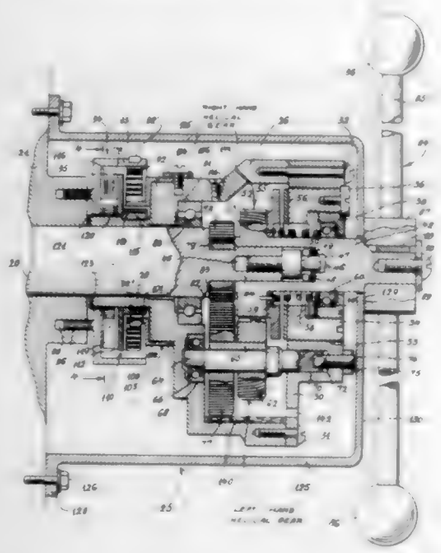
A method of making a pair of disposable suture scissors from wire stock. This method includes coining a blade section and forming a finger loop section in a piece of wire,

trimming the coined blade section to form a sharp burr, and restriking a face of this blade to make this sharp burr flush with the blade face. Finally, the scissor members are



plated and assembled to give a pair of disposable suture scissors in which grinding is not necessary to create sharp cutting edges.

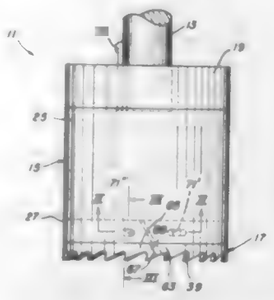
3,374,695
SPINDLE ADVANCE CONTROL FOR A DRILL PRESS
Arthur N. Lehberger, 256 Winfield Terrace, Union, N.J. 07083
Filed Jan. 18, 1966, Ser. No. 521,262
9 Claims. (Cl. 77—32.8)



A spindle advance control for a drill press comprising an attachment for the drill press adapted to effect closing of the free nonworking distance between the drill bit and work to be drilled by only a fraction of a turn of the operating handle of the drill press. The operating handle of the drill press is connected to the spindle advance shaft via a gearing mechanism which has an output to input gear speed ratio greater than 1 while the spindle is advancing freely and which has a speed ratio of 1-to-1 when the drill bit encounters the work or when the spindle has fully advanced through its free distance.

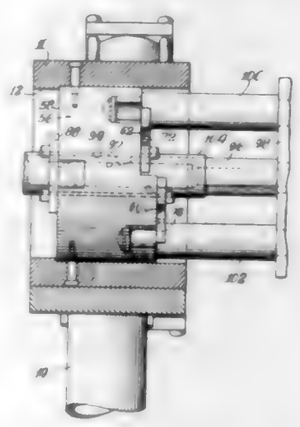
3,374,696
BIT MEANS
Walter E. Trevathan, McKenzie, Tenn., assignor to Walter Trevathan Corporation, a corporation of Tennessee
Filed Feb. 23, 1966, Ser. No. 529,490
8 Claims. (Cl. 77—69)

1. Bit means for forming a circular cut in a piece of work material comprising an elongated tubular body member adapted for rotation about its longitudinal axis and having a proximal end and a distal end, a cutting ring member having a proximal end and a distal end provided with cutting means, said members respectively including adjacent the distal end of said body member, and adjacent the proximal end of said ring member overlapping and mating stepped portions respectively attached to said members and telescopically received together to establish a substantially annular wall of said bit means extending from adjacent said proximal end of said tubular body



member to said distal end of said cutting ring member, one of said members being provided with apertures, the other of said members including projections projecting generally radially toward said one of said members and respectively into corresponding ones of said apertures for engagement with portions of said one of said members to secure said cutting ring member with respect to said body member.

3,374,697
METHOD AND APPARATUS FOR SEVERING A TUBULAR MEMBER
Walton S. Robinson, Tewksbury Township, Hunterdon County, N.J., assignor to Taylor Forge Inc., a corporation of Illinois
Filed Oct. 21, 1965, Ser. No. 499,172
14 Claims. (Cl. 83—35)

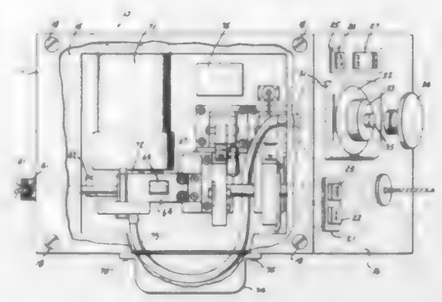


A method and apparatus for severing a tube blank from a tubular member by sequentially shearing out arcuate segments of the tubular member wherein the end portion of the tubular member is severed therefrom as a tube blank.

3,374,698
MACHINE FOR DISPENSING FLEXIBLE ELONGATED MATERIAL SUCH AS CORD AND THE LIKE
Richard J. Sleeper, 1307 W. Chicago Road, Sturgis, Mich. 49091
Filed Oct. 24, 1965, Ser. No. 504,478
18 Claims. (Cl. 83—171)

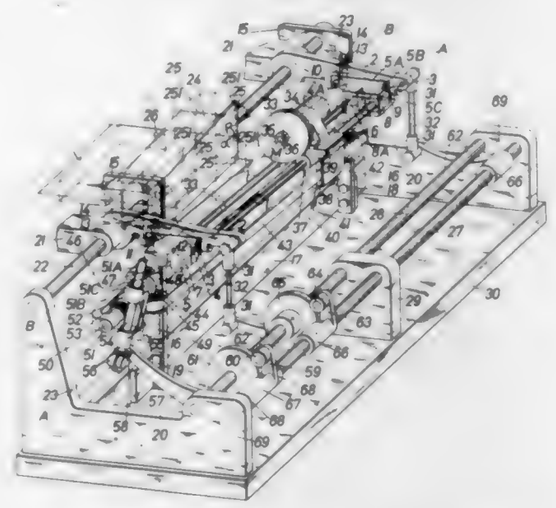
This invention resides in a line dispensing machine which is self-contained and provides portable characteristics. The mechanism has a drive mechanism which causes the movement of the line to pass through the machine.

The drive mechanism is adjacent a cutting mechanism both of which are controlled by a timer unit. The drive mechanism is controlled so that it will stop after a required length of line has been dispensed. The cutter mechanism is controlled so that it is not actuated until the drive mechanism has brought the line to a complete stop.



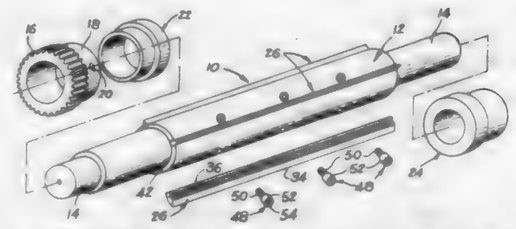
The line member is guided into and guided out of the dispensing mechanism by inlet and outlet tubes which surround the line member to control its passage. The mechanism contains controls to make dispensing manual or automatic and includes a jog switch to assist in initially loading the line member.

3,374,699
SHARPENING ARRANGEMENTS
Alfred Schmermund, 62 Kornerstrasse, Gevelsberg, Westphalia, Germany
Filed July 28, 1965, Ser. No. 475,539
Claims priority, application Great Britain, Nov. 25, 1964, 47,832/64
12 Claims. (Cl. 83—174)



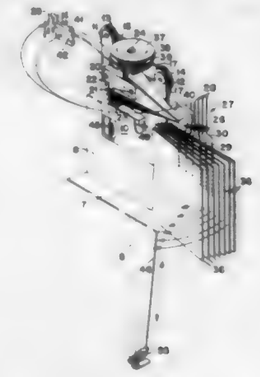
A rotary cutting device is described to cut, for example, tobacco, in which straight rotating cutting edges are inclined relative to the axis of rotation so that each cutting edge engages the tobacco progressively to obtain a slicing action rather than a chopping action. The invention provides a rotatable disc for sharpening the cutting edges while they are rotating. For ensuring that the cutting edges, notwithstanding repeated sharpening, remain straight, the sharpening disc is mounted in a lever arrangement operable by cams which are rotatable synchronously with the cutting edges so that the disc is reciprocated in the direction of the cutting edge which is being sharpened and is oscillated in a curved path transversely to the axis of rotation of the rotatable sharpening disc; means may be provided for feeding the sharpening disc towards the cutting edges.

3,374,700
BUTT CUTTING ROLL WITH REMOVABLE BLADE AND PRESS FIT GUIDE BEARINGS AND METHOD OF MAKING SAME
David H. Mages, Chicago, Ill., assignor to Webtron Corporation, a corporation of Illinois
Filed Oct. 21, 1965, Ser. No. 500,430
5 Claims. (Cl. 83—674)



An efficient butt-type cutting tool is constructed from a roller body of inexpensive, round bar stock that is longitudinally grooved radially to a depth defined at a precise distance from the point on the body selected as the center of the finished tool. Rings of hardened material are press fit into the bar stock and ground to a periphery concentric with the selected center of the tool, and an accurately formed cutter blade is removably but rigidly secured in the tool's groove to provide a precision tool.

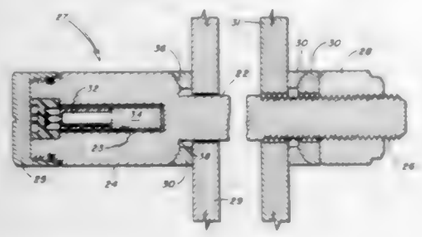
3,374,701
PAGE TURNING DEVICE
Fritz Wallenberg, 2 Bellevue Heights, Binghamton, N.Y. 13905
Filed Nov. 4, 1966, Ser. No. 592,207
3 Claims. (Cl. 84—521)



1. In an apparatus for turning the pages of a folder, particularly sheet music, comprising a support accommodating said folder in a position convenient for reading, a plurality of ferromagnetic page-engaging fingers each adapted to be placed between successive pages of said folder, said fingers being affixed to plates arranged over a pivot for movement in an arcuate path in a plane transverse to said pages, the rotation of each of said fingers over said pivot at substantially 180° effecting the turning of a page, a lifting arm pivotally supported over a stud placed adjacent to and at a predetermined distance from said pivot, said arm describing an arcuate path in substantially the same plane as the path of said fingers, the radial length of said arm being different than the radial length of said fingers, a permanent magnet affixed to the end of said arm and having a pole-face surface adapted to engage an adjacent finger, power means for rotating said arm in one direction from engagement position of said magnet over said arcuate path, the force of said magnet causing the attracted finger to follow said path thereby turning a page, said attracted finger during movement over said pivot being constrained due to the difference in radial length and pivot points between said arm and said finger to progressively slide over said pole face, the

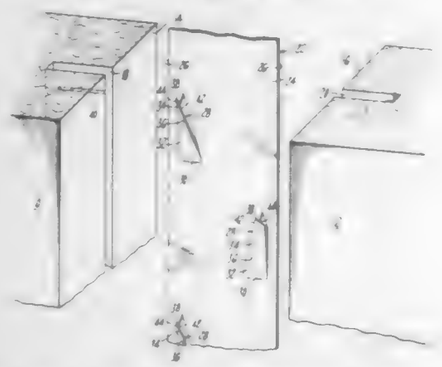
radial distance being so dimensioned with respect to the length of said surface as to effect disengagement of said finger from said magnet at the end of said page-turning travel, said arm upon rotation in the reverse direction being returned to pick up the next adjacent finger.

3,374,702
EXPLOSIVE BOLT
Vincent J. Menichelli, Silver Spring, Md., assignor to the United States of America as represented by the Secretary of the Navy
Filed Dec. 17, 1965, Ser. No. 514,744
7 Claims. (Cl. 85—1)



A mechanical fastening device severable by the detonation of a small quantity of explosive contained within the body of the device. The explosive is so located that separation occurs axially. There being no weakened or notched section, the device has a high tensile strength.

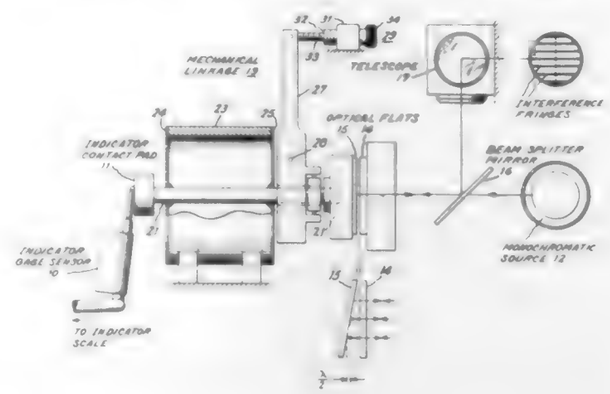
3,374,703
FASTENERS AND FASTENER ASSEMBLIES FOR BUILDING PANELS AND THE LIKE
William R. Davis, West Simsbury, Conn., and Thomas P. Anderson, Palatine, Ill., assignors to The Stanley Works, New Britain, Conn., a corporation of Connecticut
Filed Dec. 1, 1965, Ser. No. 510,785
11 Claims. (Cl. 85—13)



Spline fastener assemblies for joining building panels comprise a metal strip having biangularly deformed fastening teeth and may include a spacer strip having windows in registry with the teeth for camming the teeth into the panels during longitudinal displacement of the strip. The fastening teeth twistingly impregnate the panels due to their biangular configuration while applying a closing force on the panels. The spacers may include frame portions of various designs to provide a neat finished appearance.

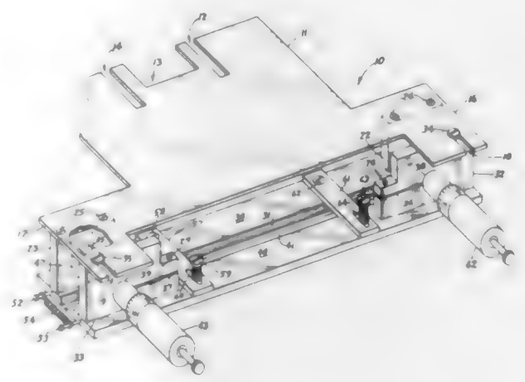
3,374,704
LINEAR CALIBRATING INTERFEROMETER
Millard S. Granger, Hillcrest, Binghamton, N.Y., assignor to General Electric Company, a corporation of New York
Filed May 26, 1964, Ser. No. 370,302
4 Claims. (Cl. 88—14)

A precision instrument for measurement of minute linear displacements by use of an interferometer which generates linear interference fringes, movement of which through a complete cycle indicates a displacement of $\lambda/2$ of the light used in the interferometer. The instrument has a rod shaped anvil one end of which is used to sense the displacement to be measured, the other to drive one of two optical surfaces of the interferometer. The anvil is supported so as to permit only linear displacement of



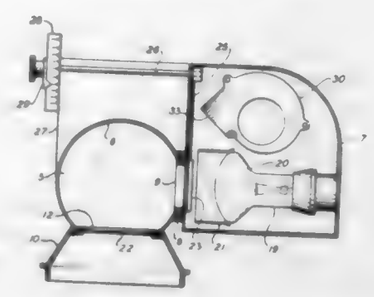
the anvil along its length. The anvil is mounted axially of a cylindrical drum mounted on the base with the anvil extending through both drum heads. The drum is inflexible, the heads elastic, metallic sheets limiting movement of the anvil to longitudinal movement.

3,374,705
OPTICAL SLIT APPARATUS
George H. Ott, Sr., St. Paul, Minn., assignor to Fabri-Tek Incorporated, Minneapolis, Minn., a corporation of Wisconsin
Filed Oct. 23, 1965, Ser. No. 503,935
9 Claims. (Cl. 88—24)



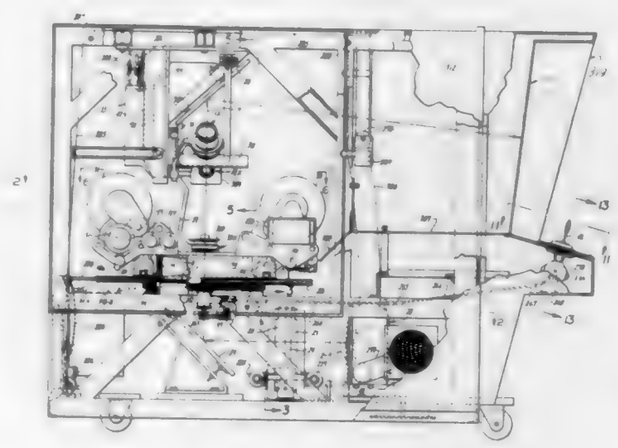
1. Adjustable optical slit apparatus comprising:
a first strip having a slit defining edge;
means connected to said first strip for stationary mounting thereof;
a second strip having a slit defining edge;
means coupling said strips and adapted to allow linear slidable motion of said first strip with respect to said second strip, said slit defining edges being in adjacent relationship;
means connected to said strips yieldingly biasing said second strip toward said first strip;
a first pair of blocks mounted one on each end of said first strip; and
a second pair of blocks mounted on said second strip each opposite one of said first pair of blocks, each of said second pair of blocks having mounted thereon precision adjustment means adapted to contact the opposite one of said first blocks for precision adjustment of the slit defined by said edges.

3,374,706
VARIABLE CONTRAST LIGHT SOURCE FOR CONDENSER ENLARGERS
Louis L. Weisglass, New York, N.Y., assignor to Simmon Brothers, Inc., Woodside, N.Y., a corporation of New York
Filed June 1, 1965, Ser. No. 460,048
4 Claims. (Cl. 88—24)



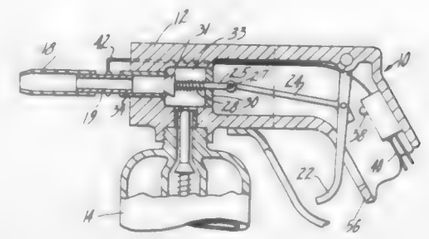
A variable contrast light source for condenser enlargers is shown including a light mixing chamber and controllable means for passing a plurality of filters between the light source and the mixing chamber, the light being cooled by a blower, the enlarger lens being carried at the end of a bellows structure.

3,374,707
VARIABLE WIDTH SCANNING FILM VIEWER
William D. Johnson, Santa Clara, Vincent Grippi, Jr., Novato, and Edward C. Aguilar, Berkeley, Calif., assignors to Houston Fearless Corporation, doing business as Nuclear Research Instruments, a division of Houston Fearless Corporation, a corporation of California
Filed Sept. 2, 1965, Ser. No. 484,579
8 Claims. (Cl. 88—28)



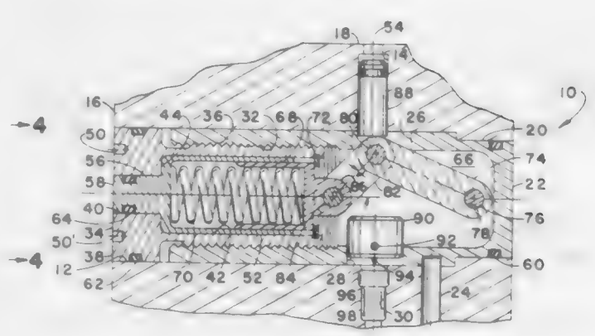
An apparatus for viewing continuous-reel film transparencies at different magnifications and at varying film speeds consisting of a viewing screen; a light source: reel means for positioning the film in the optical path between the light source and screen; means for driving the reel means rotationally and laterally; a plurality of projection lenses movable into the optical path; a plurality of condensing lenses movable into the path of the light from the light source in varying combinations; and power and control means for moving the projection lenses, the condensing lenses, the light source and the reel means.

3,374,708
ELECTRICAL ANTI-PERSONNEL WEAPON
George A. Wall, North Carver, Mass.; Eileen T. Wall, executrix of said George A. Wall, deceased, assignor to Eileen T. Wall, North Carver, Mass.
Filed Jan. 26, 1965, Ser. No. 428,096
11 Claims. (Cl. 89—1)



An electrical anti-personnel method and apparatus. The method comprises electrically energizing a stream of conductive liquid and directing the stream at a person. The apparatus comprises a pair of conductive liquid sources, a pair of conduits, a pair of nozzles, and a pair of conductive means contacting the liquid, each pair of elements separate from the other, whereby a pair of oppositely charged streams of liquid may be directed against a person.

3,374,709
FORCE-RESPONSIVE ACTUATOR
Claude E. Campbell, Levittown, Pa., and Robert B. Abrams, Hamilton Square, N.J., assignors to Thiokol Chemical Corporation, Bristol, Pa., a corporation of Delaware
Filed Mar. 23, 1967, Ser. No. 625,432
5 Claims. (Cl. 89—1)

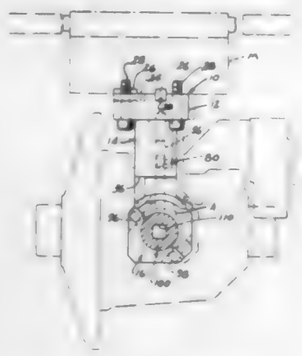


Actuator comprising a toggle joint one link of which is resiliently biased toward the pivotal axis of the other link thereof, and a plunger arranged to move the joined ends of said links toward an operating contact.

3,374,710
MACHINE TOOL VIBRATION DAMPENER
Robert Irwin Sattler, St. Clair Shores, Mich., assignor to La Salle Machine Tool, Inc., Warren, Mich.
Filed Jan. 3, 1966, Ser. No. 518,201
7 Claims. (Cl. 90—11)

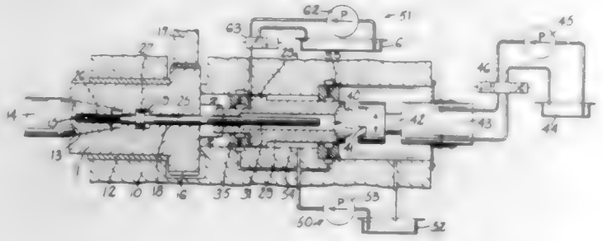
1. In a vibration dampening machine tool, the combination of,
a support member;
a generally flat base on said support member for mounting same;
a double ended cutting tool rotatably disposed at generally right angles to said support member;

and at least one pre-loaded member carried by said support member for engagement with said cutting



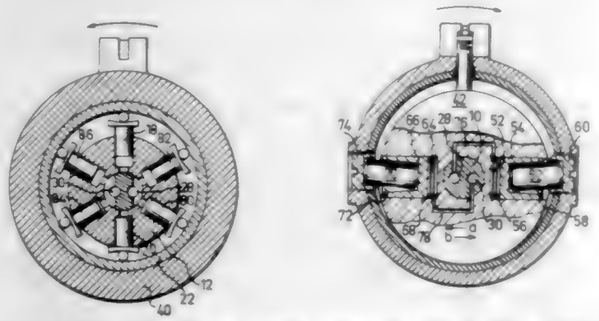
tool so as to eliminate any vibration when said cutting tool is caused to engage a workpiece.

3,374,711
POWER DRAWBAR
Alan J. Saunders, Manchester, Conn., assignor to Pratt & Whitney Inc., West Hartford, Conn.
Filed Feb. 24, 1966, Ser. No. 529,787
10 Claims. (Cl. 90—11)



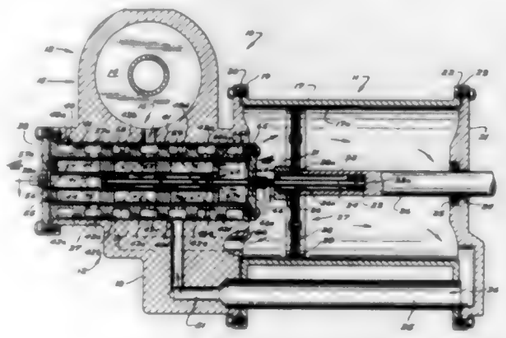
1. A power drawbar apparatus, comprising a torque tube having a bore therein with a way formed within the bore, a drawbar having a portion thereof slidably mounted in the bore of the torque tube, said drawbar having a spline mounted for slidable axial movement in said way, and said drawbar having means thereon at one end thereof for engaging a tool.

3,374,712
HYDRAULIC RADIAL PISTON MACHINES
Gustaf Erik Björklund, Stockholm, Sweden, assignor to Rederi AB Soya, Hägersten, Sweden
Filed Apr. 25, 1966, Ser. No. 545,155
Claims priority, application Sweden, May 5, 1965, 5,886/65
5 Claims. (Cl. 91—176)



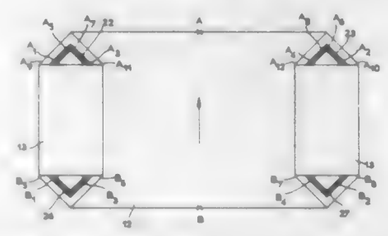
A hydraulic radial piston machine comprises a central pintle serving as a valve for the working medium, a rotor mounted on the pintle, and pistons radially movable in cylinder spaces in the rotor. These spaces communicate with the pintle through ports, the rotor defining with the pintle an intake passage and a discharge passage, the cylinder spaces communicating with those passages through the ports. A track ring is mounted eccentrically of the pintle and rotor and surrounds the rotor and bears against the pistons to cause the pistons to reciprocate in the rotor upon rotation of the rotor. The pintle is provided with a holder mounted for movement in a direction to vary the eccentricity of the machine and for movement substantially at right angles to that direction. To do this, pistons are provided which are slidable in the holder, one of the pistons being urged away from the holder by the pressure of the high-pressure passage and the other of the pistons being urged away from the holder by the pressure of the low-pressure passage. In this way, differences in pressure in the intake and discharge passages are utilized to move the ring and the pintle relative to each other in an amount and in a direction such that the angle between the diametrical plane in which the ports begin to open into the intake and discharge passages and the diametrical plane in which the pistons reverse increases with increasing pressure difference.

3,374,713
RECIPROCATING FLUID MOTOR
Arthur E. Broughton, Glens Falls, N.Y., assignor to Broughton Corporation, Glens Falls, N.Y., a corporation of New York
Filed Dec. 30, 1966, Ser. No. 606,406
6 Claims. (Cl. 91—312)



This invention relates particularly to the control portion for a reciprocating fluid motor and more particularly to a valving structure which includes a stationary spool valve with porting defined therethrough to enable the flow of fluid to either and from either side of an oscillating drive piston with a movable spool valve provided internally thereof to control the shifting of the flow of fluid to the respective sides of the oscillating drive piston and having a control member internally thereof which control member is mechanically linked to the drive piston for movement therewith but is not mechanically linked to the movable spool valve but rather is fluidly linked therewith for controlling of fluid to the respective sides of the removable piston for shifting thereof when the drive piston reaches the respective ends of its stroke. The shifting of the shiftable spool valve is accomplished by moving the control rod with the drive piston past a valving port which will cut off pressure to one end of the slidable spool valve and introduce pressure to the other end thereof such that shifting of the movable spool valve will be accomplished and will thereby, in turn, accomplish shifting of the porting in the stationary valve to direct fluid flow to the opposite side of the drive piston. The linkage of the control rod and the spool valve is accomplished only through fluid linkages thereby eliminating any mechanical connection therebetween other than that required for sealing.

3,374,714
INSTALLATIONS FOR THE MANUFACTURE OF LARGE-CAPACITY BAGS
Marius Berghgracht, Le Vieux Logis, Place Joyale, Vineuil-St.-Firmin, Oise, France
Filed Aug. 10, 1965, Ser. No. 478,554
Claims priority, application Luxembourg, Aug. 20, 1964, 46,804
19 Claims. (Cl. 93—8)

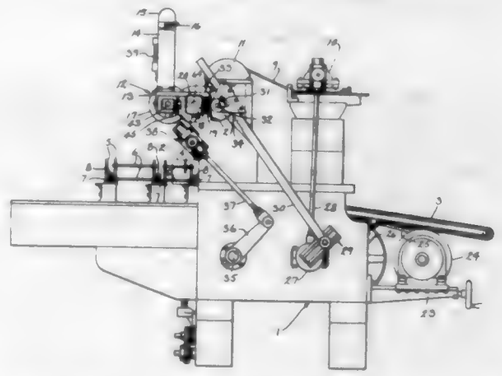


1. Installation for the manufacture of large-capacity bags from tubes of strong paper or the like, comprising a tubemaker for forming the tubes to be transformed each into a bag and a bottom-maker for forming a flat bottom at least at one end of each tube, characterized in that it includes means for supporting a pile of tubes delivered by the tubemaker and intended to feed the bottom-maker, a continuous conveyor for the bags delivered by the bottom-maker and placed separately on the conveyor, and means arranged adjacent the conveyor for controlling the correct folding of the bottoms of the bags during the passage of the bags under these control means, by checking the position of marks being part of the bottoms, said control means causing the rejection of the malformed bags.

3,374,715
PROCESS FOR IMPROVING FOLDING ENDURANCE
John W. Koning, Jr., Madison, Wis., assignor to the United States of America as represented by the Secretary of Agriculture
No Drawing. Filed Aug. 18, 1965, Ser. No. 480,826
1 Claim. (Cl. 93—36)

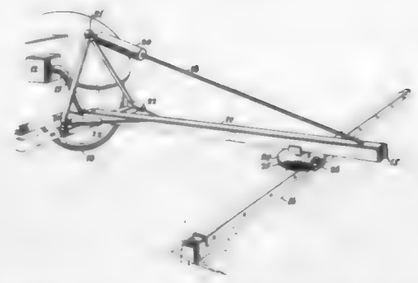
This invention relates to a process for improving the folding endurance of fiberboard containers that have been treated to increase the strength properties of the container. The invention is carried out by prefolding the treated fiberboard prior to curing the treatment impregnant.

3,374,716
JAM-UP PREVENTION APPARATUS FOR A WEB FEEDING MECHANISM
James W. Lawrie and William H. Janecek, Milwaukee, Wis., assignors, by mesne assignments, to Cleveland Container Corp., a corporation of Delaware
Filed Nov. 22, 1965, Ser. No. 508,993
5 Claims. (Cl. 93—37)



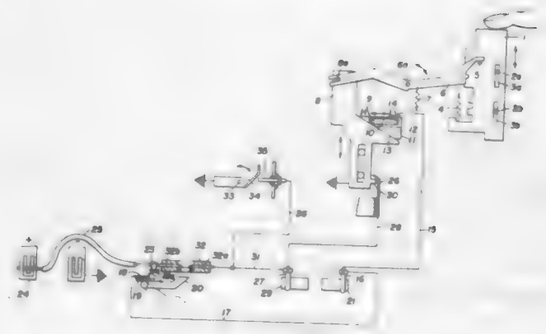
In a partition assembly machine, an idler feed roller is held in engagement with a driven feed roller by a pinion controlled cam. A rack to drive the pinion is fastened to the piston of a pneumatic cylinder. A finger rides on the partition web fed between the feed rollers to be moved by any deflection of the web. The finger is connected to actuate a switch by its movement, and the switch energizes a solenoid that operates an air valve to actuate the pneumatic cylinder to rotate the cam and release the idler feed roller.

3,374,717
POWER FLOAT
John L. Reynolds, Jr., R.D. 1, Portville, N.Y. 14770
Filed June 27, 1966, Ser. No. 560,416
7 Claims. (Cl. 94—45)



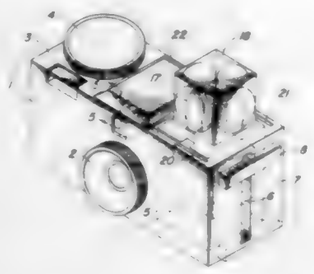
1. An apparatus for placing a surface on plastic concrete or the like to be attached to a rotatable source of power comprising boom means extending from the source of power in the direction of the surface to be attained by the concrete, float means carried by said boom means adapted to be moved substantially parallel thereto, means moving said float means along the longitudinal axis of said boom means in response to movement of the rotatable source of power, means for agitating said float means as it is moved along the axis of said boom, and means above the surface of said float means supporting said boom means in a predetermined position.

3,374,718
LOW LIGHT AND FLASH INDICATOR FOR CAMERAS
William T. Hochreiter, Rochester, N.Y., assignor to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey
Filed Mar. 4, 1965, Ser. No. 437,221
11 Claims. (Cl. 95—10)



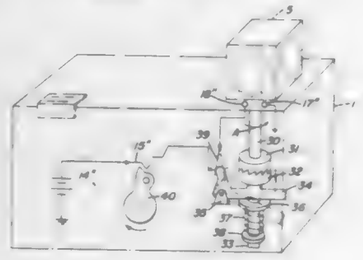
A signal in the viewfinder warns the operator when a flashbulb is required. A second signal indicates whether an inserted flashbulb is good. The apparatus includes a movable meter needle and a sensing cam which closes the circuit to the first signal when the shutter release slide is partially depressed and the needle is in the low scene brightness region. Partial depression of the slide also closes the circuit to the second signal if a flashbulb is in position and if it is a good flashbulb.

3,374,719
STORAGE AND ACTUATING MEANS FOR FLASH MECHANISM
William Howard Horton and James Edward Dierks, Rochester, N.Y., assignors to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey
Filed July 12, 1965, Ser. No. 471,178
5 Claims. (Cl. 95—11)



In a photographic camera, a socket for a multilamp flash package and means for manually moving the socket and package from a storage recess in the camera where the socket and package are stored when flash operation is not desired, to the exterior of the camera when flash operation is desired. The socket is automatically placed in the camera flash synchronizing circuit when brought to the exterior position.

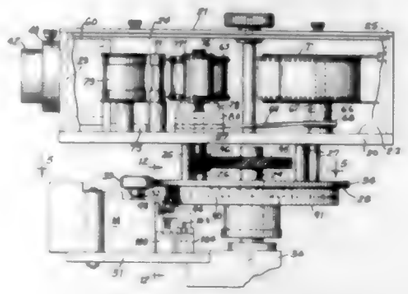
3,374,720
SELECTOR ALLOWING FLASH OR NON-FLASH CAMERA OPERATION WITH IN-PLACE FLASH-LAMPS
Donald M. Harvey, Rochester, N.Y., assignor to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey
Filed July 12, 1965, Ser. No. 471,013
10 Claims. (Cl. 95—11.5)



Either flash or non-flash operation can be chosen with the flashcube in place at all times. In one embodiment the camera has both a flash shutter release button and a non-flash button. In another embodiment the camera has a single shutter release button and a selector lever having a flash position and a non-flash position. The selector apparatus can be separate from or part of the indexing means and has a first position in which it prevents indexing and maintains the flash circuit open and a second position in which it permits indexing and permits closing of the flash circuit.

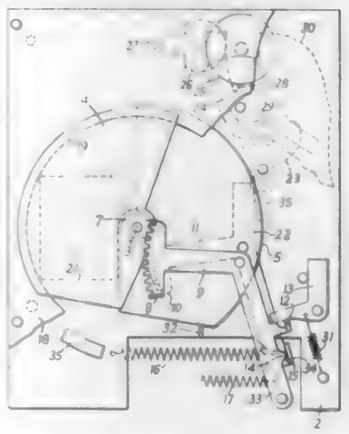
3,374,721
PANORAMIC CAMERA
Clifford F. Van Praag, Oceanside, N.Y., assignor to A.V.E. Corporation, New York, N.Y., a corporation of New York
Filed Apr. 26, 1965, Ser. No. 450,621
3 Claims. (Cl. 95—15)

A panoramic camera is provided which is adapted to be rotated through a desired arcuate distance, the camera having its film set in synchronization with the camera rotational speed. An adjustable exposure slot is also provided and means are provided for discontinuing the rota-



tion of the camera at any of an infinite number of camera positions as determined by the angular rotation of the camera housing.

3,374,722
FOCAL PLANE SHUTTER
Rolf Noack and Johannes Weise, Dresden, Germany, assignors to Veb Pentacon Dresden Kamera- und Kinowerke, Dresden, Germany
Filed June 11, 1965, Ser. No. 463,312
5 Claims. (Cl. 95—60)

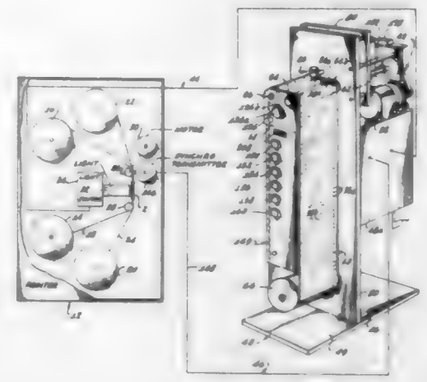


1. A photographic focal plane shutter having rotating opening and closing discs, which successively open and close the image aperture at a time interval determinable by an escapement mechanism, comprising a pair of rotatably mounted double-armed levers, each of which comprises a toothed segment arm having a drive arm connected with the end of a drive spring, the one lever as opening lever meshing with a pinion of the opening disc and the other lever as closing lever meshing with a pinion of the closing disc.

3,374,723
AUTOMATIC ELECTRICAL CONTROL APPARATUS AND FILM PRINTER CUING SYSTEM EMBODYING SAME
Harlan L. Baumbach, 14332 Mulholland Drive, Los Angeles, Calif. 90024
Filed Mar. 16, 1965, Ser. No. 440,131
30 Claims. (Cl. 95—75)

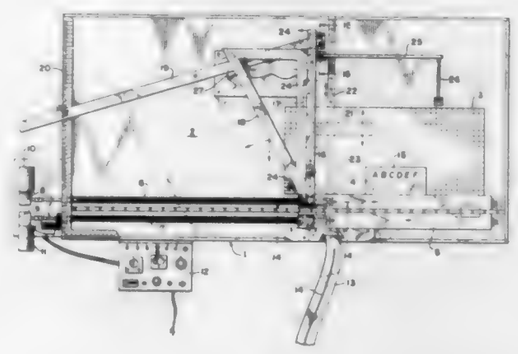
An automatic electrical control system for film printers and other devices which require initial recording and subsequent retrieval of control information in aggregately synchronized relation to the movement of a member external to the control system, the control system having an information storage member, a transcribing head for recording control information on and retrieving the control information from the storage member, and a transport mechanism powered by a synchro motor electrically

linked to a synchro transmitter driven by the external member for driving the storage member and transcribing



head in relative movement in unison with the movement of the external member.

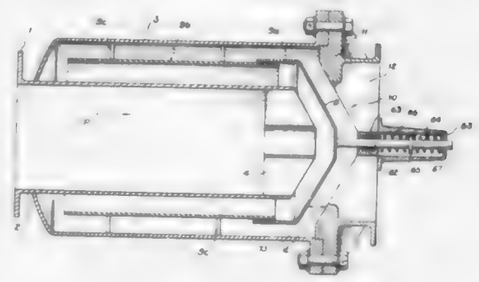
3,374,724
REPROPORTIONING MACHINE
Ruben H. Torres, New York, N.Y., assignor to The Headliners International, Inc., New York, N.Y.
Filed Apr. 5, 1965, Ser. No. 445,567
5 Claims. (Cl. 95—75)



A reproportioning machine for distorting and changing an image from a negative and printing said distorted image on a photosensitive material by exposing the negative and printing material through a small elongated aperture that moves progressively over the negative until the entire negative has been exposed. The negative and printing material are each mounted on a separate platen and move relative to each other during exposure.

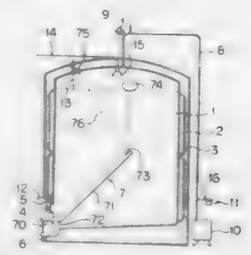
3,374,725
VALVE FOR AIR RAID SHELTERS
Paul Schierse and Gunter Franke, Lubeck, Germany, assignors to Ewers & Miesner Hartgusswerk und Maschinenfabrik G.m.b.H., Lubeck, Germany
Continuation of application Ser. No. 428,446, Jan. 27, 1965. This application Nov. 22, 1966, Ser. No. 596,345
Claims priority, application Germany, Jan. 31, 1964, E 23,316; July 11, 1964, E 27,387; Dec. 17, 1964, E 28,381
6 Claims. (Cl. 98—119)

An air intake or exhaust valve for an air raid shelter and which closes rapidly when subject to shock wave pressure is composed of a housing, a valve seat and a mo[illegible]low piston valve head in the housing, and an air i[illegible]e which extends to within the skirt of the valve head. [illegible] is of greater diameter than the intake pipe so that when the valve is closed by a shock wave the intake pipe communicates with the interior of



the housing to deflect the shock wave. A spring holds the valve in normally open position.

3,374,726
BEVERAGE FERMENTATION AND STORAGE TANK OF A LARGE CAPACITY
Sho Takayanagi, Tokyo, Japan, assignor to Asahi Breweries Ltd., Chuo-ku, Tokyo, Japan, a corporation of Japan
Filed Aug. 18, 1966, Ser. No. 573,280
Claims priority, application Japan, June 7, 1966, 41/3,663
2 Claims. (Cl. 99—275)

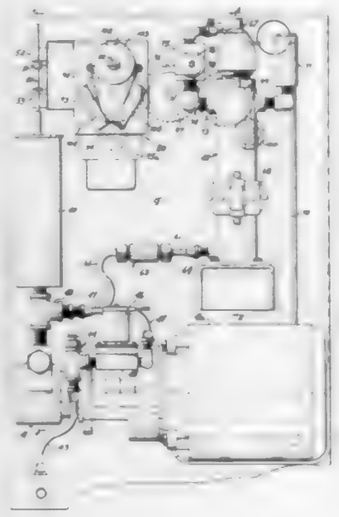


A beverage fermentation and storage tank apparatus having an externally cooled and insulated tank having an inlet and an outlet adjacent the bottom thereof, an exhaust pipe communicating with the upper portion of the tank and having pressure relief valve means for limiting the maximum pressure within the tank, one-way valve means connecting the exhaust pipe to the atmosphere for supplying air to the exhaust pipe when the pressure therein is less than atmosphere pressure, a vacuum relief valve connected with the exhaust pipe and rotary cleaning means mounted in the upper portion inside the tank.

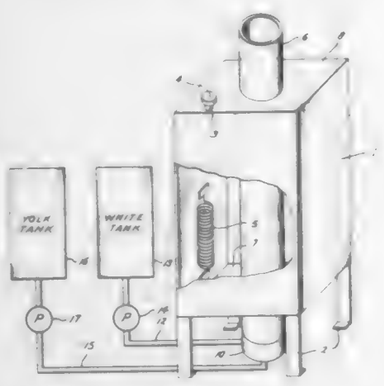
3,374,727
BEVERAGE DISPENSING APPARATUS
Robert C. Wright, Huntingdon Valley, Pa., assignor to Rudd-Melikian, Inc., Warminster, Pa., a corporation of Pennsylvania
Filed June 20, 1966, Ser. No. 558,925
5 Claims. (Cl. 99—282)

1. In apparatus for sequentially brewing beverage portions by passing a hot brewing liquid through particulate beverage material, said apparatus comprising a pair of brewing members arranged for relative movement toward and away from a position of engagement with each other in which they cooperate to define a beverage extraction chamber in which said briquettes are successively confined and wherein one of said members has an inlet port for the introduction of hot water thereinto and the other has an outlet port for the discharge of extract therefrom; a reservoir for storing a supply of water, a water line connected to said reservoir, said line being adapted to be

connected to an outside source of water under line pressure, an inlet valve in said line and means controlling said valve for selectively admitting water from said outside source to fill said reservoir with a metered quantity of water, a positive displacement pump, an inlet for said pump connected to said reservoir and a pump outlet, a boiler including a boiler chamber and a heater for heating a supply of water in said chamber, the outlet of said pump being connected to the bottom of said chamber, an outlet line connecting the boiler chamber with the extraction chamber inlet port, a discharge valve in said outlet line, means for opening said valve when said brewing members are in said position of engagement, and for operating said pump to pump the water in said reservoir into said boiler, thereby displacing hot water under pressure through said outlet line, and pressure regulating means for said pump, said pressure regulating means being operable to maintain the pressure in said extraction chamber at a substantially constant level above atmospheric throughout an extraction operation.

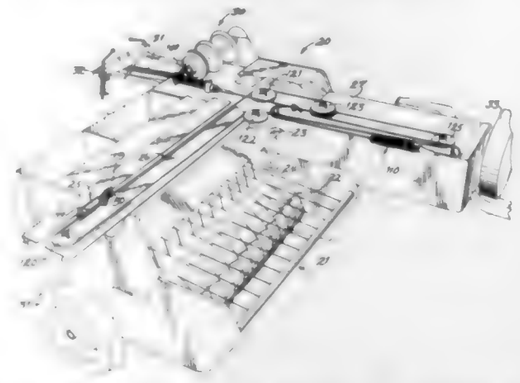


3,374,728
EGG COOKING DEVICE
Roy A. Owens, 1002 Bissonnet, Houston, Tex. 77005
Filed Mar. 24, 1965, Ser. No. 442,449
4 Claims. (Cl. 99—353)



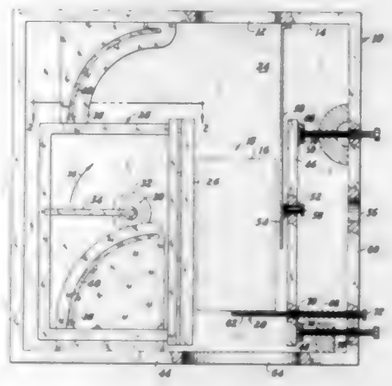
Apparatus for producing an egg product comprising means for propelling egg whites and egg yolks in a continuous stream through a cooking tube with the yolk in concentric relation with the whites.

3,374,729
AGRICULTURAL APPARATUS
Patrick L. May, Memphis, Tenn., Clyde G. Vidrine, Thibodaux, La., and Ralph E. Beyer, Memphis, Tenn., assignors to International Harvester Company, Chicago, Ill., a corporation of Delaware
Filed June 23, 1965, Ser. No. 466,327
11 Claims. (Cl. 100—142)



A feeding mechanism for a baler, and having a carriage reciprocable rectilinearly into and out of the bale chamber. The carriage is connected to the baler plunger by a cable having a feed run for moving the carriage toward the bale chamber as the plunger moves in its retractive stroke, a return run fo moving the carriage away from the bale chamber as the plunger moves in its compressive stroke and a run anchored to the baler support.

3,374,730
CRUSHING DEVICE
Hall H. Cain, R.R. 4, Spencer, Ind. 47460
Filed June 13, 1966, Ser. No. 556,995
4 Claims. (Cl. 100—233)

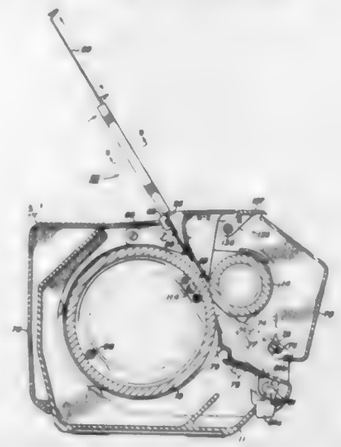


A can-crushing device, power-operated, in which the crushing is achieved by a compound relative movement of crushing walls, the movement first being primarily longitudinally of the can axis, thereby achieving a can-weakening effect with relatively little power, and subsequently the movement being primarily transversely of the can axis achieving the can-crushing with relatively little power after the can has been weakened.

3,374,731
FABRIC PRINTING
Ward Thorne, Westport, Conn., assignor to Armstrong Cork Company, Lancaster, Pa., a corporation of Pennsylvania
Filed Nov. 30, 1964, Ser. No. 414,713
2 Claims. (Cl. 101—129)

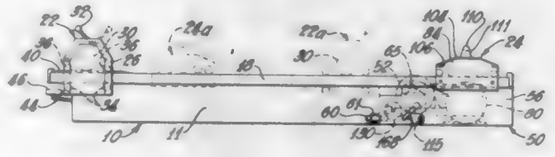
1. A method of printing a pattern on a pile fabric comprising disposing over the fabric in proximity to the surface of the pile a screen at least as fine as 300 mesh having blocking at portions thereof so as to form said pattern at the unblocked parts; selecting a liquid coloring material of sufficient viscosity to be retained against gravity on said screen and to maintain a mechanically graded level; applying said liquid coloring material in a relatively thick layer of liquid coloring material on the face of the screen opposite to the fabric to a controlled substantially uniform thickness of at least 1/50 inch by mechanical grading; directing a transient gas pressure increase against the free surface of said liquid coloring layer sufficient to cause passage of all the coloring material overlying said unblocked screen portions therethrough into said pile fabric.

3,374,732
SELF-ALIGNING COPY DRUM STRIP-OUT MECHANISM FOR REPRODUCTION MACHINES
Donald G. Mallory, Penfield, James R. Cassano, Rochester, and Robert H. Liva, Henrietta, N.Y., assignors to Xerox Corporation, Rochester, N.Y., a corporation of New York
Filed Sept. 30, 1965, Ser. No. 491,565
3 Claims. (Cl. 101—132)



A reproduction apparatus of the pressure-transfer type incorporating a three-way roller bearing support for the rotatable copy drum and driving pressure roll, toggle type force generating means for holding the pressure roll in pressure contact with the copy drum, a foldable paper tray, automatic gripping means for attaching the transfer sheet to the copy drum, means for separating copies from the transfer sheet, and programming control means adapted at the last copy programmed to release the gripping means whereby the transfer sheet is expelled with the last copy.

3,374,733
CARD PRINTING MACHINE AND TYPE INKING APPARATUS
William F. Goodrich, Adrian, Mich., assignor to The Signpress Company, Adrian, Mich., a corporation of Illinois
Filed Mar. 22, 1965, Ser. No. 441,582
6 Claims. (Cl. 101—269)

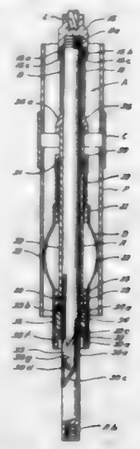


6. In a card printing and type inking apparatus, in combination, support means including a type supporting bed, parallel track means mounted on the support means at edge regions of the type supporting bed, a printing carriage mounted on the track means for reciprocable movement over the type supporting bed, card clamping means disposed adjacent one end region of the type supporting bed, a type inking carriage mounted on said track means for reciprocable movement independently of the printing carriage over said type supporting bed, a plurality of rotatable type-engaging inking rolls carried by said inking carriage, an ink supply roll journally mounted on the support means, motive means, drive means connecting the motive means with the ink supply roll for rotating the ink supply roll, said type-engaging inking rolls being disposed to successively engage the surface of the ink supply roll during reciprocable movement of the type inking carriage adjacent the ink supply roll, an ink distributing roll of lesser length than the ink supply roll, a shaft supporting the ink distributing roll for rotatable movement, said ink distributing roll being engageable with the ink supply roll to effect rotation of the ink distributing roll, said shaft having a multiple return groove therein, and means carried by the ink distributing roll engaging in said groove to effect reciprocable movement of the ink distributing roll lengthwise of the shaft during rotation of the ink distributing roll.

3,374,734
METHODS FOR PROVIDING PLANOGRAPHIC PRINTING PLATES WITH IMAGE AREAS CONTAINING CHLORINATED RUBBER
Loni Schell, Mainz, and Fritz Uhlig and Jürgen Braun, Wiesbaden-Biebrich, Germany, assignors, by mesne assignments, to Azoplate Corporation, Murray Hill, N.J.
No Drawing. Filed Aug. 20, 1964, Ser. No. 391,042
Claims priority, application Germany, Aug. 23, 1963, K 50,618/63
7 Claims. (Cl. 101—466)

7. A process for modifying the image areas of an imaged planographic printing plate which comprises inking up the plate with a greasy ink, wiping the plate with a solution of water-soluble colloid, drying the thus-applied colloid coating, scribing through the coating in the areas to be modified, applying a lacquer containing chlorinated rubber in an organic solvent to the scribed surface, drying the plate and rinsing the plate with water.

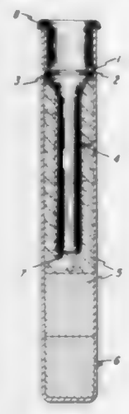
3,374,735
APPARATUS FOR LOCATING COLLARS AND THE LIKE IN WELL PIPE
Lawrence K. Moore, 3716 Ingold St., Houston, Tex. 77005
Filed Sept. 29, 1966, Ser. No. 582,936
10 Claims. (Cl. 102—21.8)



An apparatus for locating collars or the like in a well pipe, and which may be used in conjunction with detonator apparatus, wherein means are provided for multiple selective collar location in a single run of the apparatus in a

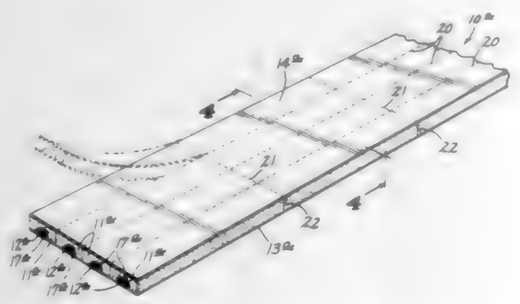
well pipe by the manipulation of a wire line, whereby a plurality of collars at different elevations may be located by movement of the apparatus in either an upward or downward longitudinal direction in the well pipe and without requiring electrical cables extending from the apparatus to the surface or a removal of the apparatus from the well pipe.

3,374,736
WATER DESENSITIZED WATER WORK BOOSTERS
Richard Dow, Bloomingdale, Paul E. Kelly, Wanaque, and Paul A. Ramsdell, Ridgewood, N.J., assignors to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Filed Aug. 2, 1966, Ser. No. 569,703
8 Claims. (Cl. 102—24)



An explosive booster which is desensitized after exposure to water by ingress of water through at least one aperture in the booster facilitated by a surfactant on at least one surface adjacent said aperture.

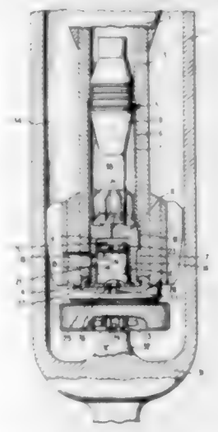
3,374,737
DETONATING TAPE
Earl A. Pike, Rte. 4, Box 203, Excelsior, Minn. 55331
Filed Feb. 15, 1967, Ser. No. 616,213
16 Claims. (Cl. 102—27)



The basic embodiment disclosed is an adhesive backed, flexible detonating tape that can be cut to a desired length and quickly attached to a secondary explosive or other object. The tape has a central carrier member with a longitudinal channel formed therein to house and support an explosive column having a predetermined configuration. The carrier member is adhesively attached between a base member and a top member, both of which have a ribbon-like configuration. A suitable adhesive coating is provided on the bottom surface of the base member.

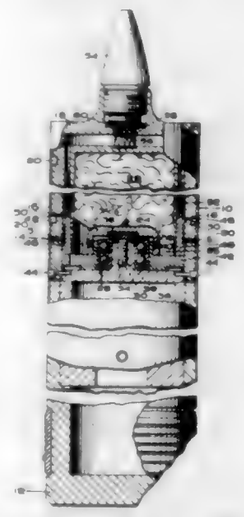
Also disclosed is an embodiment in which a plurality of carrier members are supported in a side-by-side relationship between a base member and a top member, both of which are provided with one or more rows of longitudinal perforations to permit the tape to be longitudinally split into sections. Each section has the same construction as to the above described basic embodiment. Both embodiments can be formed into a roll for ease of storage and handling.

3,374,738
PRACTICE AMMUNITION FOR MORTARS
Heinz Gawlick and Rudolf Stahlmann, Furth, and Erich Mauer, Cologne-Weidenpesch, Germany, assignors to Dynamit Nobel A.G., Troisdorf, Germany
Filed Mar. 18, 1966, Ser. No. 535,565
Claims priority, application Germany, Apr. 9, 1965, D 46,999
10 Claims. (Cl. 102—49.1)



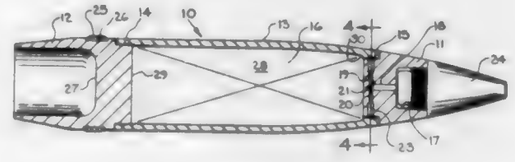
Practice ammunition of a mortar wherein a dummy projectile resembling the live projectile includes an inset barrel for firing therefrom a practice projectile. The practice projectile is held within a practice cartridge case having a bottom piece and a rearwardly opening central chamber rearward of the bottom piece for receiving therein an ejection charge that is ignitable to eject the dummy projectile from the mortar.

3,374,739
PAYLOAD RECOVERY SYSTEM
Robert L. Rodger, Hackettstown, N.J., assignor to the United States of America as represented by the Secretary of the Army
Filed Mar. 16, 1966, Ser. No. 536,587
4 Claims. (Cl. 102—56)



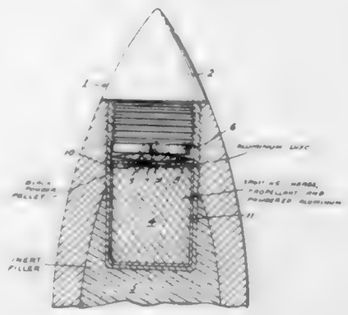
A payload recovery system including a hollow cylindrical body attached at the forward end of the payload to be recovered. Included inside said hollow cylindrical body is a ballute device attached to a thrust bearing which is attached to the payload. A fuze means is located at the forward end of the hollow cylindrical body which, through its normal mode of operation, will initiate the separation of the hollow cylindrical body from the payload thereby allowing the ballute device to inflate and allow the payload to return to earth safely.

3,374,740
PROJECTILE
John J. Voda, Evansville, Ind., assignor to Whirlpool Corporation, a corporation of Delaware
Filed Dec. 8, 1965, Ser. No. 514,167
3 Claims. (Cl. 102—57)



A projectile having nose and tail sections and a relatively thin skin connecting said sections and enclosing a payload. Detonation means in the nose section when exploded causig the thin skin to split, and further splitting thereof is caused by atmospheric and centrifugal forces so the skin is removed, releasing the payload.

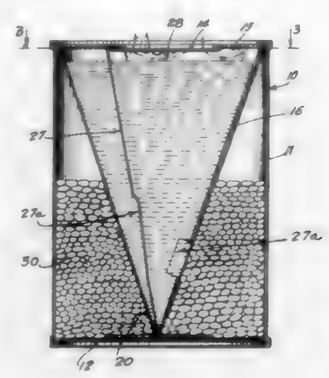
3,374,741
SPOTTING CHARGE
Ottis W. Bass, Baltimore, Md., assignor to the United States of America as represented by the Secretary of the Army
Filed Dec. 28, 1965, Ser. No. 517,161
3 Claims. (Cl. 102—87)



A spotting charge is placed in the nose of a projectile and the spotting charge is ignited by a time delay device at a predetermined time after the projectile is fired.

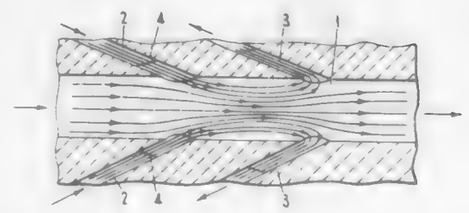
3,374,742
VAPOR-PRODUCING ARTICLE
Alan D. Brite, 5147 W. Jefferson Blvd., Los Angeles, Calif. 90016
Filed Mar. 22, 1965, Ser. No. 441,657
3 Claims. (Cl. 128—187)

A self-contained and disposable article for producing steam and vapor of a desired vaporizable material by adding water to a composition comprising an alkaline earth oxide, which has been coated with an oil to delay the rate of the resultant exothermic reaction. Said article is cylindrical with a cone-shaped cup inside separating the water from the oxide except where small openings in



the cup are provided. There is a central opening in the article where the water is added and the vapor escapes.

3,374,743
PUMPS
John Richard Stutely, Ruislip Manor, and Anthony John Walkden, Beckenham, England, assignors to The General Electric Company Limited, London, England, a British company
Filed Aug. 24, 1966, Ser. No. 574,758
Claims priority, application Great Britain, Sept. 2, 1965, 37,530/65
16 Claims. (Cl. 103—1)

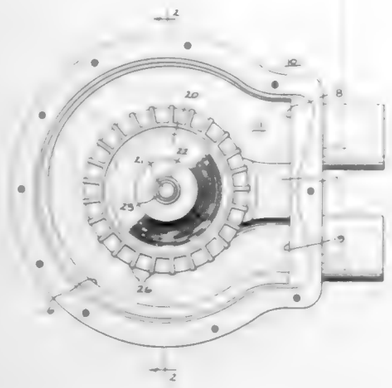


A pump especially suitable for use with corrosive fluids has a fluid-filled pump channel with side passages extending from points spaced along the channel length, each of which passages is partly filled with the fluid the amount of which lying within the passage is caused to pulsate by means entirely external of the channel, the passage inlets being directed along the channel length and the pulsations between the passages being so phased as to induce a net forward flow of the fluid. A liquid can be pumped by variations in the gas pressure applied over the liquid level within the passages, and the passages and passage inlets can be arranged so that for each passage the suck strokes as well as the blow strokes induce a forward flow of the liquid.

3,374,744
TURBINE PUMP
Daniel N. Toma, Louisville, Ky., assignor to General Electric Company, a corporation of New York
Filed Jan. 24, 1966, Ser. No. 522,544
1 Claim. (Cl. 103—3)

A turbine pump is provided with a generally annular chamber having a pair of openings for ingress and egress of fluid. A turbine impeller is mounted for reversible rotation within the chamber to pump fluid in one opening

and out the other. The clearance between the impeller and the circumferential wall of the chamber is at a mini-



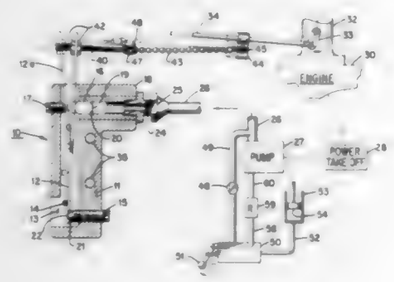
mum adjacent one opening and continuously increases toward the other opening.

3,374,745

HYDRAULIC THROTTLE CONTROL

Kenneth R. Moffett, Euclid, Ohio, assignor to Hunter Manufacturing Company, Solon, Ohio, a corporation of Ohio

Filed Oct. 7, 1966, Ser. No. 585,065
6 Claims. (Cl. 103—16)



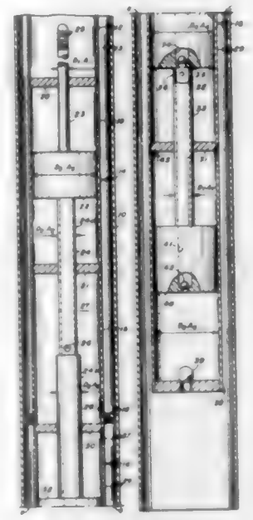
1. An automatic control device for controlling the throttle of an engine driving a hydraulic pump, said automatic control device comprising a housing, a cylinder in said housing, a piston in said cylinder, a conduit connected to one end of said cylinder and communicating with the outlet side of said pump, whereby pressure on the outlet of said pump tends to move said piston away from said one end of said cylinder toward the other end of said cylinder, leaf-spring means in said housing and having a first end engaging said piston for moving said piston toward said one end of said cylinder and a second end, a pivot pin engaging said leaf-spring means intermediate the ends of said leaf-spring means, a first adjustable screw means positioned to engage said spring means on one side thereof for limiting travel of said spring means in response to pressure in said cylinder, a second adjustable screw means engaging the opposite side of said spring means from said first screw means and at a point on the opposite side of said pivot pin from said first screw means for adjusting the force exerted by said spring means on said piston, and coupling means operatively coupling said leaf-spring means to the throttle to open the throttle in response to an increase in fluid pressure in said cylinder and to permit the throttle to close when the fluid pressure in said cylinder is reduced.

3,374,746

HYDRAULICALLY OPERATED SUBSURFACE MOTOR AND PUMP COMBINATION

Roy L. Chenault, Dallas, Tex., assignor to United States Steel Corporation, a corporation of Delaware

Filed July 11, 1966, Ser. No. 564,152
6 Claims. (Cl. 103—46)



1. In a hydraulically operated subsurface motor and pump combination, the motor of which includes a barrel, cylinder heads at the ends of said barrel, a reciprocable piston within said barrel, and tubular upper and lower piston rods attached to said piston and extending through said cylinder heads, an improved pump spaced below said motor and comprising upper and lower pump barrels arranged in tandem, cylinder heads fixed to the upper and lower ends of said upper pump barrel, a standing valve carried by said lower pump barrel at its lower end, respective upper and lower reciprocable elements within said pump barrels, the lower piston rod of said motor being attached to said upper reciprocable element, and a traveling valve in said upper reciprocable element, said combination including a spacer connecting the barrel of said motor and said upper pump barrel and through which the lower piston rod of said motor extends, said third-named piston rod having a port for fluid to enter and leave said upper pump barrel, the lower piston rod of said motor having a port for discharging fluid from said motor and pump into said spacer, said spacer having a port for discharging fluid from the combination, the cross-sectional areas of the parts of said motor and pump being proportioned to provide the same ratio of power piston area to displacement area on both upstrokes and downstrokes of said piston and reciprocable elements, thereby achieving a balanced load.

3,374,747

SELF-PRIMING DEVICE AND METHOD FOR PUMPS

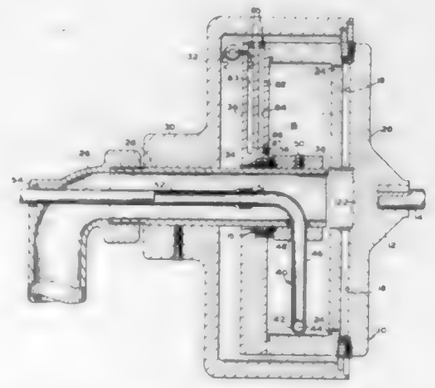
William L. King and John F. King, Eugene, Oreg., assignors to Loyal W. James and Leonard James, both of Eugene, Oreg.

Filed Aug. 19, 1966, Ser. No. 573,659
14 Claims. (Cl. 103—101)

This application discloses several different pump embodiments all of which utilize the aspirator or jet pump principle to withdraw air from the suction line of the pump either directly or indirectly, and significantly, use air or other ambient gas as the aspirating or pumping

medium rather than requiring an auxiliary supply of water, steam or the like as in prior art self-priming pumps. The aspirating means in each instance includes an aspirator head, or velocity tube, incorporating a venturi, reverse pitot nozzle, orifice or equivalent means to create a zone of low pressure within the tube as air at high velocity generated by rotation of the pump's impeller passes axially therethrough. The aspirating means also includes a suction tube which opens into the zone of low pressure within the velocity tube and extends into communication with the pump's suction line so that the air within the line will be drawn through the suction tube toward the velocity tube, thereby evacuating the suction line to permit the fluid to be pumped to enter such line and the impeller.

In one illustrated embodiment, the velocity tube is mounted on the outside of a rotatable pump casing and the suction passage extends through a wall of the casing and opens into the main pump chamber, which is in communication with the suction line, so that upon rotation of the casing, air exterior to the casing passes through the velocity tube to reduce pressure within the casing and suction line.



In a second embodiment the velocity tube is stationarily mounted within the main chamber of a rotatable pump casing which incorporates radial impeller passages within its walls, and the suction tube passes from the chamber into the suction line of the pump. The high velocity airstream created within the chamber by rotation of the pump's impeller means passes through the velocity tube to draw air from, and thereby reduces pressure in, the suction line.

In a third illustrated embodiment the self-priming device is incorporated in a conventional centrifugal pump having a stationary casing and rotatable impeller within the main chamber of the casing. In this embodiment the velocity tube of the self-priming device is mounted on an interior wall of the pump casing on the discharge side of the impeller, and the suction tube passes from the velocity tube exteriorly of the casing to the suction side of the impeller so that the airstream created by rotation of the impeller passes through the velocity tube to suck air from the suction line of the pump.

3,374,748

PUMP

Jerald S. Marsh, Cedar Falls, Iowa, assignor to Viking Pump Company, Cedar Falls, Iowa, a corporation of Iowa

Filed May 27, 1966, Ser. No. 553,377
2 Claims. (Cl. 103—126)

1. In a reversible pump of the internal gear type, the combination comprising

(1) a housing,

(2) a rotor gear journaled in the housing,

(3) means for driving said rotor gear,

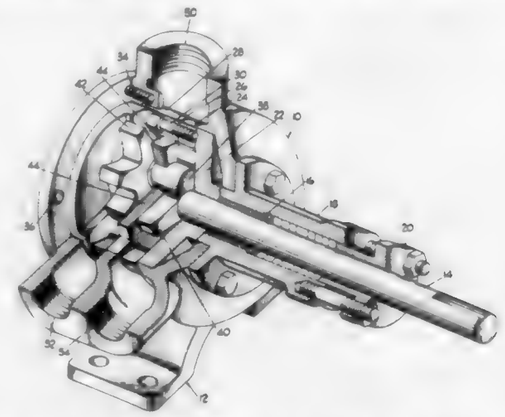
(4) a toothed rotor ring fixed on the teeth of said rotor gear, the teeth of the ring forming extensions of the teeth of the rotor gear,

(5) a head forming a cover plate for said housing,

(6) an idler pin extending within said housing, from said head, and eccentrically mounted with respect to the toothed rotor,

(7) a divider plate mounted on said idler pin,

(8) idler gears mounted on said idler pin on each side of said divider plate, one of said idler gears



being adapted to intermesh with teeth of said rotor gear and the other idler gear being adapted to intermesh with teeth of said rotor ring,

(9) a crescent-shaped projection extending from said head into the space between said rotors and said idler gears, and

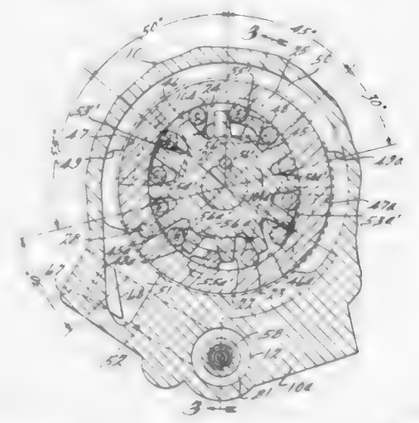
(10) ports in said housing providing fluid inlet and outlet means.

3,374,749

PORTING FOR BALANCED HYDRAULIC ROLLER PUMP

Carl A. Pace, Jr., and Christopher Nuss, Warren, Mich., assignors to Chrysler Corporation, Highland Park, Mich., a corporation of Delaware

Filed Jan. 3, 1967, Ser. No. 606,934
23 Claims. (Cl. 103—136)



Rollers carried within circumferential notches in a pump rotor ride along an out-of-round cam surface to pump fluid from radially outer and inner inlet ports (associated with inlet cam arcs of increasing radius) to radially outer and inner outlet ports associated with outlet cam arcs of decreasing radius. The outer inlet ports are restricted and open axially into radially outer portions of the notches subsequently to the axial opening of the inner inlet ports into the notches at locations radially inwardly of the rollers, the latter opening being subsequent to appreciable movement of the rollers along the inlet cam arcs, thereby to effect a gradual fluid pressure rise in the rotor notches and a radial pressure gradient

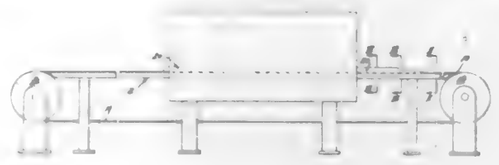
enhancing roller stability within the inlet cam arcs. The inner outlet ports discharge high pressure fluid axially from the notches and are arranged to exert unbalanced fluid pressure force axially in one direction on the ends of the rollers as they move along approximately the trailing thirds of the outlet cam arcs, thereby to end load these rollers and enhance their stability.

3,374,750
PUMP
Heinz K. Hetz, Doylestown, Pa., assignor to Yarway Corporation, Philadelphia, Pa., a corporation of Pennsylvania
Filed July 28, 1966, Ser. No. 568,528
13 Claims. (Cl. 103—152)

1. In a pump assembly comprising a diaphragm pump having a pumping chamber, a work chamber, a valve-controlled inlet and valve-controlled outlet for said work chamber, and a pumping port for admitting a pulsating liquid pumping fluid to said pumping chamber to flex the diaphragm and effect pumping of work fluid through said work chamber; and a rotary pump for supplying a pulsating pumping fluid to said pumping port; the improvement wherein said pumping chamber includes means to vent gaseous fluid from said pumping chamber comprising a passage in the top of the pumping chamber, a shaft intersecting said passage to separate the passage into a lower branch and an upper branch, said shaft including pocket means operable upon displacement of said shaft between first and second positions to alternatively register respectively with the top of said lower branch and the bottom of said upper branch, means to introduce liquid pumping fluid into said upper branch, and means to displace said shaft successively between said first position wherein said pocket receives a predetermined volume of fluid from the top of said lower branch, and said second position wherein said pocket receives said predetermined volume of liquid pumping fluid from the bottom of said upper branch, whereby any gaseous fluid in said pumping chamber is transferred to said upper branch upon displacement of said shaft from said first position to said second position and pumping fluid is transferred from said upper branch to said chamber upon displacement of said shaft from said second position to said first position.

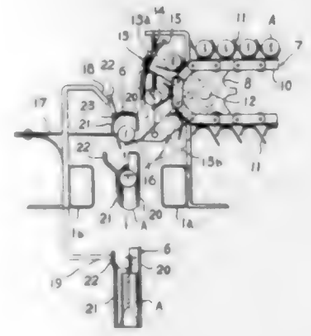
3,374,751
BAKING OVEN AND METHOD
Charles R. Werner, Grand Rapids, Mich., assignor to Werner Machinery Company, Grand Rapids, Mich., a corporation of Michigan
Filed June 10, 1965, Ser. No. 462,982
11 Claims. (Cl. 107—54)

A baking oven having an endless conveyor member passing through it, in which the endless conveyor member is a normally flat, flexible belt which is given a trough-shape as it passes through the oven by contact with generally vertical forming means in the nature of flanges disposed at the edges of the belt at the entrance to and through the oven, such that the belt itself forms the container for the dough which is to be baked in the oven. The dough is deposited upon the belt as the same enters



the oven and is given the aforesaid trough-shape, and the dough is baked as the belt carries it through the oven. At the outlet of the oven, the belt resiliently resumes its normally flat shape and separates from the edges of the baked product, which is subsequently removed from the flat belt prior to the point at which the latter returns to the inlet of the oven on its endless travel.

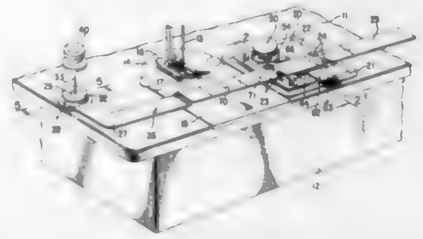
3,374,752
TRANSPLANTER
Atsushi Shirozu, 644 Chuo, Shiroishi-cho, Sapporo, Hokkaido, Japan
Filed Aug. 9, 1966, Ser. No. 571,246
Claims priority, application Japan, Mar. 22, 1966, 41/26,235
5 Claims. (Cl. 111—2)



A transplanter for paper cylinders containing seeds, said transplanter comprising means adapted to receive said cylinders from a supply means and convey them to a lever pivotally mounted on the frame of the transplanter. At least one cylinder holder is also carried by the frame and is adapted to grasp the cylinders from the lever and convey the cylinders to a planting position with respect to the frame, and means are provided for releasing the cylinders from the cylinder holder upon the former reaching said planting position.

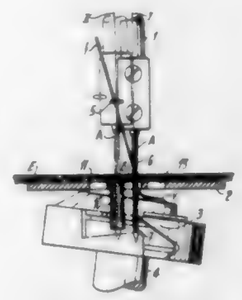
3,374,753
CIRCULAR STITCHING ATTACHMENT FOR SEWING MACHINES
Joseph G. Rakacs, Cranford, N.J., assignor to The Singer Company, New York, N.Y., a corporation of New Jersey
Filed Sept. 9, 1966, Ser. No. 578,198
4 Claims. (Cl. 112—2)

1. A circular stitching attachment for a sewing machine having a work supporting bed, a thread engaging needle reciprocable in an endwise path relatively to said work supporting bed, and a work feeding mechanism effective adjacent to said needle path for transporting work fabric in a direction transversely across said work supporting bed, said attachment comprising a base, means for securing said base rigidly to said sewing machine work supporting bed, a work fabric engaging pivot pin, a carrier arm supporting said pivot pin, guide means on said base plate slidably constraining said carrier arm for movement lengthwise of said work supporting bed, a locking element engageable with said carrier arm adjac-



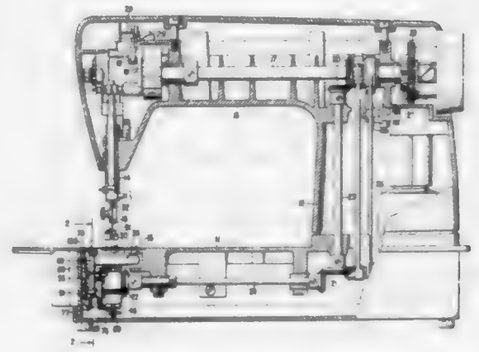
ent to said guide means, spring means anchored on said base plate and biasing said locking element against said carrier arm, and an operator influenced finger grip associated with said locking element for at will shifting said locking element in opposition to said spring means out of engagement with said carrier arm.

3,374,754
ARRANGEMENT FOR BASTING ON A SEWING MACHINE
Rolando Gianinazzi, Geneva, Switzerland, assignor to Mefina S.A., Fribourg, Switzerland, a corporation of Switzerland
Filed Feb. 16, 1966, Ser. No. 527,655
Claims priority, application Switzerland, Mar. 19, 1965, 3,886/65
1 Claim. (Cl. 112—158)



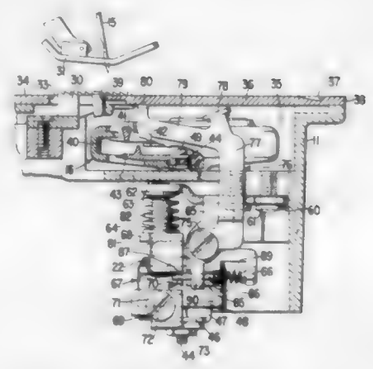
1. In combination with a zigzag stitch sewing machine, a needle bar, a needle carried by said bar, a thread carried by said needle, a needle hole plate over which a piece of fabric is adapted to be moved, said hole plate provided with a perforation system extending transversely across the path of movement of said piece of fabric, said needle bar adapted to be reciprocated selectively through two different points of the perforation system during movement of the piece of fabric thereover to provide a zigzag seam, a hook disposed beneath the needle hole plate, means for moving the hook to engage the thread carried by the needle at the end of each downward movement thereof through either of said two points, a tubular member secured to and extending downwardly from said needle hole plate and surrounding the path of the needle reciprocating through one of said two points, whereby engagement of the hook with the thread carried by the needle is prevented when the needle moves downwardly through said tubular member at said one point to limit the stitches produced to those obtained by the needle when passing through the other of said points while performing a basting operation.

3,374,755
THREAD REPLENISHING MECHANISMS FOR LOCKSTITCH SEWING MACHINES
Henry D. Chaplin, Jr., Cranford, N.J., assignor to The Singer Company, New York, N.Y., a corporation of New Jersey
Filed Apr. 26, 1965, Ser. No. 450,834
6 Claims. (Cl. 112—181)



A control mechanism is disclosed for rendering effective and ineffective devices for replenishing bobbin thread in a bobbin in place in the loop taker of a sewing machine. The control mechanism is accessible for influence by the operator through the access opening in the sewing machine which is ordinarily provided for access to the bobbin. Closing of the slide cover plate for the access opening trips latch release mechanism automatically rendering the bobbin replenishing mechanism inoperative.

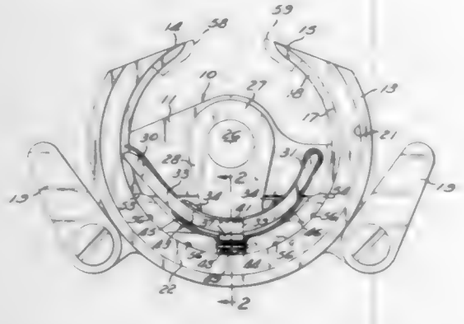
3,374,756
BOBBIN THREAD REPLENISHING CONTROL MECHANISM FOR SEWING MACHINES
John Blackwood, Linden, N.J., and George Thomas Genneken, Southington, Conn., assignors to The Singer Company, New York, N.Y., a corporation of New Jersey
Filed Aug. 22, 1966, Ser. No. 573,938
3 Claims. (Cl. 112—184)



1. In a lockstitch sewing machine having a frame, a loop taker carrier in said frame, a bobbin journaled in said loop taker, said sewing machine frame being formed with an upwardly open cavity through which said bobbin in said loop taker is accessible, a cover plate for said cavity, means shiftably supporting said cover plate on said sewing machine frame for movement in a predetermined path into and out of position covering said cavity, bobbin winding mechanism associated with said loop taker for effecting replenishment of thread on said bobbin in place in said loop taker, including a member shiftable relatively to said loop taker into and out of a position

for effecting bobbin winding, and a latch means constraining said member in effective bobbin winding position, and control means for said bobbin winding mechanism comprising a single lever fulcrumed relatively to said sewing machine frame and disposed in said cavity, said single lever having an operative connection with said shiftable member of said bobbin winding mechanism, an operative connection with said latch means, and a lever arm extending toward said cover plate, an operator influenced finger grip carried by said lever arm accessible to a machine operator when said cover plate is shifted out of position covering said cavity, and a latch release projection from said upstanding lever arm extending into the path of movement of said cover plate.

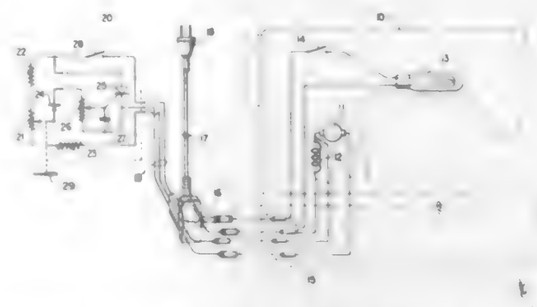
3,374,757
SHUTTLE RACE CLEANER
Sidney J. Hamlett, Parma, Ohio, assignor to White Consolidated Industries, Inc., Cleveland, Ohio, a corporation of Delaware
Filed Nov. 8, 1966, Ser. No. 592,860
7 Claims. (Cl. 112—192)



1. A sewing machine loop-taking mechanism comprising a housing defining a circular race, a shuttle slidably guided in said race for oscillating movement in an arcuate path, a shuttle driver mounted in said housing for oscillating movement about an axis concentric with said race and spaced radially inward from said race, an axial groove on the inner surface of said shutter driver, a shuttle race cleaner supported in said race and having an arcuate surface generally conforming with said race, a clip having parallel tabs secured to said shuttle race cleaner, one of said tabs engaged in said groove and the other tab engaging the outer surface of said shuttle driver whereby said shuttle race cleaner is oscillated with said shuttle driver by the driving connection of said clip in said groove and spring means operable to bias said shuttle race cleaner into engagement with said race.

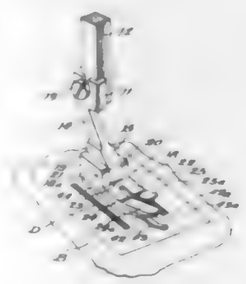
3,374,758
SILICON CONTROLLED RECTIFIER CIRCUIT ARRANGEMENT FOR SEWING MACHINE DRIVES
James W. Mais, Weehawken, N.J., assignor to The Singer Company, New York, N.Y., a corporation of New Jersey
Filed May 26, 1965, Ser. No. 458,857
1 Claim. (Cl. 112—220)

1. In combination, a sewing machine, an electric motor driving said sewing machine, a controller positioned externally of said sewing machine, a plurality of electrical circuit elements mounted in said controller, detachable means for electrically connecting said circuit elements to said motor and to a source of voltage, said elements including a silicon controlled rectifier having control terminals, an operator-adjustable means controlling the firing voltage for said rectifier to control the motor speed over a desired range of speeds and a three-terminal pre-set trim potentiometer having two of its terminals connected directly to the respective control terminals of said rectifier to form a voltage divider for applying a pre-set portion of said firing voltage to the control



terminals of the rectifier in order to provide circuit compensation for the combined effect of the tolerance variations in said circuit elements such that said operator-adjustable means is effective over the desired speed range.

3,374,759
SEWING MACHINE PRESSER FOOT
Milton M. Longcore, Stronach, Mich., assignor to Glen Mfg., Inc., a corporation of Wisconsin
Filed Sept. 16, 1965, Ser. No. 487,727
8 Claims. (Cl. 112—235)



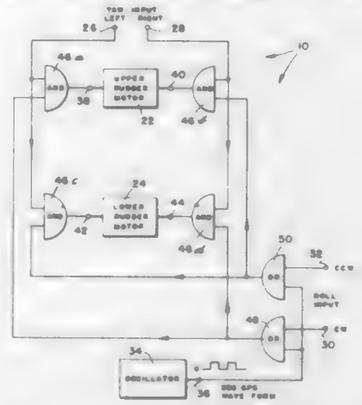
A presser foot usable in making "crack stitches" immediately adjacent a fold in a piece of material, said presser foot including a pair of laterally spaced toes defining a needle receiving slot therebetween. A guide surface is provided intermediate of said toes, and is adapted to be engaged by the fold in said material, whereby said material can be moved along said guide surface and a stitch made immediately adjacent said fold.

3,374,760
TORPEDO ROLL CONTROL SYSTEM
Edward M. Kimura, Pasadena, Calif., assignor to the United States of America as represented by the Secretary of the Navy
Filed May 4, 1966, Ser. No. 548,820
2 Claims. (Cl. 114—20)

1. In an azimuth-roll control system for a torpedo including on-off control input consisting of a left yaw signal, a right yaw signal, a clockwise roll signal and a counter clockwise roll signal, the combination comprising;

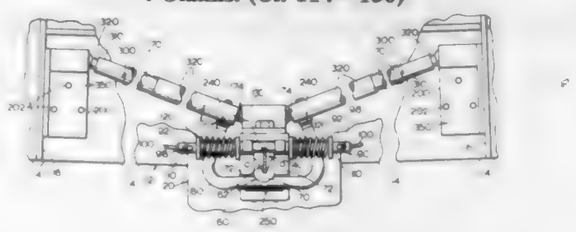
(a) upper and lower rudder surfaces separately pivoted about a common vertical axis, and upper and lower variable speed, reversible speed rudder motors geared to the upper and lower rudder surfaces, respectively,
(b) each of said motors having a first AND GATE input for receiving a signal for driving same in a predetermined angular direction about said axis and a second AND GATE input for receiving a signal for driving same in the opposite angular direction,

(c) means for generating a regular periodic pulse signal having a pulse frequency of an order of magnitude greater than the natural frequency of the motor,
(d) first and second OR GATES, said periodic pulse signal being applied to one input of each OR GATE, said clockwise roll signal and said counter clockwise signals being applied to the other input of the first and second OR GATE, respectively,
(e) means for applying the left yaw signal to the first AND GATE input of the upper motor, and to the first AND GATE input of the lower motor,



(f) means for applying the right yaw signal to the second AND GATE input of the upper motor and to the second AND GATE of the lower motor,
(g) means for applying the output of the first OR GATE to the first AND GATE of the upper motor and to the second AND GATE of the lower motor, and
(h) means for applying the output of the second OR GATE to the second AND Gate input of the upper motor and to the first AND GATE input of the lower motor.

3,374,761
HYDRAULIC STABILIZER FOR BOAT STEERING
Russell G. Bretz, Omaha, Nebr., assignor to Wave Crest Corporation, a corporation of Nebraska
Filed Sept. 12, 1966, Ser. No. 588,652
4 Claims. (Cl. 114—150)

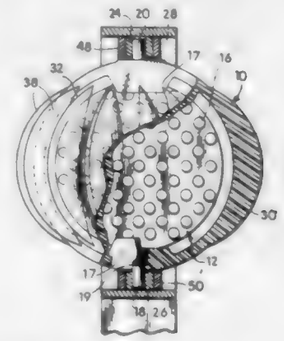


1. In combination: a boat, a controllable steering element mounted pivotally on said boat, a hydraulic stabilizer and control comprising a frame attached to said steering element, a valve attached to said frame and having two ports and having means forming a passageway between said ports, said valve having a controllable member movably mounted on said frame and operably correlated with said passageway forming means for closing said passageway at times and for opening said passageway at other times, spaced means to which control cable ends can be attached, means operably correlating said spaced means and said controllable member whereby when either one of said spaced means is pulled in a direction away from the other spaced means said controllable member is moved in a direction for opening said passageway, and means continually urging each of said spaced means into positions for causing said controllable member to be moved into a position for closing said passageway, a pair of elongated hydraulic cylinder assemblies, means attaching inner ends of said cylinder assemblies to said frame, means anchoring outer ends of said cylinder assemblies to said boat, said elongated assemblies extending generally in opposite directions approximately in parallelism with a line extending through said spaced means, each of said assemblies having a single port connected to one of said two valve ports, fluid in said cylinders and said passageway, and said cylinders being so constructed that said fluid flows from one of said cylinders to the other whenever one of said cylinders is shortened and the other lengthened by a movement of said frame toward the shortened cylinder, said means anchoring the outer end of each said cylinder assembly and the said means attaching the inner ends of each cylinder assembly to said frame together forming attachments sufficiently flexible as to permit a movement of said frame sufficiently for effective control of the steering of said boat.

3,374,762
PRESSURE INDICATOR
Alan W. Baldwin, 216 Panorama Drive, Oxon Hill, Md. 20021
Filed Jan. 27, 1967, Ser. No. 612,769
6 Claims. (Cl. 116—65)

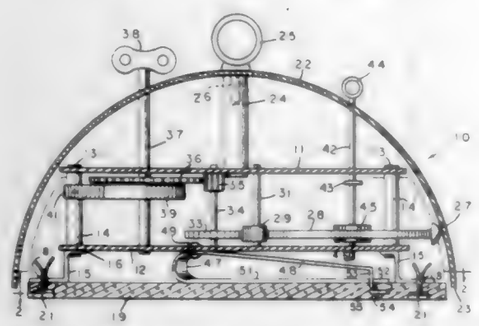
This invention is directed to a prosthetic device usable with a mechanical artificial hand to indicate the amount of force applied to an object being held in the hand. The device includes a sensing member in the form of a compressible chamber secured on the grasping face of a mechanical thumb which forces a non-compressible fluid through a tube to an indicator which is a part of a ring placed about one of the other fingers in view of the wearer. The pressure indicator indicates the force supplied in response to the finger pressure forcing an amount of fluid from the sensing chamber to the indicator. Upon release of the item held by the mechanical hand the fluid returns to the chamber with zero pressure indication of the indicator.

3,374,763
FLUID OPERATED FLASHER SIGNAL
Francis A. Browning, 2708 Bella Vista, Fort Wayne, Ind. 46809
Filed Feb. 24, 1965, Ser. No. 434,887
2 Claims. (Cl. 116—63)



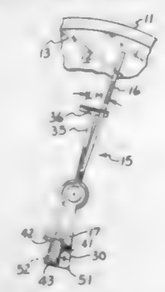
A flasher signal device is provided by a reflector element having a number of diffusor buttons mounted thereon and mounted within a rotating transparent globe causing a flasher effect signal when light comes into contact with the reflector element.

3,374,764
FLOOD DETECTOR
Martin R. Zawacki, 1857 W. Cullerton St., Chicago, Ill. 60608
Filed Oct. 21, 1965, Ser. No. 499,692
3 Claims. (Cl. 116—109)



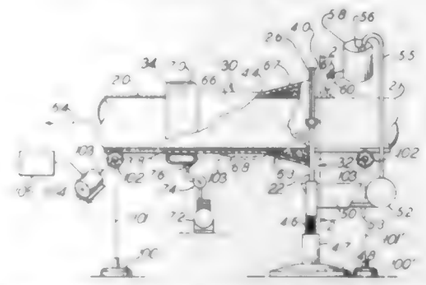
A flood detector for detecting and warning of flood conditions or leakage by the actuation of a bell mechanism having a bell dome covering a rigid frame housing a spring, gear and escapement mechanism for oscillating a bell clapper to strike the bell dome. An absorbent pad is spaced below the frame and a U-shaped spring has an upper arm secured to the frame with the spring located between the frame and the absorbent pad. One arm of the spring terminates in a tongue and the other arm terminates in a bifurcated end that receives the tongue, and a disintegratable wafer is positioned between the tongue and bifurcated end. When released by disintegration of the wafer, the upper arm lifts a release pin to allow the bell clapper and arm to oscillate and strike said bell dome thus providing an audible warning signal.

3,374,765
CHANGE INDICATOR FOR BAROMETER OR THE LIKE
Ralph H. Preiser, La Salle, Ill., assignor to General Time Corporation, Stamford, Conn., a corporation of Delaware
Filed Apr. 24, 1967, Ser. No. 633,063
1 Claim. (Cl. 116—129)



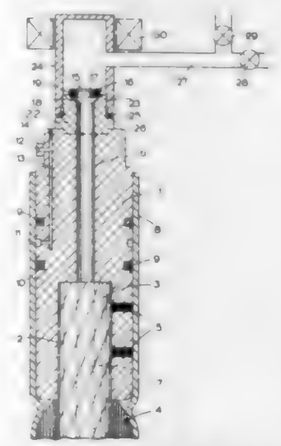
An indicating mechanism for a barometer or the like comprising an indicating hand having a tip portion and a tail portion, and a direction flag mounted on the dial under the indicating hand for indicating to the user the recent directon of movement of the hand. The direction flag is coupled to the indicating hand via a lost motion connection, and the tail portion thereof cooperates with notches in the tail portion of the indicating hand so that different corner areas of the flag are viewable in the notches at the respective limits of the lost motion, thereby providing an indication to the user of the recent direction of movement of the indicating hand. The tip portion of the flag is T-shaped, having a crossbar extending at right angles to the tip portion of the indicating hand, with a portion of the crossbar bent perpendicularly away from the dial. The bent portion of the crossbar has an elongated aperture, and the tip portion of the indicating hand is extended through said aperture to provide the lost motion connection.

3,374,766
EXTERNAL PIPE AND TUBE COATING APPARATUS
Jack W. Weaver, P.O. Box 1584 74101, and Barney L. Weaver, Jr., 5765 E. 30th Place 74114, both of Tulsa, Okla.
Filed July 25, 1962, Ser. No. 212,401
5 Claims. (Cl. 118—6)



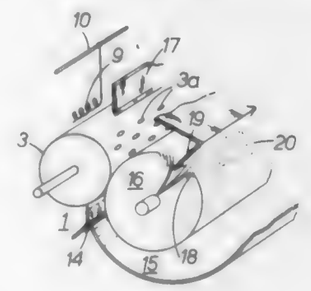
1. An apparatus for applying a coating to the exterior surface of a tubular workpiece comprising a sleeve member adapted to be disposed about and in substantial engagement with said tubular workpiece and formed of a flexible, imperforate material; said sleeve member having a cylindrical body portion including the outlet of said member and a conically configured inlet; means swingably mounting said sleeve member at the inlet and thereof whereby said member may adapt itself to non-axially-linear movement of said workpiece; said outlet being formed of an expandable material, a coating material supply associated with the inlet end of said sleeve whereby to apply coating material to said tubular workpiece; an annulus integral with and co-extensive with the outlet end of said member; fluid pressure means in communication with said annulus to effect uniform pressure and spacing of said outlet and with respect to an emergent coated portion of said workpiece whereby a coating of uniform and predetermined thickness may be produced.

3,374,767
MEANS TO IMPREGNATE A HOLLOW CABLE CORE
John Alfred Baskwell, Winchester, England, assignor to Pirelli General Cable Works Limited, London, England, a company of Great Britain
Filed June 4, 1965, Ser. No. 461,409
Claims priority, application Great Britain, July 27, 1964, 29,876/64
9 Claims. (Cl. 118—408)



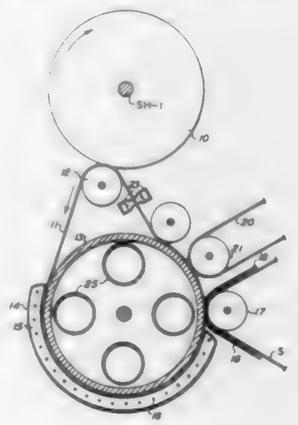
A tubular end plug utilized in impregnation of a sheathed conductor-cable and wherein one end includes means for sealing engagement with said cable and the other end includes (a) means adapted to be connected to a supply if impregnant and (b) magnetically responsive closure means whereby the cable and tubular plug may be sealed off with respect to the connecting means.

3,374,768
DEVELOPING APPARATUS FOR ELECTROPHOTOGRAPHY
Louis Frederick William Lawes, Walton-on-Thames, and Nicholas Gilbert Shreeve and Nandor Mihalik, Weybridge, England, assignors to Arlside Limited, Maidenhead, England, a corporation of the United Kingdom
Filed July 26, 1965, Ser. No. 474,743
8 Claims. (Cl. 118—637)



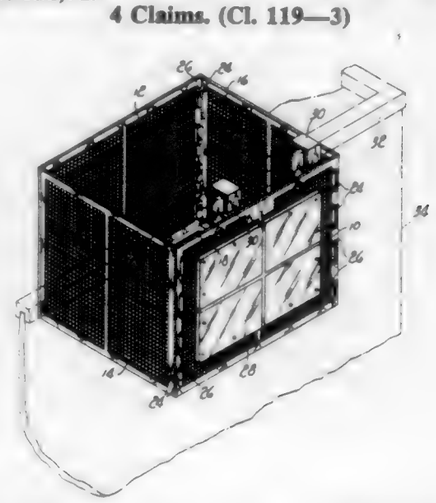
Developing apparatus for electrostatography includes a powder storage hopper opening to a metering roller having therein a plurality of recesses of predetermined shape, size and volume which are spaced axially and circumferentially from each other. A doctor blade scrapes excess powder off the metering roller, and a plurality of brush bristles are moved into contact with said metering roller and, at their point of contact with the metering roller, move in the same direction as the metering roller so as to pick up powder out of the recesses. A flick edge against and past which the bristles are moved discharges the powder from the bristles to form a powder cloud which will come into contact with the photoconducting surface of the apparatus.

3,374,769
TONER FUSING APPARATUS
Chester F. Carlson, Pittsford, N.Y., assignor, by mesne assignments, to Xerox Corporation, Rochester, N.Y., a corporation of New York
Filed Dec. 6, 1965, Ser. No. 511,652
3 Claims. (Cl. 118—641)



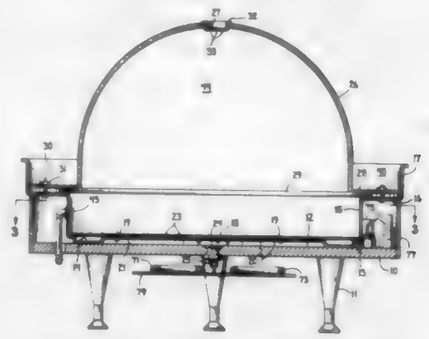
A fusing apparatus for fixing developed powder images having an intermediate transparent belt upon which is transferred the developed image and from which the developed image is placed upon a sheet of paper after being tackified while on the belt. To tackify the image, the image is passed between heater elements on one side of the belt and a reflective surface on the other for directing heat to both sides of the powder image layer.

3,374,770
FISH BREEDER
Henry Freudenberger, Mountainside, N.J., assignor to Springfield Tool & Die Company, Inc., a corporation of New Jersey
Continuation-in-part of application Ser. No. 544,224, Apr. 21, 1966. This application Feb. 14, 1967, Ser. No. 621,719
4 Claims. (Cl. 119—3)



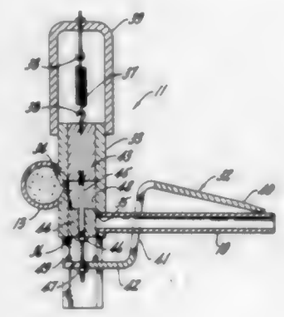
Fish breeder comprising a one piece molded plastic box like cage with perforated wall panels snapped together at their mating edges and collapsible to fold flat into overlapping relation.

3,374,771
AQUARIUM
Thomas J. Michie, 4131 Meadows Drive, Apt. E-1, Indianapolis, Ind. 46205, and John C. Bigham, Indianapolis, Ind.; said Bigham assignor to said Michie
Filed Jan. 18, 1966, Ser. No. 521,291
19 Claims. (Cl. 119—5)



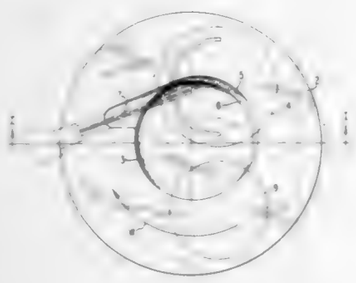
A dome-shaped aquarium provided with a water circulation system including a reservoir establishing an auxiliary or secondary pool separate from the main pool in the dome, and pumping means for delivering water to the main pool whence it will flow through an egress port substantially at the polar point of the dome back to the reservoir, which is open to the atmosphere for aeration of the circulating water, and from which it is drawn by the pump. In a preferred form, the auxiliary pool circumscribes the base of the dome and water from the egress port cascades over the external surface of the dome into the reservoir. Filter means, preferably of specified characteristics, may be cut into the circulating system by manipulation of valving means; a novel drainage means is provided; a cleaner device, energized by the circulatory water flow, may be utilized in either the main pool or the auxiliary pool; special illuminating means is provided; and the aquarium floor is specially designed to accommodate vegetation and other decorations without interference with circuation, cleaning, filtration and partial or complete drainage.

3,374,772
NOZZLE FOR ANIMAL FEEDING SYSTEM
Carl Van Gilst, Fort Atkinson, Wis., and Robert M. Peart, Lafayette, Ind., assignors to Purdue Research Foundation, Lafayette, Ind., a corporation of Indiana
Original application Sept. 20, 1965, Ser. No. 488,511, now Patent No. 3,326,187, dated June 20, 1967. Divided and this application Nov. 18, 1966, Ser. No. 595,423
4 Claims. (Cl. 119—71)



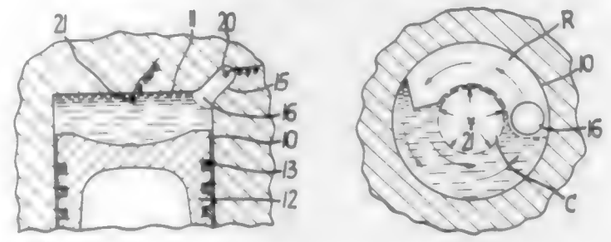
For feeding animals, a slurry of feed and water is circulated continuously from a hopper, through a dispensing conduit and then back to the hopper to be mixed with additional feed and water introduced into the hopper in amounts correlated with the amount of slurry withdrawn from the conduit by the animals. One or more feeding nozzles are connected to the conduit and each includes a valve operable to deliver a measured quantity of the slurry through the nozzle with a positive pumping action each time the animal bites on the nozzle.

3,374,773
DIESEL ENGINE
Hans O. Scherenberg, Stuttgart-Heumaden, Germany, assignor to Daimler-Benz Aktiengesellschaft, Stuttgart-Unterturkheim, Germany
Filed Apr. 27, 1965, Ser. No. 451,274
15 Claims. (Cl. 123—30)



The present disclosure relates to an improvement and to a further development of diesel engines, particularly four-cycle engines for motor vehicles, having an axially symmetrically shaped combustion chamber arranged in the piston and a nozzle arranged in the cylinder head obliquely, centrally or eccentrically to the center which injects the fuel in one or several compact jets against the combustion chamber wall in the same and/or opposite direction of an air vortex rotating about the combustion chamber axis. The fuel is caught on and held by one or more relatively wide shoulders in the central area of the combustion chamber walls. Preferably, a plurality of circumferential shoulders are provided, the decrease in width in the direction of the tangentially injected fuel and correspond in number to one or a multiple of the fuel jets. The shoulders may end circumferentially flush or in a splash off edge with respect to the combustion chamber wall.

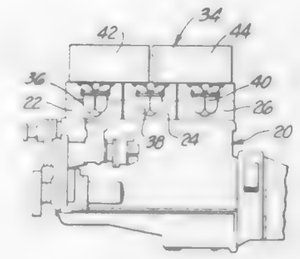
3,374,774
SUPERCHARGED OTTO GAS ENGINES
Gerhard Held, Augsburg, Germany, assignor to Maschinenfabrik Augsburg-Nuremburg A.G., Augsburg, Germany, a corporation of Germany
Filed Jan. 20, 1966, Ser. No. 521,856
Claims priority, application Germany, Jan. 26, 1965, M 63,929
14 Claims. (Cl. 123—30)



1. In internal combustion engine apparatus of the character described which can be readily converted from supercharged Otto gas operation to diesel-oil and diesel-gas operation and having an engine cylinder, a piston reciprocable in said cylinder, and a cylinder head disposed on said cylinder with valve-controlled inlet and outlet ports disposed therein, the combination which comprises a source of combustible gas mixture connected to said inlet port, an elongated substantially cylindrical ignition chamber extending upwardly and outwardly from said cylinder at the periphery thereof into said cylinder head and adjacent said outlet port and in flow communication with said cylinder through a port of relatively large cross section having gradually decreasing cross section from the said port to the opposite end thereof, spark means disposed in said ignition chamber at the end thereof opposite the said port thereof, means for firing said spark means, and swirl producing means in said inlet port for imparting a swirling movement to combustible gas mixture entering therethrough around the periphery of said cylinder and in a direction away from said ports of said ignition chamber whereby upon firing of said spark means a relatively small portion of said combustible gas mixture is ignited in the confines of said ignition chamber until such time as the flame front thereof progresses through said port thereof whereby a large cross section of ignited combustion gas is presented to the rotating movement thereof in said cylinder for the rapid and complete combustion of substantially all said combustible gas in said cylinder before knocking commences.

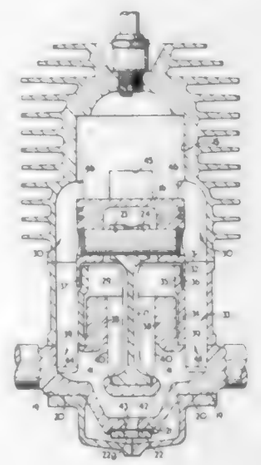
9. In a method for operating diesel-oil and diesel-gas engines as supercharged Otto gas engines by increasing the speed of combustion and completing the combustion of combustible gases consumed in the cylinder thereof to a time before the knocking cycles thereof commences, the steps which comprise introducing a combustible gas mixture into said cylinder in a swirling rotating pattern around the periphery thereof at a point therealong before the point of ignition of the said gas mixture therein, initiating combustion of the said combustible gas mixture at the point when the piston in said cylinder reaches dead center of the compression stroke by igniting a portion only of said mixture separated from the said cylinder forming a flame front for igniting the remainder of said mixture in said cylinder, conducting said flame front of said ignited combustion mixture in an approximately annular pattern around the periphery of said cylinder towards the outlet valve thereof and also spreading inwardly from the inner front of the said annular flame.

3,374,775
DIESEL ENGINE INTAKE AND EXHAUST SYSTEM
Kenneth F. Ferguson, Placentia, Calif., assignor to Hunt Foods and Industries, Inc., Fullerton, Calif., a corporation of Delaware
Filed Feb. 14, 1966, Ser. No. 527,119
6 Claims. (Cl. 123—52)



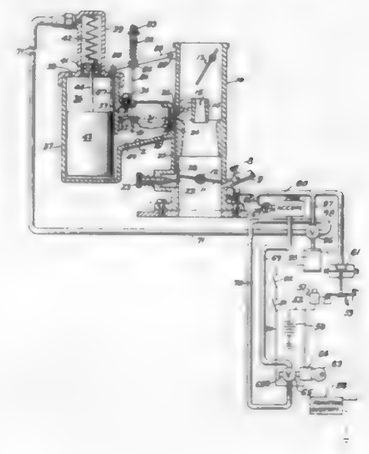
A piston engine intake and exhaust system having separate intake and exhaust manifolds for each pair of cylinders, together with a separate muffler for each exhaust manifold. Each pair of cylinders is provided with a Y-shaped intake passage which includes a common inlet portion terminating in branch outlet portions respectively leading to the cylinders. Each intake manifold is provided with a Y-shaped intake-manifold passage which includes branch inlet portions merging into a common outlet portion communicating with the inlet portion of the intake passage leading to the corresponding cylinders. The branch outlet portions of each intake passage and the branch inlet portions of the corresponding intake-manifold passage are arranged in a generally X-shaped pattern, thereby resulting in diagonal air delivery to the intake valves of the cylinders.

3,374,776
TWO-STROKE INTERNAL COMBUSTION ENGINE
Bernard Hooper, Wordsley, Stourbridge, England, assignor to The Villiers Engineering Company Limited, Wolverhampton, England, a British company
Filed Sept. 27, 1966, Ser. No. 582,341
Claims priority, application Great Britain, Oct. 8, 1965, 42,881/65
12 Claims. (Cl. 123—73)



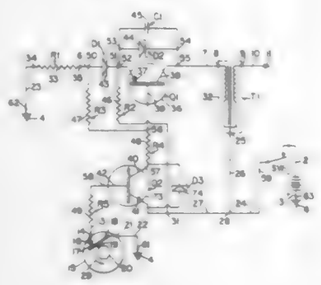
1. A two-stroke internal combustion engine employing crank case compression and including a cylinder, a piston reciprocable in the cylinder, a crank case defining a crank chamber, a crank shaft rotatably mounted by main journal means in the crank case and connected to the piston to form an assembly, main transfer passage means between the crank chamber and the cylinder for transferring the charge therebetween and auxiliary transfer passage means in said main journal means to pass the charge from the crank chamber to the main transfer passage means, and wherein during the major portions of the time during which transfer of the charge from the crank chamber to the cylinder occurs, two paths for the charge from the chamber into the main transfer passage means apart from the normal working clearance between the piston and the cylinder, the first of said paths being through the auxiliary transfer passage means and the second of said paths comprising a small clearance between the crank shaft and piston assembly and stationary abutment means of the engine, the relation between the restrictions offered to gas flow by the two paths being such that the major part of the charge flows through the auxiliary passage means during transfer.

3,374,777
VEHICLE CARBURETOR
Brooks Walker, 1280 Columbus Ave., San Francisco, Calif. 94133
Filed Nov. 6, 1964, Ser. No. 409,510
6 Claims. (Cl. 123—136)



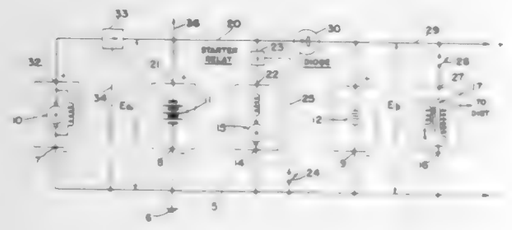
1. A carburetor for an internal combustion engine having an ignition system comprising a housing, a partition wall dividing the housing into a pair of adjacent chambers, an opening through said wall connecting said chambers, one of said chambers comprising a float bowl, a float in said bowl, a needle valve connected to said bowl for controlling the flow of fuel thereto from a supply source, means connecting said float and valve for closing the valve when the float is at a predetermined level in said bowl and for opening the valve when the float is below said level whereby to maintain a predetermined volume of fuel in said bowl; a plunger mounted in the other of said chambers for reciprocating movement therein, the volume of said second chamber beneath the plunger at one end of its stroke being sufficient to store the fuel from the float chamber whereby to prevent the feeding of fuel from the bowl, the cross-sectional area of the plunger being less than the cross-sectional area of the chamber to provide a loose fitting therein of the plunger, and the volume of said plunger being at least equal to the volume of the stored fuel, means for raising the plunger to one end of its stroke to withdraw fuel from the float bowl through said opening and into the other chamber, means for lowering the plunger to the other end of its stroke to force the fuel to return to the float bowl, and means connected to the plunger and said float for closing the needle valve when the fuel is withdrawn from the float bowl and opening the valve after the fuel is returned.

3,374,778
ELECTRONIC IGNITION SYSTEM
John A. Dixon, Los Angeles, Calif.
(7314 Variel, Canoga Park, Calif. 91303)
Filed Oct. 22, 1965, Ser. No. 501,094
2 Claims. (Cl. 123—148)



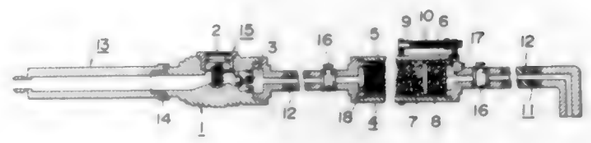
Electronic ignition systems for internal combustion engines, one using a transistorized positive ground system and another a transistorized negative ground system, the negative ground system having an ignition coil directly connected to the collector of the transistor and a circuit arrangement preventing a direct voltage path between the coil and the base of the transistor, and the positive ground system having a second transistor for turning on the first transistor and protected by a zener diode and by a circuit arrangement preventing a direct voltage path between the ignition coil and the collector of the second transistor to protect the second transistor from transient voltages and to permit the use of a lower power zener diode.

3,374,779
ELECTRIC SYSTEM
John H. Fergus, Taylors Lane, Riverton, N.J. 08077
Filed Mar. 4, 1966, Ser. No. 534,291
2 Claims. (Cl. 123—179)



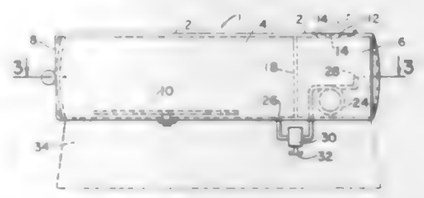
Automotive vehicular power supply system comprising a heavy-duty main battery, with means for charging it directly from the generator, and two supply leads directly connected therewith, one being a ground lead and the other being a high potential lead, and between which is maintained normally a predetermined voltage from the main battery as a current supply source for the system. An ignition circuit is connected between the supply leads to receive operating voltage therefrom in operation and is provided with a light-duty auxiliary battery connected directly with the ignition circuit for inclusion therewith. A diode rectifier is connected between the auxiliary battery and the remainder of the system exclusive of the ignition circuit and poled to prevent current flow from the auxiliary battery to the remainder of the system. When the supply voltage across the supply leads is too low for any reason, the auxiliary battery provides for supplying the ignition circuit which thus becomes isolated.

3,374,780
APPARATUS FOR SUPPLYING COMPRESSED AIR
Izumi Shimazaki, 4–25–1 Nakahara, Mitaka-shi, Tokyo, Japan
Filed Nov. 23, 1966, Ser. No. 596,518
Claims priority, application Japan, Nov. 27, 1965, 40/72,763
3 Claims. (Cl. 123—198)



1. An apparatus for supplying compressed air into tire tubes by the utilization of the compression stroke of an internal combustion engine, comprising a compressed gas intake pipe section having an outer air inlet port and a check valve; a filtrating section having a filter chamber containing adsorbent and a flow regulator composed of a plurality of regulating plates mounted around a supporting rod at appropriate intervals in staggered relation, and a gas detector having a transparent tube filled with gas detecting agent and communicating with the end of said filter chamber; and a compressed air supply port section; these sections being connected one another by means of high pressure hoses.

3,374,781
PRESSURE VESSEL
Maurice Bramson, 16 Woodcrest Road, Kings Point, N.Y. 11024
Filed Oct. 13, 1965, Ser. No. 495,435
3 Claims. (Cl. 126—369)

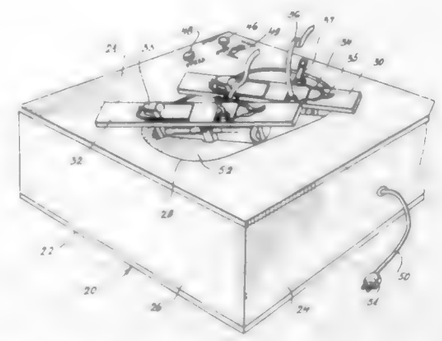


A vessel having a longitudinal body shell, said body shell including a steam pressure chamber and a condensation chamber, said chambers being tandemly arranged, said condensation chamber being at atmospheric pressure when said pressure chamber is above atmospheric pressure, partition means sealingly separating said chambers, and condensation means mounted within said condensation chamber, said condensation means having an inlet and an outlet opening, one said opening being in communication with said pressure chamber, the other said opening being in communication with the atmosphere, and valve means for regulating fluid flow through said condensation means.

3,374,782
EXERCISING MACHINE FOR SKIERS
Charles P. Izzo, 72 Main St., Ridgefield, Conn. 06877
Filed Oct. 22, 1965, Ser. No. 501,786
10 Claims. (Cl. 128—25)

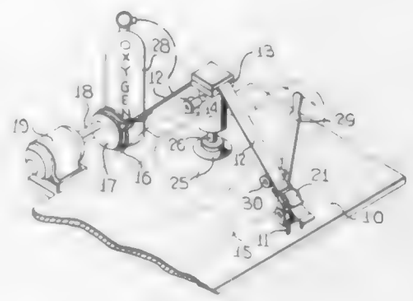
1. A machine for training and exercising a skier to perform simulated skiing movements, comprising a base, a pair of narrow platforms on said base simulating skiis for supporting a skier while both feet of the skier wearing ski boots stand on the platforms respectively, means on the platforms for engaging the ski boots, a drive motor, and a mechanism means inside the base operatively connecting the drive motor and platforms for executing continuous simulated ski turns in right and left directions by

turning the platforms simultaneously on parallel vertical axes in the same one direction while turning the platforms on parallel horizontal axes in a common angular



direction, and for elevating the rear end of only one of the platforms approaching a central vertical plane of said base during the turn in said one direction.

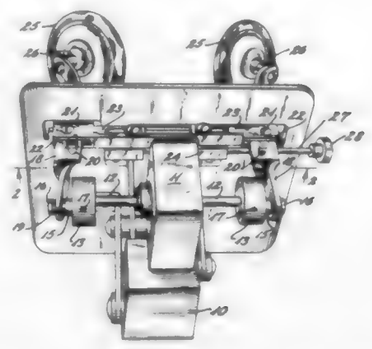
3,374,783
HEART MASSAGE UNIT
Hyman Hurvitz, 1313 Juniper St. NW., Washington, D.C. 20012
Filed Dec. 23, 1965, Ser. No. 515,865
8 Claims. (Cl. 128—51)



1. A heart massage unit, comprising
a plate underlying a patient,
a length of belt extending over the patient at the location of the sternum of the patient,
means securing said length of belt at both its ends to said plate,
a pressure applicator secured to said length of belt and extending from said belt into contact with said sternum,
said means comprising means for periodically tightening and releasing said belt at a rate of about 1 (reciprocation per second) and to an extent such that said applicator moves inwardly toward said sternum and is released at said rate for a distance of about 1",
said last means being located at least adjacent one end of said length of belt.

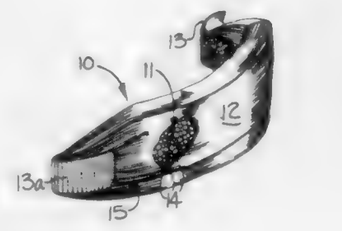
3,374,784
MECHANICAL MASSAGE APPARATUS WITH CRANK AND SLIDE
George T. Brent, 311 N. Fort Harrison St., 33515, and Edward S. Aronoff, 1826 Nottingham Lane, 33516, both of Clearwater, Fla.
Filed Jan. 7, 1966, Ser. No. 519,209
6 Claims. (Cl. 128—61)

1. A mechanical massager comprising massage elements located in a manner to engage and massage spaced portions of the body, an arm pivotally mounting each of said massage elements, each arm having an inclined slot along its length, a support, a pin extending through each of said slots and being attached to said support means connected to the end of each of said arms remote from



said massage elements, and power means for rotating said last mentioned means, whereby said arms will be projected, retracted, and oscillated to impart motion to said massage elements.

3,374,785
CERVICAL COLLAR
John F. Gaylord, Jr., Matthews, N.C., assignor to Medical Specialties, Inc., Charlotte, N.C., a corporation of North Carolina
Filed Oct. 11, 1965, Ser. No. 494,422
7 Claims. (Cl. 128—75)

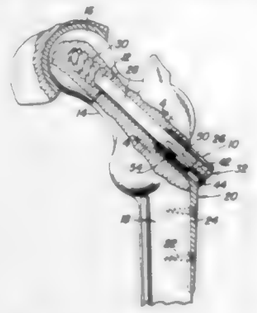


1. A cervical collar comprising:
(a) an elongate, resilient, porous core of discrete particles of polyurethane foam material bonded together, said core having
(1) a size generally corresponding to the overall shape of the collar;
(2) a density of about six pounds per cubic foot, and
(3) an enhanced porosity comparable to that of common polyurethane foam material of about two pounds per cubic foot density;
(b) a porous covering on said core; and
(c) means positioned on each end of said covered core for securement of such ends together when the collar is placed about a wearer's neck.

3,374,786
FRACTURED BONE SETTING FASTENER ASSEMBLY
George R. Callender, Jr., 1308 Quarrier St., Charleston, W. Va. 25301
Filed Dec. 15, 1964, Ser. No. 418,427
8 Claims. (Cl. 128—92)

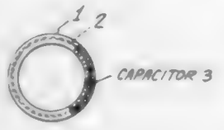
A nailing apparatus for fractured femoral bones consisting of a sleeve member and a femoral fastening member, the latter having parallel slots joined at their opposite ends by a circumferential slot, the slots cooperat-

ing with a keying means on the sleeve and a limit screw attached to one end of the fastening member to alternately



permit relative axial displacement of the fastening member or locking it against such movement.

3,374,787
INTRA-UTERINE CONTRACEPTIVE DEVICE
Fred L. Hatke, Skillman, N.J., assignor to Radio Corporation of America, a corporation of Delaware
Filed Nov. 18, 1965, Ser. No. 508,456
6 Claims. (Cl. 128—130)

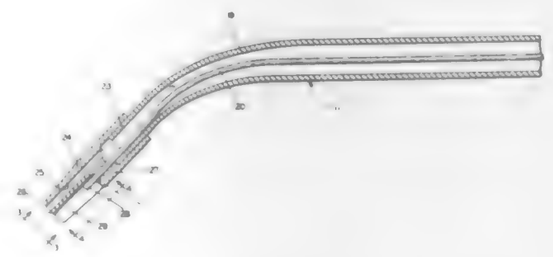


6. A contraceptive intra-uterine device comprising:
a smooth, flexible, resilient, tubular ring-like member adapted to be placed with its primary plane in the frontal plane of a uterus with the actual shape of said member conforming to the internal shape and dimensions of said uterus at the position of said member in said uterus,
a metallic electrically conductive wire ring internal to said member and conforming in shape to that of said member, said wire ring having a value of inductance determined by the shape thereof and therefore of the shape of said member when in said uterus, and
a capacitor internal to said member and connected to said wire ring to form with the inductance of said wire ring a resonant circuit having a resonant frequency determined by the value of said inductance and therefor the position of said member in said uterus.

3,374,788
CONTRACEPTIVE DEVICES AND METHODS
Gerald S. Rosenthal, Ogden, Utah, assignor to Deseret Pharmaceutical Company, Salt Lake City, Utah, a corporation of Utah
Continuation-in-part of application Ser. No. 461,281, June 4, 1965. This application Oct. 24, 1965, Ser. No. 515,284
22 Claims. (Cl. 128—130)

1. An intra-uterine contraceptive assembly comprising an intra-uterine contraceptive device of biologically inert material comprising a trunk portion from which a pair of oppositely disposed loops protrude, an elongated tubular member adapted to linearly receive the device with said loops being unlooped in side-by-side generally linear relation for placement of the device within the uterus, said tubular member being of such size and shape so as to extend at its distal end through the cervical os into the uterus and at its proximal end project entirely outside the body of the patient so as to provide an external portion which can be visualized and manually grasped for purposes of manipulation, and a plunger the leading end of which is joined the trunk portion of the device for to and fro joint manipulation so that when the plunger is slidably disposed within the tubular element but with the trailing end of the plunger projecting from the proximal end thereof pulling of the plunger outward through the proximal end of the tubular member a predetermined distance will load the device into the tubular member through the distal end thereof until the loops are unlooped in the mentioned side-by-side relation and, thereafter pushing the plunger inwardly through the proximal end of the tubular member a predetermined distance will accommodate ejection of the device, when the tubular element is so placed within the uterus, such that the loops, due to the shape-retention characteristics of the inert material, are restored to their looped positions within the frontal plane of the uterine cavity.

3,374,789
DENTAL SYRINGE WITH NOVEL NOZZLE TIP
John A. Maurer, Canton, Ohio, assignor to The Weber Dental Manufacturing Company, Canton, Ohio, a corporation of Ohio
Filed Sept. 18, 1964, Ser. No. 397,398
6 Claims. (Cl. 128—173.1)



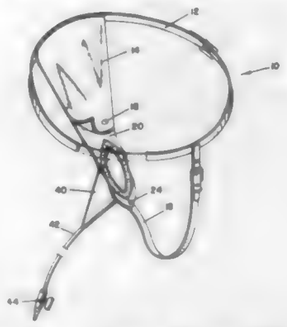
A dental syringe nozzle for selectively discharging air or water or an air-water mixture having an air tube terminal at the nozzle tip and a diametrically aligned adjacent water tube terminal spaced from the nozzle tip in a channel open at the side and end of the tip to discharge air alone when desired without aspirating unwanted water.

ERRATUM

For Class 128—189 see:
Patent No. 3,374,742

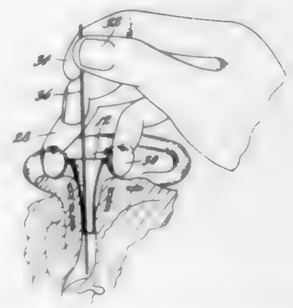
3,374,790
EXTERNAL FEMALE URINAL
Irene B. Mayhorne, Perry Hall Medical Center, Baltimore, Md.
Filed Dec. 2, 1963, Ser. No. 327,297
11 Claims. (Cl. 128—295)

9. A urinal adapted to be positioned at the vulva region of the body of a human female comprising an elongate sheet of material, said sheet being impervious to water and urine so as not to absorb urine which may come into contact therewith, and being pliable to thereby conform to the body of a said human female, said sheet having a generally elongate opening therein, said opening having its major axis extending longitudinally of said sheet, a pad on one side of said sheet, said pad surrounding said opening and being of flexible yieldable and resilient material, said pad being of lesser thickness at one end thereof and of greater thickness at the other end thereof with the thickness increasing in the direction of said axis of said opening, whereby it may engage with and substantially seal against the vulva region of a female human body, means extending from said sheet oppositely from said pad for receiving liquid passed through



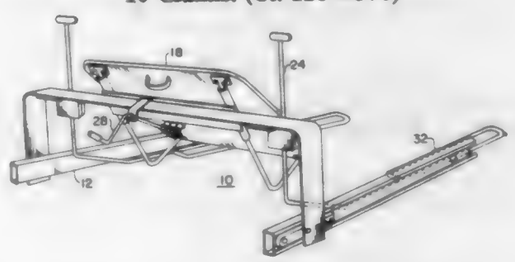
said opening, said means being of material which is pliable, foldable and impervious to water and urine, said means having a flexible tube attached to it in fluid conducting relationship at a point remote from said sheet, and substantially flexible means for securing said sheet and pad in position against the vulva region of a female human body.

3,374,791
EAR SPECULUM
Samuel Thomas Westerman, 519 E. Tabor Road, Philadelphia, Pa. 19120
Filed July 21, 1965, Ser. No. 473,738
2 Claims. (Cl. 128—343)



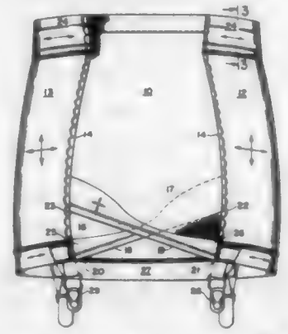
An ear speculum which terminates upwardly in a wide mouth which is finished with an outwardly rolled peripheral rim and a pair of rim connected, curved finger hold extensions substantially diametrically opposed and extending outwardy from the said rolled rim.

3,374,792
NEGATIVE PRESSURE DEVICE
Robert C. Armstrong, La Mesa, Calif., assignor to General Dynamics Corporation, San Diego, Calif., a corporation of Delaware
Filed Dec. 17, 1965, Ser. No. 514,622
10 Claims. (Cl. 128—376)



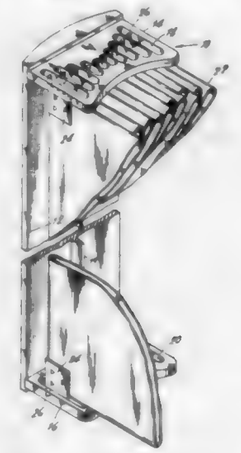
1. A negative pressure control device for a dry immersion bed comprising in combination:
(a) support means,
(b) negative pressure control means adjustably mounted on said support means, and
(c) head rest means adjustably mounted on said support means.

3,374,793
NON-ROLL FOUNDATION GARMENT
James F. Young, Dover, and John D. Ferguson, Alapocas, Wilmington, Del., assignors to Sarong, Inc., Dover, Del., a corporation of Delaware
Continuation of application Ser. No. 236,926, Nov. 13, 1962. This application Feb. 18, 1966, Ser. No. 528,505
6 Claims. (Cl. 128—533)



1. A girdle construction including a woven circumferentially elastic collar joined at its bottom edge to the top edge of the girdle proper, the collar being made of one-way stretch fabric having a high degree of longitudinal elasticity and containing vertically disposed threads having a fineness in the range of 200 to 700 deniers or equivalent fineness, said collar comprising a body portion and a lip portion, said body portion having at least two interwoven fabric layers, the upper edge of the collar being divided into two free separate overlapping lips each being integrally interwoven with the collar body and being integral extensions of its fabric layers, the body of the collar being wider and stiffer than the lips whereby tensions generated by movement of the body of the wearer are distributed through the collar to cause the lip portion to turn in towards the body of the wearer and thus substantially reduce rolling of the top of the collar.

3,374,794
RECORD HOLDER
Murray Z. Reed, Syosset, N.Y., assignor to Eagle Druggists Supply Company, Inc., New York, N.Y., a corporation of New York
Filed Dec. 6, 1965, Ser. No. 511,842
4 Claims. (Cl. 129—20)



Phonograph record album includes a support element, respective plates perpendicularly affixed near the opposite transverse ends of the element, a given plurality of parallel

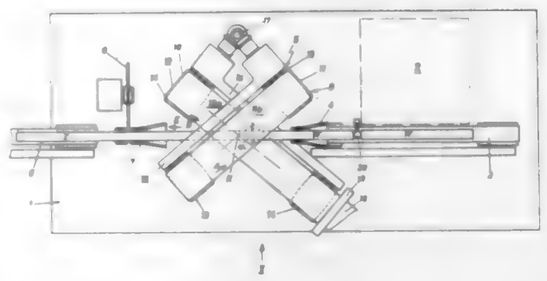
disposed openings provided in the plates, the openings being disposed substantially perpendicularly to the element and progressively symmetrically decreasing in size from the outer to the inner openings to provide an array of symmetrical bitrapezoidal configuration, corresponding ones of the openings in the upper and lower plates respectively being in registration, the corresponding openings receiving record containing sleeves therein, each of the sleeves including a pair of adjacent closed corners, and means insertable into the openings provided at each of the closed corners, each of the insertable means including a projecting tab for insertion into one of the openings to adapt a sleeve to be received into a pair of corresponding registered openings and an integral blank folded in half to define a pair of leaves, the projecting tab being aligned with the fold point of the blank, the sleeves having an open edge opposite the closed corners.

3,374,795
APPARATUS FOR MAKING CONTINUOUS CIGARETTE RODS
Desmond Walter Molins, Deptford, London, England, and Francis Auguste Maurice Labbé, Neuilly-sur-Seine, France, assignors to The Molins Organisation Limited, London, England, a corporation of Great Britain
Filed July 27, 1965, Ser. No. 475,113
Claims priority, application Great Britain, Sept. 11, 1964, 37,375/64
2 Claims. (Cl. 131—21)

In a continuous rod cigarette making machine, "shorts" are removed from the supply of tobacco in the hopper and are fed into a reservoir, from which they are discharged at a controlled rate into an air stream which carries tobacco for forming a tobacco filler. Control of the rate of discharge of shorts from the reservoir is effected by a detector which detects the quantity of shorts in the reservoir.

3,374,796
APPARATUS FOR CONTINUOUSLY ROLLING CIGAR CORES
Walter Galliker, Pfeffikon, Lucerne, Switzerland, assignor to Villiger Sohne A.G., Aargau, Switzerland, a corporation of Switzerland
Filed Dec. 9, 1964, Ser. No. 417,134
Claims priority, application Germany, Dec. 11, 1963, V 25,020
4 Claims. (Cl. 131—59)

An apparatus for continuously wrapping axially aligned, successively fed cigar cores, wherein said apparatus comprises a pair of conveyor belts each having longitudinally moving working courses, said working courses being disposed in different planes and crossing to define a rolling zone therebetween. One of said conveyor belts is arranged for receiving a wrapper on the working course thereof and for conducting the wrapper to the rolling zone. The cigar cores are axially introduced into the rolling zone with each of the conveyor belt working courses being positioned at an angle to the lengthwise axis of said cores introduced therebetween. The working courses are spaced apart a preselected distance to enable said working courses to engage each of said cores at two diametrically spaced locations within the rolling zone for simultaneously



rotating said cores to spirally wind a wrapper thereon and axially drive the cores through and out of said rolling zone in a wrapped condition.

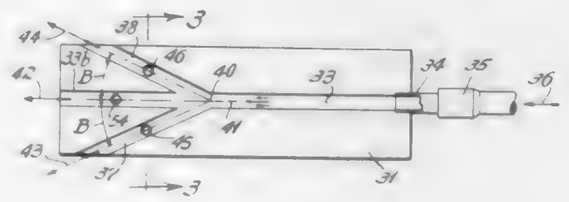
3,374,797
COLLAPSIBLE SHELTERS
Otto Walter Neumark, 2 Churchill Ave., Stockport, England
Filed May 25, 1965, Ser. No. 458,607
Claims priority, application Great Britain, May 25, 1964, 21,621/64
4 Claims. (Cl. 135—1)

A collapsible shelter or tent comprising, a canopy of substantially hexagonal shape when viewed in plan and with the canopy flattened. Posts are provided beyond at least three of the sides of the canopy. Supporting cables extend between the posts and to the ground, such cables defining an equilateral triangle between them. Secondary cables extend from the posts to the center of the canopy and couple thereat to a triangulated plate. Stressing cables are provided at the six sides of the canopy and these cables extend along upwardly curved lines which define the tops of the sides or walls of the resultant tent, the said sides or walls being convexly curved at the top by the action of the said stressing cables.

3,374,798
CAMOUFLAGE EQUIPMENT
Knut August Sigvard Samuelson, Stockholm, Sweden, assignor to Licentia, Ekman & Brundin, Stockholm, Sweden
Filed Nov. 29, 1965, Ser. No. 510,195
Claims priority, application Sweden, Dec. 7, 1964, 14,763/64
4 Claims. (Cl. 135—20)

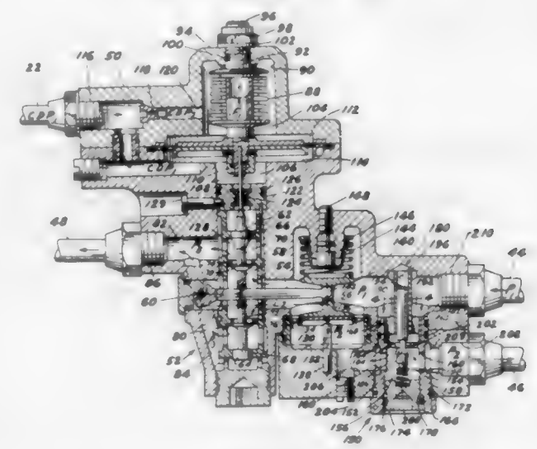
A readily transportable camouflaging device comprises a shaft; a plurality of ribs pivotally connected to the shaft adjacent one end of the latter and directed laterally in various directions from the shaft (after the manner of an umbrella) and camouflage net means supported on the ribs. The ribs are arranged in series, one over the other, to provide at least two groups of ribs, and are of varying lengths mutually and in the various series. A slide displaceable on the shaft and lockable in at least one position therealong is connected to said ribs through link means, for presenting the ribs in more or less extended portions.

3,374,799
FLUID FLOW CONTROL SYSTEM
Brooks Lyman, Pound Ridge, N.Y., assignor to Pitney-Bowes, Inc., Stamford, Conn., a corporation of Delaware
Original application June 21, 1962, Ser. No. 204,206, now Patent No. 3,194,253. Divided and this application Nov. 25, 1964, Ser. No. 413,943
2 Claims. (Cl. 137—81.5)



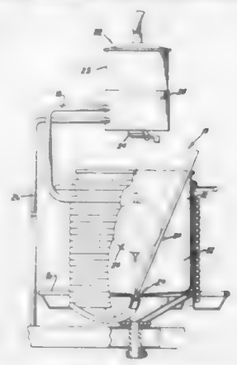
1. A method of selectively controlling the flow of a fluid along at least two predetermined flow paths; comprising the steps of
providing a fluid flow source;
establishing a continuous main fluid stream from said source;
establishing two symmetrically disposed divergent flow paths which communicate at a substantially common point with the main stream whereby at any given time at least a portion of said main stream is conducted along only one of said divergent flow paths, this fluid flow system normally remaining in a stable condition until caused by a predetermined fluid control signal having at least a predetermined minimum power to shift to another stable condition wherein at least a portion of the main stream is conducted along the other of said divergent paths;
applying a reduced fluid control signal having a power less than said predetermined minimum power to said [first and second] one of said divergent flow paths downstream of said common point;
interrupting the fluid flow along the main stream during the application of said reduced fluid control signal; and
re-establishing said main fluid stream during the application of said reduced fluid control signal so that at least a portion of the main fluid stream flows along only the said other of said divergent flow paths.

3,374,800
GAS TURBINE ENGINE CONTROL HAVING BY-PASS VALVE MEANS
Dean F. Wheeler, Detroit, and Warren H. Cowles, Birmingham, Mich., assignors to Holley Carburetor Company, Warren, Mich., a corporation of Michigan
Filed Mar. 21, 1963, Ser. No. 267,017
9 Claims. (Cl. 137—117)



1. A hydraulic system, comprising a high pressure chamber; a low pressure return; a control valve between said high pressure chamber and said low pressure return; a source of air under pressure; a pneumatic pressure responsive system physically connected to and directly operating said control valve, said pneumatic system including a first chamber having a first pressure responsive means therein, a second pressure responsive means forming a movable wall between said first chamber and a second chamber, a conduit communicating between said first and second chambers, and a restriction in said conduit; and means enabling the use of a low pressure seal to separate hydraulic fluid from said second chamber, said means being the connection of said pneumatic system to said valve through said low pressure return rather than through said high pressure chamber.

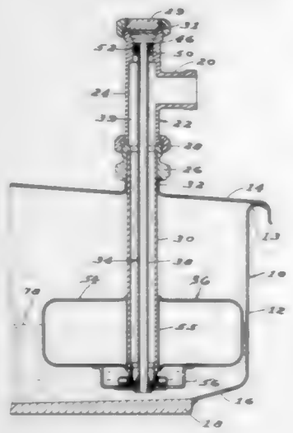
3,374,801
SIPHON BREAKING APPARATUS FOR MILK-HANDLING SYSTEMS AND THE LIKE
Robert H. Rander, Grand Rapids, Mich., assignor to Werner Machinery Company, Grand Rapids, Mich., a corporation of Michigan
Filed July 19, 1965, Ser. No. 473,149
2 Claims. (Cl. 137—143)



A liquid transferring apparatus of the type which has a container with an open top and a throat outlet at the bottom thereof which is connected to a long length of conduit or hose. The conduit or hose is subjected to vacuum so that any liquid poured into the container will be drawn through the conduit. The improvement in this device is means for causing the fluid to be drawn through

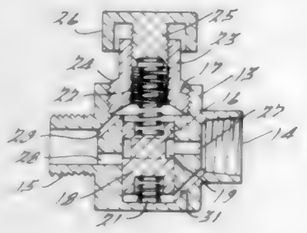
the pipe at a greater rate and comprises in combination with the above container and conduit a single length of pipe having a passageway throughout its length, the pipe being inserted into the throat of the container outlet so as to provide a supply of atmospheric air at the throat. The pipe is inserted in the throat and rests against the top edge of the container and it can be readily inserted or removed at will so as not to interfere with a valve within the container which shuts off the throat when the liquid within the container is exhausted.

3,374,802
FLOAT VALVE
Harry B. Egleston, Livonia, Mich., assignor to Ex-Cell-O Corporation
Filed Oct. 21, 1965, Ser. No. 500,404
14 Claims. (Cl. 137—432)



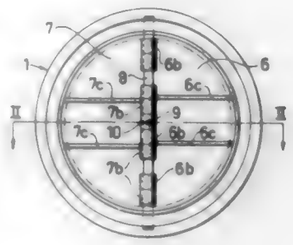
This invention relates to a float valve member having an unbalanced pressure force provided by a pressure surface or a differential of two pressure surfaces to assist in opening the valve to pass liquid from a liquid pressure source to a tank unit where a controlled liquid level is to be maintained. The float valve member has a rolling O-ring seal to assist in providing a more sensitive control level system.

3,374,803
VOLUME AND FLOW CONTROL DEVICE
Treffle J. Leveque, 16606 Glastonbury, Detroit, Mich. 48219
Filed June 17, 1965, Ser. No. 464,643
4 Claims. (Cl. 137—503)



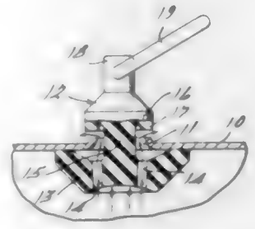
The valve of the present invention maintains a set pressure for operating a device to which it is applied irrespective of higher pressures at different supply sources. The body of the valve is a screw machine part having aligned threaded, recessed bosses. The recesses communicate with the valve body through passageways therefrom that are offset relative to each other. This prevents the valve body from binding and assures accurate control of the air pressure.

3,374,804
CHECK VALVES
Olof G. Stegerud, Timra, Sweden, assignor to Axel Larsson Maskinaffar AB, Bromma, Sweden
Filed July 7, 1965, Ser. No. 470,066
3 Claims. (Cl. 137—512.1)



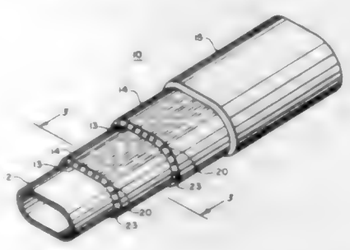
A check valve that is particularly well suited for pipe systems conveying fibrous material by the two semi-circular flanges of the check valve being provided with diametrical knife edges that engage each other upon closure of the valve so as to cut off neatly any fibers that may fasten between the knife edges.

3,374,805
PRESSURE RELIEF VALVE
David J. Trevarrow, Jr., Maple Glen, Pa., assignor to Kelsey-Hayes Company, Romulus, Mich., a corporation of Delaware
Filed Aug. 16, 1965, Ser. No. 479,934
3 Claims. (Cl. 137—525)



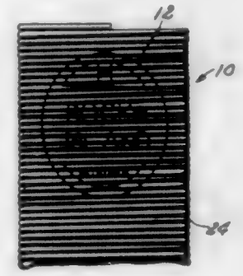
A one piece pressure relief valve for a container that is either automatically or manually operable for permitting the escape of excess gas from the container.

3,374,806
SUBMARINE HOSE
Clayton H. Skinner, Buffalo, N.N.Y., assignor to Hewitt-Robins Incorporated, Stamford, Conn.
Filed Feb. 10, 1965, Ser. No. 431,521
9 Claims. (Cl. 138—119)



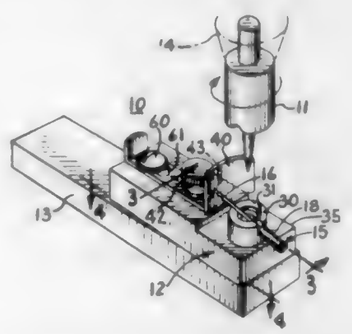
A submersible hose having a steel, copper head or other heavy material fiber or threads incorporated longitudinally in the hose fabric or impregnating the hose fabric for ballast purposes. The ballasted portions of the hose are preferably separated by unballasted hose fabric to provide a hinge portion about which the hose may collapse for compact storage on a reel.

3,374,807
LABELED ARTICLE AND METHOD FOR FORMING SAME
Vesta F. Michael, Wichita, Kans., assignor to Rock Island Oil & Refining Co., Inc., Wichita, Kans., a corporation of Kansas
Filed Nov. 25, 1964, Ser. No. 413,855
2 Claims. (Cl. 138—144)



1. An article of manufacture comprising a labeled, filament-reinforced cured resin pipe body; said body comprising layers of transparent filamentous reinforcements, said reinforcements comprising alternate layers of tensioned filaments arranged parallel and transversely to the longitudinal axis of said body embedded in cured transparent resin; label means locked in desired position and embedded beneath an outermost layer of helical filamentous reinforcements; the amount of glass-filaments and resin overlying said label means bein such that said label means may be clearly visible from the exterior of the pipe.

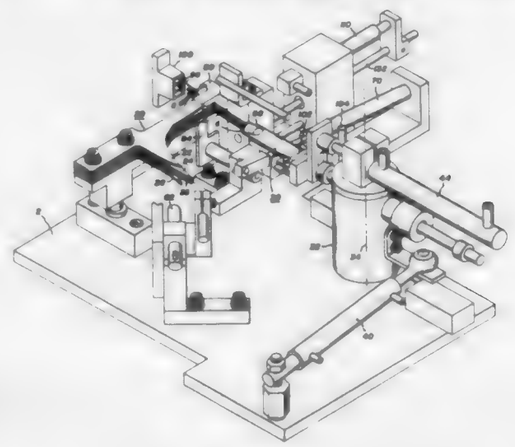
3,374,808
WIRE LOOPER
Erwin Schroeder, Roselle, Ill., assignor, by mesne assignments, to Precision Scientific Company, Chicago, Ill., a corporation of Delaware
Filed May 10, 1965, Ser. No. 454,455
11 Claims. (Cl. 140—102)



A tool for forming a loop on the end of a length of wire composed of a rotary forming head having a groove or shoulder for wrapping of the tip of the wire into a loop about a pilot pin extending from the forming head and a receptacle opposite the pilot pin for holding the wire in position and for allowing ironing of the completed loop.

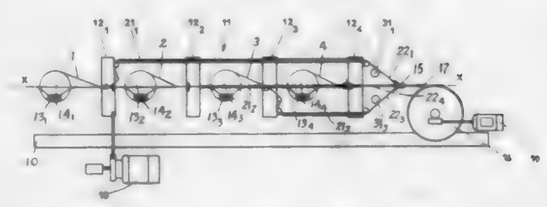
3,374,809
LEAD ORIENTOR
Elwin H. Fleckenstein, Alden, N.Y., assignor to General Electric Company, a corporation of New York
Filed July 30, 1965, Ser. No. 476,071
5 Claims. (Cl. 140—147)

In a mechanism for automatically straightening the leads of an electronic component such as a transistor and inserting the leads into a receptacle, e.g., inserting the leads into the apertures of a test socket, the components (transistors) are fed down a chute where the leads are preoriented by virtue of a slot in the chute, the leads are further preoriented by a comb-like lead spreader which has tapered fingers that advance between the root portions of the leads of the lower most transistor and the chute in order to spread the leads apart in a vertical direction and also by a ram which moves forward and gives the lead a slightly forward rake in the horizontal direction in advance of the ram. Orientation of the leads in a vertical or elevational sense is provided by a comb-like member which consists of a plurality of leaf-like or plate-like teeth which extend generally horizontally and have a vertical spacing such as to accommodate the respective leads of the transistors. Once the leads of the transistor are preoriented, a



transfer arm which is mounted for oscillation about a vertical axis picks up the component and is rotated forward so that the leads are pulled through the comb and the leads are oriented in the vertical sense. In order to provide the proper orientation of the leads in a horizontal sense, a stop is provided at the end of the comb whereby the forward rake of the leads are intercepted by the stop and preferably a seating arm is rotated behind the leads in order positively to seat them against this stop and give the leads the desired orientation so that they may be inserted in a socket if desired. Preferably, the transfer arm holding the transistor is provided with an ejection means which moves the component forward is still the third direction of orientation either to insert the leads in a test socket or disposal bin.

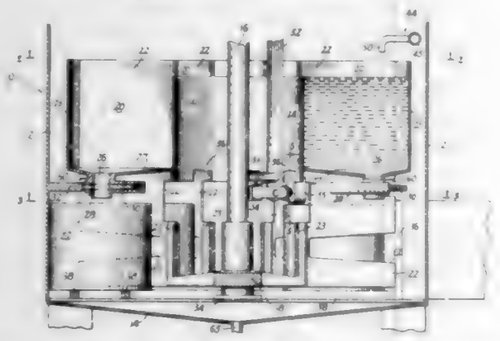
3,374,810
MANUFACTURE OF TELEPHONE QUADS
Roland Lemaire, Fere-en-Tardenois, France, assignor to Societe Etudes et Fabrications, Paris, France
Filed June 9, 1965, Ser. No. 462,521
Claims priority, application France, June 11, 1964, 977,935
5 Claims. (Cl. 140—149)



A wire quad manufacturing machine comprising a framework which is rotatable about a horizontal axis and which supports cradle members in horizontally spaced relation, each of which in turn supports an associated reel of wire for free rotation about a horizontal axis and from which the wire is drawn, by a pulling means common to

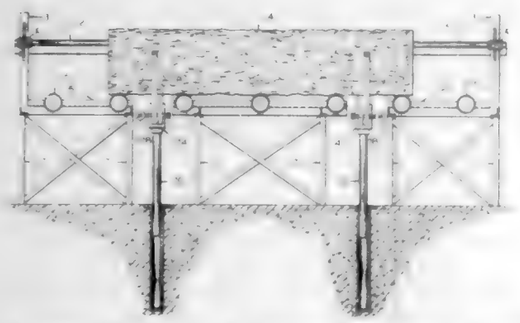
all of the wires, through a die plate means located beyond an endmost cradle member which is also common to all of the wires. Positioned between each reel and the die plate means is a pulley on which the wire passes for substantially a complete turn, the pulley being acted on by an adjustable brake-shoe for the application of an adjustable braking action on the pulley.

3,374,811
LIQUID MEASURING AND DISPENSING APPARATUS
Frederick Z. Goosman, 200 E. 57th St., New York, N.Y. 10022
Filed Aug. 12, 1965, Ser. No. 479,135
4 Claims. (Cl. 141—145)



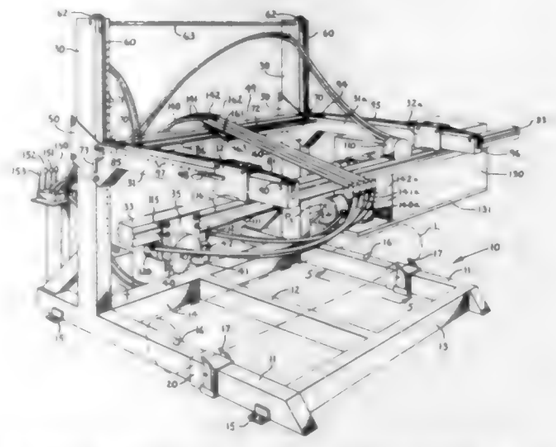
A liquid measuring and dispensing machine having a plurality of measuring compartments rotatably driven. Pusher elements depend from each compartment to engage an equal plurality of receptacles slidably disposed on a track. Each compartment has a weir for predetermining its fill level and a valve means dynamically controlled in operation to discharge its liquid content into its corresponding receptacle. Filling means for each compartment consists of several nozzles capable of delivery at different flow velocities and means are provided to assure the return of liquid spilling over the weirs to such filling means.

3,374,812
POSITIONING AND RETAINING DEVICE SYSTEM FOR LOGS IN A HIGH CAPACITY SAWMILL EMPLOYING A HORIZONTAL TRAVERSING BANDSAW ADJUSTABLY MOUNTED OVER THE LOG BEING SAWED
Charles E. McManama, Rte. 2, Box 81, Potlatch, Idaho 83855
Filed June 26, 1964, Ser. No. 378,118
2 Claims. (Cl. 143—19)



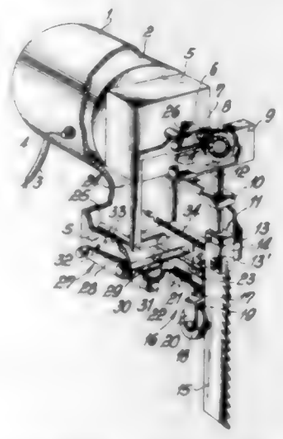
1. In a sawmill having a horizontal bandsaw which traverses in sawing upon paired side rails which straddle a log, a mechanism to adjustably support said rails as desired to saw dimensions of lumber from said log, and a log carriage to support the log; a log carriage comprising powerable and reversible rolls in a roll case aligned beneath and with said rails, and a number of log engaging vises having paired laterally opening jaws extending upward through the roll case between the rolls at appropriate intervals beneath and between said rails, a means in each said vise operating the jaws thereof so the log will be held in a centered position under the saw, and a means to raise and lower said vises from their positions between the rolls.

3,374,813
PORTABLE SAWMILL APPARATUS
Lawrence Ivan Tillery, 1201 Cedar St., La Grande, Oreg. 97851
Filed Feb. 7, 1966, Ser. No. 525,451
12 Claims. (Cl. 143—38)



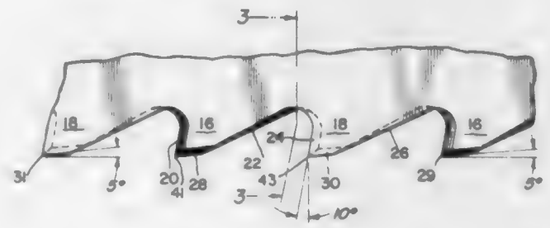
1. A sawmill comprising a base frame arranged to receive a log rolled over one side thereof into sawing position on the base frame, means for clamping the log on said base frame in said sawing position, a pair of uprights on the other side of said base frame, a pair of horizontal arms extending transversely over said base frame, vertically slidable cantilever supports for said arms on said uprights, a track bar extending longitudinally of said base frame mounted for transverse sliding movement along said arms, a saw carriage mounted for travel along said track bar, and horizontal and vertical circular saws on said carriage arranged to saw boards from the log when said carriage is traversed on said track bar.

3,374,814
SAWING APPARATUS
Albert Kaufmann, Zuchwil, Soleure, Switzerland, assignor to Scintilla A.G., Solothurn, Switzerland
Filed Jan. 20, 1966, Ser. No. 521,887
Claims priority, application Germany, Jan. 21, 1965, S 95,091
15 Claims. (Cl. 143—68)



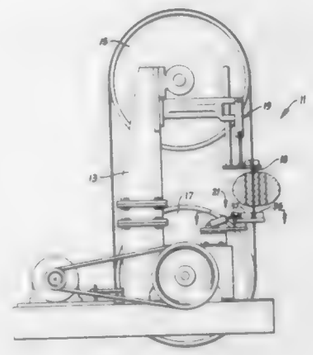
A sawing apparatus in which feeding means engage an elongated saw blade reciprocatable in longitudinal direction to impart to the saw blade during its reciprocation a feeding movement transverse to the direction of its reciprocation and in which operator controlled adjusting means cooperate with the feeding means for regulating the movement of the blade in the feeding direction between zero and a prdetermined maximum.

3,374,815
WOODCUTTING SAW BLADE
Leroy L. Anderson, Jr., and Frederick Drugan, Greenfield, Mass., assignors to Millers Falls Company, Greenfield, Mass., a corporation of Massachusetts
Filed Aug. 30, 1965, Ser. No. 483,680
2 Claims. (Cl. 143—133)



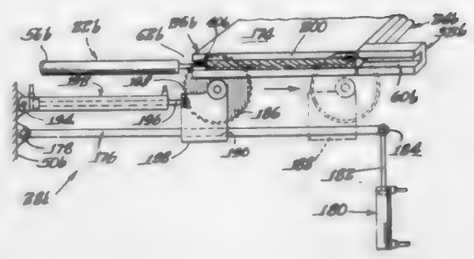
A reciprocating saw blade particularly adapted for woodcutting, comprising a plurality of cutting teeth which each include a generally transversely extending, chiseling edge and a scoring point such that, during the use of the saw blade, each of these cutting teeth both chisel and score the wood being cut.

3,374,816
BANDSAW GUIDE
John A. Alich, Burlingame, Calif., assignor, by mesne assignments, to The P. B. Yates Machine Company Limited, Hamilton, Ontario, Canada, a company of British Columbia
Filed Oct. 20, 1965, Ser. No. 498,286
14 Claims. (Cl. 143—160)



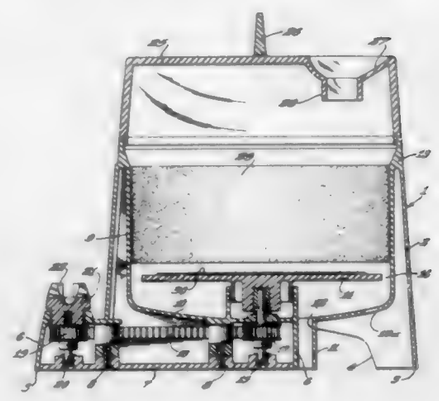
A bandsaw guide constructed for rapid movement between a guide position and a retracted position with the retraction being accomplished by powered driving means suitably controlled by a structure for switching the power to the power drive means so as to drive the guide between the two positions as desired; the preferred guide structure being mounted on a suitable base and having a fixed guide member and a retractable guide member slideably mounted and connected to a fluid cylinder serving as the power driving means, and control for the fluid cylinder in the form of a switching valve for directing fluid power to the cylinder and actuating it to retract the guide member and return same.

3,374,817
TANDEM STATION MACHINE FOR MAKING PIANO ACTION PARTS
Clifford W. Andersen, De Kalb, Ill., assignor to The Wurlitzer Company, Chicago, Ill., a corporation of Ohio
Filed Sept. 1, 1965, Ser. No. 484,218
2 Claims. (Cl. 144—3)



Piano action parts making apparatus having two work stations, a parts blank being cut into individual unfinished parts at one station by a cutter that is arranged to trace a multi-sided path and finished parts being produced at the second station by reciprocably mounted tools.

3,374,818
VEGETABLE PEELER
Fred E. Knoedler, P.O. Box 397, Streator, Ill. 61364
Filed Mar. 10, 1966, Ser. No. 533,523
10 Claims. (Cl. 146—49)

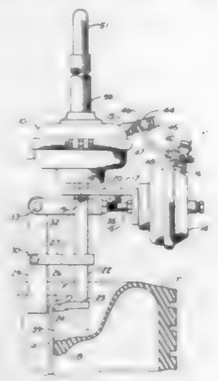


1. In a vegetable peeler,
a container having an opening at the top and an outlet opening at the bottom,
a flat-top turntable in the lower part of said container and of less diameter than the inside diameter of the container to leave a flow passage therebetween,
drive means to rotate said turntable connected to the underside thereof,
an abrasive band around the inside of said container in the region vegetables are located for peeling, and
an abrasive disc on the upper face of said turntable and of less diameter than the turntable.

3,374,819
TIRE REMOVAL TOOL
Richard H. Haynes, 144 Fulton St., New Milford, N.J. 07646
Filed Sept. 10, 1965, Ser. No. 486,324
2 Claims. (Cl. 157—1.17)

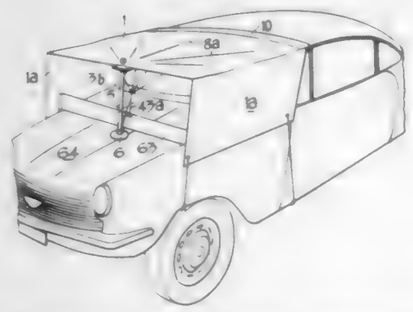
A tire removal tool having a first pneumatic means and a second pneumatic means mounted at right angles to each other on a common right angle bracket means and

gripping means operated by the first pneumatic means to grip the opposite sides of the wall of a wheel rim and



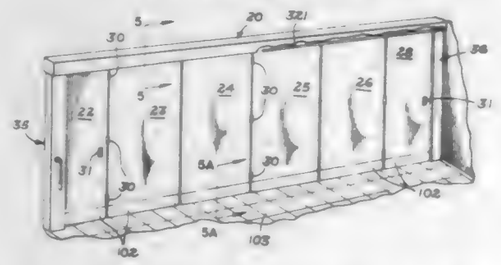
jacking means operated by the second pneumatic means to separate a tire bead from a wheel rim.

3,374,820
MEANS FOR FACILITATING THE VIEWING OF OPEN-AIR SPECTACLES FROM A MOTORCAR
Johann Stöckli, 4 Sanlam Bldg., Market St., George, and Aldo W. Dall'Oglio, Old Mutual Bldg., Oudtshoorn, both of Cape Province, Republic of South Africa
Continuation-in-part of application Ser. No. 476,899, Aug. 3, 1965. This application Oct. 11, 1965, Ser. No. 495,377
5 Claims. (Cl. 160—22)



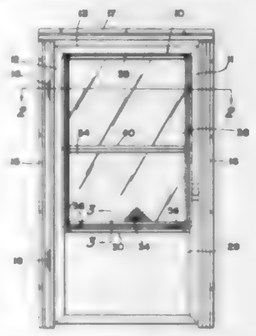
This specification discloses motorcar windscreen shields, adapted to be removably erected on a motorcar, and to shield the windscreen from rainfall and water running off the roof, comprising a flexible sheet material and collapsible frames of several types, and a splash catching strip extending transversely across the motorcar bonnet, applicable with minor obvious modifications to the shields of various frame types, for use in combination therewith for the purpose of minimising splashing into the windscreen.

3,374,821
MOVABLE SPACE DIVIDER STRUCTURE
Dean S. White, New Castle, Ind., assignor to New Castle Products, Inc., a corporation of Indiana
Filed Oct. 14, 1965, Ser. No. 495,988
9 Claims. (Cl. 160—40)



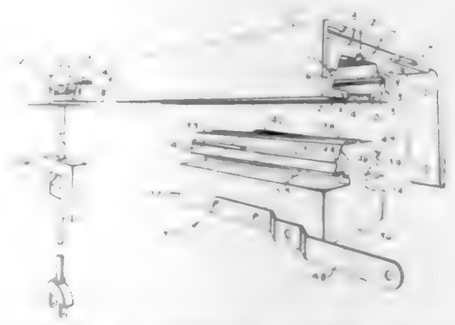
A folding partition incorporating a floor sealing mechanism operated by a handle, in which a plunger in the fixed jamb post engages a floor seal rod in the adjacent panel, with the rod motion being translated from panel to panel, the partition also incorporating end seals at the ends of the floor seals to effect sound isolation free of air gaps between panels and further incorporating a spring biasing mechanism for assisting in the turning of the first panel next to the jamb when the panels are moved from the extended position to the folded position.

3,374,822
SELF-STORING STORM DOORS
Dale J. Youssi, Dover, and Eugene L. Brand, Clinton, Ohio, assignors to Alsco, Inc., Akron, Ohio, a corporation of Delaware
Filed Mar. 22, 1965, Ser. No. 441,497
3 Claims. (Cl. 160—91)



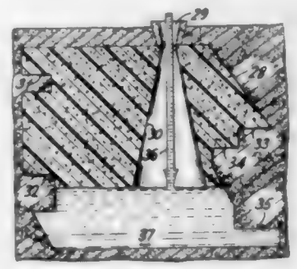
1. In combination with a storm door having a frame, a pair of sash units mounted in the frame, the improvement comprising means for retaining the pair of sash units in the frame, said retaining means including means defining a track, a third sash unit received by said track, means including means movable relative to said third sash unit and carried thereby engageable with said track for guiding said third sash unit between raised and lowered positions, said engageable means also being disengageable from said track to permit said third sash unit to be removed from the track while said track is mounted on the frame.

3,374,823
STRUCTURAL DEVICE
James A. Ford, Sturgis, Mich., assignor to Kirsch Company, Sturgis, Mich., a corporation of Michigan
Continuation-in-part of application Ser. No. 375,276, June 15, 1964. This application Feb. 7, 1967, Ser. No. 614,473
25 Claims. (Cl. 160—331)



An assembly for supporting a movable panel for longitudinal traversing movement which comprises elongated guide means guiding and supporting said panel. Reaction means extends along said guide means and is fixed with respect thereto so that a power unit, which is movable longitudinally with respect to said guide means and generates a moving magnetic field, will be reactive with said reaction means to cause a mechanical motion of said power unit with respect to said guide means.

3,374,824
DISPLACEMENT PROCESS FOR THE CASTING OF METALS
Thomas E. Snelling, Rte. 2, Box 792, Boring, Oreg. 97009
Filed July 13, 1965, Ser. No. 471,679
5 Claims. (Cl. 164—34)

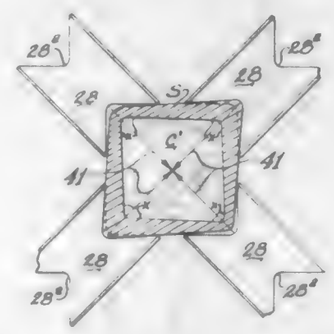


A method and mold are provided for producing metal castings. A pattern of porous plastic material is employed which, when heated, is capable of forming a vapor without leaving a residue. The pattern is confined within a sand mold and has an entry portion exposed to receive molten metal. As molten metal is poured into the entry portion of the pattern, the plastic material is decomposed and displaced by the molten metal until the metal occupies the space previously occupied by the plastic pattern.

3,374,825
CORE OIL COMPOSITIONS CONTAINING ORGANIC FIBERS
Robert J. Johnson, Chicago, Ill., assignor to Swift & Company, Chicago, Ill., a corporation of Illinois
No Drawing. Filed June 21, 1962, Ser. No. 204,085
8 Claims. (Cl. 164—47)

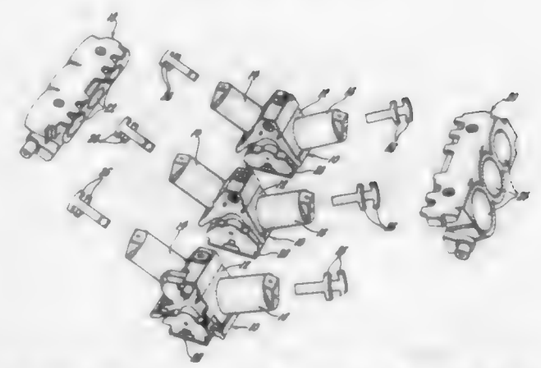
8. The method of casting metals which comprises mixing a core body material with a refractory minor portion of a core binder comprising: a mixture of an aliphatic dicarboxylic anhydride adduct and the polymeric reaction product of an oxirane-containing higher fatty acid ester, an aliphatic lactam, and a polyamine curing agent, and an admixture of organic fibers having a length of at least about one millimeter, forming a mold of the resulting composition, and casting the metal in the resulting mold.

3,374,826
PROCESS FOR CONTINUOUSLY CASTING ELONGATED METAL BODIES
James T. Black, Jr., Birmingham, Ala., assignor to H. K. Porter Company, Inc., a corporation of Delaware
Filed Mar. 1, 1965, Ser. No. 436,033
4 Claims. (Cl. 164—82)



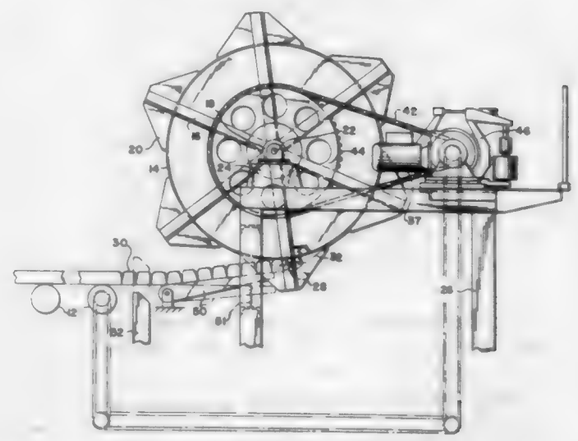
A process for delivering from a mold of a continuous casting machine a casting which in cross section conforms to the cross section of the mold, which process includes subjecting the casting to compressive forces on the outer skin thereof in the areas which are distorted relative to the shape of the mold, which forces are directed inwardly of the casting and which converge toward the cross sectional geometrical center of the casting, all the foregoing being carried out while the casting is being delivered from the mold, in continuous fashion.

3,374,827
METHOD OF USING VAPORIZABLE CORE ASSEMBLY SPACERS
Clarence A. Schebler, Saginaw, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Nov. 17, 1965, Ser. No. 508,197
5 Claims. (Cl. 164—137)



The speed and economy of preparing a mold which includes an assembly of two or more cores cemented together in a predetermined relationship, suitable for casting intricate articles is markedly improved by employing preformed expanded synthetic resin spacers to maintain the assembled cores in a desired spatial relationship to each other while the cement dries and/or the assembled cores are positioned in the mold, the resin spacers being vaporized by molten metal which is subsequently poured into the mold to form the cast article.

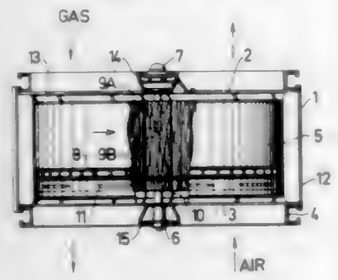
3,374,828
STORAGE APPARATUS FOR DUMMY INGOTS
Edouard Menu, Chaville, France, assignor to Societe Fives Lille-Cail, Paris, France
Filed Nov. 22, 1965, Ser. No. 509,056
Claims priority, application France, Nov. 23, 1964, 995,920
4 Claims. (Cl. 164—274)



A dummy ingot which plugs the bottom of a curved ingot mold at the beginning of each continuous ingot casting run consists of individual rigid elements connected by a pliable connecting member, and is wound on and unwound from a drum mounted on a frame above

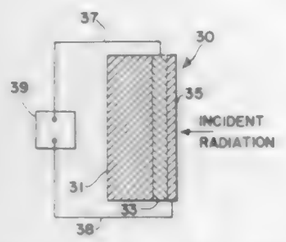
the conveyor which carries ingots from the mold, thus permitting storage of the dummy ingot near the conveyor without additional spaced requirements and permitting easy handling of the dummy ingot.

3,374,829
GAS PURGING SEAL IN ROTARY REGENERATOR
Kurt Veser, Schwetzingen, and Karl Heinz Mock, Neckargemund, Germany, assignors to Svenska Rotor Maskiner Aktiebolag, Nacka, Sweden, a corporation of Sweden
Filed Aug. 11, 1966, Ser. No. 571,872
Claims priority, application Germany, Aug. 13, 1965, K 56,880
4 Claims. (Cl. 165—7)



Apparatus for use in rotary regenerative air preheaters which provides for reduction of gas flow leakage from the hot flue gas portion of the preheater to the air portion of the preheater, which apparatus includes a flue gas collecting chamber positioned adjacent a flue gas sector plate and also positioned along the edge adjacent the air flow portion of the preheater. The flue gas collecting chamber has an opening toward the end surface of the regenerator body which communicates with the flue gas supply duct so that the flue gas content of each compartment of the preheater leaving the gas flow portion thereof is forced out of the compartment and into the collecting chamber by air entering each compartment in the air portion of the preheater.

3,374,830
THERMAL CONTROL PANEL
William J. O'Sullivan, Jr., Newport News, Va., assignor to the United States of America as represented by the Administrator of the National Aeronautics and Space Administration
Filed Mar. 28, 1966, Ser. No. 538,908
10 Claims. (Cl. 165—96)



1. A thermosensitive panel for achieving a predetermined temperature in an enclosure skin when said enclosure is subject to external solar or other high temperature electromagnetic radiation of steady or variable intensity either with or without flow of heat between the skin and the interior of the enclosure, comprising:

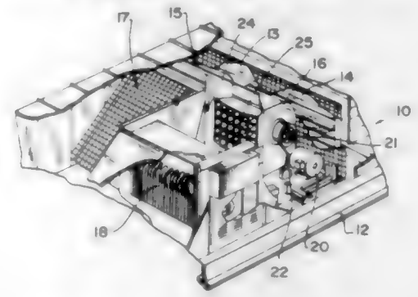
a laminate structure having variable radiation absorptivity/emissivity property characteristics disposed on the exterior side of said enclosure skin and in thermal contact with said skin,

said laminate structure including at least two electrically conductive layers, and having radiation absorptivity/emissivity characteristics such that the amount of incident radiation absorbed exceeds that emitted and causes the said skin temperature to increase, and

electrical means for applying an electrical potential to said conductive layers to alter the radiation absorptivity/emissivity characteristics of the laminate structure such that the amount of radiation emitted exceeds that absorbed and causes said skin temperature to decrease, means for sensing temperature in said enclosure skin, and

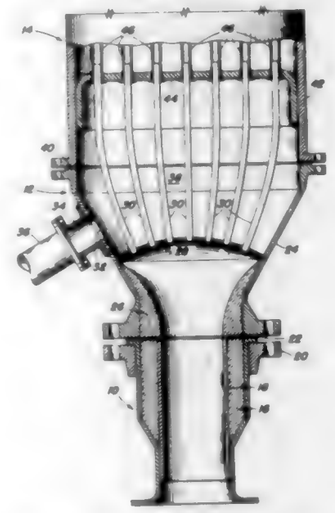
means for alternately applying and removing said electrical potential from said conductive layers so as to maintain the enclosure skin at a predetermined temperature.

3,374,831
BLOWER DIFFUSER
Wayne F. Sieverding, Union Grove Lake, Iowa, assignor to Lennox Industries Inc., a corporation of Iowa
Filed Jan. 25, 1966, Ser. No. 523,508
3 Claims. (Cl. 165—122)



An air treating device including a blower, a heat exchanger downstream of the blower, and a blower diffuser disposed at the outlet from the blower for converting the velocity energy of the air to static energy for improving the heat transfer of the air as it passes over the heat exchanger.

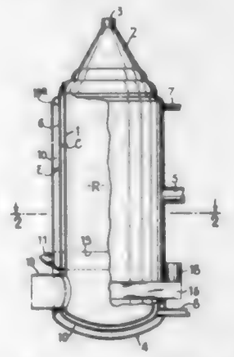
3,374,832
INLET CONE DEVICE AND METHOD
William Tucker, Great Neck, N.Y., assignor to The Lummus Company, New York, N.Y., a corporation of Delaware
Filed May 13, 1966, Ser. No. 549,852
8 Claims. (Cl. 165—134)



This invention relates to a novel inlet device for connecting the output of a cracking heater with the inlet of a transfer line heat exchanger, and a method of operating

the same. In essence the present invention comprises the combination of a plurality of inlet cone tubes, the majority of said tubes being loosely slip-fitted into exchanger tubes, together with an inert fluid purge of the space between the exchanger tube sheet and inlet cone tube sheet, the inert fluid being supplied at a higher pressure than the heater effluent. In an alternate embodiment, the inlet cone tube sheet is eliminated by utilizing hexagonal tubes welded to each other. The inert fluid effectively purges the cone area of any hydrocarbon which may enter, and because of the slip-fit of the inlet cone tubes within the transfer line exchanger tubes, the inlet fluid may pass around the outside of the inlet cone tubes and into the exchanger tubes.

3,374,833
HEATING STILL
Jacques Henri Bernard, Livry-Gargan, France, assignor to Societe pour l'Equipement de la Blanchisserie et de la Teinturerie Francaises, Paris, Seine, France, a French body corporate
Filed May 4, 1966, Ser. No. 547,660
Claims priority, application France, May 12, 1965, 16,675
1 Claim. (Cl. 165—140)



A still comprising a tank for a liquid to be vaporized, a heating chamber which surrounds said tank and is in communication with a source of heating fluid, a heat exchange chamber disposed around said heating chamber, two expansion chambers adjacent said heat exchange chamber and in fluid communication therewith, a fluid to be heated being introduced into the heat exchange chamber through one of the expansion chambers and leaving the heat exchange chamber through the other expansion chamber.

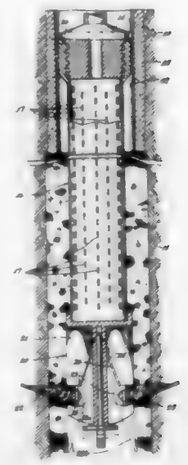
3,374,834
SOIL STABILIZATION AND GROUTING METHOD
Joseph Ramos and Roger F. Rensvold, Duncan, Okla., assignors to Halliburton Company, Duncan, Okla., a corporation of Delaware
No Drawing. Filed Oct. 31, 1966, Ser. No. 590,537
12 Claims. (Cl. 166—33)

1. A method of stabilizing earth formations which comprises injecting into the formation, an aqueous solution of a gelling material containing a quantity of finely divided inert solids and a quantity of a hydrous oxide of silicon, magnesium and/or aluminum characterized by a needle-like or acicular mode of crystallization as a suspending agent for the solids.

3,374,835
FRACTURE ACIDIZING
John A. Knox, Duncan, Okla., assignor to Halliburton Company, Duncan, Okla., a corporation of Delaware
No Drawing. Filed Jan. 21, 1966, Ser. No. 522,019
9 Claims. (Cl. 166—42)

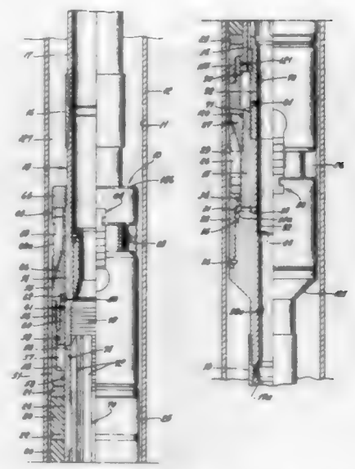
Fracture acidizing of a well is accomplished by injecting into an earthen formation an oily fluid composition having dispersed therein a finely divided acid soluble fluid loss component and then injecting into the formation an aqueous acidizing fluid capable of dissolving the fluid loss component.

3,374,836
LINER ANCHOR
Franklin P. Gribbin, P.O. Box 2102, Bakersfield, Calif., 93303
Filed Dec. 23, 1965, Ser. No. 516,048
6 Claims. (Cl. 166—51)



Anchor elements for a perforated liner in an oil well are located at the lower end of the liner, leaving the upper end unrestrained. This eliminates "creep" resulting from repeated thermal expansion and contraction cycles.

3,374,837
RETRIEVABLE PACKER
John S. Page, Lakewood, and Harvey R. Edwards, Bellflower, Calif.; said Edwards assignor to Page Oil Tools, Inc., Long Beach, Calif., a corporation of California
Filed Oct. 18, 1965, Ser. No. 496,831
12 Claims. (Cl. 166—120)

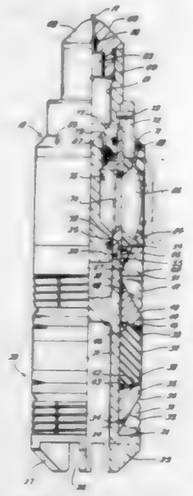


The invention provides for setting of a packer in a well by means of pressurization of fluid in a tubing string in relation to vertical manipulation of the string, the packer being carried on the string and typically being locked in set position; the invention also provides for release of the packer in response to pressurization of fluid in the string and vertical manipulation of the string.

3,374,838
FLUID EXPANSIBLE PACKER AND ANCHOR APPARATUS

James H. Current, Houston, Tex., assignor to Schlumberger Well Surveying Corporation, Houston, Tex., a corporation of Texas

Filed Nov. 8, 1965, Ser. No. 506,626
8 Claims. (Cl. 166—123)

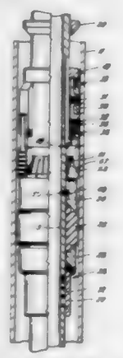


The particular embodiments described herein as illustrative of some of the various forms which the present invention can take include a well tool having a body member with slips and packing which are expanded by abutments movable relatively toward each other. In order to move the abutments relatively towards each other, pressure generating means is adapted to apply force to oppositely movable members, one of which is coupled to the body member and the other of which is coupled to one of the abutments. The oppositely movable members can include pistons and cylinders relatively sized to amplify the force applied to the body member and abutments. The oppositely movable members can be alternatively comprised of normally retracted expansible elastomeric means which can be expanded into engagement with the well casing wall and then elongated under pressure to apply force to the body member and abutments. Moreover, the present invention can include a releasing mechanism which is hydraulically operated to release the pressure generating means and oppositely movable members from the well tool after the slips and packing are expanded.

3,374,839
WELL PACKER APPARATUS

Maurice P. Lebourg, Houston, Tex., assignor, by mesne assignments, to Schlumberger Technology Corporation, Houston, Tex., a corporation of Texas

Filed Apr. 4, 1966, Ser. No. 539,794
4 Claims. (Cl. 166—131)

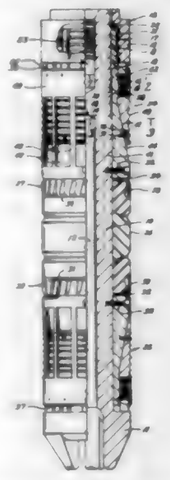


A well packer apparatus including a body member having a fluid passageway, slip and expander means for anchoring against movement in a well conduit, packing means for packing off a well conduit, port means in the body member extending between the passageway and the exterior of the body member, the packing means being normally disposed on the body member above the port means, and releasable means which couples the packing means to the body member and which is responsive to a predetermined force to permit movement of the packing means relative to the body member to position below the port means.

3,374,840
WELL TOOL

James H. Current, Houston, Tex., assignor to Schlumberger Well Surveying Corporation, Houston, Tex., a corporation of Texas

Filed Oct. 23, 1965, Ser. No. 503,945
6 Claims. (Cl. 166—134)

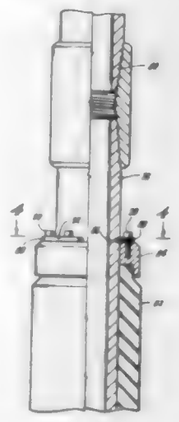


A well packer apparatus including a body member having a packing element mounted thereon, expander sleeves adjacent the end of the packing element, abutments engageable with the expander sleeves and movable relatively toward each other in order to advance the expander sleeves toward each other and thereby compress and expand the packing element, slip means movable on the expander sleeves to set positions, and means for moving the slip means to set positions independently of movement of the abutments relatively toward each other.

3,374,841
PACKER WITH SHEAR MEMBER

James H. Current, Houston, Tex., assignor to Schlumberger Well Surveying Corporation, Houston, Tex., a corporation of Texas

Filed Oct. 22, 1965, Ser. No. 500,946
3 Claims. (Cl. 166—138)



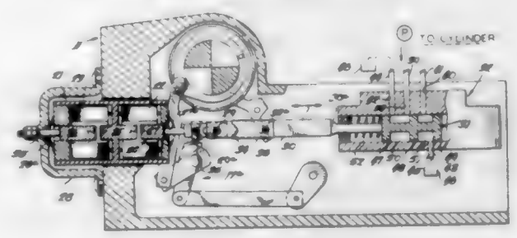
The particular embodiment described herein as illustrative of one form of the invention in well tools in-

cludes a mandrel with a packing element mounted thereon for packing off a well bore. An abutment engages one end of the packing element for exerting compression force thereon, and is releasably coupled to the mandrel by a shear member which normally prevents relative movement between the abutment and body, but which is responsive to a predetermined force to uncouple the abutment and mandrel. The shear member can be weakened along radial lines to permit segments thereof to be conveniently removed in order to selectively change the predetermined force necessary to uncouple the mandrel and abutment.

3,374,842
SOLENOID ACTUATOR FOR HYDRAULIC DRAFT CONTROL SYSTEM

Raymond H. Smith, Jr., Lockport, Ill., assignor to International Harvester Company, Chicago, Ill., a corporation of Delaware

Filed Apr. 30, 1965, Ser. No. 452,093
8 Claims. (Cl. 172—7)

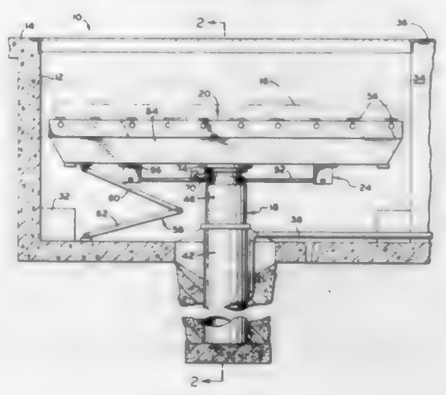


An electrical circuit capable of controlled positioning of a hydraulic valve in the power lift mechanism of a tractor to raise and lower a tractor-drawn implement in response to the sensing of undesired draft load conditions, which circuit includes a three member solenoid with two separate windings, the solenoid being operatively connected to the hydraulic valve for successive positioning thereof in response to successive energizing and deenergizing of the windings by switches which are actuated to make and break the circuit in response to a signal from a draft load sensing mechanism.

3,374,843
ELEVATING SCALES

Robert D. Ruggles, Weston, and Frank B. Carder, Darien, Conn., assignors to Dorr-Oliver Incorporated, Stamford, Conn., a corporation of Delaware

Filed Feb. 18, 1965, Ser. No. 433,592
11 Claims. (Cl. 177—1)



1. A pallet-loading lift scale for use in assembling large palletized cargo loads comprising:

(a) means defining a recess in the floor of a pallet loading area;

(b) a pallet-supporting platform adapted to fit within said recess;

(c) a hydraulic piston assembly in said recess connected to said platform to selectively position said platform in positions above and below the floor level of the loading area;

(d) and load isolating and measuring means for determining the vertical component of force between said platform and said piston assembly, said load isolating and measuring means including:

(1) an elongated depending member rigidly secured to said platform and extending longitudinally with respect to said hydraulic piston assembly;

(2) a plurality of radially extending stay bars horizontally positioned to connect the uppermost end of said piston assembly with said platform to prevent horizontal motion therebetween;

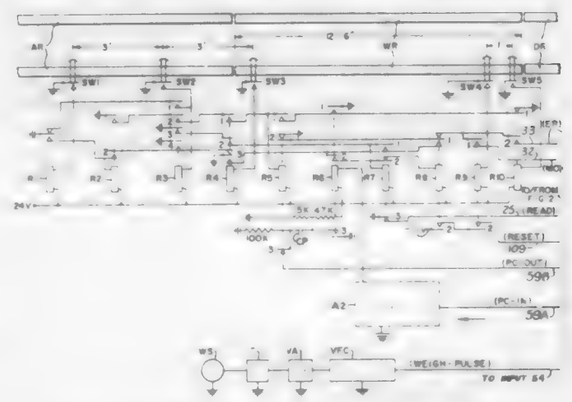
(3) horizontal force transmitting means positioned between the lower end of said depending platform member and said piston assembly to prevent horizontal motion therebetween;

(4) and a load cell positioned for through transmission of a vertical force from the platform to said assembly.

3,374,844
APPARATUS AND METHOD FOR WEIGHING RAILROAD CARS IN MOTION

Edward Laurence Rogers, Chicago, Ill., assignor to Railroad Machinery Development Corporation, Northfield, Ill., a corporation of Ohio

Continuation-in-part of application Ser. No. 365,470, May 6, 1964. This application Oct. 22, 1965, Ser. No. 501,391
21 Claims. (Cl. 177—134)



1. Apparatus for weighing successive railroad cars of a train in motion, said apparatus including a railroad track weigh section, members spaced from one another in a direction lengthwise of the weigh section for actuation in succession as the rolling equipment approaching the weighing position on the weigh section reaches predetermined successive positions for determining if the rolling equipment is a freight car to be weighed or a locomotive and for determining if the equipment is a freight car having trucks of two axles or of three axles, and a weight recorder controlled by said members.

3,374,845
COMMAND CONTROL SYSTEM FOR VEHICLES

Donald Selwyn, 238 Poplar Ave., Pompton Lakes, N.J. 07442

Filed May 5, 1966, Ser. No. 547,832
18 Claims. (Cl. 180—6.5)

1. A multi-function control system for generating a plurality of distinct control signals responsive to the com-

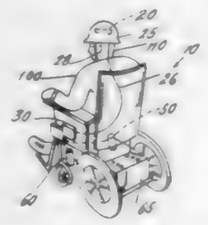
ponents of movement of a user's body in selectively determined command directions, comprising:

a housing structure having means for attachment to a user's body;

a sensing assembly carried by said housing structure;

said sensing assembly including sensing means for responding to the different components of movement of said housing structure, and providing output command signals operatively related to the particular directional components of movement of said housing structure;

a logic circuit including an input, signal processing means, and an output;



said sensing means output signals connected to the input of said logic circuit;

said signal processing means providing an output logic signal in accordance with the particular sensing means command signals presented to said logic circuit;

means for performing a multiplicity of functions operatively connected to the output of said logic circuit;

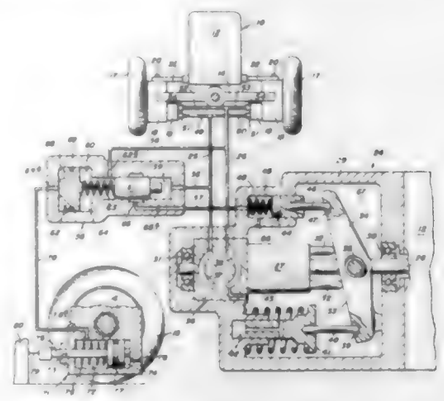
said output logic signal providing a plurality of control signals for controlling the operation of said multi-function means in a selectively determined manner, such that the direction of movement of said housing structure allows the user to selectively control the operation of said multi-function means by his body movement.

3,374,846
STEERING AND BRAKING HYDRAULICS
Luigi Massone, Genoa, Italy, assignor to Landini S.p.A., Reggio Emilia, Italy
Filed Oct. 21, 1965, Ser. No. 499,153
8 Claims. (Cl. 180—6.7)

A hydraulic steering clutch and steering brake control for a tracked vehicle including a pair of actuating spools each of which is movable from a spring biased position to sequentially cause disengagement of the steering clutch and engagement of the steering brake of its associated track.

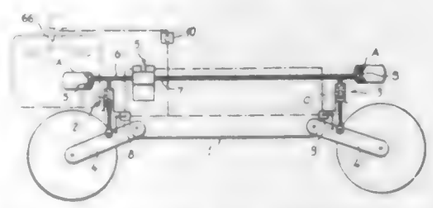
3,374,847
TRACTOR DRIVING EFFORT RESPONSIVE TO PULLED LOAD
Tadeusz Budzich, 80 Murwood Drive, Moreland Hills, Ohio
Filed Oct. 21, 1965, Ser. No. 509,672
27 Claims. (Cl. 180—14)

An auxiliary hydrostatic transmission for a farm tractor which employs a variable fluid pump adapted to drive fluid motors mounted on the wheels of the tractor. A force sensing cell is provided which is attached to the connecting couple of the tractor and through a control



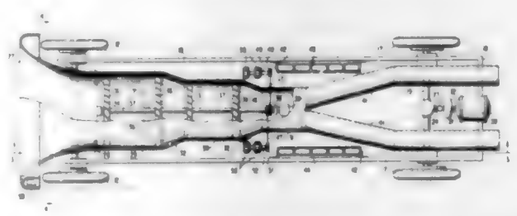
mechanism provides a signal to vary the energy output of the fluid pump corresponding to the magnitude of the load being pulled by the tractor.

3,374,848
VEHICLE ATTITUDE CORRECTING DEVICES
Gaëtan de Coye de Castelet, Billancourt, France, assignor to Regie Nationale des Usines Renault, Billancourt, Seine, France
Filed Oct. 4, 1965, Ser. No. 492,647
Claims priority, application France, Jan. 20, 1965, 2.583, Patent 1,432,614
4 Claims. (Cl. 180—41)



A device for correcting the attitude of a vehicle including hydraulic means actuated by a fluid distributor to raise and lower the vehicle frame with respect to at least two of its wheels, and a control lever movable in response to relative movements between the frame and the wheels to actuate valve means which control the operation of the distributor in response to said relative movement. Regulating means are also provided which cooperate with the valve means to regulate the desired ground clearance of the frame.

3,374,849
ELECTRIC VEHICLE
Lawrence E. Redman, 2005 E. Adams St., Phoenix, Ariz. 85034
Filed Sept. 28, 1966, Ser. No. 582,647
7 Claims. (Cl. 180—65)



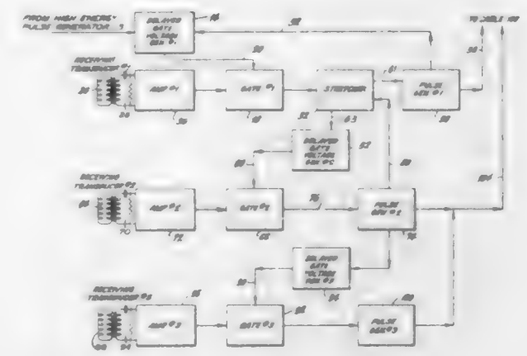
1. In a vehicle having a frame and a pair of driving wheels, an electric motor mounted on said frame and connected to said wheels for rotatably driving same, a support mounted on each side of said vehicle frame, a bank

of batteries in each support, an air scoop at the forward end of said frame, an elongated housing communicating with said scoop, a plurality of turbine elements positioned in said housing for rotation therein, a plurality of alternators driven by said turbine elements and control means for connecting said electric motor to one of said bank of batteries for driving said vehicle while connecting the other bank of batteries to said alternators for replenishing the charge in said other bank of batteries upon the rotation of said turbine elements.

3,374,850
RESILIENTLY BIASED STEERING SYSTEM
Donald A. Cech, Cicero, Ill., assignor to International Harvester Company, Chicago, Ill., a corporation of Delaware
Filed Aug. 2, 1966, Ser. No. 569,747
1 Claim. (Cl. 180—79.2)

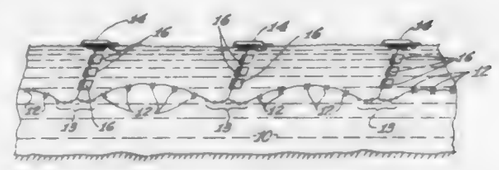
A device for use in a steering system for holding a rotatable steering wheel in a centered position, the device having a predetermined resilient bias force acting on a rotatable steering column which bias can be overcome by a sufficient steering turning force to then provide steering action.

3,374,851
SIMULTANEOUS DUAL SPACED ACOUSTIC WELL LOGGING SYSTEM
Adrian P. Brokaw, Stillwater, Okla., assignor, by mesne assignments, to Dresser Industries, Inc., Dallas, Tex., a corporation of Delaware
Continuation of application Ser. No. 35,969, June 14, 1960. This application Aug. 25, 1967, Ser. No. 663,446
4 Claims. (Cl. 181—.5)



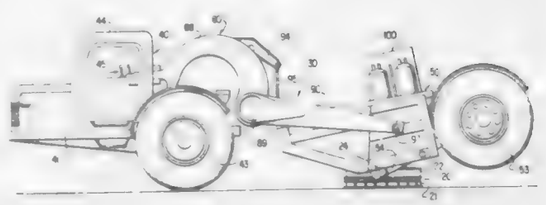
Three acoustic receivers are trailingly spaced from a single acoustic transmitter. The first receiver circuit is opened after a predetermined delay from the time of the acoustic pulse from the transmitter and closed upon receipt of the pulse. The second receiver circuit, being responsive to the first receiver circuit, is opened after a predetermined delay from the time the acoustic pulse is received in the first receiver circuit and closed upon receipt of the pulse in the second receiver circuit. The third receiver circuit, being responsive to the second receiver circuit, is opened after a predetermined delay from the time the acoustic pulse is received in the second receiver circuit and closed at a predetermined time after opening.

3,374,852
HYDROPHONE SUSPENSION SYSTEM FOR MAINTAINING HYDROPHONE FOR A PRESELECTED DEPTH
Booth B. Strange and Ben B. Thigpen, Shreveport, La., assignors to Western Geophysical Company of America, Los Angeles, Calif.
Filed Sept. 8, 1965, Ser. No. 485,896
1 Claim. (Cl. 181—.5)



A hydrophone suspension system for maintaining hydrophones at a uniform depth is provided which includes a positive buoyancy cable for supported plurality of spaced hydrophones. Weights are spaced along the cable to provide a negative buoyancy for the cable and weights. A plurality of floats are provided which are connected to the cable adjacent to the aforesaid weights to provide a net positive buoyancy for the entire suspension system.

3,374,853
TRANSPORTABLE SEISMIC WAVE GENERATOR SUPPORT
Lauren G. Kilmer, Tulsa, Okla., assignor, by mesne assignments, to Sinclair Research, Inc., New York, N.Y., a corporation of Delaware
Continuation-in-part of application Ser. No. 321,743, Nov. 6, 1963. This application Apr. 22, 1966, Ser. No. 544,482
4 Claims. (Cl. 181—.5)

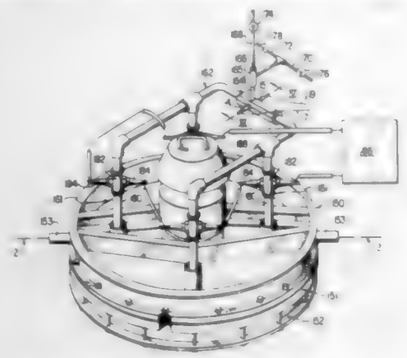


A two-part, transportable seismic wave generator support permitting engagement of the generator between forward and rear supporting wheels which is capable of moving the generator vertically including a shock absorbing unit arranged between the two parts thereof.

3,374,854
SEISMIC PULSE GENERATOR WITH GAS CUTOFF
Lauren G. Kilmer, Tulsa, and William W. Burress, Broken Arrow, Okla., assignors, by mesne assignments, to Sinclair Research, Inc., New York, N.Y., a corporation of Delaware
Filed June 9, 1966, Ser. No. 556,502
13 Claims. (Cl. 181—.5)

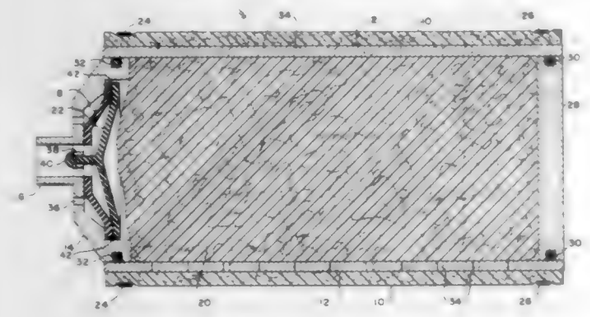
A gas exploder-type seismic wave generator including an explosion chamber and valved gas conduits for supplying gas to the chamber and having an ionization gap

across which current passes when a flame is present within the chamber. The current triggers solenoids which



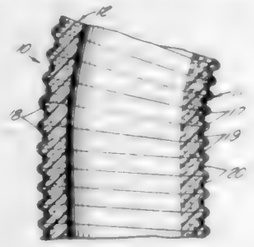
close valves in the gas conduits to insure that no more gas is supplied to the chamber once the flame has been initiated.

3,374,855
MUFFLER AND DIFFUSER FOR UNDERWATER DIVING
Thomas E. Kelly, Victoria, British Columbia, Canada, and Frederick Bigger, Key West, Fla., assignors to the United States of America as represented by the Secretary of the Navy
Filed Apr. 20, 1967, Ser. No. 634,039
10 Claims. (Cl. 181—36)



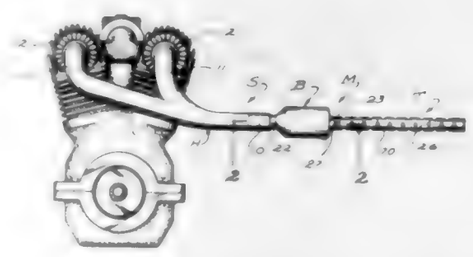
An underwater sound muffler comprising a container having a check valve for admitting air at one end. The container is apertured and filled with membraneless open cell type foam material. A layer of open cell type foam material having membranes covers the container allowing air to diffuse out without the formation of bubbles.

3,374,856
FLEXIBLE SOUND ATTENUATING DUCT WITH FOAMED PLASTIC LINING
Leslie S. Wirt, Phoenix, Ariz., assignor to The Garrett Corporation, Los Angeles, Calif., a corporation of California
Filed Sept. 9, 1966, Ser. No. 578,362
11 Claims. (Cl. 181—42)



1. A flexible sound-attenuating duct comprising:
(a) a flexible tubular casing; and
(b) a liner in said casing, said liner being composed of a sound-damping material with a through-flow resistance of the same order of magnitude as the specific acoustic impedance of the fluid to be carried by the duct, said material having the characteristic of being extensible in a direction parallel to the axis of the casing when subjected to tension and retractable upon the release of such tension.

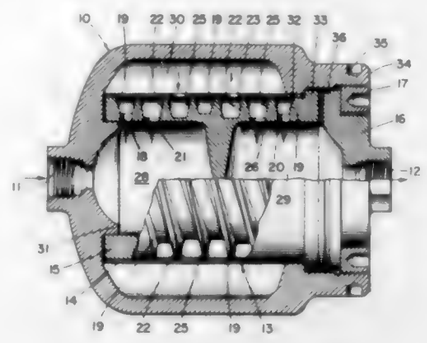
3,374,857
MUFFLER CONSTRUCTION
Hugh A. Hutchins, 1362 Green Lane, La Canada, Calif. 91011
Filed Dec. 29, 1966, Ser. No. 605,889
10 Claims. (Cl. 181—58)



1. A muffler construction of the character referred to including, an elongate, normally horizontally extending, tubular body with a cylindrical side wall and front and rear end walls, an elongate, central, forwardly opening, tubular inlet neck on and projecting forwardly from the front wall and communicating with the interior of the body, an elongate forwardly and rearwardly opening tail pipe concentric with and carried by the rear wall and having a forward portion projecting freely into the body and a rear portion projecting freely rearwardly from the body, a flat radially extending disc-shaped baffle in the central forward portion of the body and spaced rearwardly from the front wall and radially inward from the side wall and cooperating with said front and side walls to define a forward receiver chamber, a plurality of circumferentially spaced, radially extending vanes between the baffle and the side wall and pitched to impart cyclonic motion in and to gases and matter flowing rearwardly in the body between the baffle and the side wall, and a radially inwardly and axially forwardly inclined directing cone in the body between the forward end of the tail pipe and the side wall and spaced axially between the baffle and the rear wall to cooperate with the said baffle, side and rear walls to define a central separator chamber and a rear trap chamber, the outer rear portion of the cone being formed to define an axial opening adjacent the top of the side wall establishing communication between the separator and trap chambers.

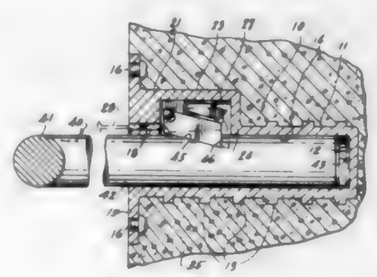
3,374,858
ACOUSTIC FILTER WITH PLURAL HELICAL PASSAGES
John F. Richards, Santa Paula, Calif., assignor to Wilhelm S. Everett, Ventura County, Calif.
Filed Aug. 24, 1966, Ser. No. 574,642
6 Claims. (Cl. 181—59)

1. An improved acoustic filter for decreasing pressure pulsations in a fluid line comprising: a closed housing having an inlet port and an outlet port connected in series with said line; first partition means defining with said housing an inlet chamber and an outlet chamber communicating, respectively, with said inlet port and outlet port; second partition means defining with said housing an intermediate chamber separated from said inlet chamber and said outlet chamber; a first helical passage extending circumferentially within said housing from said inlet chamber to said outlet chamber; a second helical passage extending circumferentially within said housing from said inlet chamber to said intermediate chamber;



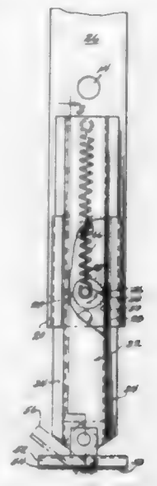
a third helical passage extending circumferentially within said housing from said intermediate chamber to said outlet chamber.

3,374,859
ANCHOR DEVICE WITH RELEASABLE LATCH MEANS
Alfred F. Dobert, Sand Lake, N.Y., assignor to Creative Associates of Albany, Ltd., Latham, N.Y., a corporation of New York
Continuation of application Ser. No. 386,335, July 30, 1964. This application July 24, 1967, Ser. No. 655,670
4 Claims. (Cl. 182—92)



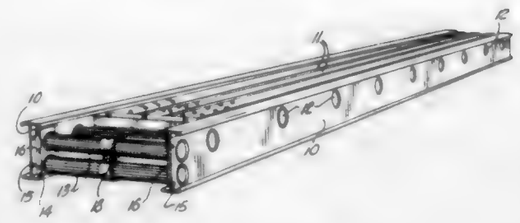
1. A fixture assembly for a poured concrete wall, said fixture assembly comprising, in combination, at least one socket insert for anchoring in the wall during pouring thereof, said socket insert comprising a laterally extended flange and a substantially rectilinear sleeve integral with said flange and extending normal thereto, said sleeve opening outwardly through said flange and having a closed inner end; said sleeve defining a relatively elongated socket; a pair of laterally spaced parallel walls extending rearwardly from said flange and substantially radially outwardly from said sleeve and defining, with a third wall extending therebetween and between said flange and said sleeve, an outwardly closed recess opening laterally from said socket; a pivot pin extending between said spaced parallel walls; a substantially flat latch pivoted to said pin and having a thickness substantially equal to the spacing of said parallel walls; biasing means operable between said latch and said third wall to bias said latch to project into said socket; and a fixture having at least one elongated substantially rectilinear shank substantially conformingly insertable into said sleeve with its length within said sleeve being in substantially full surface-to-surface engagement with said sleeve, and formed with a notch for locking inter-engagement with said latch to inhibit withdawal of said shank from said socket; said flange being formed with a passage extending inwardly from the outer face thereof and communicating at its inner end with said recess to receive a pin or the like to engage and pivot said latch to release the same from said notch.

3,374,860
SELF-LEVELING LADDER ATTACHMENT
Lyle F. Stewart, Tippecanoe, Ohio 44699
Filed May 2, 1966, Ser. No. 546,967
16 Claims. (Cl. 182—204)



A leveling attachment for a ladder including an extension member slidably received in a channel attached to the ladder leg and an eccentric cam pivotally secured to the channel member and adapted to frictionally engage a substantially flat, continuous locking surface on an interior face of the extension member.

3,374,861
SCAFFOLDING PLATFORM
Raymond H. Shaver, Newark Valley, N.Y., assignor to Harsco Corporation, Wormleysburg, Pa.
Filed Mar. 8, 1967, Ser. No. 621,688
2 Claims. (Cl. 182—222)

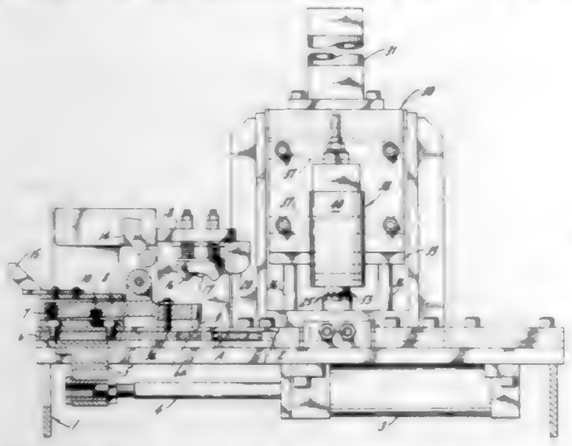


A scaffolding platform of light weight metal having a decking comprising longitudinally extending laterally interconnected floor slats supported on intermediate rungs or transverse bars between parallel rails. End rungs are positioned between end portions of the rails to protect the ends of said decking and to stiffen the platform structure against torsional strains. Said end rungs are mounted with their ends engaged in channels secured to the rails and are reinforced by rigid elements which securely connect their intermediate portions.

3,374,862
BEARING BALL GREASING MACHINE
Curtiss A. Reynolds, Rockford, Ill., assignor to Rehnberg-Jacobson Mfg. Co., Inc., Rockford, Ill., a corporation of Illinois
Filed June 3, 1965, Ser. No. 461,003
7 Claims. (Cl. 184—1)

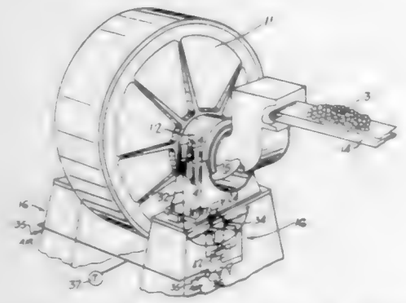
A greasing assembly for bearinigs having movable retainers, including a track, a finger movable into a bear-

ing and tiltable to move the retainer, and a grease nozzle alignable with the positioned retainer valleys to deposit



grease radially of the bearing and means for maintaining a clean nozzle.

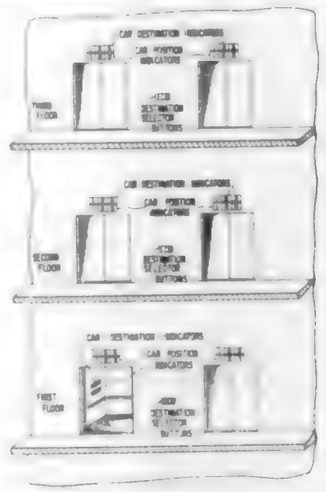
3,374,863
AUTOMATIC HIGH PRESSURE LUBRICATION SYSTEM FOR ROTARY GRINDING MILLS
Melvin M. Kozlowski, Montreal, Quebec, and Thomas E. Harris, Pointe Claire, Quebec, Canada, assignors to Dominion Engineering Works Limited, Montreal, Quebec, Canada
Filed Apr. 29, 1965, Ser. No. 451,842
4 Claims. (Cl. 184—6)



1. In a rotary grinding mill having a grinding drum rotatably supported on coaxially extending journals, having a journal low pressure lubricating system normally operative with operation of the mill to supply lubricant to said journals, the improvement comprising a high pressure lubricant supply means connected to the underside of said journals to provide journal lubricant at sufficient pressure to free and lubricate said journals prior to rotation of the mill, lubricant control means to control the operation of said supply means for a predetermined time interval, and means connecting said control means with the starting system of said mill to initiate operation of said control means whereby on starting the mill said high pressure means is energized to free and lubricate the mill prior to rotation thereof, said predetermined time interval overlapping the commencement of mill rotation to maintain lubrication by high press lubricant until said normally operative lubricating system becomes effective.

3,374,864
ELEVATOR CONTROL WHEREIN CAR DESTINATION IS REGISTERED BY SAME SWITCH WHICH REGISTERS CAR CALL
Leo Weiser Port, 10 Terrigal Ave., Turramurra, near Sydney, New South Wales, Australia
Filed Feb. 6, 1964, Ser. No. 342,975
4 Claims. (Cl. 187—29)

1. In an elevator system comprising at least two elevator cars each serving at least three floors, an array of floor selector buttons adjacent to the car landings at each floor, circuit means which are pre-set by operation of any one of said floor selector buttons, said circuit means being adapted, after pre-setting, to control the driving motors of the elevator cars so as to control one of said elevator cars to halt at a floor at which a floor selector



button was operated, and to remain there for a time sufficient to enable a passenger to enter said car, and then to control said car to travel to the selected destination floor and means located in each of said elevator cars for indicating the destination of that car and means located at each of said floors for indicating the destination of each elevator car.

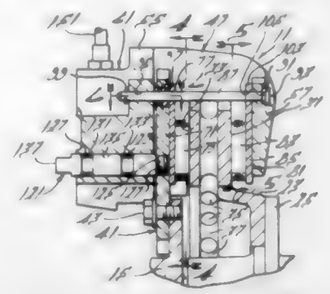
3,374,865
SNUBBER FOR DEPLOYING LINES
Jimmie M. Craig, China Lake, Calif., assignor to the United States of America as represented by the Secretary of the Navy
Filed Oct. 17, 1966, Ser. No. 588,269
1 Claim. (Cl. 188—1)

Shock absorber for a line disposed between a parachute and a suspended load in which a portion of the line is looped within a plastic deformable tube which compresses in stacked convolutions as the line increases in tension, the convolutions providing increasing frictional resistance against shortening of the loop as the loop ends are pulled from the tube.

3,374,866
MOUNTING MEANS FOR A SLIDING CALIPER DISK BRAKE
Chester W. Miles, Detroit, Mich., assignor to Kelsey-Hayes Company, Romulus, Mich., a corporation of Delaware
Filed Oct. 6, 1966, Ser. No. 584,803
4 Claims. (Cl. 188—73)

A sliding caliper type disk brake embodying a torque plate carrying a pair of outwardly extending pins that

are perpendicular to the braking surface of the associated disk and which extend away from the disk. The caliper assembly of the brake has a pair of bores in one of its

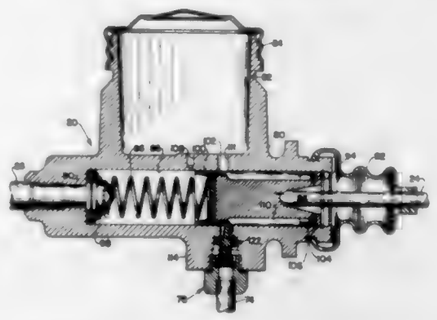


legs that slidably supports the caliper upon the pins. Resilient O-rings are interposed between the pins and caliper bores for exerting a restoring force upon the caliper when the brakes are released.

3,374,867
AUTOMATIC DEVICE FOR TAKING UP WEAR IN THE LININGS OF BRAKES
Max Henry Pirard, Chateau de la Cachette, Nouzonville, Ardennes, France
Filed May 16, 1966, Ser. No. 550,247
Claims priority, application France, Dec. 29, 1965, 44,142
5 Claims. (Cl. 188—79.5)

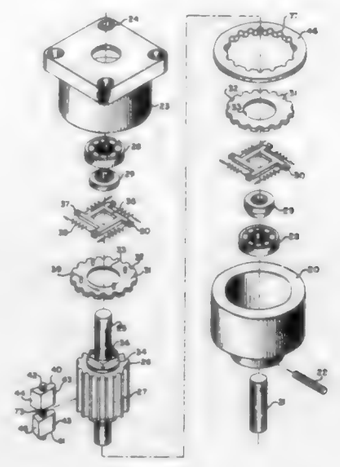
Braking system in which operator control is coupled to a brake by a ratchet and pawl in turn connected to a friction device which slips for taking into account the wear of the brake.

3,374,868
BRAKE SYSTEM
James C. Cumming, Pleasant Ridge, Mich., assignor to Rockwell-Standard Corporation, Pittsburgh, Pa., a corporation of Delaware
Continuation of application Ser. No. 491,774, Sept. 30, 1965. This application Sept. 20, 1966, Ser. No. 580,828
2 Claims. (Cl. 188—152)



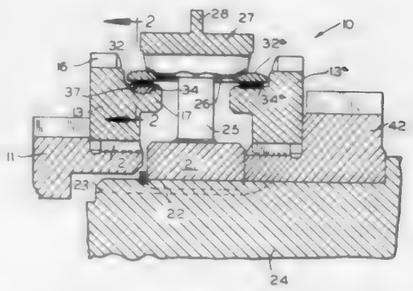
Master cylinder for a torque reaction brake system with independent primary and secondary circuits, the master cylinder having a piston, a portion of which pressurizes only the primary circuit and another portion of which controls a valve for isolating the primary and secondary circuits except when the brakes are released.

3,374,869
CAM OPERATED REVERSIBLE CLUTCH MECHANISM
James M. Steinke, Dayton, Ohio, assignor to The National Cash Register Company, Dayton, Ohio, a corporation of Maryland
Filed Sept. 2, 1966, Ser. No. 576,948
9 Claims. (Cl. 192—26)



A reversible clutch mechanism including an output shaft mounted within a driving member and a driven or brake member. A first set of cam members are mounted between the driving member and the output shaft with a second set of cam members mounted between the output shaft and the driven or brake member, corresponding cam members of both sets being interconnected for simultaneous movement. A control member operated externally of the clutch mechanism engages the interconnecting means to move one or the other set of cam members into an engaging position so that the output shaft is either driven or stopped. One embodiment of the clutch mechanism has wedged shaped cam members while a second embodiment has roller shaped cam members.

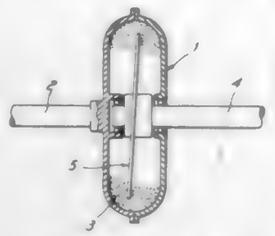
3,374,870
TRANSMISSION SYNCHRONIZER
Lawrence M. Johnston, Jr., Fort Wayne, Ind., assignor to International Harvester Company, a corporation of Delaware
Filed Nov. 4, 1965, Ser. No. 506,320
10 Claims. (Cl. 192—53)



A synchronizer clutch mechanism capable of controlling the engagement of two positively engageable clutch elements that form part of a torque delivery path between a driving member and a driven member of a power mechanism and involves a friction clutch of the type including a helically-wound spring capable of being wrapped or radially expanded into frictional or gripping engagement with a flexible strip ring so as to couple the driving and driven members together frictionally.

3,374,871
METHOD TO START HIGH-POWERED MACHINES BY MEANS OF CENTRIFUGAL POWDER OR GRANULAR TYPE JOINTS

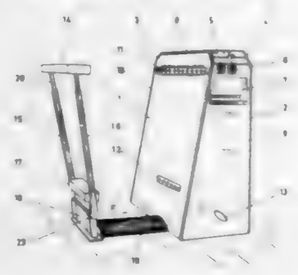
Ubaldo Ranzi, Via Roma 2, Legnano, Italy
Filed June 29, 1965, Ser. No. 467,850
4 Claims. (Cl. 192—58)



1. A torque transmitting coupling comprising relatively rotatable driving and driven elements, said driving element being a hollow casing with a drive shaft connected thereto, said driven element comprising a driven shaft having a disc rotatable therewith and disposed in said casing, said disc having a diameter less than the diameter of said casing, said casing having a mass of discrete granular material therein which serves as the torque transmitting medium between said elements, and the casing having an interior smooth and highly polished surface.

3,374,872
APPARATUS FOR AUTOMATICALLY CONTROLLING ADMISSION TO THEATERS AND THE LIKE

Theophile Guillerm, Cinema de Francais, 22 Cotes-du-Nord, Lannion, France
Filed July 28, 1966, Ser. No. 568,571
6 Claims. (Cl. 194—10)

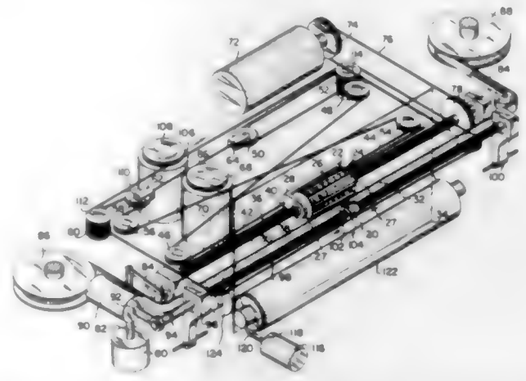


A housing at the entrance to a theater encloses a money handling device which counts and collects money introduced into the housing, gives change, and collects tokens. A ticket distributing device in the housing discharges tickets, and a token distributing device discharges tokens. The passing of a person past the housing is sensed. The several devices are connected with each other and an alarm by an electronic circuit so that the alarm is energized by the sensed passing of a person in one direction unless the alarm is inactivated by the collecting of money and the subsequent automatic delivery of a ticket, or by the collecting of a token. A token is discharged when the passage of a person in the opposite direction is sensed.

3,374,873
PRINTING APPARATUS EMPLOYING BIDIRECTIONAL STEPPING MOTORS TO POSITION TYPE MEMBER

George Takenaka, Santa Ana, Calif., assignor to Codamite Corporation, Anaheim, Calif.
Filed Feb. 17, 1964, Ser. No. 345,342
9 Claims. (Cl. 197—49)

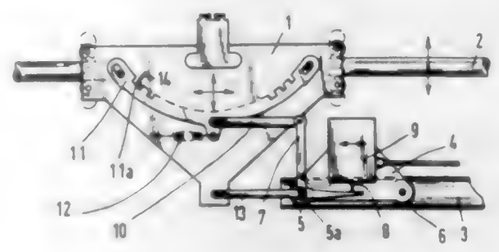
A printer is disclosed that utilizes a single font of somewhat cylindrical configuration, bearing type for various symbols upon its peripheral surface. The font is movably mounted to accommodate rotation and axial displacement, to set a desired symbol in printing position. The type font is controlled in movement by shift registers operating in combination with a source of pulses bi-directional stepping motors and reset apparatus. The printer is responsive to various codes which are registered by components in the shift registers which are then cleared



by pulses that step the stepping motors to position the type font by driving the stepping motors in a forward direction to accomplish the desired position in components. Thereafter, the type font is actuated to print the desired symbol. Structure is disclosed for returning the type font to a home position by reverse stepping the stepping motors.

3,374,874
SELECTOR SEGMENT SETTING DEVICE FOR TELETYPE MACHINES

Rudolf Rekewitz and Richard Reier, Munich, Germany, assignors to Siemens Aktiengesellschaft, Munich, Germany, a corporation of Germany
Filed Oct. 22, 1965, Ser. No. 505,138
Claims priority, application Germany, Dec. 11, 1964, S 94,576
7 Claims. (Cl. 197—72)

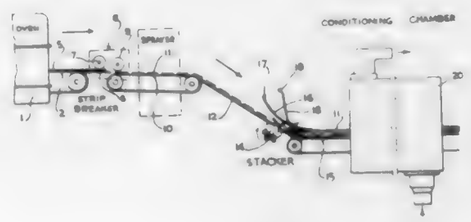


Code bar adjustment means in which the carrier for the code bar is vertically adjustable into at least three type group positions. The code bar carrier in the one form of the invention is horizontally and vertically shiftable, and the adjustment mechanism for the code bar is mounted on a carriage which is shiftable horizontally with the code bar carrier. The code bar is in the form of a segment of a circle and is adjustably mounted at its opposite ends on its carrier for movement generally conforming to the mean arc of the code bar. The actuator for adjusting the code bar is in the form of an electromagnet mounted on a carriage having an armature operating a bell crank lever pivoted to the carriage, intermediate its ends. The bell crank has a vertical arm pivotally connected at its upper end to a coupling link, pivoted to the code bar intermediate the ends of the code bar with its longitudinal center line extending generally tangentially of the lower side of the code bar. A spring connected to the code bar biases the code bar into one position of adjustment, while the

armature moves the code bar into a second position of adjustment. Vertical adjustment of the code bar carrier is compensated for by a second coupling link pivotally connected to the carrier in vertical alignment with the pivotal connection of the first coupling link to the carrier, and pivotally connected to the carriage for movement about the axis of the pivot of the bell crank. This provides a parallel compensating linkage arrangement connected between the code bar carrier and code bar, compensating for vertical adjustment of the carrier into its various positions of adjustment and enabling the positions of the code bar to be maintained uniform and to be uniformly adjusted in the various positions of adjustment of the carrier. In another form of the invention the armature of the electromagnet is directly connected to the first coupling link. The second coupling link is connected to the casing for the electromagnet. The electromagnet is mounted on a stationary support for horizontal movement, to compensate for angular movement of the first and second coupling links and the various elevations of the code bar carrier relative to the armature of the electromagnet. In a third form of the invention a cam is provided on the free end of the second coupling link and the coupling link is guided intermediate its ends for longitudinal and pivotal movement. The cam abuts an abutment surface extending from the casing for the electromagnet. This abutment surface is biased into engagement with the cam by a spring.

3,374,875
ARTICLE CONVEYING, SEPARATING AND STACKING APPARATUS

Arthur J. Griner, Wyckoff, N.J., assignor to National Biscuit Company, New York, N.Y., a corporation of New Jersey
Original application Dec. 31, 1963, Ser. No. 334,796. Divided and this application Dec. 21, 1966, Ser. No. 603,485
8 Claims. (Cl. 198—35)

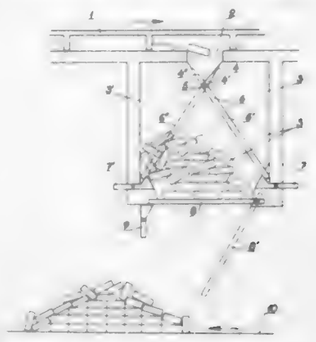


Apparatus for handling relatively flat articles comprising conveyor means for continuously feeding a column of articles onto a stationary inclined platform down which the articles slide for on-edge stacking on a slower delivery conveyor positioned a short distance below the lower end of the platform, and rotating cam members projecting through slots in the platform to lift the articles for permitting shingling thereof as the advance of the thus lifted articles is retarded by the delivery conveyor.

3,374,876
ARTICLE RECEIVING HOPPER

Alpo Rysti, Frisans, Finland, assignor to Safeko Oy, Helsinki, Finland, a corporation of Finland
Filed Oct. 26, 1966, Ser. No. 589,724
Claims priority, application Finland, Apr. 23, 1966, 1,065/66
2 Claims. (Cl. 198—68)

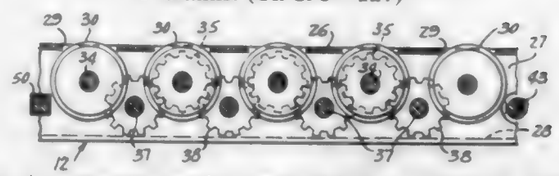
An article receiving hopper has a top opening and a shaft located within the hopper and carrying a swingable guide plate and a swingable partition. The guide plate and the partition divide the interior of the hopper into two compartments so that timber can be dropped through the top opening into any one of these two compartments. The partition can be located in any one of two end positions.



The bottom of the hopper is constituted by a lockable discharge hatch, so that timber can be dropped from the hopper upon a conveyor or the like.

3,374,877
SECTIONALIZED POWER DRIVEN CONVEYOR

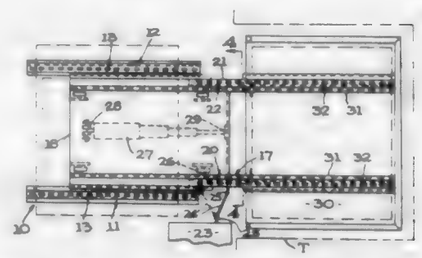
Edward T. Kornylak, Hamilton, Ohio, assignor to Kornylak Corporation, Hamilton, Ohio, a corporation of New Jersey
Filed Aug. 19, 1964, Ser. No. 390,576
5 Claims. (Cl. 198—127)



1. A conveyor section comprising a rollerway with power driven rollers, wherein the rollerway includes an inverted channel with a top web and vertical side walls, the top web having aligned longitudinally spaced openings therein adjacent one vertical side wall, axle means in said vertical side walls, rollers on said axle means and projecting slightly through said openings, each said roller comprising a hub rotatably mounted on said axle means, and having a hard elastomeric tire thereon and means within said channels for driving said rollers, said means comprising a gear formed on said hub adjacent said roller, at one side thereof, the channels are further provided with axle means mounted intermediate and below said rollers and including gears mounted on said latter mentioned axle means, said gears meshing with the gears on said hubs, and means for driving one of said gears.

3,374,878
ROLLER CONVEYOR SYSTEM

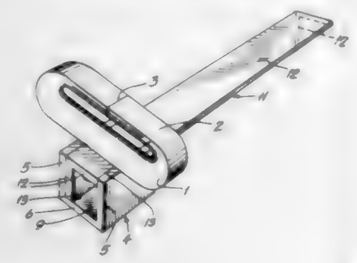
Andrew T. Kornylak, 400 Heaton St., Hamilton, Ohio 45011
Continuation-in-part of application Ser. No. 392,223, Aug. 26, 1964. This application July 25, 1966, Ser. No. 567,577
11 Claims. (Cl. 198—127)



The disclosure herein relates to an arrangement wherein two substantially aligned conveyors, i.e., a dockside conveyor and one on board a vessel or other carrier, are sepa-

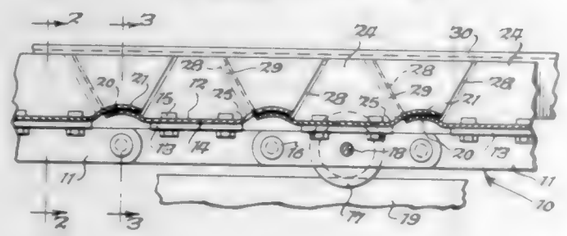
rated from one another. A movable conveyor section is arranged to move between the two aligned conveyors to bridge the gap between them. The movable or bridge section conveyor and the fixed or dockside conveyor are provided with rollerways having rollers therein and power operated means for driving said rollers. Intermediate rollers, below and between the conveyor rollers frictionally engage the conveyor rollers to drive same, and at least one intermediate roller is connected to a source of power. When the bridge section conveyor is connected to the second conveyor, on the carrier, the drive of its rollers is transferred to the rollers of the second conveyor. One form of movable conveyor is hinged on the end of the first or fixed conveyor. In another form, a carriage moves longitudinally in the space between the conveyor rails and bridges the gap between the first and second conveyors.

3,374,879
SCRAPER BLADE ATTACHMENT FOR STABLE CLEANER
Hector Vincent, St. Valerien, Quebec, Canada, assignor to La Cie Hydrolic Vincent Ltée, St. Valerien, Quebec, Canada
Filed Jan. 24, 1967, Ser. No. 611,311
7 Claims. (Cl. 198—176)



Scraper blade attachment for an endless belt.

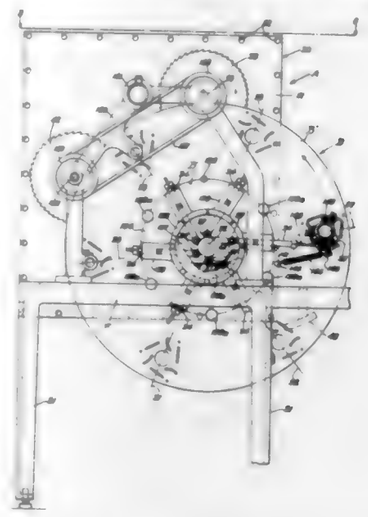
3,374,880
GUARD FOR APRON CONVEYORS
Frank J. Hohl, Snyder, N.Y., assignor to Hohl Machine & Conveyor Co., Inc., Buffalo, N.Y.
Filed Sept. 29, 1966, Ser. No. 582,839
10 Claims. (Cl. 198—196)



A plurality of aprons are arranged in overlapping relation to define a continuous conveyor supported for longitudinal movement. Inner and outer laterally spaced flights are secured to each apron adjacent each side margin for movement therewith. The flights project upwardly and form with the associated confined margins overflow channels extending continuously along the conveyor for retaining material overflowing the inner flights.

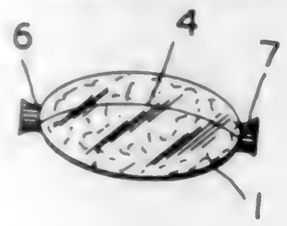
3,374,881
ARTICHOKE PROCESSING MECHANISM
Raymond C. Schwacofer, 23496 Sunset Drive, Los Gatos, Calif. 95030
Filed Sept. 15, 1965, Ser. No. 489,461
4 Claims. (Cl. 198—210)

An artichoke processing machine having a novel clamp for holding the stems of artichokes during processing. The clamp has a plurality of sets of gripping jaws mounted



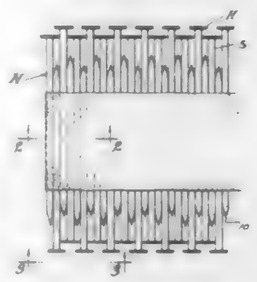
symmetrically around a peripheral portion of an indexing wheel.

3,374,882
COMPRESSED SPONGE PACKAGE
Arne S. Amaliksen, Midland, Mich., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware
Filed Dec. 13, 1965, Ser. No. 513,184
5 Claims. (Cl. 206—46)



1. A packaged, compressed sponge comprising a porous sponge, impregnated with an impregnating material, tightly compressed into a small size and totally enclosed by and sealed in a shrunken capsule of a synthetic thermoplastic film.

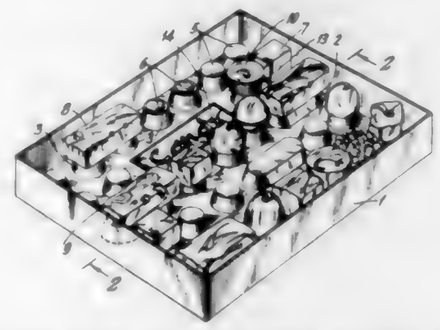
3,374,883
STICK OF FASTENERS FOR MAGAZINE SUPPLY
Richard E. Powers, San Marino, Calif., assignor to Powers Wire Products Co., Inc., El Monte, Calif., a corporation of California
Filed Feb. 7, 1966, Ser. No. 525,669
8 Claims. (Cl. 206—56)



1. A straight elongated and substantially rigid stick comprising a multiplicity of separably interengaged fasteners and wherein each fastener comprises an elongated axially disposed shank with an enlarged head concentric with the axis at one end, the axes of said multiplicity of fas-

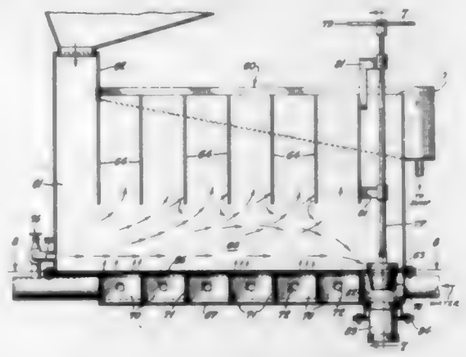
teners being disposed in a common plane and the shanks of each successive fastener being adjacent and parallel and engaged one with the other, the adjacent fasteners being oppositely faced, and each adjacent fastener being offset longitudinally along its axis with respect to the other thereby to space the heads thereof from the next adjacent shank, and there being means separately interconnecting the adjacently engaged shanks of the fasteners.

3,374,884
DISPLAY PACKAGE
Sam Chinkes, 95 Park Terrace E., New York, N.Y. 10034
Filed Apr. 13, 1967, Ser. No. 630,628
7 Claims. (Cl. 206—72)



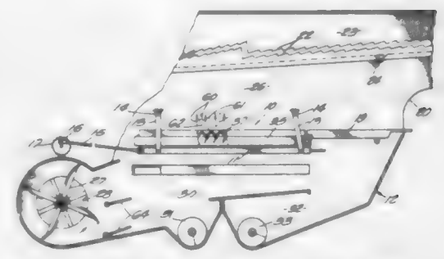
A packaging tray for small articles which is provided with adhesive coated platforms upon which the articles are removably adhered.

3,374,885
METHOD AND APPARATUS FOR BENEFICIATING MINERALS
Floyd J. Clawson and Michael C. De Stefano, Lakeland, Fla.; said Clawson assignor to Unifab, Inc., Camden, Tenn., a corporation of Tennessee
Filed Oct. 15, 1963, Ser. No. 316,372
11 Claims. (Cl. 209—17)



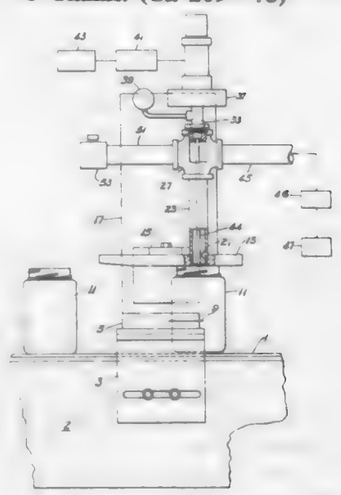
3. An apparatus for beneficiating minerals comprising:
feeder means for supplying a feed of a mineral slurry at constant volume and pressure,
a hydrocyclone for effecting a preliminary particle size separation into a lighter fines phase and a denser mineral phase of said mineral slurry,
means for delivering feed slurry from said feeder means to said hydrocyclone,
a deslimer,
means for delivering the denser mineral phase of said slurry from said hydrocyclone to said deslimer,
means separate from said denser mineral phase delivery means for injecting a first auxiliary liquid under pressure horizontally into said deslimer to move the particles in said slurry horizontally therethrough,
means for supplying a second auxiliary liquid upwardly into said deslimer under a pressure sufficient to remove the smaller slime particles but not the larger mineral particles,
means for delivering the overflow of slime particles from said deslimer back to said feeder means for reintroduction into said hydrocyclone,
and means for discharging the larger deslimed mineral particles from said deslimer.

3,374,886
GRAIN SEPARATOR CHAFFER ASSEMBLY
Arthur S. Lightsey, Cantua Creek, Calif. (1280 Allen Ave., Oakdale, Calif. 95361)
Continuation-in-part of application Ser. No. 346,719, Feb. 24, 1964. This application May 2, 1966, Ser. No. 546,914
2 Claims. (Cl. 209—28)



A chaffer assembly for combines and grain separators formed from corrugated material having rows of air inlet openings so arranged relative to adjustable air deflectors as to provide closely spaced sheet-like generally vertical streams of air flowing upward through the stream of chaff and straw passing rearwardly over the top of the chaffer assembly. The rising streams of air do not tend to blow the grain toward the rear end of the chaffer assembly and the relatively quiet air between the vertically rising air streams allows the grain to fall and pass through the air inlet openings into the grain collecting chamber below the chaffer assembly.

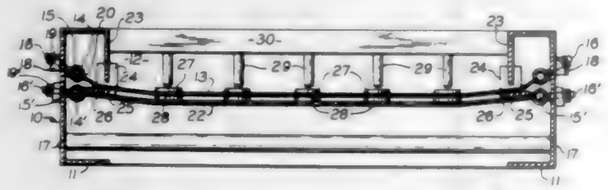
3,374,887
AUTOMATIC INSPECTION MEANS FOR CONTAINERS
Miller J. Paruolo and James H. McMeekin, Brockway, Pa., assignors to Brockway Glass Company, Inc., Brockway, Pa.
Filed Mar. 11, 1966, Ser. No. 533,521
5 Claims. (Cl. 209—73)



An apparatus for automatic inspection of containers that are advanced on a conveyor. The containers contact a switch which triggers a vacuum source. The vacuum

source will lift the container against a plate if the flat top of the container does not contain irregularities, cracks, holes or slits and register a maximum pressure difference. A reject mechanism will be activated if the top of the container contains sufficient irregularities to prevent the pressure inside from reaching a predetermined low value.

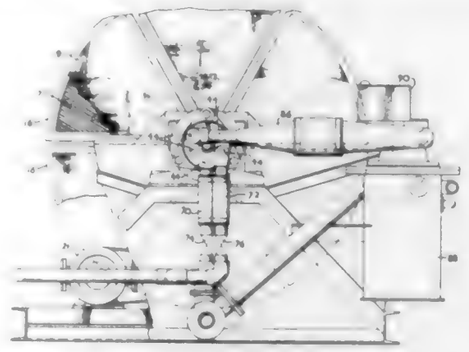
3,374,888
SCREENING MACHINE
Werner Volpert and Horst Hagen, Oelde, Germany, assignors to Haver & Boecker, Oelde, Westphalia, Germany, a private corporation
Filed Nov. 2, 1964, Ser. No. 408,187
Claims priority, application Germany, Nov. 8, 1963, H 50,779
3 Claims. (Cl. 209—319)



1. A material screening machine, which comprises a screen frame, a fine mesh screen disposed across said frame, a coarse mesh screen disposed across said frame in underlying parallel spaced relation to said fine mesh screen, a tension adjustment means connected to said frame and to said fine mesh screen to selectively adjust the tension thereof in each of two distinct lateral directions, a tension adjustment means connected to said frame and to said coarse mesh screen to selectively adjust the tension thereof in each of two distinct lateral directions, said fine and coarse mesh screens being disposed for independent tensioning adjustment by their respectively associated tension adjustment means, a first plurality of plate members secured to said fine mesh screen at individually distinct laterally spaced apart locations thereon, a second plurality of plate members secured to said coarse mesh screen at locations thereon underlying corresponding plates of said first plurality thereof, each of said first plurality of plates being disposed to receive impact forces and to transmit such received impact forces to corresponding underlying plates of said second plurality thereof, and a plurality of tappets each disposed for reciprocating movement along a path intersecting with a corresponding plate of said first plurality thereof and generally normal to the planes of said fine and coarse mesh screens to strike said plate and thereby excite vibrations in said fine and coarse mesh screens normal to their respective planes to aid in the screening of material through said screens.

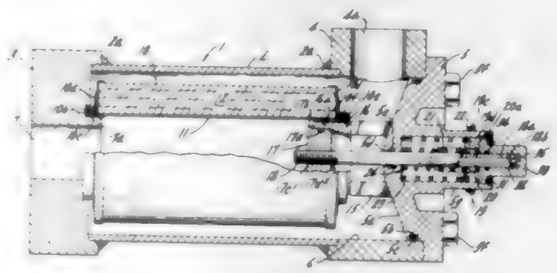
3,374,889
FILTRATION
Walter May Wallace, Carlisle, Cumberland, England, assignor to Simonacco Limited, Carlisle, England, a British company
Filed July 6, 1965, Ser. No. 469,471
Claims priority, application Great Britain, July 14, 1964, 29,201/64
1 Claim. (Cl. 210—77)

1. In a method of filtering a solid/liquid material wherein successive separate hollow filter sections of a rotatable filter assembly are cyclically immersed in said material and then removed from said material, the steps of applying vacuum to the interior of each section while it is immersed in said material to accumulate filter cake on said screening and periodically introducing compressed air into the interior of each said section in timed relation to rotation of the filter assembly to blow off filter cake while said section is removed from said material and only after said removed section has been successively immersed in said material a plurality of times so that a plurality of layers of filter cake are accumulated on each said section



before filter cake removal, said compressed air being applied to a filter section once during a period consisting of a complete revolution of the filter assembly plus a rotational increment thereof susbtantially equal to the reciprocal of the number of filter sections.

3,374,890
HYDRAULICALLY BALANCED BY-PASS INDICATOR FOR FILTERS
Walter J. Kudlaty, Elmhurst, Ill., assignor to Marvel Engineering Company, Chicago, Ill., a corporation of Illinois
Filed Feb. 19, 1965, Ser. No. 434,022
9 Claims. (Cl. 210—90)

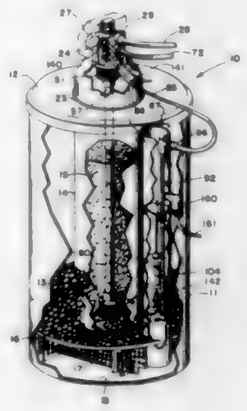


A filter assembly having a housing with an inlet and outlet, a filter element therein with a core directly communicating with the housing outlet, a closure member in said housing having a closed chamber therein, and a sleeve thereon sealingly extending into said core, a by-pass valve seating on said sleeve, an elongated rod extending through said valve into said closed chamber, said rod having an indicator thereon and a passage therein connecting said closed chamber with said core.

3,374,891
AUTOMATIC WATER SOFTENING APPARATUS
Louis J. Buchmann, Buffalo, N.Y., assignor to Aquionics Corporation, Buffalo, N.Y., a corporation of New York
Filed May 18, 1964, Ser. No. 368,024
9 Claims. (Cl. 210—126)

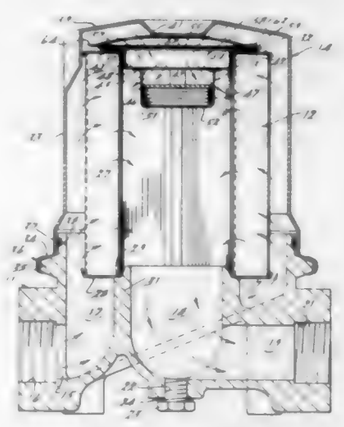
Automatic water softening apparatus which includes an outer tank for housing brine, said outer tank containing an inner tank for housing zeolites, a regeneration valve mounted on the zeolite tank, a brine valve assembly mounted within the brine tank, and associated conduits for effecting communication between the various tanks and valves. The brine valve assembly includes a columnar tube for shielding a float member from brine

pellets, and a poppet valve mounted on a common shaft with the float member for terminating flow of water from a first conduit leading into the brine tank when a predetermined level is reached in the brine tank. In addition, a poppet valve is loosely mounted on the common shaft for terminating flow from said brine tank into said first conduit leading to the zeolite tank when the level drops to a predetermined value. In addition, a handle



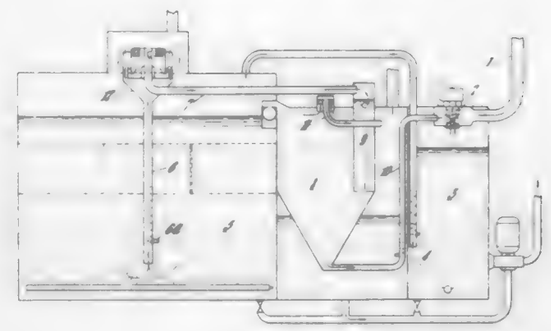
is mounted on the brine valve and is accessible from outside of the tank for varying the shut-off level of liquid in the brine tank. The regeneration valve includes a slide valve movable between a water softening and a regenerating position upon the actuation of a solenoid, and the regeneration valve includes associated conduits for effecting communication between: the brine tank and the zeolite tank; a hard water source and the zeolite tank; and the hard water source and the brine tank.

3,374,892
FILTER ASSEMBLY HAVING FILTERED BYPASS FLOW
Eugene J. Samaion, Racine, Wis., assignor to Walker Manufacturing Company, a corporation of Delaware
Filed Jan. 17, 1966, Ser. No. 521,020
4 Claims. (Cl. 210—132)



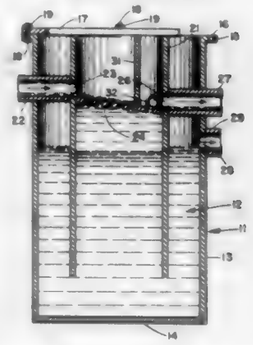
A filter assembly embodying a bypass valve assembly that incorporates a relatively coarse screen for removing large particles from the fluid when the main filter element is being bypassed. The bypass valve assembly is supported within one end of the central flow passage of an annular filter element and incorporates a leaf type spring for maintaining a seal between certain elements of the assembly.

3,374,893
SEWAGE PURIFICATION PLANT
Henry Jackson Stretton, Slough, England, assignor to G. D. Peters & Co. (Engineering) Limited, Slough, England, a British company
Filed May 23, 1967, Ser. No. 640,548
Claims priority, application Great Britain, Dec. 6, 1966, 54,607/66
4 Claims. (Cl. 210—195)



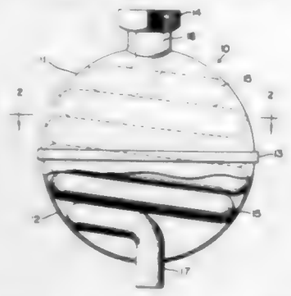
Means for transferring sewage at a substantially constant rate from one portion of an aerobic sewage treatment plant, e.g. the aeration tank, to another portion, e.g. the settlement hopper comprises an air lift pump feeding sewage from the first portion into a transfer box provided with a first weir leading back to the first portion and a lower, substantially shorter, second weir leading to the other portion, the second weir being formed in or attached to a float so as to respond to the level of sewage in the transfer box. The second weir may be a lip of a telescopically slidable upper end portion of an outlet pipe projecting into the transfer box. Flow to the second weir may be smoothed by a baffle dipping into the sewage in the transfer box. The bulk of the flow into the box returns over the first weir and the level in the box varies little, any variations being compensated by the float moving the second weir so that the height of said level above the second weir is substantially constant.

3,374,894
SEPARATING DEVICE FOR LIQUID FUEL AND WATER MIXTURES
John D. Webster, 5532 Janet Drive, Norfolk, Va. 23513
Filed July 12, 1966, Ser. No. 564,699
10 Claims. (Cl. 210—257)



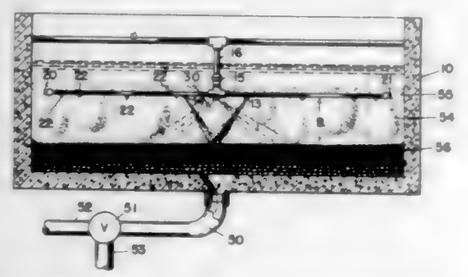
A device for separating liquid fuel and water consisting of a container in which the water level is maintained substantially constant by providing a water outlet in the side but below the fuel outlet. The mixture enters a central tubular member, flows across and through an inclined perforated baffle with the water settling to the lower section of the container while the fuel rises and is discharged at the upper fuel outlet.

3,374,895
WATER FILTER DEVICE
Zaharias Krongos, 328 W. 49th St., New York, N.Y. 10019
Filed July 18, 1967, Ser. No. 654,175
3 Claims. (Cl. 210—266)



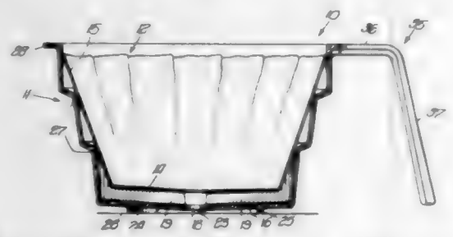
A filter adapted to be attached to faucets. The filter is comprised of a casing which contains a continuous length of coiled tubing therein. The tubing contains sequential zones of various filtering material.

3,374,896
FILTER BED AGITATOR
Charles E. Palmer and Robert H. Palmer, Fairview, Pa., assignors to Palmer Filter Equipment Company, Erie, Pa., a corporation of Pennsylvania
Continuation-in-part of application Ser. No. 553,936, May 31, 1966, which is a continuation-in-part of application Ser. No. 147,648, Oct. 25, 1961. This application Oct. 31, 1966, Ser. No. 590,816
1 Claim. (Cl. 210—272)



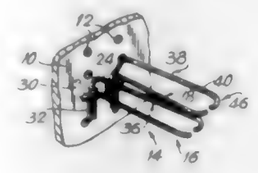
A self-propelled filter bed agitator comprising a horizontally rotatable arm supported at its center above the bed, nozzle means on opposite sides of the arm and the center to rotate the arm and agitate the bed and two nozzles on opposite sides of the center and directed downwardly inwardly to agitate the area of the bed directly below the center.

3,374,897
ONE-PIECE FUNNEL WITH INTEGRAL RIBS FOR HOLDING DISPOSABLE COFFEE CARRYING FILTER
John C. Martin, Springfield, Ill., assignor to Bunn-O-Matic Corporation, Springfield, Ill., a corporation of Delaware
Filed Feb. 1, 1966, Ser. No. 524,184
4 Claims. (Cl. 210—455)



A one-piece funnel for holding a disposable coffee carrying filter comprising an apertured sloping bottom and stepped frusto-conical sidewall. Ribs integral with the bottom and handle integral with the flanged upper end of the sidewall.

3,374,898
SAFETY-GUARDED PEGBOARD DISPLAY HANGER
Donald Karmin, 10 Hillcrest Drive, Glen Head, N.Y. 11545
Filed June 28, 1966, Ser. No. 561,174
7 Claims. (Cl. 211—59)

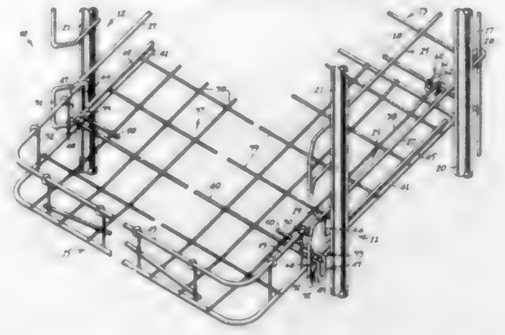


1. A guarded display hanger, said hanger including means detachably mounting the hanger on a perforated pegboard, an elongated shaft fixed on one end to said mounting means and projecting horizontally away from the pegboard, said shaft having an upwardly inclined blunt-ended tip at its forward portion, the shaft being adapted to have articles hung thereon, and a safety guard, said safety guard including means detachably mounting the guard on the pegboard in relative close proximity to the hanger, an elongated member fixed on one end to said mounting means and projecting horizontally away from the pegboard, said member having a blunt portion at its forward end, said blunt portion having at least a leading segment thereof located above and forward of the blunt end of the shaft of the display hanger and being closely adjacent but spaced above the same so as to permit packaged articles to be hung onto and removed from the shaft of the display hanger without interference, said blunt portion having a transverse dimension substantially greater than the transverse dimension of the shaft of the display hanger and being configured so as to present to the front a surface which is curved away from the front whereby a person falling against the hanger will be deflected by the safety guard from injurious contact with the tip of the display hanger.

3,374,899
TOWEL BAR WITH FOLDING RACK
Jesse A. Bator, 43 Mang Ave., Kenmore, N.Y. 14217
Filed May 13, 1966, Ser. No. 550,047
6 Claims. (Cl. 211—96)

The towel bar shown is unique in that one half-portion is equipped with a built-in small article utility rack. This rack is characterized by several projectable and retractable arms pivoted in a recess in a manner that these arms can be completely folded within the recess. When thus folded the entire rod is available for one or more towels. When the arms are projected they can be used in whatever manner desired while the other half-portion of the bar can be used without hindrance. Also, the arms are linked for simultaneous cooperation and the linking means is operable by a knob-equipped slide.

3,374,900
DISPLAY RACK TRAY SUPPORT
Clark B. Rollins, Jr., % Nashville Display Manufacturing Co., P.O. Box 491, 1415 Elm Hill Road, Nashville, Tenn. 37210
Filed Oct. 3, 1966, Ser. No. 583,558
8 Claims. (Cl. 211—133)

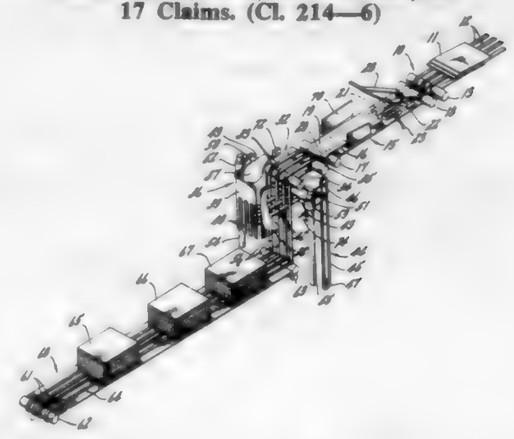


1. A tray support for a display rack comprising:
(a) an upright side support frame having an inside and an outside, and a front and rear,
(b) a tray having a side frame, said tray being adapted to be received within said rack with said side frame adjacent the inside of said side support frame,
(c) said side support frame comprising a forwardly projecting hanger rod,
(d) a wing member diverging outwardly from the front of said hanger rod,
(e) a hanger member projecting outwardly from said side frame and terminating in a depending tongue,
(f) said tongue being spaced outwardly from said side frame sufficiently that said hanger member extends across said hanger rod and said tongue depends adjacent the outside of said hanger rod when said tray is received in said rack,
(g) said wing member limiting the forward movement of said tongue.

3,374,901
LIVE BOOM SUPPORTING LIVE BOOM OR HOIST TRACK
Ray Ferwerda, 1050 NW. 163rd Drive, North Miami, Fla. 33169
Continuation-in-part of applications Ser. No. 362,331, Apr. 24, 1964, and Ser. No. 453,651, May 6, 1965. This application Apr. 18, 1966, Ser. No. 543,277
9 Claims. (Cl. 212—55)

In a backhoe having a main boom with power means for slewing it about a vertical pivot mounting on a carrying vehicle, and having a first hydraulic jack mounted between said vertical pivot mounting and the end of the main boom for oscillating the latter about a first horizontal pivot on said vertical pivot mounting, and having a second hydraulic jack pivotally mounted near the vehicle end of the main boom and adapted to have its outer end pivotally connected to a dipper stick of a backhoe bucket; means is provided, after the dipper stick is disassembled, to mount the lower end of an auxiliary boom on a second horizontal pivot intermediate the ends of the main boom, and for then pivotally connecting the outer end of the second jack to a point on the auxiliary boom spaced from said second horizontal pivot. The parts are so arranged that one operator may so convert the backhoe for use of the lifting boom. In one modification the lifting boom may support a rigid vertical hoist assembly which may be folded compactly for vehicle travel.

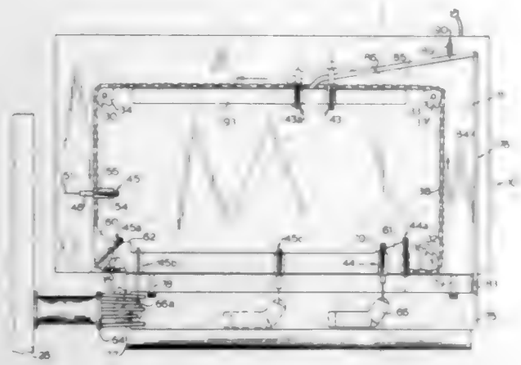
3,374,902
METHOD AND APPARATUS FOR JOGGING AND STACKING SIGNATURES
Harvey E. Mills, Kokomo, Ind., assignor to The Cuneo Press, Inc., Chicago, Ill., a corporation of Illinois
Filed July 20, 1964, Ser. No. 383,765
17 Claims. (Cl. 214—6)



9. Mechanism for converting a continuous stream of signatures into a stacked pile, such mechanism including, in combination:
means for shingling a continuous stream of signatures, said shingling means comprising a moving surface upon which lay the signatures, said moving surface having a rate of speed greater than the rate of speed of the stream of preshingled signatures, and
vacuum means arranged to cause each signature in the stream to be urged against the moving surface to thereby facilitate separation of each signature in contact with the vacuum means from the immediately succeeding signature in the stream, and to prevent slippage between each signature and that portion of the moving surface with which it is in contact,
means for collecting the shingled signatures in a stack,
means, responsive to the collection of a predetermined amount of signatures, for terminating operation of the shingling means,
means for moving the collected stack to a removal zone, and
means for reinstituting operation of the shingling means upon movement of the stack of signatures to the removal zone.

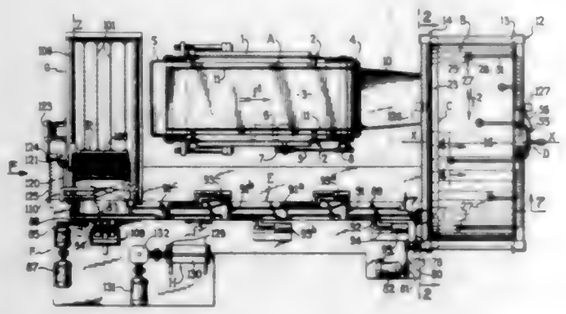
3,374,903
HOSIERY STACKING APPARATUS
Clarence J. Glover, Denton, N.C., assignor to Surratt Hosiery Mill, Inc., Denton, N.C., a corporation of North Carolina
Filed Feb. 21, 1966, Ser. No. 528,912
6 Claims. (Cl. 214—6)
An automatic hosiery transfer and stacking device includes a series of chain-mounted retractable needles

adapted to engage successive hose in the delivery station



fingers of a hosiery everting machine, pull the hose to its full length and then release the hose for stacking.

3,374,904
MACHINE FOR ARRANGING LETTERS AND THE LIKE INTO ROWS
Marcel François, Chatenay-Malabry, France, assignor to Hotchkiss-Brandt, Paris, France, a corporation of France
Filed Mar. 23, 1965, Ser. No. 442,145
Claims priority, application France, Mar. 24, 1964, 968,435
12 Claims. (Cl. 214—7)

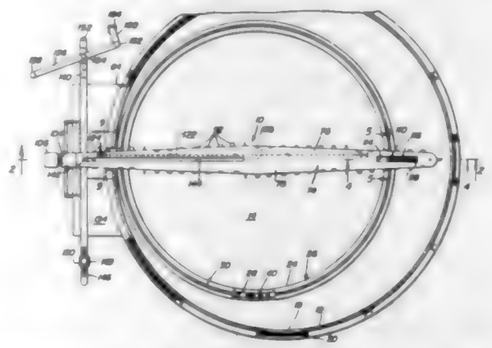


A machine for arranging letters in stacks comprising in combination: means for feeding a heap of letters, arranged haphazardly, to the lower end of a substantially cylindrical inner face of a drum having suckers for seizing the letters from the underside of said heap and releasing the seized letters at the top of the drum into letter receiving and aligning means which feed the aligned letters to a stacking magazine.

3,374,905
METHOD AND APPARATUS FOR TRANSPORTING RECEPTACLES
Harri David, Hamburg-Lohbrugge, Otto Erdmann, Hamburg-Bergedorf, Claus Jahnig, Hamburg, and Willy Rudszinat, Dassendorf, near Hamburg, Germany, assignors to Hauni-Werke Korber & Co., KG., Hamburg-Bergedorf, Germany
Filed Oct. 22, 1965, Ser. No. 500,988
Claims priority, application Great Britain, Oct. 22, 1964, 43,111/64
21 Claims. (Cl. 214—16)

Cigarettes produced by a first battery of machines are loaded into trays which are circulated by an endless feed conveyor extending along a second battery of machines which convert filled trays into empty trays. Surplus trays (including filled and empty trays) are circulated by the feed conveyor and by a second endless conveyor. Rows of empty and filled trays are accumulated in magazines disposed between the two conveyors and two sets of storing conveyors are provided, one for each magazine, to transfer empty and filled trays unidirectionally through the respective magazines from one of the conveyors to the other conveyor and to transfer empty and filled trays from the other conveyor to the one conveyor.

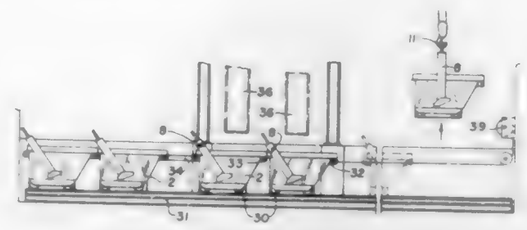
3,374,906
BOTTOM TYPE SILO UNLOADER
Harold M. Zimmerman, R.D. 1, Ephrata, Pa. 17522
Filed Jan. 6, 1966, Ser. No. 519,129
16 Claims. (Cl. 214—17)



A silo unloader for removing silage from the interior of a silo through an opening in a wall portion of the silo. The unloader includes the combination of an elongated conveyor, a drive mechanism for the conveyor, and means for moving one end portion of the conveyor horizontally orbitally with respect to the interior of the silo and for moving the conveyor horizontally reciprocally with respect to the opening in the wall portion of the silo. The conveyor cuts and conveys silage through the opening as it sweeps across at least a portion of the silo interior.

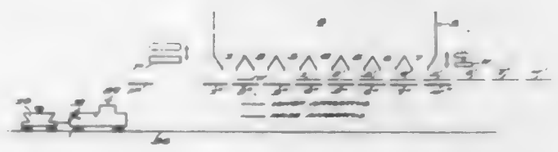
3,374,907
DUMP BUCKET
James M. Phillips, Bridgeville, and Alfred D. Parke, Jr., Pittsburgh, Pa., assignors to Phillips Mine & Mill Supply Co., Carnegie, Pa., a corporation of Pennsylvania
Filed July 5, 1966, Ser. No. 565,646
7 Claims. (Cl. 214—41)

This application discloses a so-called automatic dump bucket wherein the bucket and lifting bail for the bucket are so interconnected that when the bail is suspended from a crane hook the bucket is locked in a level position, but when the bucket is set on the ground, the bail is free to swing in an arc toward the rear of the bucket only through a limited arc to an inclined position where the bail is substantially clear of the top of the bucket, but does not extend substantially beyond the rear end of the bucket. However the arrangement is such that when the bail is lifted at an angle relative to the bucket, the bucket is then free to swing through an arc of 90° for discharging the



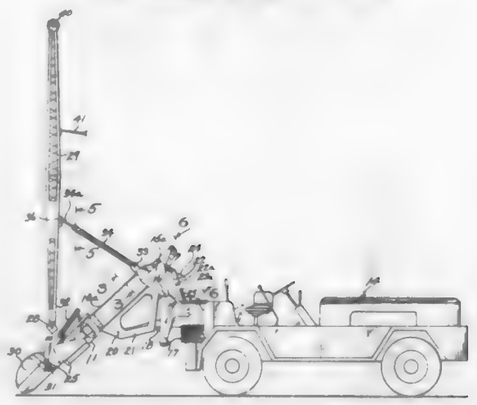
contents of the bucket. Additionally, buckets so provided are provided with wheels so that they may be close-coupled and run in succession on tracks under a discharge chute, and the bail at the inclined angle does not interfere with this close coupling, nor with the discharge of material into the open tops of the buckets.

3,374,908
SYSTEM FOR LOADING TRAIN OF CARS WITH SOLID FLUENT MATERIAL
Paul F. Giesking, Seven Islands, Quebec, Canada, assignor to Pickands Mather & Co., Cleveland, Ohio, a corporation of Delaware
Original application May 24, 1963, Ser. No. 283,041, now Patent No. 3,251,487, dated May 17, 1966. Divided and this application Oct. 23, 1965, Ser. No. 503,923
5 Claims. (Cl. 214—42)



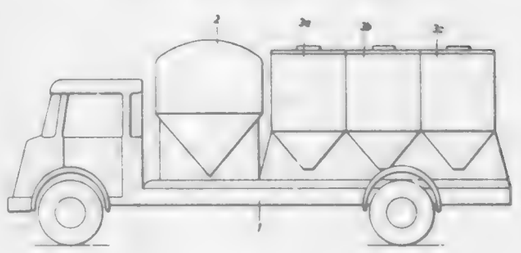
A vehicle including a receptacle spring-mounted on a wheeled truck, said receptacle having a top opening in the form of a hatch normally closed by a hatch cover, is loaded at a loading station with solid fluent material derived from a storage container for the fluent material located at said loading station as follows: The storage container is provided with at least one outlet and with means including a cam follower-controlled means for effecting discharge of fluent solids from said storage container through said outlet. The hatch cover of the vehicle receptacle is movable between a generally horizontal closed position and an upright open position, and is provided with a longitudinally extending cam track facing upwardly when the hatch cover is in its open position. Means is provided for arranging the vehicle for movement along a path of travel as will carry the hatch of the vehicle's receptacle under said container outlet, and at the approach side of said loading station there is provided means for opening of said hatch cover, said cam track then being engageable with the aforesaid cam follower means, when the vehicle reaches the loading station, to effect discharge of fluent material into said hatch while the vehicle is moving. The cam track becomes disengaged from the cam follower means by the lowering of the receptacle on the vehicle's springs, thereby terminating discharge of fluent material when a predetermined weight of the material has been loaded into said receptacle. The hatch cover is reclosed by means located at the departure side from the loading station.

3,374,909
COACTING BOOM STRUCTURE
Ray Ferwerda 1050 NW. 163rd Drive, North Miami, Fla. 33169
Filed Apr. 24, 1964, Ser. No. 362,331
12 Claims. (Cl. 214—671)



1. Coacting boom structures comprising a telescoping boom having a fixed boom section and a movable boom section slidably mounted in said fixed section for movement longitudinally retracted into and extended out of said fixed section, means for retracting and extending said boom, a rigid boom having an end pivot connection and an intermediate pivot connection intermediate the ends of said rigid boom and spaced a predetermined distance from said end pivot connection, a rigid strut shorter than said telescoping boom extended and having end pivot connections at its opposite ends, a pivot mounting fixed relative to said fixed boom section, a pivot mounting on said movable boom section, one end pivot connection of said strut adapted to pivotally coact with said rigid boom intermediate pivot connection, and said rigid boom end pivot connection and the other of said strut end pivot connection being interchangeably connectable to either of said pivot mountings, whereby, with said rigid boom end pivot connection pivotally connected to either one of said pivot mountings and the other of said strut end pivot connections pivotally connected to the other of said pivot mountings, retraction and extension of said telescoping boom will cause oscillation of said rigid boom about its end pivot connection.

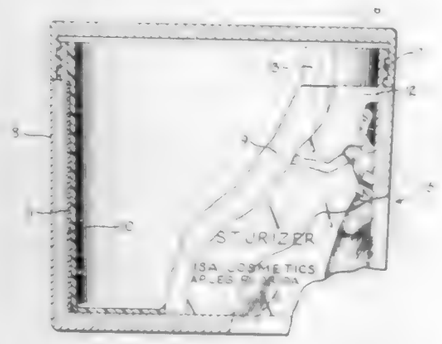
3,374,910
RECEPTACLE VEHICLE FOR BULK MATERIAL
Wilhelm Hermanns, Frankfurter Strasse 462, Porz-Urbach, Germany
Filed Aug. 10, 1965, Ser. No. 478,772
Claims priority, application Germany, Aug. 25, 1964, H 53,630
3 Claims. (Cl. 214—83.28)



A receptacle vehicle for dispensing bulk material including a pressure tank type change-over receptacle, a plurality of bulk material storage cells. A compressor in communication with the change-over receptacle is operable to supply compressed air to the receptacle to discharge bulk material therefrom and is further operable

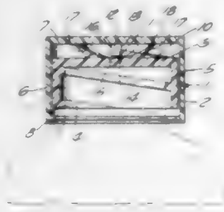
to apply a vacuum to the receptacle to draw material from a pre-selected one of the storage cells into the change-over receptacle.

3,374,911
PLASTIC COSMETIC JAR
Robert V. White, 1041 E. Knapp St., Milwaukee, Wis. 53202
Filed May 15, 1967, Ser. No. 638,245
2 Claims. (Cl. 215—8)



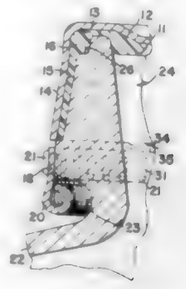
A plastic jar for cosmetic creams has a liner of plastic that is impervious to such creams inside an outer shell of clear transparent plastic, with a paper band encircling the liner and tightly confined between the contiguous surfaces of the side walls of the shell and liner, the band having decorative indicia thereon which is visible through and protected by the clear transparent side wall of the outer shell.

3,374,912
SAFETY BOTTLE TOP
Evert D. Velt, 6182 Roy St., Los Angeles, Calif. 90042
Filed July 18, 1966, Ser. No. 566,074
5 Claims. (Cl. 215—9)



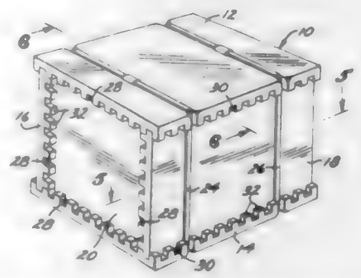
A safety bottle top comprises an inner member having an end wall and a cylindrical side wall engaging the thread of a bottle, which inner member is enclosed by on outer member having an end wall and a cylindrical side wall, the two members being rotatable relative to each other and axially movable relative to each other with spring means normally holding the two walls apart. One of the two end walls has a lug in a given radial zone projecting towards the other end wall and the other end wall has a ramp in said radial zone which merges at one end with the end wall and terminates at the other end in an abutment facing in a left hand direction. Said other end wall further has a recess in said radial zone forming a second abutment facing in the right hand direction, whereby the lug means on said one end wall may engage said first abutment when the axial spacing of the two end walls is reduced to a given degree in opposition to the spring means and whereby the lug means may enter said recess to engage said second abutment when the lug means registers with said recess and the axial spacing of the two end walls is reduced to greater than said given degree in opposition to said spring means.

3,374,913
TAMPER-PROOF PACKAGE
Donald H. Zipper, Western Springs, Ill., assignor to Continental Can Company, Inc., New York, N.Y., a corporation of New York
Filed Oct. 8, 1965, Ser. No. 494,082
5 Claims. (Cl. 215—39)



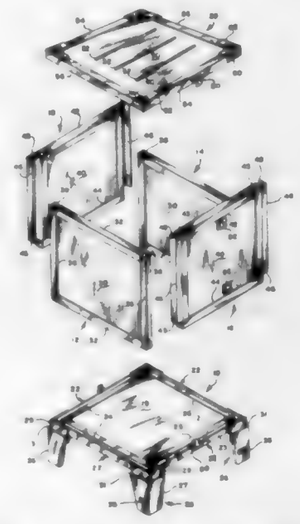
1. A tamper-proof package comprising a container having a sealing finish, said sealing finish having a plurality of cam surfaces thereon, an outwardly facing smooth circumferential portion disposed below said cam surfaces, a cylindrical portion disposed below said circumferential portion, a plurality of spaced lug means on said cylindrical portion, each of said lug means projecting radially outward from said cylindrical portion, a closure cap received over said sealing finish, said closure cap having a tap panel covering the top of said sealing finish and a depending skirt at the marginal edges of said top panel, said skirt being spaced from said sealing finish and a deformable gasket substantially filling the space between said skirt and said circumferential portion, said gasket extending into engagement to form a cam surface for co-operation with said cam surfaces on said finish, a tamper-proof band frangibly joined through spaced bridging portions to a lower portion of said skirt, said tamper-proof band having a series of spaced recesses therein with closed upper and lower ends for receiving said lug means on said cylindrical portion thereby to prevent rotation of said band, whereby rotation of said closure cap to effect removal from said package will serve to fracture said bridging portions thereby indicating that said package has been opened, the vertical length of said spaced recesses substantially exceeding the vertical length of said lug means so as to permit said tamper-proof band to drop down when it has become separated from said skirt.

3,374,914
SHIPPING CONTAINER AND STRUCTURAL MATERIAL THEREFOR
William D. Adam, Newport Beach, Calif., assignor to W. D. Adam Company, Inc., Costa Mesa, Calif., a corporation of California
Filed Oct. 23, 1965, Ser. No. 503,270
2 Claims. (Cl. 220—4)



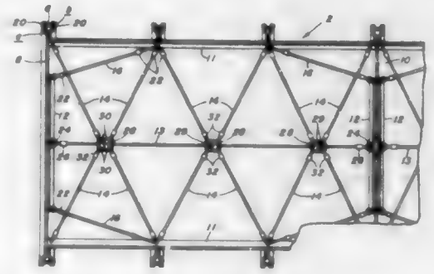
A knock-down shipping container made of sections of material provided with a uniform pattern of intersecting channels, the edges and channels of the sections being interfitted and held together to define an internal shipping space.

3,374,915
COLLAPSIBLE AND STACKABLE CONTAINER
Donald Verhein, 2116 N. Peninsula Road, and Gene D. Verhein, 150 Main St., both of Waukesha, Wis. 53186
Filed July 21, 1966, Ser. No. 566,812
6 Claims. (Cl. 220—4)



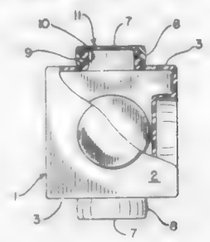
A knock-down or collapsible type container that has the side and end walls seated in a groove around the edge of a base. The end walls engage the side walls on assembly and are connected to the base to form an opened top container. A top is placed on the side and end walls in mating engagement with the top edge of the side and end walls to close the container. The base is formed to provide a storage space for the side and end walls and the top is used to hold the walls in place on the base.

3,374,916
LIQUID STORAGE TANK
Louis M. Herff, Penn Hills Township, Allegheny County, Pa., assignor to United States Steel Corporation, a corporation of Delaware
Filed Oct. 10, 1966, Ser. No. 585,685
6 Claims. (Cl. 220—5)



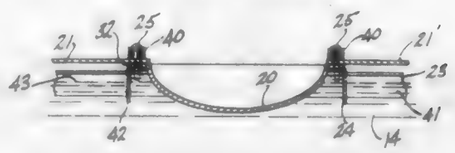
1. A tank for storing liquids comprising
an elongated metal shell,
end plates secured to the ends of said metal shell,
a primary cable secured to said end plates and extending lengthwise through said tank,
a plurality of secondary cables connected between the inner walls of said shell and said primary cable, a group of at least two of said secondary cables connected to said primary cable at a common node, and each oriented at an acute angle to said primary cable,
and baffle elements connected across alternating spaces between said secondary cables of said group to inhibit the lengthwise flow of liquid in said tank.

3,374,917
INTERLOCKING STRUCTURAL ELEMENTS
Constantine T. Troy, 1330 Cleveland Ave., Wyomissing, Pa. 19610
Filed Jan. 9, 1964, Ser. No. 336,670
4 Claims. (Cl. 220—23.4)



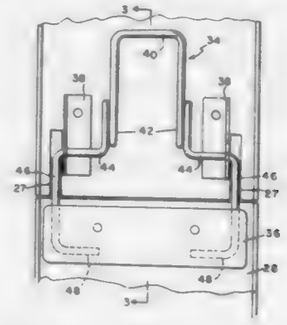
1. A closed hollow container adapted to store and dispense various materials comprising:
a cube bearing a male member on both of its end faces and a female member on each of its four side faces;
the male and female members being adapted to register in locking frictional engagement with each other and being spaced on the periphery of the cube in a manner such that planes drawn tangent to the entrance of each of the female members and tangent to the trailing portions of each of the male members will lie on the surfaces of the cube;
whereby the container may be secured in mating relationship with another similar container in any of the three planes parallel to the principal axes of the container.

3,374,918
FLOATING DECK FOR STORAGE TANK
Lou C. Creith, Allentown, Pa., assignor to Olin Mathieson Chemical Corporation, a corporation of Viriginia
Filed Jan. 25, 1966, Ser. No. 522,900
4 Claims. (Cl. 220—26)



A floating deck for use in liquid storage tanks is provided in which a plurality of individually buoyant pans to keep the deck afloat. In areas of the deck not occupied by said pans, sheets of metal are provided to avoid vaporization.

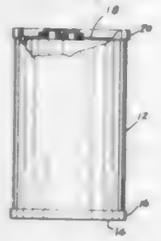
3,374,919
SPRING HINGE SUPPORTING MEANS FOR POWER HOUSING
Hendrik A. J. de Vos, Wenham, Mass., assignor to Sylvania Electric Products Inc., a corporation of Delaware
Filed June 23, 1966, Ser. No. 559,863
7 Claims. (Cl. 220—35)



An arrangement for supporting a power housing from the arm of a luminaire in which a spring hinge secured

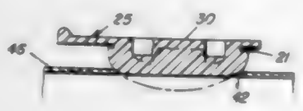
at one end thereof to the power housing is rotatably supported intermediate its ends in hinge hooks mounted on said arm.

3,374,920
CONTAINER WITH EASILY OPENED SEGMENT
Walter M. Perry, 76 Locust Hill Road, Darien, Conn. 06820
Filed Dec. 1, 1965, Ser. No. 510,742
14 Claims. (Cl. 220—54)



A can, typically for a beverage, has an end, usually aluminum, with an openable segment defined by score lines, and a lift tab disposed transversely of the segment. The tab may be widened and fastened to the segment by two spaced rivets preferably integral with the segment. One rivet is tight, and the other preferably has clearance to permit partial raising of the lift tab before taking effect, in order not to interfere with initial rupture of the segment at the first fastening means when starting to open the can. The score line grooves are formed in the top surface of the can end near the lift tab, and are formed in the bottom surface at parts of the segment remote from the lift tab. A single rivet may be used, preferably triangular, with its apex directed toward the transverse lift tab. These improvements reduce the force needed to open the container.

3,374,921
PUSHBUTTON CAN CLOSURE
Theron R. Kelley, Mattapoisett, Mass., assignor to Tedan, Inc., West Hanover, Mass., a corporation of Massachusetts
Filed Aug. 16, 1966, Ser. No. 572,831
4 Claims. (Cl. 220—60)



1. A removable-replaceable elastomer closure for a symmetrical opening in a plate of predetermined thickness, including

(a) a plug portion substantially the segment of a sphere having top and bottom faces, the outer circumferential wall of the plug curving downwardly and inwardly from the top to the bottom face,

(b) a circumferential collar of substantially rectangular cross-section area extending upwardly from the top face of the plug portion, the outer diameter of the collar being longer than the plate opening diameter,

(c) a circumferential, substantially rectangular groove with its open end facing outwardly provided in the collar,

(d) the groove being in a plane parallel to and spaced above the top face of the plug,

(e) the inner diameter of the groove being longer than the diameter of the plate opening, and the thickness of the groove being less than the thickness of the plate,

(f) a flange extending radially outward from the collar above the groove, the lower face of the flange lying in the same plane as the upper face of the groove,

(g) a pull tab extending radially outward from the flange,

(h) a pushbutton extending upwardly from the plug and positioned substantially centrally of the plug, the outer wall of the pushbutton and inner wall of the collar defining a trough therebetween,

(i) whereby the plug material below the trough constitutes a readily flexible web transmitting pressure exerted on the pushbutton axially of the closure to elongate it and reduce its circumference to pass through the plate opening.

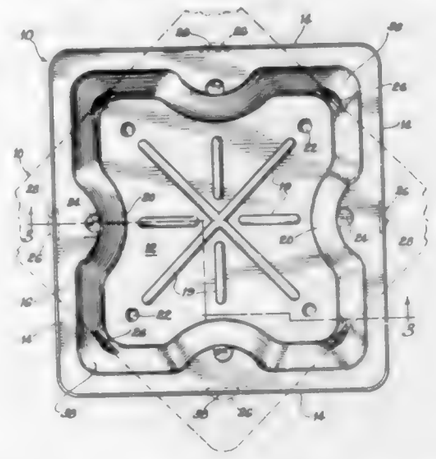
3,374,922
FOAMED CONTAINERS
Richard K. Shelby, Downers Grove, Ill., assignor to Monsanto Company, St. Louis, Mo., a corporation of Delaware
Filed Aug. 26, 1964, Ser. No. 392,186
11 Claims. (Cl. 220—97)

1. A one-piece plastic container having a base, a side wall with substantially parallel opposed, inside and outside surfaces, a portion of said side wall composed throughout of a single layer of thermoplastic material which comprises a foamed polymer portion extending from within the body of said thermoplastic material and forming said outside surface, and a non-foamed polymer portion integral with said foamed polymer portion and forming said inside surface, said foamed polymer portion extending outwardly beyond the remainder of said wall, and nesting means for maintaining said foamed polymer portion of said side wall out of contact with the inside surface of the side wall of a like container when one container is supported within another of said like containers.

3,374,923
BUS BOX CONSTRUCTION
Ralph Ettlinger, Jr., Highland Park, Ill., and John M. Welch and William Le Roy Watkins, Columbia, Mo., assignors to Raburn Products, Inc., Wheeling, Ill., a corporation of Illinois
Filed Aug. 18, 1966, Ser. No. 573,229
5 Claims. (Cl. 220—97)

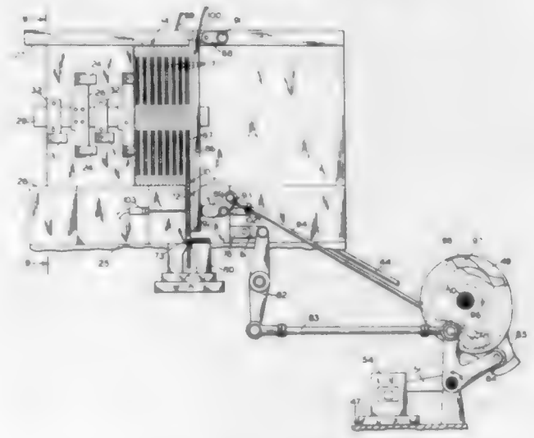
A bus box construction for restaurants comprising a tray having bottom and side walls with a flat upper rim portion. The upper rim portion is provided for supporting dish racks whereby material from dishes placed on the racks will pass through the racks and be collected in the bus box. Notches are provided at the corners of the bus box, and beaded portions are formed in the bottom wall adjacent the corners to provide interlocking means whereby the bus box can be associated with a separate box

located at a 45° angle thereto. The notches engage the upper rim of the separate box, and the beaded portions



are received by depressions defined in the rim portion of the separate box.

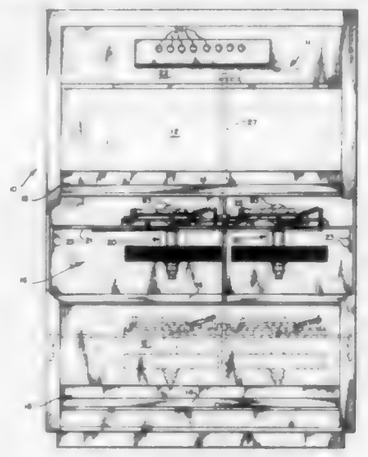
3,374,924
APPARATUS FOR JOGGING AND DISPENSING ARTICLES FROM A RACK
Charles R. Fegley, Laureldale, Pa., assignor to Western Electric Company, Incorporated, New York, N.Y., a corporation of New York
Filed Aug. 23, 1966, Ser. No. 574,357
12 Claims. (Cl. 221—11)



A rack containing rows of articles is successively advanced to present each row to a chute having an escapement device which dispenses the articles individually onto an exit trackway. Each dispensed article drops through the chute and is rotated to fall onto the trackway in an oriented position. A cyclically operated sensing brush jogs the articles and senses any jammed articles to insure that all the articles are dispensed from a row before another row of articles is presented to the chute.

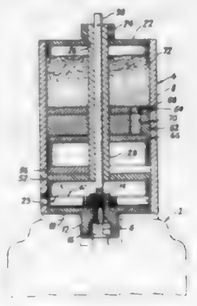
3,374,925
AUTOMATIC RECORD DISPENSER
Arnold E. Ristau and Alfred G. Ristau, Kaukana, Wis., assignors to Melodie Vendor Corporation, Appleton, Wis.
Continuation-in-part of application Ser. No. 451,581, Apr. 28, 1965. This application Dec. 1, 1966, Ser. No. 598,445
3 Claims. (Cl. 221—129)

A record dispensing apparatus having a reciprocally movable bar carrying a number of selectively actuated lever type hook arms for engaging one of a number of dispensing devices positioned in close proximity to the bar. Each dispensing device having a crank arm which is engaged by the lever means to simultaneously release a record while moving a holding means into position to



prevent the fall of more than one record. On release of the actuating bar the lever means will return to its original position dropping the next record into position to be dispensed.

3,374,926
METHOD AND APPARATUS FOR HEATING AQUEOUS MEDIA
Robert M. Friedenberg, Baltimore, Md. (7319 Laurel-Bowie Road, Apt. 204, Laurel, Md. 20810), and John Medige, 106 Wingate Ave., Buffalo, N.Y. 14216
Filed Feb. 21, 1966, Ser. No. 528,994
12 Claims. (Cl. 222—1)

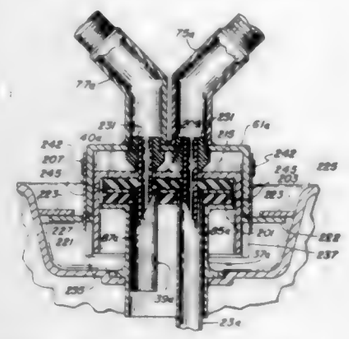


There is disclosed a dispenser for dispensing a heated aqueous medium having a casing assembly which provides a reservoir, a discharge outlet, a storage chamber, and a reactant chamber adjacent the discharge outlet. A thermogenic agent is within the storage chamber and an aqueous medium is within the reservoir. The dispenser includes means for segregating a limited volume of thermogenic agent from the storage chamber and passing it into the reactant chamber and for sealing the storage chamber from the reactant chamber. Means for discharging the aqueous medium from the reservoir includes a valve actuatable by pressure applied externally of the casing assembly and a conduit member open at a point spaced from the discharge outlet so that the discharging means and casing assembly direct a portion of the aqueous medium from the reservoir into contact with the limited volume of agent for thermogenic reaction therebetween and elevate the temperature of the reacted portion of the aqueous medium. This heated portion of the aqueous medium is then directed to the discharge outlet of the casing assembly and reacted medium is admixed with unreacted medium to provide a heated admixture of aqueous medium which is then dispensed from the dispenser through the discharge outlet.

3,374,927
TAPPING ARRANGEMENT FOR CONTAINERS

Philip H. Schmidt, Olympia, Wash., assignor to Olympia Brewing Company, Olympia, Wash., a corporation of Washington

Continuation-in-part of application Ser. No. 444,671, Apr. 1, 1965, which is a continuation-in-part of application Ser. No. 554,245, May 2, 1966. This application May 19, 1967, Ser. No. 639,809
17 Claims. (Cl. 222—82)

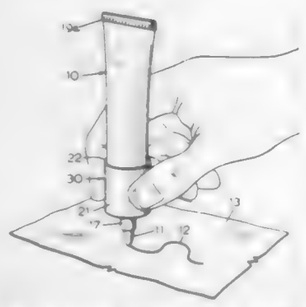


A cask tapping arrangement including a tap rod unit for the cask wherein the tap rod unit has a replaceable puncturable disc which seals the upper ends of parallel, offset, liquid outlet and gas inlet passageways, and wherein a tapper unit mounts on the tap rod unit and has puncture tubes for puncturing said disc in register with said passageways.

3,374,928
PROTECTIVE COLLAR FOR SQUEEZABLE TUBES

Reginald Harrie Alfred Hope, 7 W. Dean Valley Road, Islington, Ontario, Canada

Filed June 7, 1966, Ser. No. 555,792
16 Claims. (Cl. 222—105)

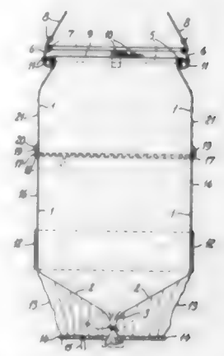


1. A collar for a tube having an annular dispensing end with an outer circular periphery of fixed diameter and a tubular wall extending from said periphery to a flattened end of the tube, the tubular wall being capable of being squeezed manually to dispense the contents of the tube through said dispensing end, the collar comprising a generally cylindrical body that is relatively undeformable as compared to said tubular wall and that has an open end whereby the collar is slidable over said periphery and tubular wall to encompass a portion of the tubular wall within the collar, the body having an internal surface that clears said periphery and tubular wall save for circumferentially spaced apart lands raised on said internal surface adjacent at least the other end of the body which lands are snugly engageable frictionally with said periphery of the dispensing end to resist displacement of the collar relative to the tube whereby the collar can then be gripped manually to press the dispensing end of the tube against a surface on which the contents of the tube are to be dispensed without forcing the collar longitudinally off the tube, the collar being sufficiently stiff to protect the portion of the tubular wall that is encompassed by the collar and prevent substantial squeezing thereof.

3,374,929
BULK CONTAINERS

Lennart Silfverskiö'd, Strandvagen 61, Stockholm, Sweden

Filed Sept. 23, 1966, Ser. No. 581,560
5 Claims. (Cl. 222—105)

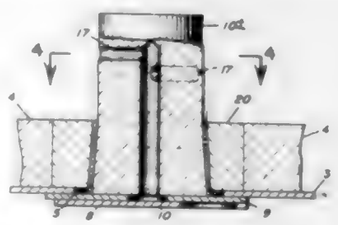


1. In a bulk container the combination of an elongated tubular fabric container body, a funnel shaped flexible container bottom extending from the lower end of the contained body, having a closable lower end opening and being foldable into a substantially flat position, when the container is empty, a band encircling and secured to the lower end of the body, having its lower edge adjacent the jointure of the body and the funnel shaped container bottom and being sufficiently rigid to retain the tubular container body expanded substantially to its full circumference, and an additional bottom closure for the encircling band comprising a fabric skirt exterior of the container bottom and having its upper edge secured to the lower edge of the band and extending downwardly therefrom with its lower edge free, the skirt having a length approximating the radius of the band and securing means associated with the free edge of the skirt for releasably securing the skirt in substantially flat position under the container bottom, when the latter is in a folded in, substantially flat position.

3,374,930
DISCHARGE BRICK FOR CASTING LADLES, INTERMEDIATE CONTAINERS AND THE LIKE

Horst Hase, Wiesbaden, and Hans-Joachim Winkler, Krefeld-Urdingen, Germany, assignors to Stoecker & Kunz GmbH, Krefeld-Linn-Rheinhafen, Germany

Filed Dec. 3, 1965, Ser. No. 511,497
Claims priority, application Germany, Dec. 5, 1964, St 23,040
7 Claims. (Cl. 222—566)

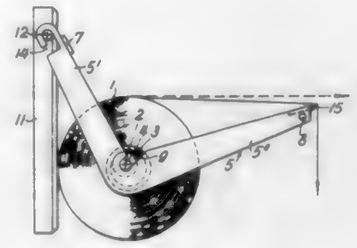


A discharge spout brick for a pouring container of casting ladles and the like wherein the body of such brick is fixed in stationary position at the bottom of the container. The body has a substantially vertical passage therein closed at the top and connecting the interior of the pouring container with the passage are a plurality of substantially horizontal inlet conduits staggered vertically. These conduits extend from the passage to the interior of the container and may be distributed equally or irregularly around the passage. They also may have a cross-section of geometrical form and the outlet of the passage is closed by a slide shutter.

3,374,931
TEAR-OFF DEVICE FOR ROTATABLY MOUNTED PAPER ROLLS PARTICULARLY TOILET PAPER ROLLS

Anton Abraham, Perchtoldsdorf, Lower Austria, Austria, assignor to Wiener Kammfabrik Anton, Abraham Komm. Ges., Wiener Neudorf, Lower Austria, Austria, a corporation of Austria

Filed Jan. 27, 1966, Ser. No. 523,386
Claims priority, application Austria, Jan. 27, 1965, A 700/65
3 Claims. (Cl. 225—79)

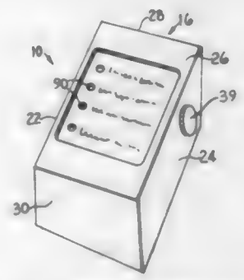


A tear-off device for rotatably mounted paper rolls, particularly toilet paper rolls, wherein, due to the pressure exerted upon a separation knife disposed at one end of a lever, said paper roll is pressed towards a wall plate and prevented from rotation thereby, which comprises a mandrel adapted to support rotatably a paper roll, and two levers bent for about a right angle at substantially the center thereof and disposed parallel relative to and spaced apart from each other at a distance corresponding with the length of the paper roll. At least one cross-member is provided which connects the levers to form a pair of levers. A carrying plate is adapted to be secured to a wall, and the pair of levers is swingably mounted on the carrying plate at the free end of one of the levers to swing about a common axis, and the free end of the other of the levers is disposed in a horizontal plane, higher than a horizontal plane extending through the rotary axis of the paper roll, so that upon pulling downwardly the end of the paper roll the latter is pressed towards the carrying plate and prevented from further rotation. A separating knife is carried by the free end of the other of the levers, and the mandrel is rotatably mounted in the levers at least near to the bent portion of the latter.

3,374,932
INFORMATION HANDLING AND STORING APPARATUS

Robert E. Spinner, 26 Deer Trail Road, North Caldwell, N.J. 07006, and David F. Wolfe, 173 Riverside Drive, New York, N.Y. 10024

Filed Feb. 23, 1966, Ser. No. 529,482
6 Claims. (Cl. 225—93)

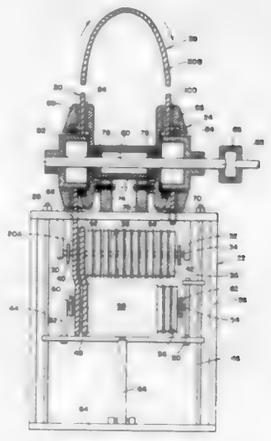


The disclosure is of information-handling apparatus comprising a housing which includes a pair of reels, one a supply reel and one a takeup reel, between which a master information roll is supported. The master information roll includes columns of apertures, each aperture being associated with a unit of information, with the columns offset laterally and longitudinally from each other along the roll. An information-receiving member positioned beneath the roll is used to enter information from each column of apertures in the roll.

3,374,933
LOOP ERECTION SYSTEM

Niels O. Young, Lincoln, Mass., assignor to Block Engineering, Inc., Cambridge, Mass., a corporation of Delaware

Filed Aug. 15, 1966, Ser. No. 572,557
11 Claims. (Cl. 226—118)



1. An erection device comprising, in combination,
an elongated flexible element forming a closed loop;
guide means providing a constraining path for a portion of said loop so that said element is movable substantially along its longitudinal axis in said path at said guide means;
means for holding a variable proportion of said element in ordered storage, the remainder of the loop not in said guide means or in storage being unconstrained, and
means for providing a thrust to said element along said path to impart speed to said element sufficient to cause said unconstrained remainder of said loop to erect into a substantially rigid structure.

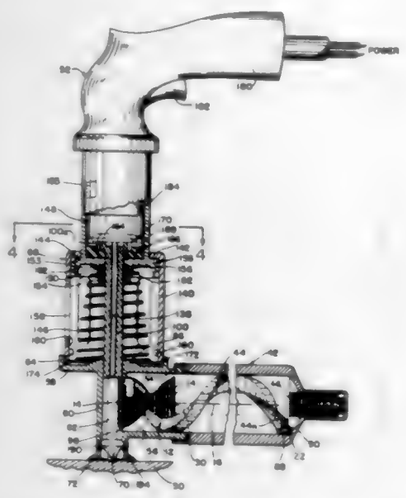
3,374,934
NAIL DRIVING APPARATUS

Robert B. Dickson, Evanston, Ill., assignor to Dickson Weatherproof Nail Company, Evanston, Ill., a corporation of Delaware

Original application Nov. 5, 1963, Ser. No. 321,450, now Patent No. 3,212,622, dated Oct. 19, 1965. Divided and this application Aug. 19, 1965, Ser. No. 481,003
13 Claims. (Cl. 227—130)

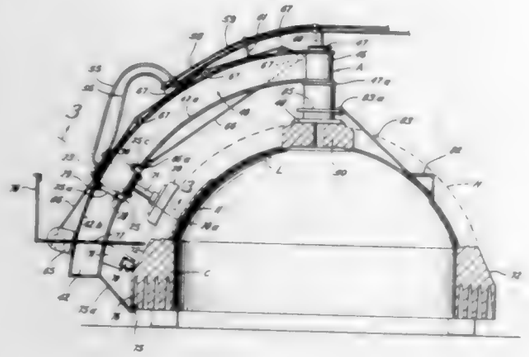
A nail driving tool in which nails are fed thereto along a helical path with their heads contacting each other and defining a cylindrical surface of revolution with their shanks also contacting each other at the axis thereof. The lead nail is helically guided into a poised position with its head partially intruding in a bore in which a piston is reciprocated manually to discharge the nail into the bore and a power driven hammer advances the nail with repeated blows on the piston step by step as the handle is moved towards a work piece keeping the piston in contact with the nail. The piston includes a nail set stem therein which is reciprocated with respect thereto by rela-

tive rotation induced by movement of the handle. The leading nail can be retracted from its poised position for



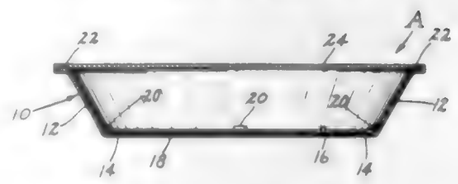
tool storage to clear the piston in its fully advanced position in which it is locked when not in use.

3,374,935
APPARATUS FOR USE IN MANUFACTURING LAMINATED HEADS OR CLOSURES
Raymond E. Pechacek, Houston, Tex., assignor to Hahn & Clay, a corporation of Texas
Filed Mar. 28, 1966, Ser. No. 537,805
7 Claims. (Cl. 228—44)



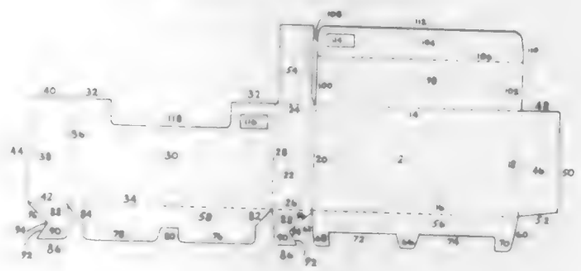
1. An apparatus for use in manufacturing laminated heads or closures, comprising:
(a) a pressure ram adapted to force an outer curved layer into close contact with an inner layer which is shaped as a partial sphere,
(b) a rotatable support arm having a curvature generally conforming to the external surface of the inner layer,
(c) a pivot pin adapted to be positioned at approximate the central point of the inner layer for pivotally mounting one end of the rotatable support arm thereto,
(d) guide means on the other end of the rotatable support arm maintaining the rotatable support arm spaced from the inner layer a predetermined distance during rotational movement thereof, and
(e) means mounting said pressure ram on said rotatable support arm for lateral movement rotationally with the support arm and for longitudinal movement in a curved path conforming to the curvature of the support arms.

3,374,936
DISPOSABLE FOOD STORAGE AND SERVING DEVICE
Albert E. Colato, Tujunga, Calif., assignor to Plastics, Inc., St. Paul, Minn.
Filed Aug. 18, 1965, Ser. No. 480,701
1 Claim. (Cl. 229—2.5)



1. A disposable food storage and serving device comprising:
(a) a dish-like body portion having an annular outwardly flaring wall structure,
(b) said annular wall structure having an annular flange extending radially and directly inwardly from the inner periphery thereof to form a bottom support and a void concentrically of the wall structure,
(c) a flat circular bottom portion resting on the flange, the diameter of said bottom portion being no greater than the outer diameter of said arcuate flange means where it extends from said annular flaring wall,
(d) lug means extending radially inwardly from said wall structure and spaced from said annular flange and under which said bottom portion is secured in pressing engagement with said flange,
(e) said wall structure molded of a plastic material whereby the device with material therein has sufficient rigidity to be held by the fingers of one hand in an extended position without external support.

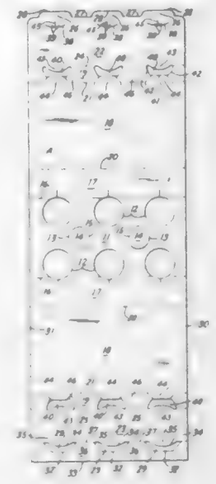
3,374,937
COLLAPSIBLE SETUP CARTON
Le Roy P. Wilson, 84 Cambridge St., Lindsay, Ontario, Canada
Filed Jan. 24, 1966, Ser. No. 522,680
5 Claims. (Cl. 229—39)



This invention relates to improvements in collapsible setup cartons and more particularly to cartons which may be set up and then filled with stationery such as envelopes by means of automatic machinery; preferably the subject carton is made from sturdy paper board commonly employed for cartons of this nature.

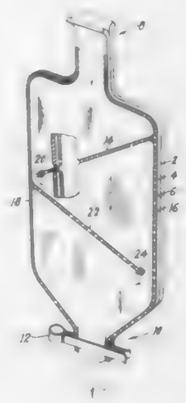
3,374,938
CONSTRUCTION OF INTERLOCKING BOTTOM PANELS FOR WRAPAROUND TYPE BOTTLE OR CAN CARRIERS
Chester J. Pierce, Jr., Palo Alto, Calif., assignor to Certipak Corporation, New York, N.Y., a corporation of Delaware
Filed May 5, 1967, Ser. No. 636,435
7 Claims. (Cl. 229—40)

The present improvements provide a construction of interlocked bottom panels of a bottle or can carrier of the wraparound type. The improved construction results in a tightly interwoven disposition of the exposed bottom panel edges in the sense that the edge of one panel alternately



overlies and underlies exposed edge portions of the other panel producing a seam which will not catch on rough or irregular surfaces over which the carrier is placed or slid.

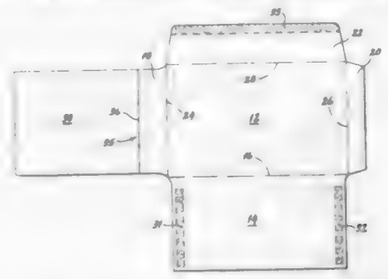
3,374,939
DISPOSABLE CONTAINERS WITH LIQUID TRAP
William R. McMenimen, 290 Haverhill St., North Reading, Mass. 01864
Filed June 22, 1966, Ser. No. 559,628
1 Claim. (Cl. 229—53)



A flexible disposable container having first and second sides formed of plastic and joined around their peripheries by heat sealing, the container being provided with an inlet and an outlet, first and second baffle means formed in said container by joining the sides by heat sealing, the baffle means cooperating to permit the flow of liquid from the inlet to the outlet, but acting to substantially obstruct flow in the reverse direction.

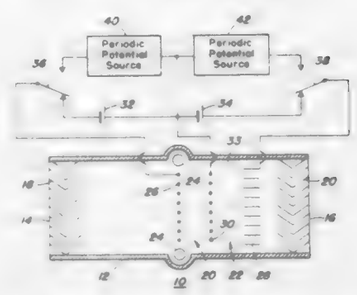
3,374,940
ENVELOPES WITH INTEGRAL, DETACHABLE COUPONS CONTAINED THEREIN
Robert D. Allison, 140 Garfield Road, West Hartford, Conn. 06091
Filed June 15, 1966, Ser. No. 557,798
7 Claims. (Cl. 229—70)

An envelope is made from a single blank of paper or other similar sheet material. The blank includes an extension which constitues a coupon or other item to be enclosed in the envelope. To form the envelope the blank is folded and sealed in such a way that the extension is completely enveloped and concealed. The extension is unsealed to any other part of the blank and is detachably



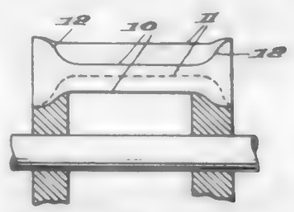
secured to the remminder of the blank by a line of perforations so that when the envelope is opened the extension may be readily removed therefrom.

3,374,941
AIR BLOWER
Ernest Carl Okress, Elizabeth, N.J., assignor to American Standard Inc., a corporation of Delaware
Filed June 30, 1964, Ser. No. 379,183
10 Claims. (Cl. 230—1)



An air blower in the form of a conduit has an inlet and an outlet. Within the conduit is means such as field generating electrodes, or other ionizing devices for ionizing the gas molecules without dissociation. Other field generating electrodes and/or magnetic devices generate fields which accelerate the ionized particles which by normal collision processes drive unionized gas molecules from the conduit outlet.

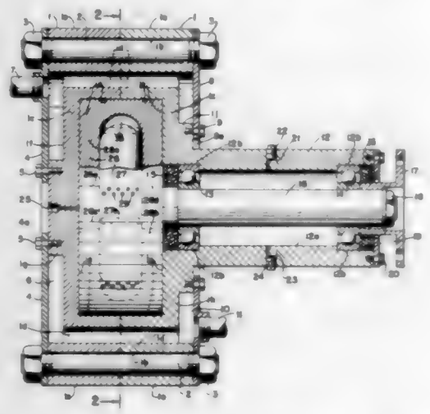
3,374,942
ROTARY PRESSURE TRANSFORMER
Claude Seippel, Zurich, Switzerland, assignor to Aktiengesellschaft Brown, Boveri & Cie, Baden, Switzerland, a joint-stock company
Filed Aug. 8, 1966, Ser. No. 571,012
Claims priority, application Switzerland, Aug. 12, 1965, 11,353/65
8 Claims. (Cl. 230—69)



1. In a rotary pressure transformer comprising a circular array of elongated cells in which energy conversions accompanied by compression and rarefaction waves are produced by opening and closing of the cell ends in rotation in conjunction with connection of the cell ends when opened with gas inflow and outflow channels, the improvement wherein said cells except for the opposite end

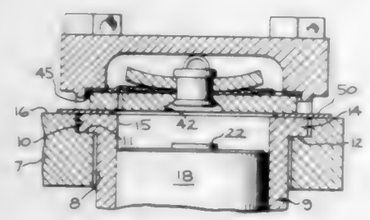
portions thereof have a cross-section favorable to the flow of the gas, and said end portions of said cells are constricted in a circumferential direction and enlarged in a direction perpendicularly thereto.

3,374,943
ROTARY GAS COMPRESSOR
Kenneth G. Cervenka, 204 N. Dewberry, Midland, Tex. 79701
Filed Aug. 15, 1966, Ser. No. 572,534
15 Claims. (Cl. 230—152)



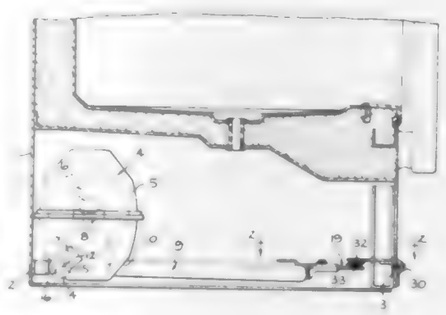
1. A rotary gas compressor comprising an outer casing having a cylindrical recess therein; a bearing carrier on said casing disposed axially of said recess; an input shaft journaled in said carrier and extending into said recess; a cylindrical inner compression casing within said recess and having an axial hole for said shaft, and having a non-cylindrical double bi-center semi-torus ring compression chamber therein provided with two sets of suction gas ports and discharge gas ports; a cylindrical rotor within said compression chamber keyed to said shaft and of width conforming with that of the compression chamber, the periphery of the rotor and the peripheral wall of the compression chamber being rounded on the same radius whereby the rotor is tangent to the walls of the compression chamber at points on the horizontal axis of the shaft thereby leaving crescent-shaped compression spaces between the upper and lower portions of the rotor and the top and bottom portions of the compression chamber disposed 180° apart into which the discharge ports and suction ports extend; said rotor having four radial slots spaced 90° apart; slidable vanes in said slots having peripheries rounded on the same radius as the peripheral walls of the rotor and compression chamber, and means for cooling the outer casing and inner compression chamber carried thereby.

3,374,944
COMPRESSOR UNIT
Owen H. Scheldorf, Fern Creek, and Robert E. Rogers, Louisville, Ky., assignors to General Electric Company, a corporation of New York
Filed Aug. 26, 1966, Ser. No. 575,290
3 Claims. (Cl. 230—172)



1. A compressor comprising:
a frame,
a drive shaft supported by said frame and having a crank pin at one end thereof,
a cylinder,
said frame including a cylinder support member having an opening therein for loosely receiving said cylinder and means for supporting said cylinder with the axis thereof in the plane of rotation of said crank pin,
a piston in said cylinder,
means for operatively connecting said piston to said shaft comprising a yoke rigidly connected to said piston and a cross slide reciprocating in said yoke and having a transverse bore for receiving said crank pin,
a valve plate having a peripheral edge overlapping said one end of said cylinder,
said plate and piston including a cooperating means for positioning said plate relative to said piston when said piston is at the top of its stroke,
a cylinder head including a discharge cavity and an annular relieved area surrounding said cavity for loosely receiving said valve plate, said relieved area including a shoulder for engaging the upper edge portion of said plate,
and fastening means for securing said cylinder head to said cylinder support member to clamp said plate and cylinder in operative positions relative to said piston.

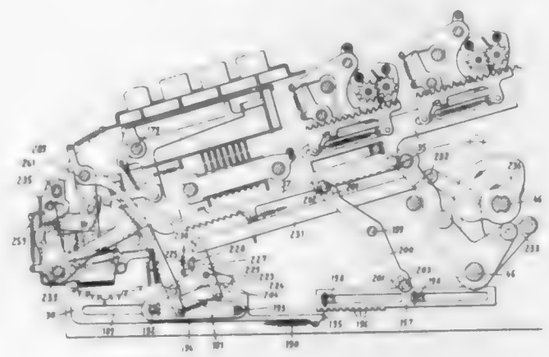
3,374,945
RESILIENT MOUNT FOR HERMETIC MOTOR COMPRESSOR UNITS
Chester F. Engleman and Alfred G. Butsch, Louisville, Ky., assignors to General Electric Company, a corporation of New York
Filed July 1, 1966, Ser. No. 562,366
2 Claims. (Cl. 230—235)



1. In combination:
a supporting frame including spaced first and second support members,
a hermetic compressor unit comprising a sealed casing positioned adjacent said first support member and an elongated member rigidly connected to and extending substantially horizontally and outwardly from one side of said casing towards said second support member with the outer end thereof spaced from said second support member,
a motor-compressor disposed within said casing and including a compressor and a motor connected to said compressor by a drive shaft disposed for rotation about a horizontal axis substantially perpendicular to said oil cooling tube,
resilient support means for pivotally supporting said casing on said first support member,
and means for resiliently supporting said unit on said second support member comprising a generally hair-pin shaped spring wire including spaced legs connected by a return bend portion,

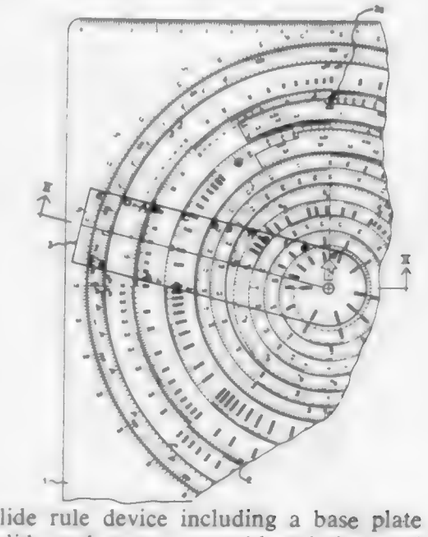
means for rigidly securing the end portions of said legs to said outer end of said elongated member and means for rigidly securing said return bend portion to said second support member,
an intermediate portion of each of said legs being formed to provide a shock and vibration absorbing substantially vertical coiled section.

3,374,946
COMPUTER FOR MULTIPLICATION WITH ABBREVIATED, CONTINUAL ADDITION OR SUBTRACTION
Otto Haberkorn, Gerstetten, Wurttemberg, Germany, assignor to Walther Buromaschinen G.m.b.H.
Filed Aug. 9, 1965, Ser. No. 478,050
Claims priority, application Germany, Aug. 7, 1964, W 37,344
24 Claims. (Cl. 235—60)



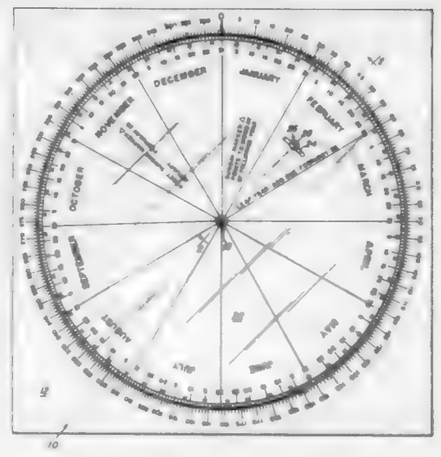
1. A calculating machine for performing multiplication with an abbreviated number of sequential additive or subtractive operations, respectively, of the multiplicand wherein the number of machine cycles for each decimal place of the multiplier, correspond to the value of the individual multiplier digits 1–5 or to the complementary value of the individual multiplier digits 6–9, respectively, characterized by the fact that the sum total of the required machine cycles assigned to the given multiplier digits is reduced, said calculator comprising at least two movably mounted distributor counter registers; means for storing a multiplicand; means for storing a multiplier; means sensing said multiplier storing means for transferring an addition or subtraction of the multiplicand for each individual multiplier digit sensed to said registers; means selectively coupling said registers to said transferring means for distributing the addition or subtraction among two or more distributor counter registers; second means for transferring the accumulated amounts of all but one of the distributor counter registers into said one distributor counter register to form the final product; a plurality of multi-members associated with each multiplier digit and longitudinally movable by an amount corresponding to the numeric value of the multiplier digit, one edge of each of said multi-members being notched to form a row of steps descending with increasing multiplier digit value for the digits 1–5 and a row of ascending steps for the digit values 6–9 with each scanned step elevation corresponding to one machine cycle, characterized by the fact that, except for the step 5, each step is assigned a number corresponding to that of the distributor counter registers used of multiplier digits following one another in the natural series; said means for sensing the position of each multi-member, for each multiplier digit, including means for enabling transfer of the multiplicand from said first transfer means during each machine cycle corresponding to a scanned elevation in each case only once into one or more than one distributor counter register.

3,374,947
SLIDE RULE
Carl Rune Wern, George Herman Wern, and Lars Åke Wern, all of Vartavagen 59, Stockholm, Sweden
Filed May 13, 1966, Ser. No. 549,882
Claims priority, application Sweden, May 20, 1965, 6,568/65; Aug. 20, 1965, 10,922/65; Mar. 11, 1966, 3,213/66
7 Claims. (Cl. 235—84)



A slide rule device including a base plate and a circular slide and runner rotatable relative to the base and to each other about an axis through the center of the base plate. Provision is made for so solving multiplication and division problems and exponential and other equations and of providing powers and roots as to simultaneously provide both the sequence of digits in the answer and the correct location of the decimal point. Also, provision may be made for computing logarithms and ascertaining sine, tangent, and arc values of angles, areas of circles having a specified radii or diameters, and reciprocals of numbers as well as other functions.

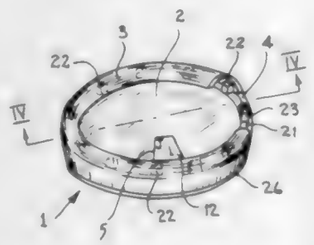
3,374,948
CALENDAR CALCULATOR
George L. McColm, 6 Boatclub Road, Poona 1, India
Filed Oct. 21, 1965, Ser. No. 500,051
3 Claims. (Cl. 235—88)



This invention relates to a calendar calculator including a base having a circle therein divided into 365 equal parts numbering consecutively from 0 to 365. A first disc is rotatably mounted on the base concentrically with the circle and is also divided into 365 equal portions and designated with the months and days of each month consecutively. A second disc is rotatably mounted on the base above the first disc and concentrically therewith.

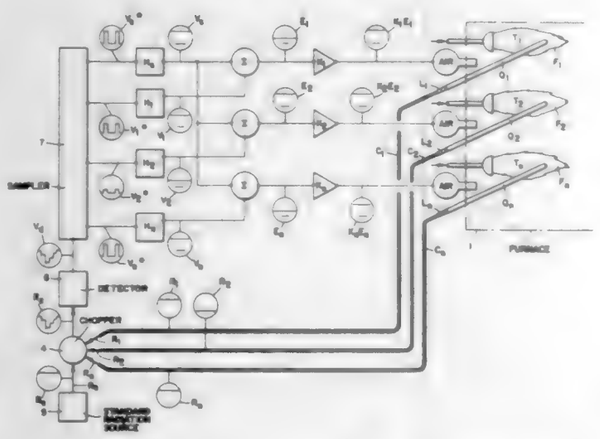
The second disc is also divided into 365 equal segments and bears indicia indicating consecutively every 7th day of the week. The indicia on the base and first and second discs are so positioned as to provide ready alignment and reading of values as needed whereby the indicia on the second disc may be selectively aligned with the indicia on the first disc to indicate on what dates a specific day of the week falls throughout the year and whereby by aligning a specific date on the first disc with the zero number on the base indicia the elapsed days from this date to any date on the first disc may be determined by reading the number on the base indicia aligned with said date.

3,374,949
RELIGIOUS ROSARIES
Martin Cecil Hayden, Loyola, 41 St. Assam's Ave., Raheny, Dublin, Ireland
Filed Nov. 23, 1966, Ser. No. 596,607
4 Claims. (Cl. 235—123)



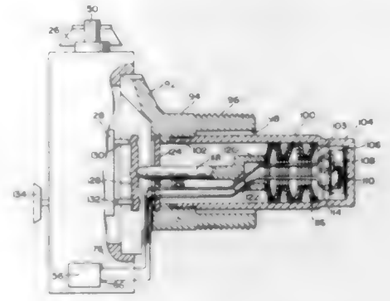
A ring-type rosary composed of a rotatable bead ring disposed within a casing with a portion of the casing slotted for manually moving the bead ring. A picture wheel having a plurality of separate radially extending sectors is positioned within the casing, and each time the bead ring completes one revolution, ratchet means within the casing move the picture wheel a predetermined angular distance. The casing has a transparent window in register with one of the sectors on the picture wheel for displaying the material depicted in the sectors.

3,374,950
PHOTO-PYROMETRIC CONTROL SYSTEM FOR EFFICIENT COMBUSTION IN MULTIPLE-BURNER, RESIDUAL-FUEL-FIRED FURNACES
Thomas C. Menzel, Orange, and John E. Gerrard, Matawan, N.J., assignors to Esso Research and Engineering Company, a corporation of Delaware
Filed Apr. 12, 1965, Ser. No. 447,292
5 Claims. (Cl. 236—15)



4. Apparatus for the control of a multiple burner furnace comprising means for measuring the radiation of each burner flame; a standard radiation source; means for converting the measured radiation of each burner flame and of said standard radiation source to proportionally equivalent electrical signals; means for sequentially comparing each electrical signal proportional to said radiation of each burner flame with the electrical signal from said standard radiation source; and means responsive to the difference between the compared signal levels for adjusting the air-fuel supply to each burner.

3,374,951
DUAL THERMOSTATIC CONTROL DEVICE
Wilbur F. Jackson and Theodore J. Dykzeul, Rolling Hills, Calif., assignors to Robertshaw Controls Company, Richmond, Va., a corporation of Delaware
Filed Apr. 28, 1966, Ser. No. 545,958
7 Claims. (Cl. 236—21)

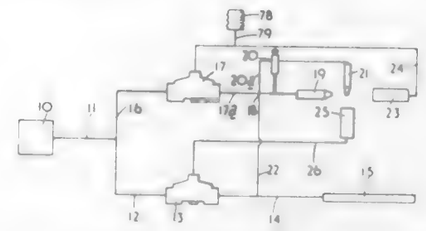


1. In a thermostatic control device, the combination comprising,
a casing having inlet and outlet means and flow passage means therebetween,
control means in said passage means movable between controlling positions,
normal temperature sensor means carried by said casing including a tube of thermally responsive material and a rod of relatively thermally non-responsive material axially disposed in said tube,
means defining an operative connection between said rod and said control means for moving the same between controlling positions in response to normal temperature conditions,
thermoelectric means including safety shut-off means in said passage means and electromagnetic means adapted to be energized for holding said safety shut-off means in an open position,
thermoelectric circuit means for energizing said electromagnetic means,
bimetal switch means in said tube electrically connected in said circuit means for deenergizing said electromagnetic means in response to abnormal temperature conditions, and
bimetal disc means in said tube engaging said rod for effecting movement thereof in response to normal temperature conditions.

3,374,952
CONTROLS FOR GAS-BURNING SYSTEMS
Frederick Carr, Birmingham, England, assignor to Servotomic Limited, London, England, a British company
Filed Jan. 11, 1966, Ser. No. 519,879
Claims priority, application Great Britain, Jan. 13, 1965, 1,471/65
6 Claims. (Cl. 236—68)

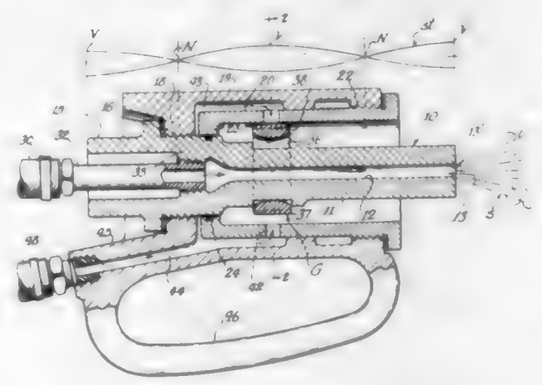
The specification discloses a gas-burning system having a main burner, a pilot burner and an auxiliary burner. Operation of the auxiliary burner controls the gas supply to the main burner. The system includes a main-burner, gas-supply valve which acts both as a shut-off valve for the main burner and, when it is open, as a pressure

governor for the gas supplied to the main burner. This valve is controlled in dependence on operation of the auxiliary burner. In one embodiment, the auxiliary burner can also be supplied from a gas control valve which oper-



ates as a shut-off valve and also as a pressure governor when open. In a second embodiment, the supply valve for the main burner is controlled in dependence on the operation both of the pilot burner and of the auxiliary burner.

3,374,953
SONICALLY VIBRATORY LIQUID SPRAYER
Albert G. Bodine, Los Angeles, Calif. (7877 Woodley Ave., Van Nuys, Calif. 91406)
Filed Aug. 25, 1965, Ser. No. 482,361
3 Claims. (Cl. 239—102)



An elastic spray member has an axial duct for conducting liquid therethrough and an axially aligned spray discharge nozzle or orifice. An orbiting-mass oscillator in the form of a gyratory ring is incorporated in the spray member to elastically vibrate such member. Such vibratory elastic resonant vibration of the spray member efficiently atomizes the liquid to provide a very fine spray from the nozzle.

3,374,954
NOZZLE COOLING AND THRUST VECTOR CONTROL APPARATUS
Theodore B. Card, Brigham City, Utah, assignor to Thiokol Chemical Corporation, Bristol, Pa., a corporation of Delaware
Filed Mar. 3, 1966, Ser. No. 531,604
2 Claims. (Cl. 239—127.1)

1. In a rocket motor, nozzle cooling and thrust vector control apparatus comprising:
a convergent-divergent nozzle having inner and outer walls disposed in spaced, concentric relation and sealably joined at the forward and aft ends thereof, an annular partition extending between said walls adjacent the throat of said nozzle and dividing the annular space between said walls into forward and aft chambers, said nozzle being provided with a plurality of circumferentially spaced cooling ports formed in said inner wall at said throat and in communication with said forward chamber, a plurality of circumferentially spaced injection ports formed in said inner wall aft of said throat, at least one fluid supply port formed in said outer wall and in communication with the forward portion of said aft chamber, a plurality of circumferentially spaced pressurized-fluid outlet ports formed in said outer wall and in communication with the aft portion of said aft chamber, and a plurality of circumferentially spaced coolant supply ports formed in said outer wall and in communication with said forward chamber;
